9.3.3.8 Reassociation Response frame format

The frame body of a Reassociation Response frame contains the information shown in Table 9-37.

Table 9-37—Reassociation Response frame body

Order	Information	Notes
1	Capability Information	See 9.4.1.4 for Capability Information field format.
2	Status code	
3	AID	This field is not present when dot11S1GOptionImplemented is true.
4	Supported Rates and BSS Membership Selectors	This field is not present if dot11DMGOptionImplemented is true.
5	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optional otherwise. This element is not present if dot11DMGOptionImplemented is true.
6	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true; otherwise not present.
7	RCPI	The RCPI element is present if dot11RMRCPIMeasurementActivated is true.
8	RSNI	The RSNI element is present if dot11RMRSNIMeasurementActivated is true.
9	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
10	RSN	An RSNE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to a Reassociation Request frame that contained an FTE (i.e., part of a fast BSS transition in an RSN); or if dot11FILSActivated is true. Otherwise, not present.
11	Mobility Domain	An MDE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true and this frame is a response to a Reassociation Request frame that contained an MDE (i.e., either an FT initial mobility domain association exchange or part of a fast BSS transition).
12	Fast BSS Transition	An FTE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to a Reassociation Request frame that contained an MDE (i.e., either an FT initial mobility domain association exchange or part of a fast BSS transition in an RSN).
13	RIC	The set of elements that formulate a RIC-Response is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true and this frame is a response to a Reassociation Request frame that contained a RIC-Request.
14	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.

Table 9-37—Reassociation Response frame body *(continued)*

Order	Information	Notes
15	Timeout Interval (Association Comeback time)	A TIE containing the Association Comeback time is present when dot11RSNAActivated is true, dot11RSNAProtectedManagementFramesActivated is true, and either the reassociation is rejected with status code REFUSED_TEMPORARILY or the reassociation request is accepted with a status code 0 and when dot11S1GOptionImplemented is true.
16	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
17	HT Operation	The HT Operation element is included by an AP when dot11HighThroughputOptionImplemented is true.
18	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
19	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true.
20	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
21	BSS Max Idle Period	The BSS Max Idle Period element is present if dot11WirelessManagementImplemented is true or optionally present if dot11S1GOptionImplemented is true.
22	TIM Broadcast Response	The TIM Broadcast Response element is present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
23	FMS Response	The FMS Response element is present if dot11FMSActivated is true and the FMS Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
24	DMS Response	The DMS Response element is present if dot11DMSActivated is true and the DMS Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
25	QoS Map	The QoS Map element is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Reassociation Request frame is 1.
26	QMF Policy	The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Reassociation Request that elicited this Reassociation Response frame.
27	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
28	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
29	DMG Operation	The DMG Operation element is present if dot11DMGOptionImplemented is true.
30	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
31	Neighbor Report	One or more Neighbor Report elements is present if the Status Code field is REJECTED_WITH_SUGGESTED_BSS_TRANSITION.

Table 9-37—Reassociation Response frame body *(continued)*

Order	Information	Notes
32	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
33	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true; otherwise, it is not present.
34	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
35	Future Channel Guidance	The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true.
36	FILS Session	The FILS Session element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
37	FILS Public Key	The FILS Public Key element is present if dot11FILSActivated is true and FILS Public Key authentication is used; otherwise not present.
38	FILS Key Confirmation	The FILS Key Confirmation element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
39	FILS HLP Container	One or more FILS HLP Container elements are optionally present if dot11FILSActivated is true; otherwise not present.
40	FILS IP Address Assignment	The FILS IP Address Assignment element is optionally present if dot11FILSActivated is true; otherwise not present.
41	Key Delivery	The Key Delivery element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
42	S1G Sector Operation	The S1G Sector Operation element is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
43	TWT	The TWT element is present if dot11TWTOptionActivated is true and the TWT element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
44	TSF Timer Accuracy	The TSF Timer Accuracy element is optionally present when dot11TSFTimerAccuracyImplemented is true; otherwise not present.
45	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
46	S1G Operation	The S1G Operation element is present when dot11S1GOptionImplemented is true; otherwise not present.
47	AID Response	The AID Response element is present when dot11S1GOptionImplemented is true.
48	Sectorized Group ID List	The Sectorized Group ID List element is optionally present when dot11S1GSectorizationActivated is true; otherwise not present.
49	S1G Relay	The S1G Relay element is optionally present if dot11RelayAPImplemented is true; otherwise not present.

Table 9-37—Reassociation Response frame body *(continued)*

Order	Information	Notes
50	Header Compression	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true.
51	SST Operation	The SST Operation element is present if dot11SelectiveSubchannelTransmissionPermitted is true.
52	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
53	S1G Relay Activation	The S1G Relay Activation element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
54	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
55	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
56	CMMG Operation	The CMMG Operation element is present when dot11CMMGOptionImplemented is true; otherwise not present.
56	OCI	The OCI element is present if dot11FILSActivated and dot11RSNAOperatingChannelValidationActivated are both true; otherwise not present.
58	GLK-GCR Parameter Set	The GLK-GCR Parameter Set element is present if dot11GLKimplemented is true and the AP has set up a GLK-GCR for groupcast transmissions over the underlying general link. Otherwise this element is not present.
59	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield and, in the case of FT reassociation, the rules for FT reassociation in Table 13-1 do not omit the RSNXE from the fourth message.
60	MSCS Descriptor	The MSCS Descriptor element is optionally present if dot11MSCSActivated is true; otherwise not present.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.

9.3.3.9 Probe Request frame format

The frame body of a Probe Request frame contains the information shown in Table 9-38.

Table 9-38—Probe Request frame body

Order	Information	Notes
1	SSID	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2.
2	Supported Rates and BSS Membership Selectors	This field is not present if dot11DMGOptionImplemented is true.
3	Request	The Request element is optionally present if dot11RadioMeasurementActivated is true. The Request element is optionally present if dot11MultiDomainCapabilityActivated is true or if dot11EstimatedServiceParametersInboundOptionImplemented is true.
4	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates and is optionally present otherwise. This element is not present if dot11DMGOptionImplemented is true.
5	DSSS Parameter Set	The element is optionally present. The DSSS Parameter Set element is present within Probe Request frames generated by STAs using Clause 15, Clause 16, or Clause 18 PHYs if dot11RadioMeasurementActivated is true. The DSSS Parameter Set element is present within Probe Request frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band if dot11RadioMeasurementActivated is true. The DSSS Parameter Set element is optionally present within Probe Request frames generated by STAs using Clause 15, Clause 16, or Clause 18 PHYs if dot11RadioMeasurementActivated is false. The DSSS Parameter Set element is optionally present within Probe Request frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band if dot11RadioMeasurementActivated is false.
6	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true. The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true.
7	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
8	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
9	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
10	SSID List	The SSID List element is optionally present if dot11SSIDListActivated is true.
11	Channel Usage	The Channel Usage element is optionally present if dot11ChannelUsageActivated is true.

Table 9-38—Probe Request frame body *(continued)*

Order	Information	Notes
12	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
13	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
14	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
15	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
16	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
17	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
18	Estimated Service Parameters Inbound	The Estimated Service Parameters Inbound element is optionally present if dot11EstimatedServiceParametersInboundOptionImplemented is true.
19	Extended Request	The Extended Request element is optionally present if dot11RadioMeasurementActivated is true.
20	FILS Request Parameters	The FILS Request Parameters element is optionally present if dot11FILSActivated is true; otherwise not present.
21	AP-CSN	The AP-CSN element is optionally present if dot11FILSActivated is true; otherwise not present.
22	Change Sequence	The Change Sequence element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
23	S1G Relay Discovery	The S1G Relay Discovery element is optionally present if dot11RelayDiscoveryOptionImplemented is true; otherwise not present.
24	PV1 Probe Response Option	The PV1 Probe Response Option element is optionally present if dot11PV1ProbeResponseOptionImplemented is true; otherwise not present.
25	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
26	EL Operation	The EL Operation element is present if dot11S1GELOperationActivated is true.
27	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
28	Vendor Specific Request	The Vendor Specific Request element is optionally present.
29	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
30	Cluster Probe	The Cluster Probe element is optionally present if dot11ClusteringActivated is true; otherwise not present.
31	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.

Table 9-38—Probe Request frame body *(continued)*

Order	Information	Notes
32	Estimated Services Parameters Outbound	The Estimated Service Parameters Outbound element is optionally present if dot11EstimatedServiceParametersOutboundOptionImplemented is true.
33	Supplemental Class 2 Capabilities	The Supplemental Class 2 Capabilities element is present when dot11Class2CapabilitiesOptionImplemented is true; otherwise not present.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.

9.3.3.10 Probe Response frame format

The frame body of a Probe Response frame contains the information shown in Table 9-39. See additional details and procedures in 11.1.4.

Table 9-39—Probe Response frame body

Order	Information	Notes
1	Timestamp	See 9.4.1.10 for Timestamp field format.
2	Beacon Interval	See 9.4.1.3 for Beacon Interval field format.
3	Capability Information	See 9.4.1.4 for Capability Information field format.
4	SSID	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2.
5	Supported Rates and BSS Membership Selectors	This field is not present if dot11DMGOptionImplemented is true.
6	DSSS Parameter Set	The element is optionally present. The DSSS Parameter Set element is present within Probe Response frames generated by STAs using Clause 15, Clause 16, and Clause 18 PHYs. The DSSS Parameter Set element is present within Probe Response frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band.
7	IBSS Parameter Set	The IBSS Parameter Set element is present only within Probe Response frames generated by IBSS STAs.
8	Country	The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
9	Power Constraint	The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true.
10	Channel Switch Announcement	The Channel Switch Announcement element is optionally present for non-DMG STAs if dot11SpectrumManagementRequired is true.
11	Quiet	The Quiet element is optionally present if dot11SpectrumManagementRequired is true or if dot11RadioMeasurementActivated is true.

Table 9-39—Probe Response frame body *(continued)*

Order	Information	Notes
12	IBSS DFS	The IBSS DFS element is present if dot11SpectrumManagementRequired is true in an IBSS.
13	TPC Report	The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
14	ERP	The ERP element is present within Probe Response frames generated by STAs using ERPs and is optionally present otherwise.
15	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optionally present otherwise. This element is not present if dot11DMGOptionImplemented is true.
16	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
17	BSS Load	The BSS Load element is present if dot11QosOptionImplemented and dot11QBSSLoadImplemented are both true.
18	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true and dot11MeshActivated is false.
19	Measurement Pilot Transmission	The Measurement Pilot Transmission element is present if dot11RMMeasurementPilotActivated is between 2 and 7.
20	Multiple BSSID	One or more Multiple BSSID elements are present if dot11RMMeasurementPilotActivated is between 2 and 7 and the AP is a member of a multiple BSSID set (see 11.10.14) with two or more members, or if dot11MultiBSSIDImplemented is true, or if dot11InterworkingServiceActivated is true and the AP is a member of a multiple BSSID set with two or more members and at least one dot11GASAdvertisementID MIB attribute exists.
21	RM Enabled Capabilities	The RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
22	AP Channel Report	If dot11RMAPChannelReportActivated is true, one AP Channel Report element is optionally present for each operating class that has at least 1 channel to report.
23	BSS Average Access Delay	The BSS Average Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true and the AP Average Access Delay field is not equal to 255 (measurement not available).
24	Antenna	The Antenna element is optionally present if dot11RMAntennaInformationActivated is true and the Antenna ID field is not equal to 0 (unknown antenna).
25	BSS Available Admission Capacity	The BSS Available Admission Capacity element is optionally present if dot11RMBSSAvailableAdmissionCapacityActivated is true with the following exceptions: 1) when Available Admission Capacity Bitmask equals 0 (Available Admission Capacity List contains no entries), or 2) when the BSS Load element is present and the Available Capacity Bitmask equals 256 (Available Admission Capacity List contains only the AC_VO entry).
26	BSS AC Access Delay	The BSS AC Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true and at least one field of the element is not equal to 255 (measurement not available).

Table 9-39—Probe Response frame body *(continued)*

Order	Information	Notes
27	Mobility Domain	The MDE is present if dot11FastBSSTransitionActivated is true.
28	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
29	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.
30	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true. The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true.
31	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
32	HT Operation	The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented is true.
33	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
34	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true.
35	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
36	QoS Traffic Capability	The QoS Traffic Capability element is optionally present if dot11ACStationCountActivated is true.
37	Channel Usage	The Channel Usage element is present if the Channel Usage element is present in the Probe Request frame and dot11ChannelUsageActivated is true.
38	Time Advertisement	The Time Advertisement element is present if dot11UTCTSFOffsetActivated is true.
39	Time Zone	The Time Zone element is present if dot11UTCTSFOffsetActivated is true.
40	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
41	Advertisement Protocol	Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists.
42	Roaming Consortium	The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
43	Emergency Alert Identifier	One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network.
44	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
45	Mesh Configuration	The Mesh Configuration element is present if dot11MeshActivated is true.
46	Mesh Awake Window	The Mesh Awake Window element is optionally present if dot11MeshActivated is true.

Table 9-39—Probe Response frame body *(continued)*

Order	Information	Notes
47	Beacon Timing	The Beacon Timing element is optionally present if both dot11MeshActivated and dot11MBCAActivated are true.
48	MCCAOP Advertisement Overview	The MCCAOP Advertisement Overview element is optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
49	MCCAOP Advertisement	One or more MCCAOP Advertisement elements are optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
50	Mesh Channel Switch Parameters	The Mesh Channel Switch Parameters element is present if dot11MeshActivated is true and either Channel Switch Announcement element or Extended Channel Switch Announcement element is present.
51	QMF Policy	The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Probe Request that elicited this Probe Response frame.
52	QLoad Report	The QLoad Report element is present if dot11QLoadReportActivated is true.
53	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
54	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
55	DMG Operation	The DMG Operation element is present if dot11DMGOptionImplemented is true.
56	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
57	Antenna Sector ID Pattern	The Antenna Sector ID Pattern element is optionally present if dot11DMGOptionImplemented is true.
58	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
59	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true; otherwise, it is not present.
60	Transmit Power Envelope element	One Transmit Power Envelope element is present for each distinct value of the Local Maximum Transmit Power Unit Interpretation subfield that is supported for the BSS if both of the following conditions are met: — dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true; — Either dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. Otherwise, this element is not present.
61	Channel Switch Wrapper element	The Channel Switch Wrapper element is optionally present if dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true and at least one of a Channel Switch Announcement element or an Extended Channel Switch Announcement element is also present in the Probe Response frame and the Channel Switch Wrapper element contains at least one subelement. The Channel Switch Wrapper element is optionally present if dot11S1GOptionImplemented is true and Extended Channel Switch Announcement element is present in the Probe Response frame.

Table 9-39—Probe Response frame body *(continued)*

Order	Information	Notes
62	Extended BSS Load element	The Extended BSS Load element is optionally present if dot11QosOptionImplemented, dot11QBSSLoadImplemented and dot11VHTOptionImplemented are true.
63	Quiet Channel	Either one Quiet Channel element containing an AP Quiet Mode field equal to 0 or, in an infrastructure BSS, one or more Quiet Channel elements each containing an AP Quiet Mode field equal to 1 are optionally present if dot11VHTOptionImplemented is true, and either dot11SpectrumManagementRequired or dot11RadioMeasurementActivated is true.
64	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
65	Reduced Neighbor Report	The Reduced Neighbor Report element is optionally present if dot11TVHTOptionImplemented or dot11FILSActivated is true; otherwise not present.
66	TVHT Operation	The TVHT Operation element is present for a TVHT STA when dot11TVHTOptionImplemented is true; otherwise it is not present.
67	Estimated Service Parameters Inbound	The Estimated Service Parameters Inbound element is optionally present if dot11EstimatedServiceParametersInboundOptionImplemented is true.
68	Relay Capabilities	The Relay Capabilities element is present if dot11RelayActivated is true; otherwise not present.
69	CAG Number	The CAG Number element is optionally present if dot11FILSActivated is true; otherwise not present.
70	FILS Indication	The FILS Indication element is present if dot11FILSActivated is true; otherwise not present.
71	AP-CSN	The AP-CSN element is optionally present if dot11FILSActivated is true; otherwise not present.
72	DILS	The DILS element is optionally present if dot11FILSActivated is true; otherwise not present.
73	RPS	The RPS element is optionally present if dot11RAWOperationActivated is true; otherwise not present.
74	Page Slice	The Page Slice element is optionally present if dot11PageSlicingActivated is true; otherwise not present.
75	Change Sequence	The Change Sequence element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
76	TSF Timer Accuracy	The TSF Timer Accuracy element is optionally present when dot11TSFTimerAccuracyImplemented is true; otherwise not present.
77	S1G Relay Discovery	The S1G Relay Discovery element is optionally present if dot11RelayDiscoveryOptionImplemented is true; otherwise not present.
78	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
79	S1G Operation	The S1G Operation element is present when dot11S1GOptionImplemented is true; otherwise not present.
80	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.

Table 9-39—Probe Response frame body *(continued)*

Order	Information	Notes
81	Short Beacon Interval	The Short Beacon Interval element is present if dot11ShortBeaconInterval is true.
82	S1G Open-Loop Link Margin Index	The S1G Open-Loop Link Margin Index element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
83	S1G Relay	The S1G Relay element is optionally present if dot11RelayAPImplemented is true; otherwise not present.
84	Max Channel Switch Time	The Max Channel Switch Time element is optionally present when a Channel Switch Announcement or an Extended Channel Switch Announcement element is also present.
85	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
86	Extended Cluster Report	The Extended Cluster Report element is optionally present if dot11ClusteringActivated is true; otherwise not present.
87	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
88	CMMG Operation	The CMMG Operation element is present when dot11CMMGOptionImplemented is true; otherwise not present.
89	Estimated Services Parameters Outbound	The Estimated Service Parameters Outbound element is optionally present if dot11EstimatedServiceParametersOutboundOptionImplemented is true.
90	Service Hint	The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true.
91	Service Hash	The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true.
91	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
Last–1	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements, except the Requested elements.
Last	Requested elements	Elements requested by the Request element or Extended Request element(s) of the Probe Request frame are present if dot11MultiDomainCapabilityActivated or dot11EstimatedServiceParametersInboundOptionImplemented is true. See 11.1.4.3.2 and 11.44.

9.3.3.11 Authentication frame format

The frame body of an Authentication frame contains the information shown in Table 9-40. FT authentication is used when FT support is advertised by the AP and dot11FastBSSTransitionActivated is true in the STA. SAE authentication is used when dot11MeshActiveAuthenticationProtocol is sae (1). FILS authentication is used if support for FILS authentication is advertised by the AP and dot11FILSActivated is true in the STA.

Table 9-40—Authentication frame body

Order	Information	Notes
1	Authentication algorithm number	
2	Authentication transaction sequence number	
3	Status code	The status code information is reserved in certain Authentication frames as defined in Table 9-41.
4	Finite Cyclic Group	An unsigned integer indicating a finite cyclic group as described in 9.4.1.42. This is present only in certain Authentication frames as defined in Table 9-41.
5	Anti-Clogging Token	A random bit string used for anti-clogging purposes as described in 12.4.6. This is present only in certain Authentication frames as defined in Table 9-41.
6	Send-Confirm	A binary encoding of an integer used for anti-replay purposes as described in 12.4.7.5. This is present only in certain Authentication frames as defined in Table 9-41.
7	Scalar	An unsigned integer encoded as described in 12.4.7.4. This is present only in certain Authentication frames as defined in Table 9-41.
8	FFE field	An element in a finite field encoded as described in 12.4.7.4. This is present only in certain Authentication frames as defined in Table 9-41.
9	Confirm	An unsigned integer encoded as described in 12.4.7.5. This is present only in certain Authentication frames as defined in Table 9-41.
10	Challenge text	A Challenge Text element is present only in certain Authentication frames as defined in Table 9-41.
11	RSN	An RSNE is present only in certain Authentication frames as defined in Table 9-41.
12	Mobility Domain	An MDE is present only in certain Authentication frames as defined in Table 9-41.
13	Fast BSS Transition	An FTE is present only in certain Authentication frames as defined in Table 9-41.
14	Timeout Interval (reassociation deadline)	A TIE containing the reassociation deadline interval is present only in certain Authentication frames as defined in Table 9-41.
15	RIC	A resource information container, containing a variable number of elements, is present only in certain Authentication frames as defined in Table 9-41.
16	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
17	Neighbor Report	One or more Neighbor Report elements are present only in certain Authentication frames as defined in Table 9-41.
18	FILS Nonce	The FILS Nonce element is present in FILS Authentication frames as defined in Table 9-41.
19	FILS Session	The FILS Session element is present in FILS Authentication frames as defined in Table 9-41.
20	FILS Wrapped Data	The FILS Wrapped Data element is present in FILS Authentication frames as defined in Table 9-41.

Table 9-40—Authentication frame body *(continued)*

Order	Information	Notes
21	Association Delay Info	The Association Delay Info element is present in FILS Authentication frames as defined in Table 9-41.
22	Password Identifier	The Password Identifier element is optionally present in certain Authentication frames as defined in Table 9-41.
23	Rejected Groups	The Rejected Groups element is present only in certain Authentication frames as defined in Table 9-41.
24	Anti-Clogging Token Container	The Anti-Clogging Token Container element is present only in certain Authentication frames as defined in Table 9-41.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.

Table 9-41—Presence of fields and elements in Authentication frames

Authentication algorithm	Authentication transaction sequence number	Status code	Presence of fields and elements from order 4 onward
Open System	1	Reserved	Not present
Open System	2	Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION	Not present
Open System	2	REJECTED_WITH_SUGGESTED_BSS_TRANSITION	One or more Neighbor Report element(s) is present
Shared Key	1	Reserved	Not present
Shared Key	2	Any	The Challenge Text element is present
Shared Key	3	Reserved	The Challenge Text element is present
Shared Key	4	Any	Not present
FT	1	Reserved	The Mobility Domain element is present. The Fast BSS Transition element and RSNEs are present if dot11RSNAActivated is true.
FT	2	Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION	The Mobility Domain element is present if the Status Code field is 0. The Fast BSS Transition element and RSNEs are present if the Status Code field is 0 and dot11RSNAActivated is true.
FT	2	REJECTED_WITH_SUGGESTED_BSS_TRANSITION	One or more Neighbor Report element(s) is present

Table 9-41—Presence of fields and elements in Authentication frames *(continued)*

Authentication algorithm	Authentication transaction sequence number	Status code	Presence of fields and elements from order 4 onward
FT	3	Reserved	The Mobility Domain element is present. The Fast BSS Transition element and RSNEs are present if dot11RSNAActivated is true. The RIC element is optionally present.
FT	4	Any	The Mobility Domain element is present if the Status Code field is 0. The Fast BSS Transition element and RSNEs are present if dot11RSNAActivated is true. The RIC element is optionally present if the Status Code field is 0. The TIE (reassociation deadline) is present if a RIC element is present.
SAE	1	Any	The Scalar field is present if the Status Code field is zero or 126. The FFE field is present if the Status Code field is zero or 126. When the hunting-and-pecking method is used to drive the PWE, the Anti-Clogging Token field is present if the Status Code field is ANTI_CLOGGING_TOKEN_REQUIRED or if the Authentication frame is in response to a previous rejection with the Status Code field equal to ANTI_CLOGGING_TOKEN_REQUIRED. The Finite Cyclic Group field is present if the Status Code field is zero, ANTI_CLOGGING_TOKEN_REQUIRED, 77 or 126. The Password Identifier element is optionally present if the Status Code field is zero, 123 or 126. The Rejected Groups element is conditionally present if the Status Code field is 126, as described in 12.4.7.4. When the hash-to-element method is used to derive the PWE, the Anti-Clogging Token Container element is present if the Status Code field is ANTI_CLOGGING_TOKEN_REQUIRED or if the Authentication frame is in response to a previous rejection with the Status Code field equal to ANTI_CLOGGING_TOKEN_REQUIRED.
SAE	2	Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION	The Send-Confirm field is present. The Confirm field is present.
SAE	2	REJECTED_WITH_SUGGESTED_BSS_TRANSITION	One or more Neighbor Report element(s) are present

Table 9-41—Presence of fields and elements in Authentication frames *(continued)*

Authentication algorithm	Authentication transaction sequence number	Status code	Presence of fields and elements from order 4 onward
FILS Shared Key authentication without PFS	1	Reserved	The RSNE is present. The MDE is present if the FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present. The FILS Session element is present. The FILS Wrapped Data element is present.
FILS Shared Key authentication without PFS	2	Status	The RSNE is present. The MDE and the FTE are present if the Status Code field is 0 and FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present if the Status Code field is 0. The FILS Session element is present if the Status Code field is 0. The FILS Wrapped Data element is present if the Status Code field is 0. The Association Delay Info element is present if the Status Code field is 0 and the AP expects that the (Re)Association Response frame will be transmitted more than 1 TU after the (Re)Association Request frame.
FILS Shared Key authentication with PFS	1	Reserved	The Finite Cyclic Group field is present. The FFE field is present. The RSNE is present. The MDE is present if the FILS authentication is used for FT initial mobility domain association. The FILS Nonce element is present. The FILS Session element is present. The FILS Wrapped Data element is present.

9.3.3.12 Deauthentication

The frame body of a Deauthentication frame contains the information shown in Table 9-42.

Table 9-42—Deauthentication frame body

Order	Information
1	Reason code
Last – 1	One or more Vendor Specific elements are optionally present.
Last	The MME is present when management frame protection is enabled at the AP and the frame is a group addressed frame.
NOTE—The MME appears after all fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 12.5.4.	

9.3.3.13 Action frame format

The frame body of an Action frame contains the information shown in Table 9-43.

Table 9-43—Action frame body and Action No Ack frame body

Order	Information
1	Action
Last – 2	One or more Vendor Specific elements are optionally present. These elements are absent when the Category subfield of the Action field is Vendor-Specific, Vendor-Specific Protected, or Self-protected or when the Category subfield of the Action field is VHT and the VHT Action subfield of the Action field is VHT Compressed Beamforming.
Last – 1	The MME is present when management frame protection is enabled at the AP, the frame is a group addressed robust Action frame, and the category of the Action frame does not support group addressed privacy as indicated by Table 9-51.
Last	The Authenticated Mesh Peering Exchange element is present in a Self-protected Action frame if dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true and a PMK exists between the sender and recipient of this frame; otherwise not present.
NOTE—The MME appears after any fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 12.5.4.	

9.3.3.14 Action No Ack frame format

The frame body of an Action No Ack frame contains the information shown in Table 9-43.

NOTE—The selection of Action or Action No Ack is made per frame that uses these formats.

Unless specified as allowing the use of the Action No Ack management frame subtype, a frame described as an “Action frame” uses only the Action subtype.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.3.3.15 Timing Advertisement frame format

The frame body of a Timing Advertisement frame contains the information shown in Table 9-44.

Table 9-44—Timing Advertisement frame body

Order	Information	Notes
1	Timestamp	See 9.4.1.10 for Timestamp field format.
2	Capability Information	See 9.4.1.4 for Capability Information field format.
3	Country	The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true.
4	Power Constraint	The Power Constraint element is optionally present if the Country element is present; otherwise not present.
5	Time Advertisement	The Time Advertisement element is optionally present. See 9.4.2.60.
6	Extended Capabilities	The Extended Capabilities element is present.
Last	Vendor specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.

9.3.4 Extension frames

9.3.4.1 Format of Extension frames

The format of Extension frames is defined in Figure 9-75. The MAC header of an Extension frame starts with the Frame Control field followed by the Duration field. The MAC header of different Extension frames can have different number and types of fields following the Duration field.

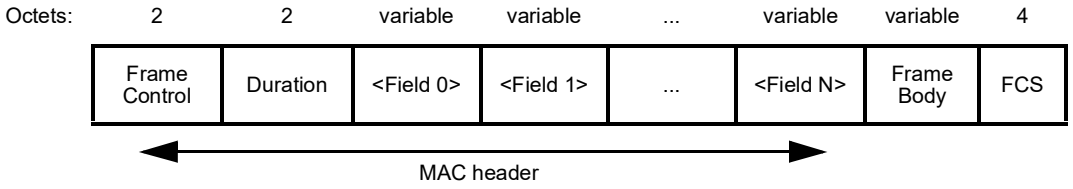

Figure 9-75—Extension frame format

9.3.4.2 DMG Beacon

The format of the DMG Beacon frame is shown in Figure 9-76.

In addition to supporting functions such as network synchronization (see 11.1), the DMG Beacon frame can also be used as a training frame for beamforming (see 10.42).

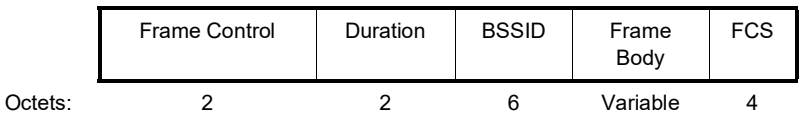

Figure 9-76—DMG Beacon frame format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Duration field is set to the time remaining until the end of the beacon transmission interval (BTI).

The BSSID field contains the BSSID.

The Frame Body field of the DMG Beacon frame contains the elements listed in Table 9-45.

Table 9-45—DMG Beacon frame body

Order	Information	Notes
1	Timestamp	See 9.4.1.10
2	Sector Sweep	See 9.5.1
3	Beacon Interval	See 9.4.1.3
4	Beacon Interval Control	See Figure 9-77.
5	DMG Parameters	See 9.4.1.46
6	Clustering Control	Optional. See Figure 9-78 and Figure 9-79.
7	DMG Capabilities	The DMG Capabilities element is optionally present.
8	Extended Schedule	The Extended Schedule element is optionally present.
9	RSN	The RSNE is optionally present if dot11RSNAActivated is true.
10	Multiple BSSID	One or more Multiple BSSID elements are optionally present if dot11MultiBSSIDImplemented is true.
11	DMG Operation	The DMG Operation element is optionally present.
12	Next DMG ATI	The Next DMG ATI element is optionally present.
13	DMG BSS Parameter Change	The DMG BSS Parameter Change element is optionally present.
14	Multi-band	Zero or more Multi-band elements are present if dot11MultibandImplemented is true.
15	Awake Window	The Awake Window element is optionally present. If present, this element specifies the characteristics of the awake window of a CBAP (see 11.2.7).
16	DMG Wakeup Schedule	The DMG Wakeup Schedule element is optionally present (see 11.2.7.3.3.
17	UPSIM	The UPSIM element is optionally present (see 11.2.7.2.2).
18	SSID	The SSID element is optionally present.
19	IBSS Parameter Set	The IBSS Parameter Set element is present only within DMG Beacon frames generated by IBSS STAs.
20	Country	The Country element is optionally present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
21	BSS Load	The BSS Load element is optionally present if dot11QosOptionImplemented and dot11QBSSLoadImplemented are both true.
22	EDCA Parameter Set	The EDCA Parameter Set element is optionally present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-45—DMG Beacon frame body *(continued)*

Order	Information	Notes
23	Power Constraint	The Power Constraint element is optionally present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true.
24	Neighbor Report	The Neighbor Report element is optionally present.
25	Quiet	The Quiet element is optionally present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
26	QoS Capability	The QoS Capability element is optionally present.
27	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.
28	BSS Average Access Delay	The BSS Average Access Delay element is optionally present.
29	RM Enabled Capabilities	The RM Enabled Capabilities element is optionally present if dot11RadioMeasurementActivated is true.
30	Nontransmitted BSSID Capability	The Nontransmitted BSSID Capability element is optionally present.
31	Interworking	The Interworking element is optionally present if dot11InterworkingServiceActivated is true.
32	Advertisement Protocol	The Advertisement Protocol element is optionally present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists.
33	Roaming Consortium	The Roaming Consortium element is optionally present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
34	STA Availability	The STA Availability element is optionally present.
35	Next PCP List	The Next PCP List element is optionally present.
36	PCP Handover	The PCP Handover element is optionally present.
37	Antenna Sector ID Pattern	The Antenna Sector ID Pattern element is optionally present.
38	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
39	Dynamic Bandwidth Control	The Dynamic Bandwidth Control element is optionally present if a STA operates as an AP or PCP and dot11CDMGOptionImplemented is true; otherwise not present.
40	Cluster Probe	The Cluster Probe element is optionally present if dot11ClusteringActivated is true; otherwise not present.
41	Extended Cluster Report	The Extended Cluster Report element is optionally present if dot11ClusteringActivated is true; otherwise not present.
42	Cluster Switch Announcement	The Cluster Switch Announcement element is optionally present if dot11ClusteringActivated is true; otherwise not present.
43	Extended Cluster Report	The Extended Cluster Report element is optionally present if dot11ClusteringActivated is true; otherwise not present.

Table 9-45—DMG Beacon frame body *(continued)*

Order	Information	Notes
44	Cluster Switch Announcement	The Cluster Switch Announcement element is optionally present if dot11ClusteringActivated is true; otherwise not present.
45	SPSH Report	The SPSH Report element is optionally present if dot11ClusteringActivated is true; otherwise not present.
46	Clustering Interference Assessment	The Clustering Interference Assessment element is optionally present if dot11ClusteringActivated is true; otherwise not present.
47	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
48	CMMG Operation	The CMMG Operation element is present if dot11CMMGOptionImplemented is true; otherwise not present.
49	Power Constraint	The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true; otherwise not present.
50	TPC Report	The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true; otherwise not present.
51	BSS Load	The BSS Load element is present if dot11QosOptionImplemented and dot11QBSSLoadImplemented are both true; otherwise not present.
52	CDMG Extended Schedule	The CDMG Extended Schedule element is optionally present.
53	Service Hint	The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true.
54	Service Hash	The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.

The format of the Beacon Interval Control field is shown in Figure 9-77.

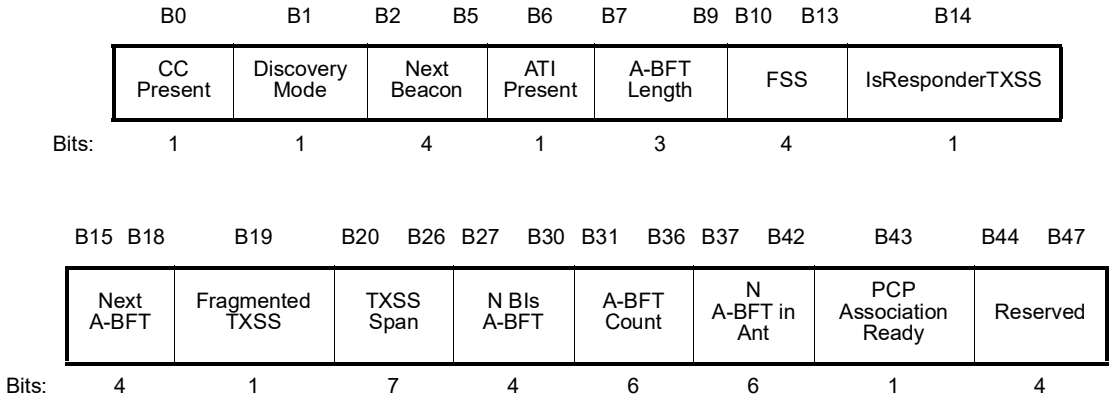

Figure 9-77—Beacon Interval Control field format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The CC Present subfield is set to 1 to indicate that the Clustering Control field is present in the DMG Beacon frame. Otherwise, the Clustering Control field is not present.

The Discovery Mode subfield is set to 1 if the STA is generating the DMG Beacon frame following the procedure described in 11.1.3.4. Otherwise, this subfield is set to 0.

The Next Beacon subfield indicates the number of beacon intervals following the current beacon interval during which the DMG Beacon frame will not be transmitted.

The ATI Present subfield is set to 1 to indicate that the announcement transmission interval (ATI) is present in the current beacon interval. Otherwise, the ATI is not present.

The A-BFT Length subfield indicates the number of sector sweep slots (10.42.5) in the A-BFT following the BTI, minus 1.

The FSS subfield indicates the number of SSW frames allowed per sector sweep slot (10.42.5). The subfield contains the number of SSW frames allowed minus one. The range of this subfield is 0 to 15.

The IsResponderTXSS subfield is set to 1 to indicate the A-BFT following the BTI is used for responder transmit sector sweep (TXSS). This field is set to 0 to indicate responder receive sector sweep (RXSS). When this subfield is set to 0, the FSS subfield specifies the length of a complete receive sector sweep by the STA sending the DMG Beacon frame.

The Next A-BFT subfield indicates the number of beacon intervals during which the A-BFT is not present. This subfield is set to 0 if the A-BFT immediately follows this BTI.

The Fragmented TXSS subfield is set to 1 to indicate the TXSS is a fragmented sector sweep and is set to 0 to indicate the TXSS is a complete sector sweep.

The TXSS Span subfield indicates the number of beacon intervals it takes for the STA sending the DMG Beacon frame to complete the TXSS phase. This subfield is always greater than or equal to 1.

The N BIs A-BFT subfield indicates the interval, in number of beacon intervals, at which the STA sending the DMG Beacon frame allocates an A-BFT. The subfield is set to 1 if every beacon interval contains an A-BFT.

The A-BFT Count subfield indicates the number of A-BFTs since the STA sending the DMG Beacon frame last switched RX DMG antennas for an A-BFT. The subfield is set to 0 if the DMG antenna used in the forthcoming A-BFT differs from the DMG antenna used in the last A-BFT. This subfield is reserved if the Number of RX DMG Antennas field within the STA's DMG Capabilities element is 1.

The N A-BFT in Ant subfield indicates how many A-BFTs the STA sending the DMG Beacon frame receives from each DMG antenna in the DMG antenna receive rotation. This subfield is reserved if the Number of RX DMG Antennas field within the STA's DMG Capabilities element is 1.

The PCP Association Ready subfield is set to 1 to indicate that the PCP is ready to receive Association Request frames from non-PCP STAs and is set to 0 otherwise. This subfield is reserved when transmitted by a non-PCP STA.

The DMG Parameters field is defined in 9.4.1.46.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the Discovery Mode field is 0, the Clustering Control field is formatted as shown in Figure 9-78. If the Discovery Mode field is 1, the Clustering Control field is formatted as shown in Figure 9-79.

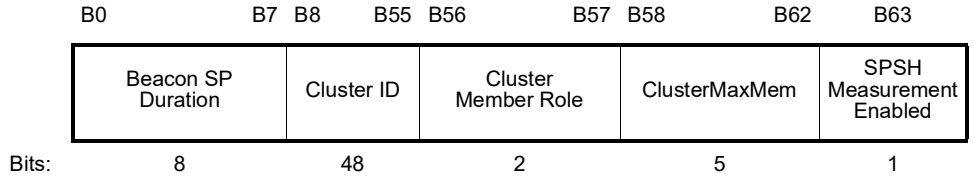

Figure 9-78—Clustering Control field format if the Discovery Mode field is 0

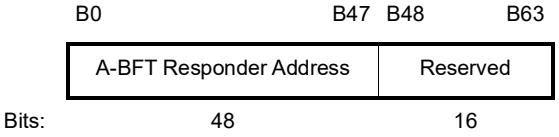

Figure 9-79—Clustering Control field format if the Discovery Mode field is 1

If ECAPC Policy Enforced field is set to 0, the Beacon SP Duration subfield indicates the duration, in units of 8 μs, of the Beacon SPs in the cluster. If ECAPC Policy Enforced field is set to 1, the Beacon SP Duration subfield indicates the maximum duration, in units of 8 μs, of the beacon header interval (BHI) of the BSS, and the minimum duration of Beacon SPs in the cluster (see 10.40.2.2).

The cluster to which the transmitter of the Clustering Control field belongs is identified by the Cluster ID subfield. The MAC address of the S-AP or synchronization PCP (S-PCP) is the Cluster ID of the cluster.

The Cluster Member Role subfield identifies the role that the transmitting STA assumes within the cluster. A 0 means that the STA is currently not participating in clustering. A 1 means that the STA acts as the S-AP or S-PCP of the cluster. A 2 means that the STA participates in the cluster, but not as the S-AP or S-PCP. The value 3 is reserved.

The ClusterMaxMem subfield defines the maximum number of PCPs and/or APs, including the S-AP or S-PCP, that can participate in the cluster. The ClusterMaxMem subfield is computed in relation to the beacon interval value (10.42.2). The value 0 is reserved. Values 8 and above are reserved if the ECAPC Policy Enforced field is set to 0. The value 1 is assigned to the S-AP or S-PCP.

The SPSH Measurement Enabled subfield is used by a CDMG S-AP or S-PCP to indicate whether the member APs or member PCPs in an AP or PCP cluster are allowed to perform channel measurement to achieve spatial sharing. If the SPSH Measurement Enabled subfield is 1, a SPSH measurement period starts. In this period, the member APs or member PCPs in an AP or PCP cluster can perform channel measurement in its BSS and spatial reuse is not allowed. If the SPSH Measurement Enabled subfield is 0, SPSH measurement terminates and SP reuse is conducted in the following time interval, i.e., APs or PCPs of the AP or PCP cluster are allowed to allocate time-overlapping SPs among different BSSs. In a DMG Beacon frame transmitted by a non-CDMG S-AP or S-PCP, the SPSH Measurement Enabled subfield is reserved.

The A-BFT Responder Address subfield contains the MAC address of the STA that is allowed to transmit during the A-BFT, if present, that follows the BTI.

9.3.4.3 S1G Beacon frame format

The format of the S1G Beacon is shown in Figure 9-80.

	Frame Control	Duration	SA	Time-stamp	Change Sequence	Next TBTT (optional)	Compressed SSID (optional)	Access Network Options (optional)	Frame Body	FCS
Octets:	2	2	6	4	1	0 or 3	0 or 4	0 or 1	variable	4

Figure 9-80—S1G Beacon frame format

The Duration field is set to the duration of time, in microseconds, required by the paged STAs to transmit any pending QoS Null, PS-Poll or NDP PS-Poll frames as specified in 9.2.5.2.

The SA field is the address of the STA transmitting the S1G Beacon frame.

The Timestamp field contains the value of the 4 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Timestamp field appears at the transmit antenna connector.

The Change Sequence field is defined as an unsigned integer, initialized to 0, that increments when a critical update to the Beacon frame has occurred (see 10.46.2).

The Next TBTT field is present if the Next TBTT Present field in the Frame Control field is 1 and indicates the most significant 3 octets of the 4 least significant octets of the next TBTT. Otherwise, it is not present.

The Compressed SSID field is present if the Compressed SSID Present field in the Frame Control is 1 and indicates a 32-bit CRC calculated over the SSID contained in the S1G Beacon frame (calculation is performed as defined in 9.2.4.8 where the SSID is the calculation fields). Otherwise, it is not present.

The Access Network Options field is present if the ANO field in the Frame Control field is 1 and it is defined in 9.4.2.91 (see Figure 9-484). Otherwise, it is not present.

The Frame Body field contains the optional elements listed in Table 9-46. The minimum set of optional elements is included in an S1G Beacon frame transmitted at a TSBTT that is not a TBTT and the full set of optional elements is included in an S1G Beacon frame that is transmitted at a TBTT (see 11.1.3.10.1). See 10.28.6 on the parsing of the elements.

Table 9-46—Minimum and full set of optional elements

Order	Information	Notes	Allowed in minimum set	Allowed in full set
1	S1G Beacon Compatibility	The S1G Beacon Compatibility element is present within S1G Beacon frames generated at TBTTs.	No	Yes
2	Traffic indication map (TIM)	The TIM element is present within S1G Beacon frames generated by APs at TBTTs and is optionally present otherwise.	Yes	Yes

Table 9-46—Minimum and full set of optional elements

Order	Information	Notes	Allowed in minimum set	Allowed in full set
3	FMS Descriptor	The FMS Descriptor element is present if dot11FMSActivated is true.	Yes	Yes
4	RPS	The RPS element is optionally present if dot11RAWOperationActivated is true.	Yes	Yes
5	SST Operation	The SST Operation element is present if dot11SelectiveSubchannelTransmissionPermitted is true.	No	Yes
6	Subchannel Selective Transmission	The Subchannel Selective Transmission element is optionally present if dot11SubchannelSelectiveTransmissionActivated is true.	Yes	Yes
7	S1G Relay	The S1G Relay element is optionally present if dot11RelayAPImplemented is true.	Yes	Yes
8	Page Slice	The Page Slice element is optionally present if dot11PageSlicingActivated is true.	No	Yes
9	S1G Sector Operation	The S1G Sector Operation element is optionally present if dot11S1GSectorizationActivated is true.	No	Yes
10	Authentication Control	The Authentication Control element is optionally present when dot11S1GCentralizedAuthenticationControlActivated is true or dot11S1GDistributedAuthenticationControlActivated is true.	No	Yes
11	TSF Timer Accuracy	The TSF Timer Accuracy element is optionally present when dot11TSFTimerAccuracyImplemented is true.	No	Yes
12	S1G Relay Discovery	The S1G Relay Discovery element is optionally present if dot11RelayDiscoveryOptionImplemented is true.	No	Yes
13	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.	No	Yes
14	S1G Operation	The S1G Operation element is present when dot11S1GOptionImplemented is true; otherwise not present.	No	Yes
15	Short Beacon Interval	The Short Beacon Interval element is present if dot11ShortBeaconInterval is true.	No	Yes
16	Multiple BSSID	One or more Multiple BSSID elements are present if dot11MultiBSSIDImplemented is true; otherwise not present.	No	Yes

Table 9-46—Minimum and full set of optional elements

Order	Information	Notes	Allowed in minimum set	Allowed in full set
Last–1	One or more elements can appear in this frame.	These elements are optionally present and follow all other elements that are not Vendor Specific elements and precede all other elements that are Vendor Specific elements that are part of the Last field in the frame.	No	Yes
Last	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.	No	Yes

9.3.5 Frame addressing in an MBSS

Mesh Data frames and Multihop Action frames enable multihop MSDU and MMPDU forwarding in an MBSS using the Mesh Control field described in 9.2.4.7.3.

Table 9-47 shows the valid combinations of address fields in mesh Data frames and Multihop Action frames along with the corresponding value of the Address Extension Mode subfield in the Mesh Control field.

Table 9-47—Valid address field usage for Mesh Data and Multihop Action frames

Supported frames	To DS	From DS	Address extension mode	Address 1	Address 2	Address 3	Address 4	Address 5	Address 6
Mesh Data (individually addressed)	1	1	None	RA	TA	DA = Mesh DA	SA = Mesh SA	*Not Present*	*Not Present*
Mesh Data (group addressed)	0	1	None	DA	TA	SA = Mesh SA	*Not Present*	*Not Present*	*Not Present*
Mesh Data (proxied, individually addressed)	1	1	Address5&6	RA	TA	Mesh DA	Mesh SA	DA	SA
Mesh Data (proxied, group addressed)	0	1	Address4	DA	TA	Mesh SA	SA	*Not Present*	*Not Present*
Multihop Action (individually addressed)	0	0	Address4	RA	TA	DA = Mesh DA	SA = Mesh SA	*Not Present*	*Not Present*
Multihop Action (group addressed)	0	0	None	DA	TA	SA = Mesh SA	*Not Present*	*Not Present*	*Not Present*

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—To DS and From DS subfields are located in the Frame Control field (see 9.2.4.1.4). The Address Extension Mode subfield is located in the Mesh Flags subfield in the Mesh Control field (see 9.2.4.7.3). Address 1, Address 2, and Address 3 fields are located in the MAC header (see 9.2.3). The Address 4 field is located in the MAC header if both To DS and From DS subfields are 1; otherwise, the Address 4 field is located in the Mesh Address Extension subfield of the Mesh Control field (see 9.2.3 and 9.2.4.7.3). Address 5 and Address 6 fields are located in the Mesh Control field if they are present (see 9.2.4.7.3).

NOTE 2—Values for the Address Extension Mode subfield are defined in see Table 9-26.

In individually addressed Mesh Data and Multihop Action frames, Address 1 and Address 2 correspond to the mesh STA receiver address (RA) and the mesh STA transmitter address (TA) for a particular mesh link. Address 3 and Address 4 correspond to the destination mesh STA and the source mesh STA of a mesh path. The Address Extension Mode subfield in the Mesh Control field indicates the presence of an optional Mesh Address Extension subfield in the Mesh Control field. When the Extension Mode subfield equals "Address5&6" (see Table 9-26), the Mesh Control field includes Address 5 and Address 6 that correspond to the end-to-end destination address (DA) and source address (SA) of STAs that communicate over the mesh path, for instance, external STAs that communicate over the mesh BSS via proxy mesh gates (see Figure 9-81).

NOTE 3—The forwarding of individually addressed mesh Data frames uses only mesh STA addresses in fields Address 1, Address 2, Address 3, and Address 4. This allows intermediate mesh STAs to forward mesh Data frames without necessarily having any knowledge of the addresses of the source and destination end stations, which might be external addresses. Thus, proxy information only needs to be maintained by proxy mesh gates and by source mesh STAs.

The term source mesh STA refers to the first mesh STA on a mesh path. A source mesh STA is either a mesh STA that is the initial source of an MSDU/MMPDU or a mesh STA that receives an MSDU/MMPDU from a mesh path or from a STA outside the mesh BSS and translates and forwards the MSDU/MMPDU on the mesh path. The address of the source mesh STA is referred to as the *Mesh SA*.

The term destination mesh STA refers to the final mesh STA on a mesh path. A destination mesh STA is either a mesh STA that is the final destination of an MSDU/MMPDU or a mesh STA that receives an MSDU/MMPDU from a mesh path and translates and forwards the MSDU/MMPDU on another mesh path or to a STA outside of the mesh BSS. The address of the destination mesh STA is referred to as the *Mesh DA*.

In group addressed mesh Data frames, Address 1 and Address 2 correspond to the group address and the mesh STA transmitter address (TA). Address 3 corresponds to the mesh source address (mesh SA) of the group addressed mesh Data frame. The Address Extension Mode indicates the presence of an optional address extension field Address 4 in the Mesh Control field that corresponds to the source address (SA) of external STAs that communicate over the mesh BSS via proxy mesh gates.

NOTE 4—The reason for not using the four-address MAC header format for group addressed traffic is to avoid interactions with existing implementations. Earlier revisions of this standard defined the four-address MAC header format without defining procedures for its use. As a result there is a large number of deployed devices that use the four-address frame format in ways that would affect and be affected by mesh traffic if four-address group addressed frames were to be used.

Figure 9-81 illustrates the addressing of a mesh Data frame that contains an MSDU transmitted and forwarded on a mesh path from a mesh STA collocated with a portal (STA 1) to a mesh STA collocated with an AP (STA 2) where the source is a STA outside of the mesh BSS (STA 33) that is reachable via the portal and the destination is an IEEE 802.11 STA associated with the AP (STA 22).

Details on how these address mappings work in forwarding processing are described in 10.38.3 and 10.38.4.

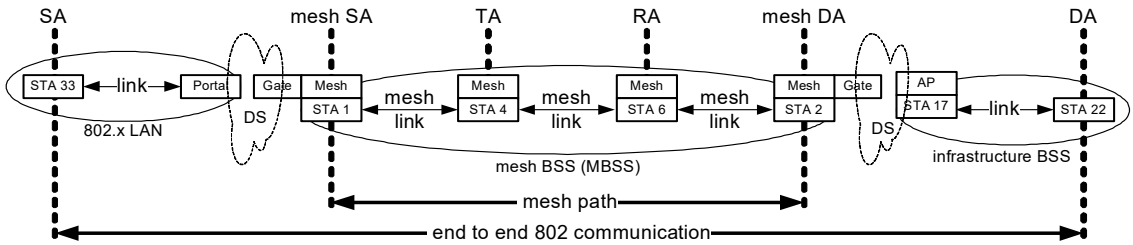

Figure 9-81—Example addressing for a mesh Data frame

9.4 Management and Extension frame body components

9.4.1 Fields that are not elements

9.4.1.1 Authentication Algorithm Number field

The Authentication Algorithm Number field indicates a single authentication algorithm. The length of the Authentication Algorithm Number field is 2 octets. The Authentication Algorithm Number field is shown in Figure 9-82. The following values are defined for authentication algorithm number:

Authentication algorithm number = 0: Open System
Authentication algorithm number = 1: Shared Key
Authentication algorithm number = 2: Fast BSS Transition
Authentication algorithm number = 3: Simultaneous Authentication of Equals (SAE)
Authentication algorithm number = 4: FILS Shared Key authentication without PFS
Authentication algorithm number = 5: FILS Shared Key authentication with PFS
Authentication algorithm number = 6: FILS Public Key authentication
Authentication algorithm number = 65 535: vendor specific use

NOTE—The use of this value implies that a Vendor Specific element is included with more information.

All other values of authentication algorithm number are reserved.

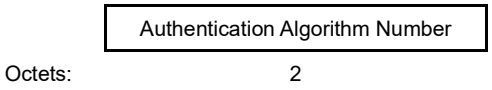

Figure 9-82—Authentication Algorithm Number field format

9.4.1.2 Authentication Transaction Sequence Number field

The Authentication Transaction Sequence Number field indicates the current state of progress through a multistep transaction. The length of the Authentication Transaction Sequence Number field is 2 octets. The Authentication Transaction Sequence Number field is shown in Figure 9-83.

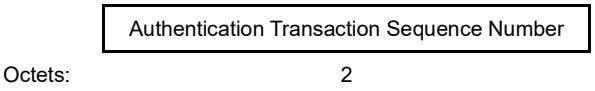

Figure 9-83—Authentication Transaction Sequence Number field format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.1.3 Beacon Interval field

The Beacon Interval field represents the number of time units (TUs) between target beacon transmission times (TBTTs). The length of the Beacon Interval field is 2 octets. The Beacon Interval field is shown in Figure 9-84.

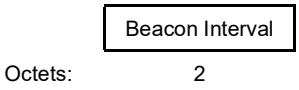

Figure 9-84—Beacon Interval field format

A 0 in the Beacon Interval field transmitted by a DMG STA indicates that the TBTT of the next BTI is unknown.

9.4.1.4 Capability Information field

The Capability Information field contains a number of subfields that are used to indicate requested or advertised optional capabilities.

The length of the Capability Information field is 2 octets. The format of the Capability Information field is defined in Figure 9-85 when transmitted by a non-DMG STA and in Figure 9-86 when transmitted by a DMG STA.

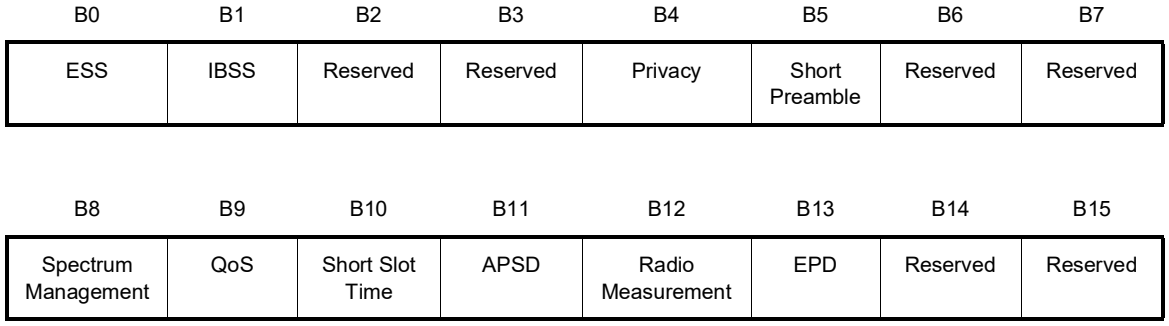

Figure 9-85—Capability Information field format (non-DMG STA)

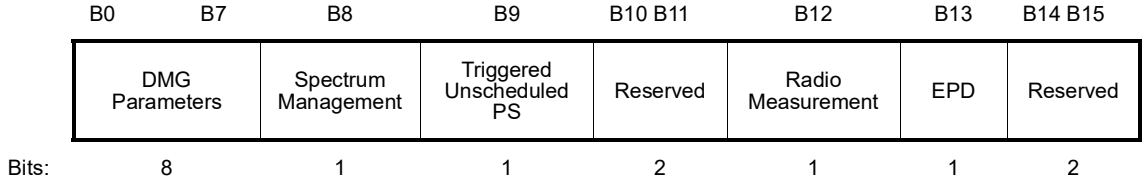

Figure 9-86—Capability Information field format (DMG STA)

A DMG STA sets the Triggered Unscheduled PS subfield to 1 within the Capability Information field when it transmits a Capability Information field in which the Reverse Direction subfield is equal to 1 and is capable of delivering a BU as an RD responder on receipt of a PPDU containing an RDG MPDU with the Power Management subfield set to 1 and sets it to 0 otherwise.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Each Capability Information subfield is interpreted according to the management frame subtype, as defined in this subclause.

An AP sets the ESS subfield to 1 and the IBSS subfield to 0 within transmitted Beacon or Probe Response frames. An IBSS STA sets the ESS subfield to 0 and the IBSS subfield to 1 in transmitted Beacon or Probe Response frames. A mesh STA sets the ESS and IBSS subfields to 0 in transmitted Beacon or Probe Response frames. Otherwise, the ESS and IBSS subfields are reserved.

An AP sets the Privacy subfield to 1 within transmitted Beacon, Probe Response, (Re)Association Response frames if data confidentiality is required for all Data frames exchanged within the BSS. If data confidentiality is not required, the Privacy subfield is set to 0.

In an RSNA, a non-AP STA in an infrastructure BSS sets the Privacy subfield to 0 within transmitted (Re)Association Request frames. The Privacy subfield is reserved in (Re)Association Request frames.

An IBSS STA sets the Privacy subfield to 1 in transmitted Beacon or Probe Response frames if data confidentiality is required for all Data frames exchanged within the IBSS. If data confidentiality is not required, An IBSS STA sets the Privacy subfield to 0 within these Management frames.

A mesh STA sets the Privacy subfield to 1 in transmitted Beacon or Probe Response frames if data confidentiality is required for all Data frames exchanged within the MBSS. If data confidentiality is not required, a mesh STA sets the Privacy subfield to 0 within these Management frames.

A STA that includes the RSNE in Beacon and Probe Response frames sets the Privacy subfield to 1 in any frame that includes the RSNE.

An AP sets the Short Preamble subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to indicate that the use of the short preamble, as described in 16.2.2.3, is allowed within this BSS; an IBSS STA sets the Short Preamble subfield to 1 in transmitted Beacon when dot11ShortPreambleOptionImplemented is true. Otherwise an AP or an IBSS STA sets the Short Preamble subfield to 0.

A mesh STA sets the Short Preamble subfield to 1 when dot11ShortPreambleOptionImplemented is true. Otherwise, a mesh STA sets the Short Preamble subfield to 0.

An ERP STA sets dot11ShortPreambleOptionImplemented to true as all ERP STAs support both long and short preamble formats.

A STA sets the Spectrum Management subfield in the Capability Information field to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.

A STA sets the QoS subfield to 1 within the Capability Information field when dot11QosOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Short Slot Time subfield to 1 in transmitted Association Request, and Reassociation Request frames when dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true. Otherwise, the STA sets the Short Slot Time subfield to 0.

An AP sets the Short Slot Time subfield in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to indicate the currently used slot time value within this BSS. See 11.1.3.2.

See 10.3.2.16 for the operation of aSlotTime.

For IBSS and MBSS, the Short Slot Time subfield is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

An AP sets the APSD subfield to 1 within the Capability Information field when dot11APSDOptionImplemented is true and sets it to 0 otherwise. A non-AP STA always sets this subfield to 0.

A STA sets the Radio Measurement subfield in the Capability Information field to 1 when dot11RadioMeasurementActivated is true and sets it to 0 otherwise.

A STA sets the EPD subfield in the Capability Information field to 1 when dot11EPDImplemented is true and sets it to 0 otherwise.

The DMG Parameters field is defined in 9.4.1.46.

9.4.1.5 Current AP Address field

The Current AP Address field is the MAC address of the AP with which the STA is currently associated. The length of the Current AP Address field is 6 octets. The Current AP Address field is shown in Figure 9-87.

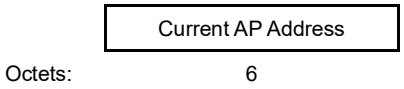

Figure 9-87—Current AP Address field format

9.4.1.6 Listen Interval field

The Listen Interval field is used to indicate to the AP how often an S1G STA with dot11NonTIMModeActivated equal to false or a non-S1G STA in power save mode wakes to listen to Beacon frames. It is also used to indicate to an AP the duration during which an S1G STA with dot11NonTIMModeActivated equal to true is required to transmit at least one frame that is addressed to the associated AP. This field is derived from the ListenInterval parameter when present as a parameter of an MLME primitive. The value is in units of beacon interval if dot11ShortBeaconInterval is false and in units of short beacon interval if dot11ShortBeaconInterval is true (see 11.1.3.10.2). The length of the Listen Interval field is 2 octets. The Listen Interval field is shown in Figure 9-88.

NOTE—The value 0 might be used by a STA that never enters power save mode.

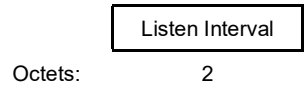

Figure 9-88—Listen Interval field format carried in a non-S1G PPDU

The Listen Interval field carried in an S1G PPDU is shown in Figure 9-89.

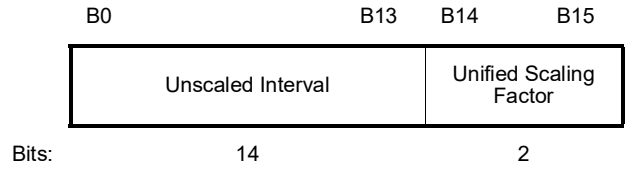

Figure 9-89—Listen Interval field format carried in an S1G PPDU

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In an S1G STA, the ListenInterval parameter used by the MLME primitives is equal to the Unscaled Interval subfield multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield. The Unified Scaling Factor subfield encoding is defined in Table 9-48.

Table 9-48—Unified Scaling Factor subfield encoding

Unified Scaling Factor	Scaling factor
0	1
1	10
2	1000
3	10 000

An AP uses the listen interval in determining the lifetime of frames that it buffers for a STA.

9.4.1.7 Reason Code field

This Reason Code field is used to indicate the reason that an unsolicited notification Management frame of type Disassociation, Deauthentication, DELTS, DELBA,)or Mesh Peering Close was generated. It is contained in the Mesh Channel Switch Parameters element to indicate the reason for the channel switch. It is contained in the PERR element to indicate the reason for the path error. The length of the Reason Code field is 2 octets. The Reason Code field is shown in Figure 9-90.

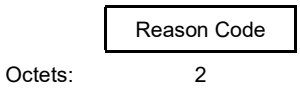

Figure 9-90—Reason Code field format

The reason codes are defined in Table 9-49.

Table 9-49—Reason codes

Reason code	Name	Meaning
0		Reserved
1	UNSPECIFIED_REASON	Unspecified reason
2	INVALID_AUTHENTICATION	Previous authentication no longer valid
3	LEAVING_NETWORK_DEAUTH	Deauthenticated because sending STA is leaving (or has left) the BSS
4	REASON_INACTIVITY	Disassociated due to inactivity
5	NO_MORE_STAS	Disassociated because AP is unable to handle all currently associated STAs
6	INVALID_CLASS2_FRAME	Class 2 frame received from nonauthenticated STA
7	INVALID_CLASS3_FRAME	Class 3 frame received from nonassociated STA

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-49—Reason codes *(continued)*

Reason code	Name	Meaning
8	LEAVING_NETWORK_DISASSOC	Disassociated because sending STA is leaving (or has left) BSS
9	NOT_AUTHENTICATED	STA requesting (re)association is not authenticated with responding STA
10	UNACCEPTABLE_POWER_CAPABILITY	Disassociated because the information in the Power Capability element is unacceptable
11	UNACCEPTABLE_SUPPORTED_CHANNELS	Disassociated because the information in the Supported Channels element is unacceptable
12	BSS_TRANSITION_DISASSOC	Disassociated due to BSS transition management
13	REASON_INVALID_ELEMENT	Invalid element, i.e., an element defined in this standard for which the content does not meet the specifications in Clause 9
14	MIC_FAILURE	Message integrity code (MIC) failure
15	4WAY_HANDSHAKE_TIMEOUT	4-way handshake timeout
16	GK_HANDSHAKE_TIMEOUT	Group key handshake timeout
17	HANDSHAKE_ELEMENT_MISMATCH	Element in 4-way handshake different from (Re)Association Request/Probe Response/Beacon frame
18	REASON_INVALID_GROUP_CIPHER	Invalid group cipher
19	REASON_INVALID_PAIRWISE_CIPHER	Invalid pairwise cipher
20	REASON_INVALID_AKMP	Invalid AKMP
21	UNSUPPORTED_RSNE_VERSION	Unsupported RSNE version
22	INVALID_RSNE_CAPABILITIES	Invalid RSNE capabilities
23	802_1_X_AUTH_FAILED	IEEE 802.1X authentication failed
24	REASON_CIPHER_OUT_OF_POLICY	Cipher suite rejected because of the security policy
25	TDLS_PEER_UNREACHABLE	TDLS direct-link teardown due to TDLS peer STA unreachable via the TDLS direct link
26	TDLS_UNSPECIFIED_REASON	TDLS direct-link teardown for unspecified reason
27	SSP_REQUESTED_DISASSOC	Disassociated because session terminated by SSP request
28	NO_SSP_ROAMING_AGREEMENT	Disassociated because of lack of SSP roaming agreement
29	BAD_CIPHER_OR_AKM	Requested service rejected because of SSP cipher suite or AKM requirement
30	NOT_AUTHORIZED_THIS_LOCATION	Requested service not authorized in this location
31	SERVICE_CHANGE_PRECLUDES_TS	TS deleted because QoS AP lacks sufficient bandwidth for this QoS STA due to a change in BSS service characteristics or operational mode (e.g., an HT BSS change from 40 MHz channel to 20 MHz channel)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-49—Reason codes *(continued)*

Reason code	Name	Meaning
32	UNSPECIFIED_QOS_REASON	Disassociated for unspecified, QoS-related reason
33	NOT_ENOUGH_BANDWIDTH	Disassociated because QoS AP lacks sufficient bandwidth for this QoS STA
34	MISSING_ACKS	Disassociated because excessive number of frames need to be acknowledged, but are not acknowledged due to AP transmissions and/or poor channel conditions
35	EXCEEDED_TXOP	Disassociated because STA is transmitting outside the limits of its TXOPs
36	STA_LEAVING	Requesting STA is leaving the BSS (or resetting)
37	END_TS END_BA	Requesting STA is no longer using the stream or session
38	UNKNOWN_TS UNKNOWN_BA	Requesting STA received frames using a mechanism for which a setup has not been completed
39	TIMEOUT	Requested from peer STA due to timeout
40–45	Reserved	
46	PEER_INITIATED	In a Disassociation frame: Disassociated because authorized access limit reached
47	AP_INITIATED	In a Disassociation frame: Disassociated due to external service requirements
48	REASON_INVALID_FT_ACTION_FRAME_COUNT	Invalid FT Action frame count
49	REASON_INVALID_PMKID	Invalid pairwise master key identifier (PMKID)
50	REASON_INVALID_MDE	Invalid MDE
51	REASON_INVALID_FTE	Invalid FTE
52	MESH-PEERING-CANCELED	Mesh peering canceled for unknown reasons
53	MESH-MAX-PEERS	The mesh STA has reached the supported maximum number of peer mesh STAs
54	MESH-CONFIGURATION-POLICY-VIOLATION	The received information violates the Mesh Configuration policy configured in the mesh STA profile
55	MESH-CLOSE-RCVD	The mesh STA has received a Mesh Peering Close frame requesting to close the mesh peering.
56	MESH-MAX-RETRIES	The mesh STA has resent dot11MeshMaxRetries Mesh Peering Open frames, without receiving a Mesh Peering Confirm frame.
57	MESH-CONFIRM-TIMEOUT	The confirmTimer for the mesh peering instance times out.
58	MESH-INVALID-GTK	The mesh STA fails to unwrap the GTK or the values in the wrapped contents do not match
59	MESH-INCONSISTENT-PARAMETERS	The mesh STA receives inconsistent information about the mesh parameters between mesh peering Management frames
60	MESH-INVALID-SECURITY-CAPABILITY	The mesh STA fails the authenticated mesh peering exchange because due to failure in selecting either the pairwise ciphersuite or group ciphersuite

Table 9-49—Reason codes *(continued)*

Reason code	Name	Meaning
61	MESH-PATH-ERROR-NO-PROXY-INFORMATION	The mesh STA does not have proxy information for this external destination.
62	MESH-PATH-ERROR-NO-FORWARDING-INFORMATION	The mesh STA does not have forwarding information for this destination.
63	MESH-PATH-ERROR-DESTINATION-UNREACHABLE	The mesh STA determines that the link to the next hop of an active path in its forwarding information is no longer usable.
64	MAC-ADDRESS-ALREADY-EXISTS-IN-MBSS	The Deauthentication frame was sent because the MAC address of the STA already exists in the mesh BSS. See 11.3.6.
65	MESH-CHANNEL-SWITCH-REGULATORY-REQUIREMENTS	The mesh STA performs channel switch to meet regulatory requirements.
66	MESH-CHANNEL-SWITCH-UNSPECIFIED	The mesh STA performs channel switching with unspecified reason.
67	TRANSMISSION_LINK_ESTABLISHMENT_ FAILED	Transmission link establishment in alternative channel failed.
68	ALTERATIVE_ CHANNEL_OCCUPIED	The alternative channel is occupied.
69–65 535		Reserved

9.4.1.8 AID field

In infrastructure BSS operation, the AID field contains a value assigned by an AP or PCP during association. The field represents the 16-bit ID of a STA. In mesh BSS operation, the AID field is a value that represents the 16-bit ID of a neighbor peer mesh STA, assigned during mesh peering. The length of the AID field is 2 octets. The AID field is shown in Figure 9-91.

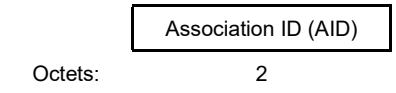

Figure 9-91—AID field format

The AID field for a non-DMG and non-S1G STA is in the range of 1 to 2007. This value is placed in the 14 LSBs of the AID field, with the two MSBs of the AID field set to 1.

The AID field for an S1G STA is in the range of 1 to 8191, and the 3 MSBs of the AID field are reserved.

The AID field for a DMG STA is in the range 1 to 254. The value 255 is reserved as the broadcast AID, and the value 0 corresponds to the AP or PCP. The 8 MSBs of the AID field are reserved.

9.4.1.9 Status Code field

The Status Code field is used in a response Management frame to indicate the success or failure of a requested operation. The Status Code field is shown in Figure 9-92.

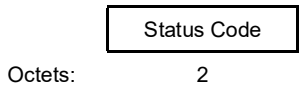

Figure 9-92—Status Code field format

If an operation is successful, then the status code is set to SUCCESS (0). A status code of SUCCESS_POWER_SAVE_MODE also indicates a successful operation. If an operation results in failure, the status code indicates a failure cause. The failure cause codes are defined in Table 9-50.

Table 9-50—Status codes

Status code	Name	Meaning
0	SUCCESS	Successful.
1	REFUSED, REFUSED_REASON_UNSPECIFIED	Unspecified failure.
2	TDLS_REJECTED_ALTERNATIVE_PROVIDED	TDLS wakeup schedule rejected but alternative schedule provided.
3	TDLS_REJECTED	TDLS wakeup schedule rejected.
4		Reserved.
5	SECURITY_DISABLED	Security disabled.
6	UNACCEPTABLE_LIFETIME	Unacceptable lifetime.
7	NOT_IN_SAME_BSS	Not in same BSS.
8–9		Reserved.
10	REFUSED_CAPABILITIES_MISMATCH	Cannot support all requested capabilities in the Capability Information field.
11	DENIED_NO_ASSOCIATION_EXISTS	Reassociation denied due to inability to confirm that association exists.
12	DENIED_OTHER_REASON	Association denied due to reason outside the scope of this standard.
13	UNSUPPORTED_AUTH_ALGORITHM	Responding STA does not support the specified authentication algorithm.
14	TRANSACTION_SEQUENCE_ERROR	Received an Authentication frame with authentication transaction sequence number out of expected sequence.
15	CHALLENGE_FAILURE	Authentication rejected because of challenge failure.
16	REJECTED_SEQUENCE_TIMEOUT	Authentication rejected due to timeout waiting for next frame in sequence.
17	DENIED_NO_MORE_STAS	Association denied because AP is unable to handle additional associated STAs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-50—Status codes *(continued)*

Status code	Name	Meaning
18	REFUSED_BASIC_RATES_ MISMATCH	Association denied due to requesting STA not supporting all of the data rates in the BSSBasicRateSet parameter, the Basic HT-MCS Set field of the HT Operation parameter, or the Basic VHT-MCS And NSS Set field in the VHT Operation parameter.
19	DENIED_NO_SHORT_PREAMBLE_ SUPPORT	Association denied due to requesting STA not supporting the short preamble option.
20		Reserved.
21		Reserved.
22	REJECTED_SPECTRUM_MANAGE MENT_REQUIRED	Association request rejected because spectrum management capability is required.
23	REJECTED_BAD_POWER_CAPABI LITY	Association request rejected because the information in the Power Capability element is unacceptable.
24	REJECTED_BAD_SUPPORTED_CH ANNELS	Association request rejected because the information in the Supported Channels element is unacceptable.
25	DENIED_NO_SHORT_SLOT_TIME_ SUPPORT	Association denied due to requesting STA not supporting short slot time.
26		Reserved.
27	DENIED_NO_HT_SUPPORT	Association denied because the requesting STA does not support HT features.
28	R0KH_UNREACHABLE	R0KH unreachable.
29		Reserved
30	REFUSED_TEMPORARILY	Association request rejected temporarily; try again later.
31	ROBUST_MANAGEMENT_POLICY _VIOLATION	Robust management frame policy violation.
32	UNSPECIFIED_QOS_FAILURE	Unspecified, QoS-related failure.
33	DENIED_INSUFFICIENT_BANDWI DTH	Association denied because QoS AP or PCP has insufficient bandwidth to handle another QoS STA.
34	DENIED_POOR_CHANNEL_CONDI TIONS	Association denied due to excessive frame loss rates and/ or poor conditions on current operating channel.
35	DENIED_QOS_NOT_SUPPORTED	Association (with QoS BSS) denied because the requesting STA does not support the QoS facility.
36		Reserved.
37	REQUEST_DECLINED	The request has been declined.
38	INVALID_PARAMETERS	The request has not been successful as one or more parameters have invalid values.
39	REJECTED_WITH_SUGGESTED_ CHANGES	The allocation or TS has not been created because the request cannot be honored; however, a suggested TSPEC/DMG TSPEC is provided so that the initiating STA can attempt to set another allocation or TS with the suggested changes to the TSPEC/DMG TSPEC.
40	STATUS_INVALID_ELEMENT	Invalid element, i.e., an element defined in this standard for which the content does not meet the specifications in Clause 9.

Table 9-50—Status codes *(continued)*

Status code	Name	Meaning
41	STATUS_INVALID_GROUP_CIPHER	Invalid group cipher.
42	STATUS_INVALID_PAIRWISE_CIPHER	Invalid pairwise cipher.
43	STATUS_INVALID_AKMP	Invalid AKMP.
44	UNSUPPORTED_RSNE_VERSION	Unsupported RSNE version.
45	INVALID_RSNE_CAPABILITIES	Invalid RSNE capabilities.
46	STATUS_CIPHER_OUT_OF_POLICY	Cipher suite rejected because of security policy.
47	REJECTED_FOR_DELAY_PERIOD	The TS or allocation has not been created; however, the HC or PCP might be capable of creating a TS or allocation, in response to a request, after the time indicated in the TS Delay element.
48		Reserved.
49	NOT_PRESENT	The Destination STA is not present within this BSS.
50	NOT_QOS_STA	The Destination STA is not a QoS STA.
51	DENIED_LISTEN_INTERVAL_TOO_LARGE	Association denied because the listen interval is too large.
52	STATUS_INVALID_FT_ACTION_FRAME_COUNT	Invalid FT Action frame count.
53	STATUS_INVALID_PMKID	Invalid pairwise master key identifier (PMKID).
54	STATUS_INVALID_MDE	Invalid MDE.
55	STATUS_INVALID_FTE	Invalid FTE.
56	REQUESTED_TCLAS_NOT_SUPPORTED	Requested TCLAS processing is not supported by the AP or PCP.
57	INSUFFICIENT_TCLAS_PROCESSING_RESOURCES	The AP or PCP has insufficient TCLAS processing resources to satisfy the request.
58	TRY_ANOTHER_BSS	The TS has not been created because the request cannot be honored; however, the HC or PCP suggests that the STA transition to a different BSS to set up the TS.
59	GAS_ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED	GAS advertisement protocol not supported.
60	NO_OUTSTANDING_GAS_REQUEST	No outstanding GAS request.
61	GAS_RESPONSE_NOT_RECEIVED_FROM _SERVER	GAS response not received from the advertisement server.
62	GAS_QUERY_TIMEOUT	STA timed out waiting for GAS query response.
63	GAS_QUERY_RESPONSE_TOO_ LARGE	GAS response is larger than query response length limit.
64	REJECTED_HOME_WITH_SUGGESTED_CHANGES	Request refused because home network does not support request.
65	SERVER_UNREACHABLE	Advertisement server in the network is not currently reachable.

Table 9-50—Status codes *(continued)*

Status code	Name	Meaning
66		Reserved.
67	REJECTED_FOR_SSP_ PERMISSIONS	Request refused due to permissions received via SSPN interface.
68	REFUSED_UNAUTHENTICATED_ACCESS_NOT_SUPPORTED	Request refused because the AP or PCP does not support unauthenticated access.
69–71		Reserved.
72	INVALID_RSNE	Invalid contents of RSNE, other than unsupported RSNE version or invalid RSNE capabilities, AKMP or pairwise cipher.
73	U_APSD_COEXISTENCE_NOT_SUPPORTED	U-APSD coexistence is not supported.
74	U_APSD_COEX_MODE_NOT_SUPPORTED	Requested U-APSD coexistence mode is not supported.
75	BAD_INTERVAL_WITH_U_APSD_COEX	Requested interval/duration value cannot be supported with U-APSD coexistence.
76	ANTI_CLOGGING_TOKEN_REQUIRED	Authentication is rejected because an anti-clogging token is required.
77	UNSUPPORTED_FINITE_CYCLIC_GROUP	Authentication is rejected because the offered finite cyclic group is not supported.
78	CANNOT_FIND_ALTERNATIVE_TBTT	The TBTT adjustment request has not been successful because the STA could not find an alternative TBTT.
79	TRANSMISSION_FAILURE	Transmission failure.
80	REQUESTED_TCLAS_NOT_SUPPORTED	Requested TCLAS not supported.
81	TCLAS_RESOURCES_EXHAUSTED	TCLAS resources exhausted.
82	REJECTED_WITH_SUGGESTED_BSS_TRANSITION	Rejected with suggested BSS transition.
83	REJECT_WITH_SCHEDULE	Reject with recommended schedule.
84	REJECT_NO_WAKEUP_SPECIFIED	Reject because no wakeup schedule specified.
85	SUCCESS_POWER_SAVE_MODE	Success, the destination STA is in power save mode.
86	PENDING_ADMITTING_FST_SESSION	FST pending, in process of admitting FST session.
87	PERFORMING_FST_NOW	Performing FST now.
88	PENDING_GAP_IN_BA_WINDOW	FST pending, gap(s) in block ack window.
89	REJECT_U-PID_SETTING	Reject because of U-PID setting.
90–91		Reserved.
92	REFUSED_EXTERNAL_REASON	(Re)Association refused for some external reason.
93	REFUSED_AP_OUT_OF_MEMORY	(Re)Association refused because of memory limits at the AP.
94	REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED	(Re)Association refused because emergency services are not supported at the AP.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-50—Status codes *(continued)*

Status code	Name	Meaning
95	QUERY_RESPONSE_ OUTSTANDING	GAS query response not yet received.
96	REJECT_DSE_BAND	Reject since the request is for transition to a frequency band subject to DSE procedures and FST Initiator is a dependent STA.
97	TCLAS_PROCESSING_ TERMINATED	Requested TCLAS processing has been terminated by the AP.
98	TS_SCHEDULE_CONFLICT	The TS schedule conflicts with an existing schedule; an alternative schedule is provided.
99	DENIED_WITH_SUGGESTED_BAN D_AND_CHANNEL	The association has been denied; however, one or more Multi-band elements are included that can be used by the receiving STA to join the BSS.
100	MCCAOP_RESERVATION_ CONFLICT	The request failed due to a reservation conflict.
101	MAF_LIMIT_EXCEEDED	The request failed due to exceeded MAF limit.
102	MCCA_TRACK_LIMIT_EXCEEDED	The request failed due to exceeded MCCA track limit.
103	DENIED_DUE_TO_SPECTRUM_MA NAGEMENT	Association denied because the information in the Spectrum Management field is unacceptable.
104	DENIED_VHT_NOT_SUPPORTED	Association denied because the requesting STA does not support VHT features.
105	ENABLEMENT DENIED	Enablement denied.
106	RESTRICTION FROM AUTHORIZED GDB	Enablement denied due to restriction from an authorized GDB.
107	AUTHORIZATION DEENABLED	Authorization deenabled.
108	ENERGY_LIMITED_OPERATION_N OT_SUPPORTED	Re(association) refused or disassociated because energy limited operation is not supported at the AP.
109	REJECTED_NDP_BLOCK_ACK_SU GGESTED	BlockAck negotiation refused because, due to buffer constraints and other unspecified reasons, the recipient prefers to generate only NDP BlockAck frames.
110	REJECTED_MAX_AWAY_DURATIO N_UNACCEPTABLE	Association denied/disassociated because the suggested value for max away duration is unacceptable.
111	FLOW_CONTROL_OPERATION_SU PPORTED	Re(association) refused or disassociated because flow control operation is not supported by the non-AP STA.
112	FILS_AUTHENTICATION_FAILURE	Authentication rejected due to FILS authentication failure.
113	UNKNOWN_AUTHENTICATION_ SERVER	Authentication rejected due to unknown Authentication Server.
114–115		Reserved.
116	DENIED_NOTIFICATION_PERIOD_ ALLOCATION	Request denied because the allocation of notification period is failed.
117	DENIED_CHANNEL_SPLITTING	Request denied because the request of channel splitting is failed.
118	DENIED_ALLOCATION	Request denied because the allocation request is failed.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-50—Status codes *(continued)*

Status code	Name	Meaning
119	CMMG_FEATURES_NOT_SUPPORTED	Association denied because the requesting STA does not support CMMG features.
120	GAS_FRAGMENT_NOT_AVAILABLE	The requested GAS fragment is not available.
121	SUCCESS_CAG_VERSIONS_MATCH	Success, the CAG Version provided by the requesting STA is the same as the latest CAG Version provided by the relevant server.
122	GLK_NOT_AUTHORIZED	The STA is not authorized to use GLK per local policy.
123	UNKNOWN_PASSWORD_IDENTIFIER	Authentication rejected because the password identifier is unknown.
124		Reserved.
125	DENIED_LOCAL_MAC_ADDRESS_POLICY_VIOLATION	Request denied because source address of request is inconsistent with local MAC address policy.
126	SAE_HASH_TO_ELEMENT	SAE authentication uses direct hashing, instead of looping, to obtain the PWE.
127		Reserved.
128	TCLAS_PROCESSING_TERMINATED_INSUFFICIENT_QOS	Requested TCLAS processing has been terminated by the AP due to insufficient QoS capacity.
129	TCLAS_PROCESSING_TERMINATED_POLICY_CONFLICT	Requested TCLAS processing has been terminated by the AP due to conflict with higher layer QoS policies.
130–65 535		Reserved.

9.4.1.10 Timestamp field

This field represents the timing synchronization function (TSF) timer (see 11.1 and 11.19) of a frame's source. The length of the Timestamp field is 8 octets. The Timestamp field is shown in Figure 9-93.

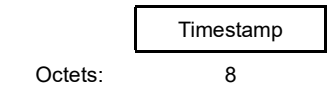

Figure 9-93—Timestamp field format

9.4.1.11 Action field

The Action field provides a mechanism for specifying extended management actions. The format of the Action field is shown in Figure 9-94.

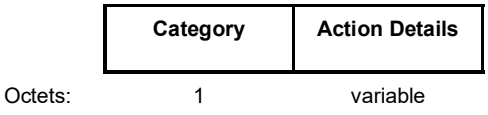

Figure 9-94—Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is set to one of the nonreserved values shown in the Code column of Table 9-51. Action frames of a given category are referred to as *<category name> Action frames*. For example, frames in the QoS category are called *QoS Action frames*. Action frames of a given category and further identified by a subfield in the Action Details field are referred to as *<subfield name> frames*. For example, frames in the QoS category with a QoS Action subfield of ADDTS Request are called *ADDTS Request frames*.

The Action Details field contains the details of the action. The details of the actions allowed in each category are described in the appropriate subclause referenced in Table 9-51.

Table 9-51—Category values

Code	Meaning	See subclause	Robust	Group addressed privacy
0	Spectrum Management	9.6.2	Yes	No
1	QoS	9.6.3	Yes	No
2	Reserved			
3	Block Ack	9.6.4	Yes	No
4	Public	9.6.7	No	No
5	Radio Measurement	9.6.6	Yes	No
6	Fast BSS Transition	9.6.8	Yes	No
7	HT	9.6.11	No	No
8	SA Query	9.6.9	Yes	No
9	Protected Dual of Public Action	9.6.10	Yes	No
10	WNM	9.6.13	Yes	No
11	Unprotected WNM	9.6.14	No	No
12	TDLS	9.6.12	See NOTE	No
13	Mesh	9.6.16	Yes	Yes
14	Multihop	9.6.17	Yes	Yes
15	Self-protected	9.6.15	No	No
16	DMG	9.6.19	Yes	No
17	Reserved (used by the Wi-Fi Alliance® [a])			
18	Fast Session Transfer	9.6.20	Yes	No

Table 9-51—Category values *(continued)*

Code	Meaning	See subclause	Robust	Group addressed privacy
27	CDMG	9.6.28	Yes	No
28	CMMG	9.6.29	Yes	No
29	GLK	9.6.30	Yes	Yes
30–125	Reserved			
126	Vendor-specific Protected	9.6.5	Yes	No
127	Vendor-specific	9.6.5	No	No
128–255	Error			
NOTE—TDLS Action fields are always transported encapsulated within a Data frame (see 11.20.1), so the question of whether these frames are robust is not applicable.				

[a] See http://www.wi-fi.org.

9.4.1.12 Dialog Token field

The Dialog Token field is used for matching action responses with action requests when there are multiple, concurrent action requests. The length of the Dialog Token field is 1 octet. The Dialog Token field is shown in Figure 9-95. See 10.28.5.

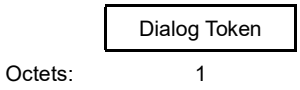

Figure 9-95—Dialog Token field format

9.4.1.13 Block Ack Parameter Set field

The Block Ack Parameter Set field is used in ADDBA Request and ADDBA Response frames to signal the parameters for setting up a block ack agreement. The length of the Block Ack Parameter Set field is 2 octets. The Block Ack Parameter Set field is shown in Figure 9-96.

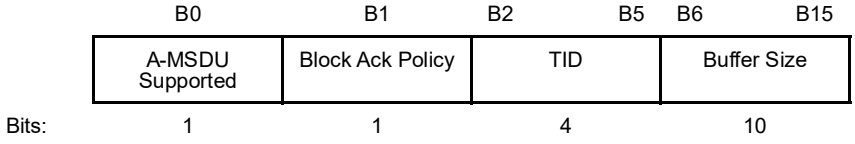

Figure 9-96—Block Ack Parameter Set field format

The A-MSDU Supported subfield is set to 1 by a STA to indicate that it supports an A-MSDU carried in a QoS Data frame sent under this block ack agreement. It is set to 0 otherwise.

The Block Ack Policy subfield is set to 1 for immediate or HT-immediate block ack.

The TID subfield contains the TC or TS for which the BlockAck frame is being requested.

The Buffer Size subfield indicates the number of buffers available for this particular TID.[23] When the A-MSDU Supported field is equal to 0 as indicated by the STA transmitting the Block Ack Parameter Set

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

field, each buffer is capable of holding a number of octets equal to the maximum size of an MSDU. When the A-MSDU Supported field is equal to 1 as indicated by the STA, each buffer is capable of holding a number of octets equal to the maximum size of an A-MSDU that is supported by the STA.

In an ADDBA Request frame, the Buffer Size subfield provides guidance for the frame receiver to decide its reordering buffer size. If the Buffer Size subfield is equal to 0, it implies that the originator of the block ack has no information to specify its value.

In an ADDBA Response frame, when the Status Code field is equal to SUCCESS, the Buffer Size subfield is set to at least 1.

9.4.1.14 Block Ack Timeout Value field

The Block Ack Timeout Value field is used in the ADDBA Request and Response frames to indicate the timeout value for a block ack agreement. The length of the Block Ack Timeout Value field is 2 octets. The Block Ack Timeout Value field is shown in Figure 9-97.

Figure 9-97—Block Ack Timeout Value field format

The Block Ack Timeout Value field contains the duration, in TUs, after which the block ack setup is terminated, if there are no frame exchanges (see 11.5.4) within this duration using this block ack agreement. The field is set to 0 to disable the timeout.

9.4.1.15 Originator Preferred MCS field

The Originator Preferred MCS field is used in ADDBA Response frame to signal the preferred MCS used for eliciting A-MPDUs from the data originator. The length of the Originator Preferred MCS field is 2 octets. The Originator Preferred MCS field is shown in Figure 9-98.

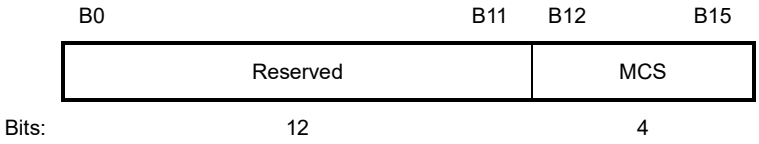

Figure 9-98—Originator Preferred MCS field format

The MCS subfield of the Originator Preferred MCS field is defined in Table 9-52.

Table 9-52—MCS subfield of the Originator Preferred MCS field

MCS subfield value	S1G-MCS Index	Description
0–10	0–10	The value represents the preferred S1G-MCS level

[23] For buffer size, the recipient of data advertises a single scalar number that is the number of fragment buffers of the maximum MSDU or A-MSDU size (indicated by the A-MSDU Supported field) available for the block ack agreement that is being negotiated. Every buffered MPDU that is associated with this block ack agreement consumes one of these buffers regardless of whether the frame contains a whole MSDU (or a fragment thereof) or an A-MSDU. For example, ten maximum-size unfragmented MSDUs consumes the same amount of buffer space at the recipient as ten smaller fragments of a single MSDU of maximum size.

Table 9-52—MCS subfield of the Originator Preferred MCS field

11–14		Reserved
15		The value represents that the asymmetric BA is not supported by either the originator or the intended recipient of the ADDBA Response that contains this value in the MCS subfield of the Originator Preferred MCS field. See 10.25.1 for asymmetric BA and 11.5.2.3 on how to set the MCS subfield of the Originator Preferred MCS field in the ADDBA Response.

9.4.1.16 DELBA Parameter Set field

The DELBA Parameter Set field is used in a DELBA frame to terminate an already set up block ack agreement. The length of the DELBA Parameter Set field is 2 octets. The DELBA Parameter Set field is shown in Figure 9-99.

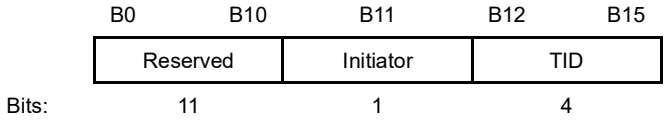

Figure 9-99—DELBA Parameter Set field format

The Initiator subfield indicates if the originator or the recipient of the data is sending this frame. It is set to 1 to indicate the originator and is set to 0 to indicate the recipient. The TID subfield indicates the TSID or the UP for which the block ack has been originally set up.

9.4.1.17 QoS Info field

The QoS Info field contains capability information bits. The contents of the field are dependent on whether the STA is contained within an AP.

The format of the QoS Info field, when sent by the AP, is defined in Figure 9-100.

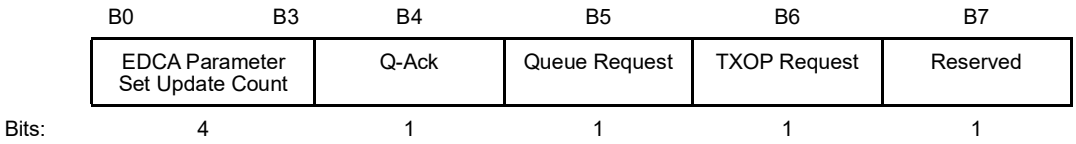

Figure 9-100—QoS Info field format when sent by an AP

The EDCA Parameter Set Update Count subfield is described in 10.2.3.2.

APs set the Q-Ack subfield to 1 when dot11QAckOptionImplemented is true and set it to 0 otherwise.

APs set the Queue Request subfield to 1 if they can process a nonzero Queue Size subfield in the QoS Control field in QoS Data frames and set it to 0 otherwise.

APs set the TXOP Request subfield to 1 if they can process a nonzero TXOP Duration Requested subfield in the QoS Control field in QoS Data frames and set it to 0 otherwise.

The format of the QoS Info field, when sent by the non-AP STA, is defined in Figure 9-101.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

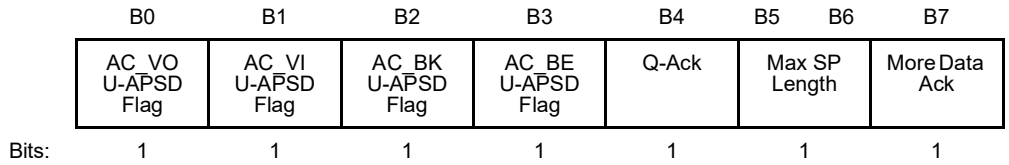

Figure 9-101—QoS Info field format when set by a non-AP STA

Each of the ACs U-APSD Flag subfields set to 1 in (Re)Association Request frames to indicate that the corresponding AC (AC_BE, AC_BK, AC_VI, or AC_VO) is both trigger-enabled and delivery-enabled. It is set to 0 in (Re)Association Request frames to indicate that the corresponding AC is neither trigger-enabled nor delivery-enabled. A TSPEC as described in 11.2.3.5 is to be used to make a particular AC exclusively either trigger-enabled or delivery-enabled. These subfields are set to 0 when the APSD subfield in the Capability Information field received from the AP with which the non-AP STA is associating is equal to 0.

Non-AP STAs set the Q-Ack subfield to 1 when dot11QAckOptionImplemented is true and set it to 0 otherwise.

The Max SP Length subfield indicates the maximum number of buffered BUs the STA is prepared to receive during any SP triggered by the STA. This subfield is reserved when the APSD subfield in the Capability Information field is equal to 0. If the APSD subfield in the Capability Information field is equal to 1, the settings of the values in the Max SP Length subfield are defined in Table 9-53.

Table 9-53—Settings of the Max SP Length subfield

Bit 5	Bit 6	Usage
0	0	The STA is prepared to receive all buffered BUs.
1	0	The STA is prepared to receive a maximum of two BUs per SP.
0	1	The STA is prepared to receive a maximum of four BUs per SP.
1	1	The STA is prepared to receive a maximum of six BUs per SP.

Non-AP STAs set the More Data Ack subfield to 1 to indicate that they can process Ack frames with the More Data bit in the Frame Control field equal to 1 and remain in the awake state. Non-AP STAs set the More Data Ack subfield to 0 otherwise. For APs, the More Data Ack subfield is reserved.

9.4.1.18 Measurement Pilot Interval field

The Measurement Pilot Interval field represents the number of time units (TUs) between target measurement pilot transmission times (TMPTTs). The length of the Measurement Pilot Interval field is 1 octet. The Measurement Pilot Interval field is shown in Figure 9-102.

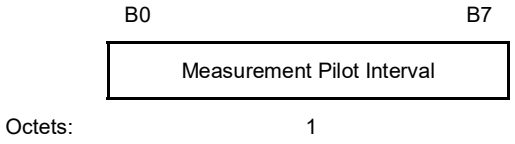

Figure 9-102—Measurement Pilot Interval field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.1.19 Max Transmit Power field

The Max Transmit Power field is a 2s complement signed integer. It provides an upper limit, in units of dBm, on the transmit power as measured at the antenna connector to be used by the transmitting STA on the current channel. The Max Transmit Power value has a tolerance of ± 5 dB. See 11.10.13. The Max Transmit Power field is shown in Figure 9-103.

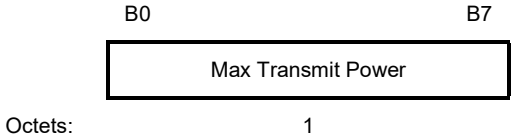

Figure 9-103—Max Transmit Power field format

9.4.1.20 Transmit Power Used field

The Transmit Power Used field is a 2s complement signed integer. It is less than or equal to the Max Transmit Power and indicates the actual power used as measured at the antenna connector, in units of dBm, by a STA when transmitting the frame containing the Transmit Power Used field. The Transmit Power Used value is determined any time prior to sending the frame in which it is contained and has a tolerance of ± 5 dB. The Transmit Power Used field is shown in Figure 9-104.

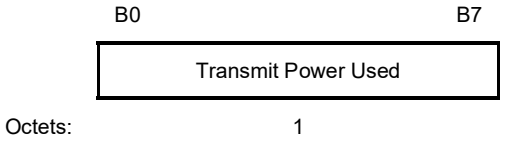

Figure 9-104—Transmit Power Used field format

9.4.1.21 Channel Width field

The Channel Width field is used in a Notify Channel Width frame (see 9.6.11.2) to indicate the channel width on which the sending STA is able to receive. The length of the field is 1 octet. The Channel Width field is shown in Figure 9-105.

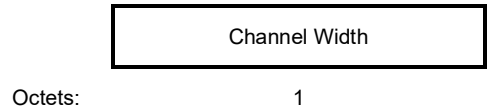

Figure 9-105—Channel Width field

If a STA transmitting or receiving this field is operating in an operating class that includes a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E, then the Channel Width field is defined in Table 9-54. If a STA transmitting or receiving this field

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

is operating in an operating class that does not include a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E, then this field is reserved.

Table 9-54—Settings of the Channel Width field

Value	Meaning
0	20 MHz channel width
1	Any channel width in the STA's Supported Channel Width Set subfield
2–255	Reserved

9.4.1.22 Operating Class and Channel field

The Operating Class and Channel field is used in the Location Indication Channels subelement of the Location Parameters element and in the Channel Usage element. The Operating Class and Channel field indicates an operating class and channel. The format of the field is defined in Figure 9-106.

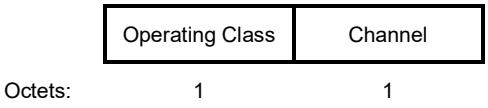

Figure 9-106—Operating Class and Channel field format

The Operating Class field indicates an operating class value as defined in Annex E. The operating class is interpreted in the context of the country specified in the Beacon frame.

The Channel field indicates a channel number, which is interpreted in the context of the indicated operating class. Channel numbers are defined in Annex E.

9.4.1.23 SM Power Control field

The SM Power Control field is used in an SM Power Save frame (see 9.6.11.3) by a STA to communicate changes in its SM power saving state. The field is shown in Figure 9-107.

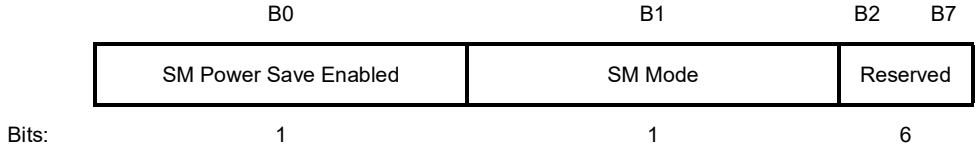

Figure 9-107—SM Power Control field format

The SM Power Save Enabled subfield indicates whether SM power saving is enabled at the STA. A 1 indicates enabled, and a 0 indicates disabled.

The SM Mode subfield indicates the mode of operation. A 1 indicates dynamic SM power save mode, a 0 indicates static SM power save mode. The modes are described in 11.2.6.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.1.24 PSMP Parameter Set field

PSMP is obsolete. Support for this mechanism might be removed in a later revision of the standard.

The PSMP Parameter Set field is used in a PSMP frame (see 9.6.11.4) to define the number of PSMP STA Info fields held in the PSMP frame, to indicate whether the PSMP sequence is to be followed by another PSMP sequence, and to indicate the duration of the PSMP sequence.

The structure of the PSMP Parameter Set field is defined in Figure 9-108.

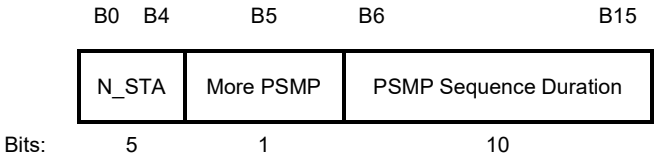

Figure 9-108—PSMP Parameter Set field format

The N_STA subfield indicates the number of STA Info fields present in the PSMP frame that contains the PSMP Parameter Set field.

The More PSMP subfield, when set to 1, indicates that the current PSMP sequence will be followed by another PSMP sequence. The subfield is set to 0 to indicate that there will be no PSMP sequence following the current PSMP sequence.

The PSMP Sequence Duration subfield indicates the duration of the current PSMP sequence that is described by the PSMP frame, in units of 8 μs, relative to the end of the PSMP frame. Therefore, this field can describe a PSMP sequence with a duration of up to 8.184 ms. The next PSMP sequence within the current PSMP burst starts a SIFS after the indicated duration.

9.4.1.25 PSMP STA Info field

PSMP is obsolete. Support for this mechanism might be removed in a later revision of the standard.

The PSMP STA Info field is used by the PSMP frame (see 9.6.11.4). The PSMP STA Info field defines the allocation of time to the downlink (PSMP-DTT) and/or uplink (PSMP-UTT) associated with a single RA. There are two variants of the structure for the individually addressed and group addressed cases. The length of the PSMP STA Info field is 8 octets.

The structure of the STA Info field is defined in Figure 9-109 and Figure 9-110.

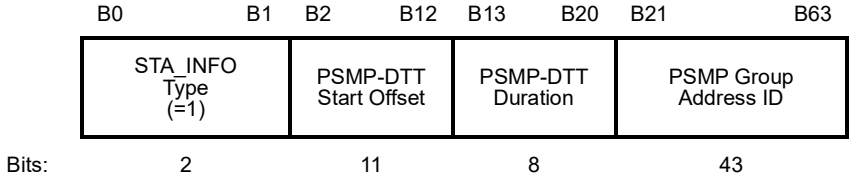

Figure 9-109—PSMP STA Info field format (group addressed)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

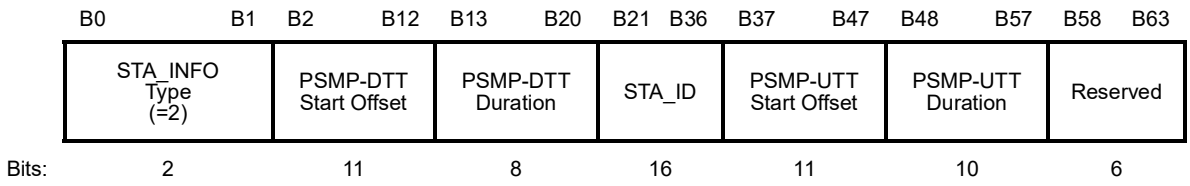

Figure 9-110—PSMP STA Info field format (individually addressed)

The STA_INFO Type subfield indicates the format of the remainder of the structure. When the STA_INFO Type subfield is equal to 1, the PSMP STA Info field is structured as defined in Figure 9-109 and supports the transmission of group addressed data by the AP. When the STA_INFO Type subfield is equal to 2, the PSMP STA Info field is structured as defined in Figure 9-110 and supports the exchange of data with a single STA. STA_INFO Type subfield values 0 and 3 are reserved.

The PSMP-DTT Start Offset subfield indicates the start of the PSMP-DTT for the destination identified by the PSMP STA Info field, relative to the end of the PSMP frame, in units of 4 μs. This subfield locates the start of the first PPDU containing downlink data for this destination.

The PSMP-DTT Duration subfield indicates the duration of the PSMP-DTT for the destination identified by the PSMP STA Info field, in units of 16 μs. This subfield locates the end of the last PPDU containing downlink data for this destination relative to the PDMP-DTT start offset.

If no PSMP-DTT is scheduled for a STA, but a PSMP-UTT is scheduled for that STA, the PSMP-DTT Duration subfield is set to 0, and the PSMP-DTT Start Offset subfield is reserved.

The PSMP Group Address ID (B21 to B63) subfield contains MAC_ADDR[5:47] of a 48 bit MAC address. Use of this subfield is described in 10.30.2.8. B63 contains bit 47 of the group address.

The STA_ID subfield contains the AID of the STA to which the PSMP STA Info field is directed.

The PSMP-UTT Start Offset subfield indicates the start of the PSMP-UTT. The offset is specified relative to the end of the PSMP frame. It is specified in units of 4 μs. The first PSMP-UTT is scheduled to begin after a SIFS from the end of the last PSMP-DTT described in the PSMP.

The PSMP-UTT Duration subfield indicates the maximum length of a PSMP-UTT for a STA. PSMP-UTT duration is specified in units of 4 μs. All transmissions by the STA within the current PSMP sequence lie within the indicated PSMP-UTT.

If no PSMP-UTT is scheduled for a STA, but a PSMP-DTT is scheduled for that STA, the PSMP-UTT Start Offset and PSMP-UTT Duration subfields are both set to 0.

9.4.1.26 MIMO Control field

The MIMO Control field is used to manage the exchange of MIMO channel state or transmit beamforming feedback information. It is used in the CSI (see 9.6.11.5), Noncompressed Beamforming (see 9.6.11.6), and Compressed Beamforming (see 9.6.11.7) frames.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MIMO Control field is defined in Figure 9-111.

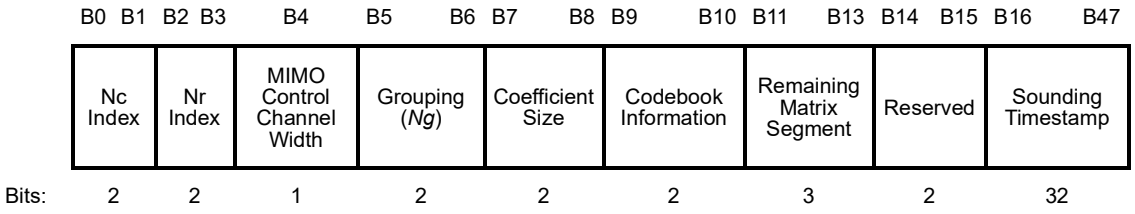

Figure 9-111—MIMO Control field format

The subfields of the MIMO Control field are defined in Table 9-55.

Table 9-55—Subfields of the MIMO Control field

Subfield	Description
Nc Index	Indicates the number of columns in the compressed beamforming feedback matrix minus one.
Nr Index	Indicates the number of rows in the compressed beamforming feedback matrix minus one. The value 0 is reserved.
MIMO Control Channel Width	Indicates the width of the channel in which a measurement was made: Set to 0 for 20 MHz Set to 1 for 40 MHz
Grouping (*Ng*)	Number of carriers grouped into one: Set to 0 for *Ng* = 1 (No grouping) Set to 1 for *Ng* = 2 Set to 2 for *Ng* = 4 The value 3 is reserved
Coefficient Size	Indicates the number of bits in the representation of the real and imaginary parts of each element in the matrix. For CSI feedback: Set to 0 for *Nb* = 4 Set to 1 for *Nb* = 5 Set to 2 for *Nb* = 6 Set to 3 for *Nb* = 8 For noncompressed beamforming feedback: Set 0 for *Nb* = 4 Set 1 for *Nb* = 2 Set 2 for *Nb* = 6 Set 3 for *Nb* = 8
Codebook Information	Indicates the size of codebook entries: Set to 0 for 1 bit for ψ, 3 bits for ϕ Set to 1 for 2 bits for ψ, 4 bits for ϕ Set to 2 for 3 bits for ψ, 5 bits for ϕ Set to 3 for 4 bits for ψ, 6 bits for ϕ

Table 9-55—Subfields of the MIMO Control field *(continued)*

Subfield	Description
Remaining Matrix Segment	Contains the remaining segment number for the associated measurement report. Set to 0 for the last segment of a segmented report or the only segment of an unsegmented report.
Sounding Timestamp	Contains the lower 4 octets of the TSF timer sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the sounding PPDU that was used to generate feedback information contained in the frame.

9.4.1.27 CSI Report field

The CSI Report field is used by the CSI frame (see 9.6.11.5) to carry explicit channel state information to a transmit HT beamformer, as described in 10.34.3.

The CSI Matrix subfields in the CSI Report field shown in Table 9-56 and Table 9-57 are matrices whose elements are taken from the CHAN_MAT parameter of RXVECTOR (see Table 19-1).

Table 9-56—CSI Report field (20 MHz)

Field	Size (bits)	Meaning
SNR in receive chain 1	8	Signal-to-noise ratio in the first receive chain of the STA sending the report.
...		
SNR in receive chain *Nr*	8	Signal-to-noise ratio in the *Nr*'th receive chain of the STA sending the report.
CSI Matrix for carrier –28	3+2× *Nb*×*Nc*×*Nr*	CSI matrix (see Figure 9-112)
...		
CSI Matrix for carrier –1	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
CSI Matrix for carrier 1	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
...		
CSI Matrix for carrier 28	3+2× *Nb*×*Nc*×*Nr*	CSI matrix

The structure of the field depends on the value of the MIMO Control Channel Width subfield. The CSI Report field for 20 MHz has the structure defined in Table 9-56 where

Nb is the number of bits determined by the Coefficients Size field of the MIMO Control field
Nc is the number of columns in a CSI matrix determined by the Nc Index field of the MIMO Control field
Nr is the number of rows in a CSI matrix determined by the Nr Index field of the MIMO Control field

The CSI Report field for 40 MHz has the structure defined in Table 9-57.

Table 9-57—CSI Report field (40 MHz)

Field	Size (bits)	Meaning
SNR in receive chain 1	8	Signal-to-noise ratio in the first receive chain of the STA sending the report.
...		
SNR in receive chain *Nr*	8	Signal-to-noise ratio in the *Nr*'th receive chain of the STA sending the report.
CSI Matrix for carrier –58	3+2× *Nb*×*Nc*×*Nr*	CSI matrix (see Figure 9-112)
...		
CSI Matrix for carrier –2	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
CSI Matrix for carrier 2	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
...		
CSI Matrix for carrier 58	3+2× *Nb*×*Nc*×*Nr*	CSI matrix

The signal-to-noise ratio (SNR) values in Table 9-56 and Table 9-57 are encoded as an 8-bit 2s complement value of 4 × (SNR_average – 22), where SNR_average is the decibel representation of linearly averaged values over the subcarriers represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps.

Grouping is a method that reduces the size of the CSI Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the CSI Report field is *Nr*×8+*Ns*×(3+2×*Nb*×*Nc*×*Nr)* bits, where the number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent are shown in Table 9-58. If the size of the CSI Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

Table 9-58—Number of matrices and carrier grouping

BW	Grouping *Ng*	*Ns*	Carriers for which matrices are sent
20 MHz	1	56	All data and pilot carriers: –28, –27,…–2, –1, 1, 2,…27, 28
	2	30	–28,–26,–24,–22,–20,–18,–16,–14,–12,–10,–8,–6,–4,–2,–1, 1,3,5,7,9,11,13,15,17,19,21,23,25,27,28
	4	16	–28,–24,–20,–16,–12,–8,–4,–1,1,5,9,13,17,21,25,28
40 MHz	1	114	All data and pilot carriers: –58, –57, …, –3, –2, 2, 3,…, 57, 58
	2	58	–58,–56,–54,–52,–50,–48,–46,–44,–42,–40,–38,–36,–34,–32,–30,–28,–26,–24, –22,–20,–18,–16,–14,–12,–10,–8,–6,–4,–2, 2,4,6,8,10,12,14,16,18,20,22,24,26,28,30,32,34,36,38,40,42,44,46,48,50,52,54, 56,58
	4	30	–58,–54,–50,–46,–42,–38,–34,–30,–26,–22,–18,–14,–10,–6, –2, 2,6,10,14,18,22,26,30,34,38,42,46,50,54,58

The CSI matrix H_{eff} for a single carrier has the structure defined in Figure 9-112. The encoding rules for the elements of the H_{eff} matrix are given in 19.3.12.3.2.

        each element of H_eff includes the real part of the element (Nb bits) and
        imaginary part of the element (Nb bits) in that order
    }

}
```

Figure 9-112—CSI matrix coding

When operating with a 40 MHz channel width, CSI feedback with a bandwidth of 20 MHz corresponds to the subcarriers in the primary 20 MHz channel.

9.4.1.28 Noncompressed Beamforming Report field

The Noncompressed Beamforming Report field is used by the Noncompressed Beamforming frame to carry explicit feedback in the form of noncompressed beamforming feedback matrices *V* for use by a transmit HT beamformer to determine steering matrices Q, as described in 10.34.3 and 19.3.12.3.

The structure of the field is dependent on the value of the MIMO Control Channel Width subfield. The Noncompressed Beamforming Report field for 20 MHz has the structure defined in Table 9-59 where

Nb is the number of bits determined by the Coefficients Size field of the MIMO Control field

Nc is the number of columns in a beamforming feedback matrix determined by the Nc Index field of the MIMO Control field

Nr is the number of rows in a beamforming feedback matrix determined by the Nr Index field of the MIMO Control field

Table 9-59—Noncompressed Beamforming Report field (20 MHz)

Field	Size (bits)	Meaning
SNR for space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1.
...		
SNR for space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*.
Beamforming Feedback Matrix for carrier –28	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V* (see Figure 9-113)
...		
Beamforming Feedback Matrix for carrier –1	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*
Beamforming Feedback Matrix for carrier 1	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*
...		
Beamforming Feedback Matrix for carrier 28	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*

The Noncompressed Beamforming Report field for 40 MHz has the structure defined in Table 9-60.

Table 9-60—Noncompressed Beamforming Report field (40 MHz)

Field	Size (bits)	Meaning
SNR for space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1.
...		
SNR for space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*.
Beamforming Feedback Matrix for carrier –58	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V* (see Figure 9-113).
...		
Beamforming Feedback Matrix for carrier –2	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*.
Beamforming Feedback Matrix for carrier 2	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*.
...		
Beamforming Feedback Matrix for carrier 58	+2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*.

The SNR values in Table 9-59 and Table 9-60 are encoded as an 8-bit 2s complement value of 4 × (SNR_average – 22), where SNR_average is the sum of the values of SNR per subcarrier (in decibels) divided by the number of subcarriers represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps. The SNR in space-time stream *i* corresponds to the SNR associated with the column *i* of the beamforming feedback matrix *V*. Each SNR corresponds to the predicted SNR at the HT beamformee when the HT beamformer applies the matrix *V*.

Grouping is a method that reduces the size of the Noncompressed Beamforming Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the Noncompressed Beamforming Report field is $Nc \times 8 + Ns \times (2 \times Nb \times Nc \times Nr)$ bits. The number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent is shown in Table 9-58. If the size of the Noncompressed Beamforming Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

A beamforming feedback matrix *V* for a single carrier has the structure defined in Figure 9-113.

Encoding rules for elements of the *V* matrix are given in 19.3.12.3.5.

When operating with a 40 MHz channel width, noncompressed feedback with a bandwidth of 20 MHz corresponds to the subcarriers in the primary 20 MHz channel.

    }
}
```

Figure 9-113—*V* matrix coding (noncompressed beamforming)

9.4.1.29 Compressed Beamforming Report field

The Compressed Beamforming Report field is used by the Compressed Beamforming frame (see 9.6.11.7) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices *V* for use by a transmit HT beamformer to determine steering matrices Q, as described in 10.34.3 and 19.3.12.3.

The size of the Compressed Beamforming Report field depends on the values in the MIMO Control field.

The Compressed Beamforming Report field contains the channel matrix elements indexed, first, by matrix angles in the order shown in Table 9-61 and, second, by data subcarrier index from lowest frequency to highest frequency. The explanation on how these angles are generated from the beamforming feedback matrix *V* is given in 19.3.12.3.6.

Table 9-61—Order of angles in the Compressed Beamforming Report field

Size of *V* (*Nr* × *Nc*)	Number of angles (*Na*)	The order of angles in the Quantized Beamforming Feedback Matrices Information field
2×1	2	ϕ_{11}, ψ_{21}
2×2	2	ϕ_{11}, ψ_{21}
3×1	4	ϕ_{11}, ϕ_{21}, ψ_{21}, ψ_{31}
3×2	6	ϕ_{11}, ϕ_{21}, ψ_{21}, ψ_{31}, ϕ_{22}, ψ_{32}
3×3	6	ϕ_{11}, ϕ_{21}, ψ_{21}, ψ_{31}, ϕ_{22}, ψ_{32}
4×1	6	ϕ_{11}, ϕ_{21}, ϕ_{31}, ψ_{21}, ψ_{31}, ψ_{41}
4×2	10	ϕ_{11}, ϕ_{21}, ϕ_{31}, ψ_{21}, ψ_{31}, ψ_{41}, ϕ_{22}, ϕ_{32}, ψ_{32}, ψ_{42}
4×3	12	ϕ_{11}, ϕ_{21}, ϕ_{31}, ψ_{21}, ψ_{31}, ψ_{41}, ϕ_{22}, ϕ_{32}, ψ_{32}, ψ_{42}, ϕ_{33}, ψ_{43}
4×4	12	ϕ_{11}, ϕ_{21}, ϕ_{31}, ψ_{21}, ψ_{31}, ψ_{41}, ϕ_{22}, ϕ_{32}, ψ_{32}, ψ_{42}, ϕ_{33}, ψ_{43}

The angles are quantized as defined in Table 9-62. All angles are transmitted LSB to MSB.

Table 9-62—Quantization of angles

Quantized ψ	Quantized ϕ
$\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians where $k = 0, 1, \ldots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ (defined by the Codebook Information field of the MIMO Control field; see 9.4.1.26);	$\phi = \frac{k\pi}{2^{b_\phi-1}} + \frac{\pi}{2^{b_\phi}}$ radians where $k = 0, 1, \ldots, 2^{b_\phi} - 1$ b_ϕ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the MIMO Control field; see 9.4.1.26)

The Compressed Beamforming Report field for 20 MHz has the structure defined in Table 9-63, where *Na* is the number of angles used for beamforming feedback matrix *V* (see Table 9-61).

Table 9-63—Compressed Beamforming Report field (20 MHz)

Field	Size (bits)	Meaning
SNR in space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1.
...		
SNR in space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc.*
Beamforming Feedback Matrix *V* for carrier –28	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V.*
...		
Beamforming Feedback Matrix *V* for carrier –1	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V.*
Beamforming Feedback Matrix *V* for carrier 1	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V.*
...		
Beamforming Feedback Matrix *V* for carrier 28	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V.*

The Compressed Beamforming Report field for 40 MHz has the structure defined in Table 9-64, where *Na* is the number of angles used for beamforming feedback matrix *V* (see Table 9-61).

The SNR values in Table 9-63 and Table 9-64 are encoded as an 8-bit 2s complement value of 4 × (SNR_average – 22), where SNR_average is the sum of the values of SNR per subcarrier (in decibels) divided by the number of subcarriers represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps. Each SNR value per subcarrier in stream *i* (before being averaged) corresponds to the SNR associated with the column *i* of the beamforming feedback matrix *V* determined at the HT beamformee. Each SNR corresponds to the predicted SNR at the HT beamformee when the HT beamformer applies the matrix *V*.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-64—Compressed Beamforming Report field (40 MHz)

Field	Size (bit)	Meaning
SNR in space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1.
...		
SNR in space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*.
Beamforming Feedback Matrix *V* for carrier –58	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.
Beamforming Feedback Matrix *V* for carrier –58 + *Ng*	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.
...		
Beamforming Feedback Matrix *V* for carrier –2	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.
Beamforming Feedback Matrix *V* for carrier 2	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.
Beamforming Feedback Matrix *V* for carrier 2 + *Ng*	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.
...		
Beamforming Feedback Matrix *V* for carrier 58	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*.

Grouping is a method that reduces the size of the Compressed Beamforming Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the Compressed Beamforming Report field is $Nc\times 8+Ns\times(Na\times(b_\psi+b_\phi)/2)$ bits, where the number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent is defined in Table 9-58. If the size of the Compressed Beamforming Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

See Figure 9-114 and Figure 9-115 for examples of this encoding.

Bits	b0..b4	b5..b7	b8..b12	b13..b15	…	b440..b444	b445..b447
Data	$\phi_{11}(-28)$	$\psi_{21}(-28)$	$\phi_{11}(-27)$	$\psi_{21}(-27)$	…	$\phi_{11}(28)$	$\psi_{21}(28)$

Conditions:
- 2 × 2 V
- $b_\psi = 3$, $b_\phi = 5$
- No grouping
- 20 MHz width
- The matrix *V* is encoded using 8 bits per subcarrier.

Figure 9-114—First example of Compressed Beamforming Report field encoding

Bits	b0..b3	b4..b7	…	b26..b27	b28..b29	b30..b33	…	b58..b59	…	b870..b873	…	b898..b899
Data	$\phi_{11}(-58)$	$\phi_{21}(-58)$	…	$\psi_{32}(-58)$	$\psi_{42}(-58)$	$\phi_{11}(-54)$	…	$\psi_{42}(-54)$	…	$\phi_{11}(58)$	…	$\psi_{42}(58)$

Conditions:
- — 4×2 V
- — $b_{\psi} = 2$, $b_{\phi} = 4$
- — 4 subcarrier grouping
- — 40 MHz width
- — The matrix V is encoded using 30 bits per subcarrier .

Figure 9-115—Second example of Compressed Beamforming Report field encoding

When operating with a 40 MHz channel width, compressed feedback with a bandwidth of 20 MHz corresponds to the subcarriers in the primary 20 MHz channel.

9.4.1.30 Antenna Selection Indices field

The Antenna Selection Indices field is used within the Antenna Selection Indices Feedback frame to carry ASEL feedback, as described in 10.35.

The Antenna Selection Indices field is shown in Figure 9-116.

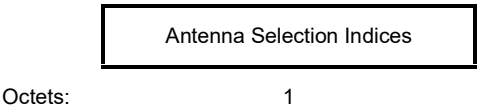

Figure 9-116—Antenna Selection Indices field format

Bits 0 to 7 in the Antenna Selection Indices field correspond to antennas with indices 0 to 7, respectively. A 1 in a bit indicates the corresponding antenna is selected, and a 0 indicates the corresponding antenna is not selected.

9.4.1.31 Organization Identifier field

The Organization Identifier field contains a public unique identifier assigned by the IEEE Registration Authority as a 24-bit OUI, a 24-bit CID, or a 36-bit OUI-36, see IEEE Registration Authority [B15] and [B16]. The order of the Organization Identifier field is described in 9.2.2.

The length of the Organization Identifier field (j) is the minimum number of octets required to contain the entire IEEE-assigned identifier (see Figure 9-117). Thus, the Organization Identifier field is 3 octets in length if the IEEE-assigned identifier is an OUI or CID, or 5 octets in length if the IEEE-assigned identifier is an OUI-36.

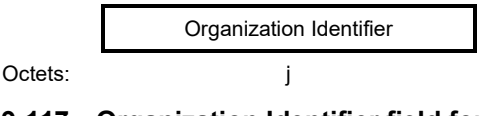

Figure 9-117—Organization Identifier field format

If the length of the IEEE-assigned identifier is not an integer number of octets, the least significant bits of the last octet are specified by the organization identified.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE—For example, for the IEEE-assigned identifier 0x0050C24A4, the Organization Identifier field would contain 0x0050C24A4*y* where *y* represents the four least significant bits of the fifth octet of the field. The value of *y* is specified by the organization whose identifier is 0x0050C24A4.

9.4.1.32 Rate Identification field

The Rate Identification field contains the rate identification information for a frame that is not the current frame transmitted or received by a STA. This information allows services to exchange frame rate information prior to use of the frames that use the rate specified by the Rate Identification field. The contents of the field is defined in Figure 9-118.

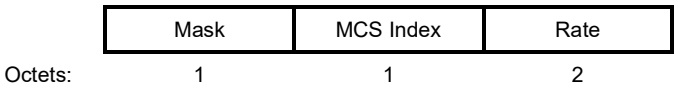

Figure 9-118—Identification field format

The Mask field specifies the other fields in the Rate Identification field that are used by a STA. The format of the Mask field is shown in Figure 9-119.

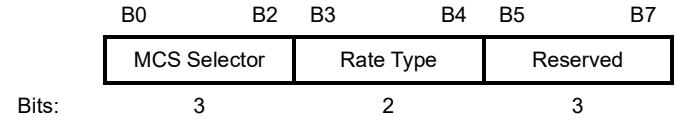

Figure 9-119—Mask field format

The MCS Selector field value 0 indicates that the MCS Index field is reserved. The MCS Selector field value 1 indicates the MCS Index field specifies an index value that is taken from Table 19-27 to Table 19-30 and Table 19-36 to Table 19-38 in 19.5.

The MCS Selector field value 2 indicates that the MCS Index field specifies:

— Values that are taken from Table 19-31 to Table 19-35 and Table 19-40 to Table 19-41 in 19.5, when carried in frames transmitted by a non-S1G STA.

— Values that are taken from Table 23-41 to Table 23-44, indicating an S1G-MCS for a 1 MHz channel width, when carried in frames transmitted by an S1G STA.

The MCS Selector field value 3 indicates that the MCS Index field specifies:

— Values that are taken from Table 21-29 to Table 21-36, indicating a VHT-MCS for a 20 MHz channel width, when carried in frames transmitted by a non-S1G STA.

— Values that are taken from Table 23-45 to Table 23-48, indicating an S1G-MCS for a 2 MHz channel width, when carried in frames transmitted by an S1G STA.

The MCS Selector field value 4 indicates that the MCS Index field specifies

— Values that are taken from Table 21-37 to Table 21-44, indicating a VHT-MCS for a 40 MHz channel width, when carried in frames transmitted by a non-TVHT and non-S1G STA.

— Values that are taken from Table 22-26 to Table 22-29, indicating a TVHT-MCS for a TVHT_W channel width, when carried in frames transmitted by a TVHT STA.

— Values that are taken from Table 23-49 to Table 23-52, indicating an S1G-MCS for a 4 MHz channel width, when carried in frames transmitted by an S1G STA.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MCS Selector field value 5 indicates that the MCS Index field specifies

- Values that are taken from Table 21-45 to Table 21-52, indicating a VHT-MCS for an 80 MHz channel width, when carried in frames transmitted by a non-TVHT and non-S1G STA.
- Values that are taken from Table 22-30 to Table 22-33, indicating a TVHT-MCS for a TVHT_2W or TVHT_W+W channel width, when carried in frames transmitted by a TVHT STA.
- Values that are taken from Table 23-53 to Table 23-56, indicating an S1G-MCS for an 8 MHz channel width, when carried in frames transmitted by an S1G STA.

The MCS Selector field value 6 indicates that the MCS Index field specifies

- Values that are taken from Table 21-53 to Table 21-60, indicating a VHT-MCS for a 160 MHz or 80+80 MHz channel width, when carried in frames transmitted by a non-TVHT and non-S1G STA.
- Values that are taken from Table 22-34 to Table 22-37, indicating a TVHT-MCS for a TVHT_4W or TVHT_2W+2W channel width, when carried in frames transmitted by a TVHT STA.
- Values that are taken from Table 23-57 to Table 23-60, indicating an S1G-MCS for a 16 MHz channel width, when carried in frames transmitted by an S1G STA.

The MCS Selector field value 7 is reserved.

The Rate Type field set to 0 indicates the Rate field is reserved. The Rate Type field set to 1 indicates the Rate field specifies a data rate that is in the basic rate set. The Rate Type field set to 2 indicates the Rate field specifies a data rate that is not in the basic rate set.

If MCS Selector is 1 or 2, the MCS Index field is a 1 octet unsigned integer that specifies the row index for one of the MCS parameter tables in 19.5.

If MCS Selector field is 3, 4, 5, or 6, the MCS Index field format is as shown in Figure 9-120. In frames transmitted by an S1G STA, the MCS Index field format is also valid when MCS Selector field is 2. The NSS subfield indicates the number of spatial streams, and the VHT-MCS Index Row subfield indicates a value from the VHT-MCS Index column of Table 21-29 to Table 21-60 in 21.5 or from the MCS Index column of Table 22-26 to Table 22-37 in 22.5 that corresponds to the channel width and N_{SS} values, or from the MCS Idx column of Table 23-41 to Table 23-60 that corresponds to the channel width and NSS values.

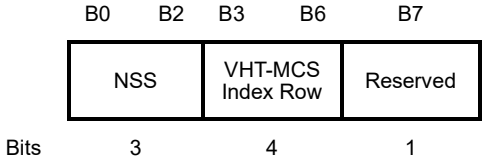

Figure 9-120—MCS Index field format when the MCS Selector field is 3, 4, 5, or 6

For non-S1G STAs, the Rate field contains an unsigned integer that specifies the PHY rate in 0.5 Mb/s units. For S1G STAs, it is reserved.

9.4.1.33 GAS Query Response Fragment ID field

A GAS Query Fragment Response ID field is used by the STA to indicate when a GAS Query Response spans multiple MMPDUs. STAs responding to GAS request use this field to inform the requesting STA of the GAS fragment number of the transmitted frames as well as identifying the last GAS fragment of the Query Response. Requesting STAs use this field to determine if any fragments of the Query Response are missing. The maximum value permitted in the GAS Query Response Fragment ID is 127. The More GAS Fragments field is set to 1 in GAS Query Response fragments of GAS Comeback Response frames that have

another GAS fragment of the current query response to follow; otherwise, it is set to 0. The format of GAS Query Response Fragment ID is shown in Figure 9-121.

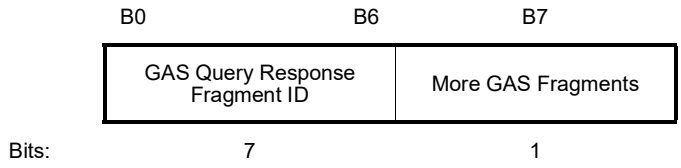

Figure 9-121—GAS Query Response Fragment ID field format

9.4.1.34 Venue Info field

The Venue Info field contains Venue Group and Venue Type subfields. The format of Venue Info subfield is shown in Figure 9-122.

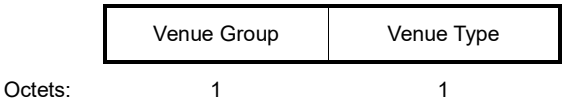

Figure 9-122—Venue Info field format

The Venue Group and Venue Type subfields are selected from Table 9-65 and Table 9-66, respectively. The entries in Table 9-65 and Table 9-66 are drawn from the *International Building Code*'s Use and Occupancy Classifications [B49].

9.4.1.35 Target Channel

The Target Channel field specifies the channel number of the target channel. The length of the Target Channel field is 1 octet. The Target Channel field is shown in Figure 9-123.

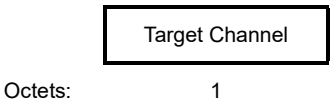

Figure 9-123—Target Channel field format

9.4.1.36 Operating Class

The Operating Class field specifies the operating class for the channel field included in the same frame. The length of the Operating Class field is 1 octet. Operating classes are defined in Annex E. The Operating Class field is shown in Figure 9-124.

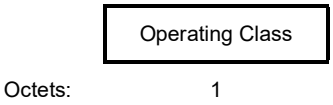

Figure 9-124—Operating Class field format

9.4.1.37 Send-Confirm field

The Send-Confirm field is used with SAE authentication as an anti-replay counter as specified in 12.4. See Figure 9-125.

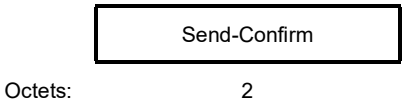

Figure 9-125—Send-Confirm field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.1.38 Anti-Clogging Token field

The Anti-Clogging Token field is used with SAE authentication for denial-of-service protection as specified in 12.4. See Figure 9-126.

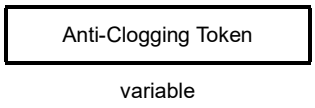

Figure 9-126—Anti-Clogging Token field format

9.4.1.39 Scalar field

The Scalar field is used with SAE authentication to communicate cryptographic material as specified in 12.4. See Figure 9-127.

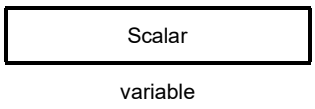

Figure 9-127—Scalar field format

9.4.1.40 FFE field

The FFE field is used with SAE authentication and FILS authentication to communicate an element in a finite field as specified in 12.4. See Figure 9-128.

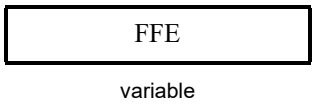

Figure 9-128—FFE field format

9.4.1.41 Confirm field

The Confirm field is used with SAE authentication to authenticate and prove possession of a cryptographic key as specified in 12.4. See Figure 9-129.

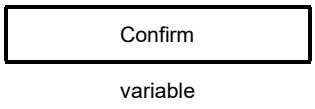

Figure 9-129—Confirm field format

9.4.1.42 Finite Cyclic Group field

The Finite Cyclic Group field is used as specified in Clause 12 to indicate an unsigned integer, from a repository maintained by IANA as “Group Description” attributes for IETF RFC 2409 (IKE) [B14][B30] that specifies the cryptographic group to use in a cryptographic exchange. See Figure 9-130.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Finite Cyclic Group field is used in SAE to indicate the cryptographic group to use in the SAE authentication as specified in 12.4. This field is also used in FILS to indicate the cryptographic group to use in FILS authentication as specified in 12.11 . See Figure 9-130.

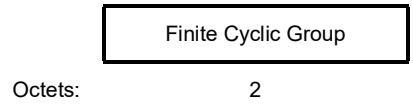

Figure 9-130—Finite Cyclic Group field format

9.4.1.43 TXOP Reservation field

The format of the TXOP Reservation field is shown in Figure 9-131.

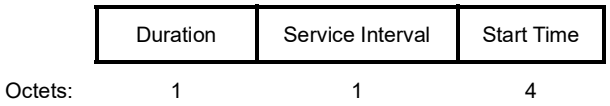

Figure 9-131—TXOP Reservation field format

The Duration subfield specifies the duration of the TXOP in units of 32 μs.

The Service Interval subfield contains an unsigned integer that specifies the service interval (SI) of the reservation in units of milliseconds.

The Start Time subfield is the offset from the next TBTT to the start of the first SP and indicates the anticipated start time, expressed in microseconds, of the first TXOP after the TBTT.

9.4.1.44 Relay Capable STA Info field

The format of the Relay Capable STA Info field is defined in Figure 9-132.

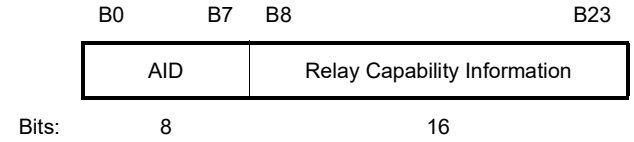

Figure 9-132—Relay Capable STA Info field format

The AID subfield contains the AID of the relay capable STA that is associated with the AP or PCP.

The Relay Capability Information subfield is defined in 9.4.2.147.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.1.45 Band ID field

The Band ID field is defined in Table 9-67.

Table 9-67—Band ID field

Band ID value	Meaning
0	TV white spaces
1	Sub-1 GHz (excluding TV white spaces)
2	2.4 GHz
3	3.6 GHz
4	4.9 and 5 GHz
5	60 GHz
6	45 GHz
7–255	Reserved

9.4.1.46 DMG Parameters field

The format of the DMG Parameters field is shown in Figure 9-133.

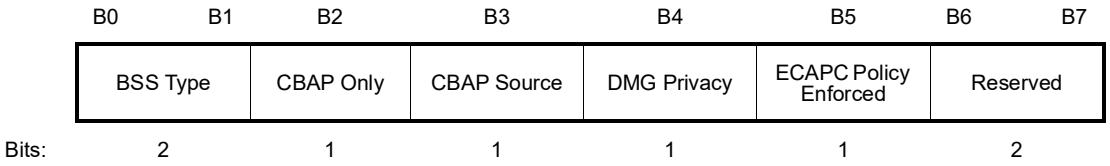

Figure 9-133—DMG Parameters

If the BSS Type field is transmitted as part of a DMG Beacon frame that has the Discovery Mode field within the Beacon Interval Control field (see Figure 9-77) equal to 0, then the BSS Type subfield is defined in Table 9-68 for specific types of frame cited below. An AP sets the BSS Type subfield to 3 within transmitted DMG Beacon, Probe Response, or (Re)Association Response frames. A PCP sets the BSS Type subfield to 2 within transmitted DMG Beacon, Probe Response, or (Re)Association Response frames. An IBSS STA or a STA that is not a member of a BSS sets the BSS Type subfield to 1 within transmitted DMG Beacon or Probe Response frames. The BSS Type subfield is reserved for all other types of frame.

Table 9-68—The BSS Type subfield when the Discovery mode field is 0

Subfield value	BSS Type	Transmitted by DMG STA
3	Infrastructure BSS	AP
2	PBSS	PCP
1	IBSS	Any non-AP and non-PCP DMG STA
0	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the BSS Type field is transmitted as part of a DMG Beacon frame that has the Discovery Mode field within the Beacon Interval Control field (see Figure 9-77) equal to 1, the BSS Type subfield is defined in Table 9-69. Depending on the role of the STA that responds to the DMG Beacon frame (identified by the Responding STA role column of Table 9-69), the behavior is different and is defined in 10.42.5.2.

Table 9-69—The BSS Type subfield when the Discovery mode field is 1

Subfield value	Responding STA role	Applicable BSS types
3	AP	Infrastructure BSS
2	PCP	PBSS
1	Non-AP STA	PBSS, IBSS
0	Any	Infrastructure BSS, PBSS, IBSS

The CBAP Only, CBAP Source, and ECAPC Policy Enforced subfields are valid only when transmitted within a DMG Beacon, Probe Response, or (Re)Association Response frames and are set as follows:

— The CBAP Only subfield indicates the type of link access provided by the STA sending the DMG Beacon frame in the data transfer interval (DTI) (see 10.39.2) of the beacon interval. The CBAP Only subfield is set to 1 when the entirety of the DTI portion of the beacon interval is allocated as a CBAP. The CBAP Only subfield is set to 0 when the allocation of the DTI portion of the beacon interval is provided through the Extended Schedule element.

— The CBAP Source subfield is valid only if the CBAP Only subfield is 1. The CBAP Source subfield is set to 1 to indicate that the AP or PCP has higher priority to transmit during the CBAP than non-AP and non-PCP STAs. The CBAP Source subfield is set to 0 otherwise.

— The ECAPC Policy Enforced subfield is set to 1 to indicate that medium access policies specific to the centralized AP or PCP cluster are required as defined in 10.40.3.4. The ECAPC Policy Enforced subfield is set to 0 to indicate that medium access policies specific to the centralized AP or PCP cluster are not required.

The DMG Privacy subfield is set to 1 if dot11RSNAActivated is true. Otherwise, this subfield is set to 0.

9.4.1.47 CMMG Parameters field

The definition of the CMMG parameters field is the same as the definition of the DMG parameters field (see 9.4.1.46).

9.4.1.48 VHT MIMO Control field

The VHT MIMO Control field is included in every VHT Compressed Beamforming frame (see 9.6.22.2). The VHT MIMO Control field is defined in Figure 9-134.

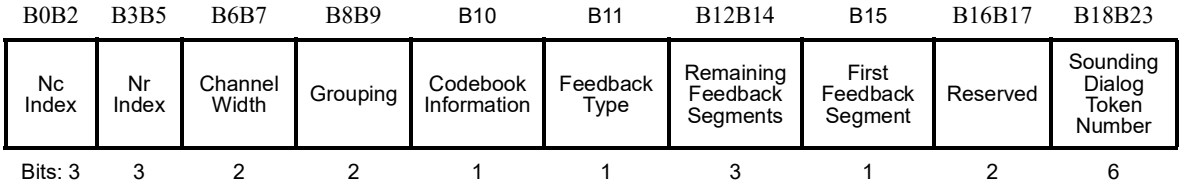

Figure 9-134—VHT MIMO Control field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The subfields of the VHT MIMO Control field are defined in Table 9-70.

Table 9-70—Subfields of the VHT MIMO Control field

Subfield	Description
Nc Index	Indicates the number of columns, *Nc*, in the compressed beamforming feedback matrix minus 1. In an S1G PPDU, the Nc Index field does not indicate an *Nc* that is greater than 4.
Nr Index	Indicates the number of rows, *Nr*, in the compressed beamforming feedback matrix minus 1. The value 0 is reserved. In an S1G PPDU, the Nr Index field does not indicate an *Nr* that is greater than 4.
Channel Width	Indicates the width of the channel in which the measurement to create the compressed beamforming feedback matrix was made: In a non-S1G PPDU: Set to 0 for 20 MHz Set to 1 for 40 MHz Set to 2 for 80 MHz Set to 3 for 160 MHz or 80+80 MHz In an S1G PPDU: Set to 0 for 2MHz Set to 1 for 4 MHz Set to 2 for 8 MHz Set to 3 for 16 MHz
Grouping	Indicates the subcarrier grouping, *Ng*, used for the compressed beamforming feedback matrix: Set to 0 for $Ng = 1$ (No grouping) Set to 1 for $Ng = 2$ Set to 2 for $Ng = 4$ The value 3 is reserved
Codebook Information	Indicates the size of codebook entries: If Feedback Type is SU in a VHT PPDU: Set to 0 for 2 bits for ψ, 4 bits for ϕ Set to 1 for 4 bits for ψ, 6 bits for ϕ If Feedback Type is SU in an S1G PPDU with Nc Index field equal to 0: Set to 0 for 2 bits for ϕ, and ψ is not fed back Set to 1 for 2 bits for ψ, and 4 bits for ϕ If Feedback Type is MU in a VHT PPDU: Set to 0 for 5 bits for ψ, 7 bits for ϕ Set to 1 for 7 bits for ψ, 9 bits for ϕ If Feedback Type is MU in an S1G PPDU: Set to 0 for 5 bits for ψ, 7 bits for ϕ Set to 1 for 7 bits for ψ, 9 bits for ϕ
Feedback Type	Indicates the feedback type: Set to 0 for SU Set to 1 for MU
Remaining Feedback Segments	Indicates the number of remaining feedback segments for the associated VHT Compressed Beamforming frame: Set to 0 for the last feedback segment of a segmented report or the only feedback segment of an unsegmented report. Set to a value between 1 and 6 for a feedback segment that is neither the first nor the last of a segmented report. Set to a value between 1 and 7 for a feedback segment that is not the last feedback segment of a segmented report. In a retransmitted feedback segment, the field is set to the same value associated with the feedback segment in the original transmission.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-70—Subfields of the VHT MIMO Control field *(continued)*

Subfield	Description
First Feedback Segment	Set to 1 for the first feedback segment of a segmented report or the only feedback segment of an unsegmented report; set to 0 if it is not the first feedback segment or if the VHT Compressed Beamforming Report field and MU Exclusive Beamforming Report field are not present in the frame. In a retransmitted feedback segment, the field is set to the same value associated with the feedback segment in the original transmission.
Sounding Dialog Token Number	The sounding dialog token from the VHT NDP Announcement frame soliciting feedback

In a VHT Compressed Beamforming frame not carrying all or part of a VHT Compressed Beamforming report (see 10.36.5 for a description of such a case), the Nc Index, Nr Index, Channel Width, Grouping, Codebook Information, Feedback Type and Sounding Dialog Token Number subfields are reserved, the First Feedback Segment subfield is set to 0 and the Remaining Feedback Segments subfield is set to 7.

9.4.1.49 VHT Compressed Beamforming Report field

The VHT Compressed Beamforming Report field is used by the VHT compressed beamforming feedback (see 9.6.22.2) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices V for use by a transmit beamformer to determine steering matrices Q, as described in 10.34.3 and 19.3.12.3.

The size of the VHT Compressed Beamforming Report field depends on the values in the VHT MIMO Control field. The VHT Compressed Beamforming Report field contains VHT Compressed Beamforming Report information or successive (possibly zero-length) portions thereof in the case of segmented VHT compressed beamforming feedback (see 10.36.5). VHT Compressed Beamforming Report information is always included in the VHT compressed beamforming feedback.

The VHT Compressed Beamforming Report information contains the channel matrix elements for each subcarrier from lowest frequency to highest frequency. For each subcarrier, the channel matrix element is represented by a sequence of angles. The order of the angles within each subcarrier when used in a non-S1G band is shown in Table 9-71. The order of the angles within each subcarrier when used in an S1G band for SU and MU type feedback are shown in Table 9-72 and Table 9-73, respectively. Explanation on how these angles are generated from the beamforming feedback matrix V is given in 19.3.12.3.6.

In Table 9-71,

Nc is the number of columns in a compressed beamforming feedback matrix determined by the Nc Index field of the VHT MIMO Control field,

Nr is the number of rows in a compressed beamforming feedback matrix determined by the Nr Index field of the VHT MIMO Control field.

The beamforming feedback matrix V is formed by the beamformee as follows. The beamformer transmits an NDP with $N_{STS,NDP}$ space-time streams, where $N_{STS,NDP}$ takes a value between 2 and 8. Based on this NDP, the beamformee estimates the $N_{RX,\,BFEE} \times N_{STS,\,NDP}$ channel, and based on that channel it determines a $Nr \times Nc$ orthonormal matrix V, where Nr and Nc satisfy Equation (9-1).

$$Nr = N_{STS,\,NDP},\ Nc \leq min(N_{STS,\,NDP}, N_{RX,\,BFEE}) \tag{9-1}$$

Further restrictions on *Nc* are described in 10.36.5.

The angles are quantized as defined in Table 9-74.

Table 9-74—Quantization of angles

Quantized ψ	Quantized ϕ
$\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians where $k = 0, 1, \ldots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ (defined by the Codebook Information field of the VHT MIMO Control field (see 9.4.1.48)	$\phi = \frac{k\pi}{2^{b_\phi-1}} + \frac{\pi}{2^{b_\phi}}$ radians where $k = 0, 1, \ldots, 2^{b_\phi} - 1$ b_ϕ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the VHT MIMO Control field (see 9.4.1.48)

The VHT Compressed Beamforming Report information has the structure defined in Table 9-75, where *Na* is the number of angles used for the compressed beamforming feedback matrix (see Table 9-71, Table 9-72, and Table 9-73).

Table 9-75—VHT Compressed Beamforming Report information

Field	Size (bits)	Meaning
Average SNR of Space-Time Stream 1	8	Signal-to-noise ratio at the beamformee for space-time stream 1 averaged over all data subcarriers. See Table 9-77.
...	…	…
Average SNR of Space-Time Stream *Nc*	8	Signal-to-noise ratio at the beamformee for space-time stream *Nc* averaged over all data subcarriers. See Table 9-77.
Compressed Beamforming Feedback Matrix *V* for subcarrier $k = scidx(0)$	$Na \times (b_\psi + b_\phi)/2$	Compressed beamforming feedback matrix as defined in Table 9-71, Table 9-72, or Table 9-73
Compressed Beamforming Feedback Matrix *V* for subcarrier $k = scidx(1)$	$Na \times (b_\psi + b_\phi)/2$	Compressed beamforming feedback matrix as defined in Table 9-71, Table 9-72, or Table 9-73

Table 9-75—VHT Compressed Beamforming Report information *(continued)*

Field	Size (bits)	Meaning
Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(2)$	$Na \times (b_\psi + b_\phi)/2$	Compressed beamforming feedback matrix as defined in Table 9-71, Table 9-72, or Table 9-73
...	…	…
Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(Ns - 1)$	$Na \times (b_\psi + b_\phi)/2$	Compressed beamforming feedback matrix as defined in Table 9-71, Table 9-72, or Table 9-73
NOTE—*scidx()* is defined in Table 9-76.		

Ns is the number of subcarriers for which the compressed beamforming feedback matrix is sent back to the beamformer. A beamformee might choose to reduce *Ns* by using a method referred to as grouping, in which only a single Compressed Beamforming Feedback Matrix is reported for each group of *Ng* adjacent subcarriers. *Ns* is a function of the Channel Width and Grouping subfields in the VHT MIMO Control field (see 9.4.1.48). Table 9-76 lists *Ns*, the exact subcarrier indices and their order for which the compressed beamforming feedback matrix is sent back. No padding is present between angles in the VHT Compressed Beamforming Report information, even if they correspond to different subcarriers. If the size of the VHT Compressed Beamforming Report information is not an integer multiple of 8 bits, up to seven zeros are appended to the end of the field to make its size an integer multiple of 8 bits.

Table 9-76—Subcarrier indices for which a compressed beamforming feedback matrix is sent back

Channel Width	*Ng*	*Ns*	Subcarrier indices for which Compressed Beamforming Feedback Matrix subfield is sent: *scidx*(0), *scidx*(1), …, *scidx*(*Ns*-1)
20 MHz in a non-S1G band or 2 MHz in an S1G band	1	52	–28, –27, –26, –25, –24, –23, –22, –20, –19, –18, –17, –16, –15, –14, –13, –12, –11, –10, –9, –8, –6, –5, –4, –3, –2, –1, 1, 2, 3, 4, 5, 6, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27, 28 NOTE—Pilot subcarriers (± 21, ± 7) and DC subcarrier (0) are skipped
	2	30	–28, –26, –24, –22, –20, –18, –16, –14, –12, –10, –8, –6, –4, –2, –1, 1, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28
	4	16	–28, –24, –20, –16, –12, –8, –4, –1, 1, 4, 8, 12, 16, 20, 24, 28

The Average SNR of Space-Time Stream *i* subfield in the Table 9-75 is an 8-bit 2s complement integer whose definition is shown in Table 9-77.

Table 9-77—Average SNR of Space-Time Stream *i* subfield

Average SNR of Space-Time Stream *i* subfield	$AvgSNR_i$
–128	≤ –10 dB
–127	–9.75 dB
–126	–9.5 dB
…	…
+126	53.5 dB
+127	≥ 53.75 dB

The $AvgSNR_i$ in Table 9-77 is found by computing the SNR per subcarrier in decibels for the subcarriers identified in Table 9-76, and then computing the arithmetic mean of those values. Each SNR value per subcarrier in stream *i* (before being averaged) corresponds to the SNR associated with the column *i* of the beamforming feedback matrix *V* determined at the beamformee. Each SNR corresponds to the predicted SNR at the beamformee when the beamformer applies all columns of the matrix *V*.

A STA with a 40 MHz, 80 MHz, or 160 MHz operating channel width and sending feedback for a 20 MHz channel width includes only subcarriers corresponding to the primary 20 MHz channel in the Compressed Beamforming Feedback Matrix subfield.

A STA with an 80 MHz or 160 MHz operating channel width and sending feedback for a 40 MHz channel width includes only subcarriers corresponding to the primary 40 MHz channel in the Compressed Beamforming Feedback Matrix subfield.

A STA with a 160 MHz or 80+80 MHz operating channel width and sending feedback for an 80 MHz channel width includes only subcarriers corresponding to the primary 80 MHz channel in the Compressed Beamforming Feedback Matrix subfield.

9.4.1.50 TVHT Compressed Beamforming Report field

The format of the TVHT Compressed Beamforming Report field is the same as the VHT Compressed Beamforming Report field in 9.4.1.49 except for the following modifications.

The subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in Table 9-76 for 40 MHz are used for each basic channel unit (BCU) in TVHT_MODE_1 and TVHT_MODE_2N. See subcarrier location description in Table 22-9.

For TVHT_MODE_2C with 6 MHz and 8 MHz channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in the Lower BCU are based on subtracting 72 from the values shown in Table 9-76 and for the Upper BCU by adding 72.

For TVHT_MODE_2C with 7 MHz channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in the Lower BCU are based on subtracting 84 from the values shown in Table 9-76 and for the Upper BCU by adding 84.

For TVHT_MODE_4C with 6 MHz and 8 MHz channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 216, subtracting 72, adding 72, and adding 216 from the values shown in Table 9-76, respectively.

For TVHT_MODE_4C with 7 MHz channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 252, subtracting 84, adding 84, and adding 252 from the values shown in Table 9-76, respectively.

For TVHT_MODE_4N channelization, the subcarriers for which Compressed Beamforming Feedback Matrix subfield is sent in each of the two noncontiguous frequency segments are as described for TVHT_MODE_2C.

A STA with a TVHT_2W, TVHT_4W, TVHT_W+W, or TVHT_2W+2W operating channel width and sending feedback for a TVHT_W channel width includes a representation of the compressed beamforming feedback matrices of the subcarriers corresponding to the primary TVHT_W channel in the Compressed Beamforming Feedback Matrix subfield.

A STA with a TVHT_4W or TVHT_2W+2W operating channel width and sending feedback for a TVHT_2W channel width includes a representation of the compressed beamforming feedback matrices of the subcarriers corresponding to the primary TVHT_2W channel in the Compressed Beamforming Feedback Matrix subfield.

9.4.1.51 MU Exclusive Beamforming Report field

The MU Exclusive Beamforming Report field is used by the VHT compressed beamforming feedback (see 9.6.22.2) to carry explicit feedback information in the form of delta SNRs. The information in the VHT Compressed Beamforming Report field and the MU Exclusive Beamforming Report field can be used by the transmit MU beamformer to determine steering matrices Q, as described in 10.34.3, 19.3.12.3, and 21.3.11.

The size of the MU Exclusive Beamforming Report field depends on the values in the VHT MIMO Control field. The MU Exclusive Beamforming Report field contains MU Exclusive Beamforming Report information or successive (possibly zero-length) portions thereof in the case of segmented VHT compressed beamforming feedback (see 10.36.5). The MU Exclusive Beamforming Report information is included in the VHT compressed beamforming feedback if the Feedback Type subfield in the VHT MIMO Control field indicates MU (see 9.4.1.48).

The MU Exclusive Beamforming Report information consists of Delta SNR subfields for each space-time stream (1 to Nc) of a subset of the subcarriers typically spaced $2Ng$ apart, where Ng is signaled in the Grouping subfield of the VHT MIMO Control field, starting from the lowest frequency subcarrier and continuing to the highest frequency subcarrier. No padding is present between $\Delta SNR_{k,i}$ in the MU Exclusive Beamforming Report field, even if they correspond to different subcarriers. The subset of subcarriers included is determined by the values of the Channel Width and Grouping subfields of the VHT MIMO Control field as listed in Table 9-79. For each subcarrier included, the deviation in dB of the SNR of that subcarrier for each column of V relative to the average SNR of the corresponding space-time stream is computed using Equation (9-2).

$$\Delta SNR_{k,i} = min(max(\text{Round}(10\log_{10}\left(\frac{\left\|H_k V_{k,i}\right\|^2}{N}\right) - \overline{SNR_i}), -8), 7) \quad (9\text{-}2)$$

where

k is the subcarrier index in the range *scidx*(0), …, *scidx*(*Ns*'–1)
i is the space-time stream index in the range 1, …, *Nc*
H_k is the estimated MIMO channel for subcarrier k
$V_{k,i}$ is column i of the beamforming matrix V for subcarrier k
N is the average noise plus interference power, measured at the beamformee, that was used to calculate $\overline{SNR_i}$
$\overline{SNR_i}$ is the average SNR of space-time stream i reported in the VHT Compressed Beamforming Report information (Average SNR of Space-Time Stream i field)

Each Delta SNR subfield contains the $\Delta SNR_{k,i}$ computed using Equation (9-2) and quantized to 4 bits in the range –8 dB to 7 dB with 1 dB granularity. The structure of the MU Exclusive Beamforming Report field is shown in Table 9-78.

Table 9-78—MU Exclusive Beamforming Report information

Field	Size (bits)	Meaning
Delta SNR for space-time stream 1 for subcarrier k = *scidx(0)*	4	$\Delta SNR_{scidx(0),1}$ as defined in Equation (9-2)
…	…	…
Delta SNR for space-time stream Nc for subcarrier k = *scidx(0)*	4	$\Delta SNR_{scidx(0),Nc}$ as defined in Equation (9-2)
Delta SNR for space-time stream 1 for subcarrier k = *scidx(1)*	4	$\Delta SNR_{scidx(1),1}$ as defined in Equation (9-2)
…	…	…
Delta SNR for space-time stream Nc for subcarrier k = *scidx(1)*	4	$\Delta SNR_{scidx(1),Nc}$ as defined in Equation (9-2)
…	…	…
Delta SNR for space-time stream 1 for subcarrier k = *scidx(Ns'–1)*	4	$\Delta SNR_{scidx(Ns'-1),1}$ as defined in Equation (9-2)
…	…	…
Delta SNR for space-time stream Nc for subcarrier k = *scidx(Ns'–1)*	4	$\Delta SNR_{scidx(Ns'-1),Nc}$ as defined in Equation (9-2)
NOTE—*scidx*() is defined in Table 9-79.

Table 9-79—Number of subcarriers and subcarrier mapping *(continued)*

Channel Width	*Ng*	*Ns*'	Subcarrier indices for which the Delta SNR subfield is sent: *scidx*(0), *scidx*(1), … *scidx*(*Ns*'–1)
80+80 MHz	4	64	–122(L), –114(L), –106(L), –98(L), –90(L), –82(L), –74(L), –66(L), –58(L), –50(L), -42(L), –34(L), –26(L), –18(L), –10(L), –2(L), 2(L), 10(L), 18(L), 26(L), 34(L), 42(L), 50(L), 58(L), 66(L), 74(L), 82(L), 90(L), 98(L), 106(L), 114(L), 122(L), –122(H), –114(H), –106(H), –98(H), –90(H), –82(H), –74(H), –66(H), –58(H), –50(H), –42(H), –34(H), –26(H), –18(H), –10(H), –2(H), 2(H), 10(H), 18(H), 26(H), 34(H), 42(H), 50(H), 58(H), 66(H), 74(H), 82(H), 90(H), 98(H), 106(H), 114(H), 122(H)

NOTE 1—*scidx*() is defined in Table 9-78.

NOTE 2— *x*(L) denotes subcarrier index *x* in the frequency segment lower in frequency, and *x*(H) denotes subcarrier index *x* in the frequency segment higher in frequency.

9.4.1.52 TVHT MU Exclusive Beamforming Report field

See 9.4.1.51 with the following modifications:

— For each BCU in TVHT_MODE_1 and TVHT_MODE_2N, the subcarriers used in the Delta SNR subfield are defined in Table 9-79 for 40 MHz. See the subcarrier location description in Table 22-9.

— For TVHT_MODE_2C with 6 MHz and 8 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the Lower BCU are based on subtracting 72 from the values shown in Table 9-79 and for the Upper BCU by adding 72.

— For TVHT_MODE_2C with 7 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the Lower BCU are based on subtracting 84 from the values shown in Table 9-79 and for the Upper BCU by adding 84.

— For TVHT_MODE_4C with 6 MHz and 8 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 216, subtracting 72, adding 72, and adding 216 from the values shown in Table 9-79, respectively.

— For TVHT_MODE_4C with 7 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 252, subtracting 84, adding 84, and adding 252 from the values shown in Table 9-79, respectively.

— For TVHT_MODE_4N channelization, the subcarriers for which Delta SNR subfield is sent in each of the two noncontiguous frequency segments are as described for TVHT_MODE_2C.

9.4.1.53 Operating Mode field

The Operating Mode field is present in the Operating Mode Notification frame (see 9.6.22.4) and Operating Mode Notification element (see 9.4.2.165).

The Operating Mode field for a non-S1G STA is shown in Figure 9-135.

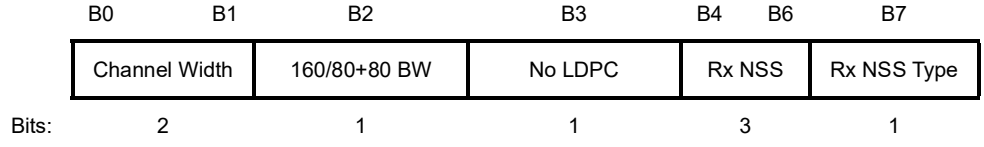

Figure 9-135—Operating Mode field format when it is carried in a non-S1G PPDU

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Operating Mode field in an S1G PPDU is shown in Figure 9-136.

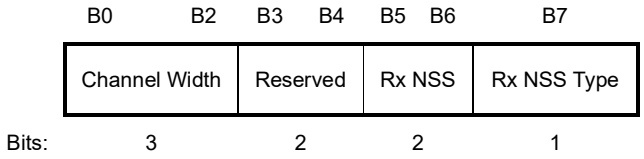

Figure 9-136—Operating Mode field format when it is carried in an S1G PPDU

The STA transmitting this field indicates its current operating channel width and the number of spatial streams it can receive using the settings defined in Table 9-80.

Table 9-80—Subfield values of the Operating Mode field

Subfield	Description
Channel Width	If the Rx NSS Type subfield is 0, indicates the supported channel width: In a VHT STA, see Table 9-81 In a TVHT STA: Set to 0 for TVHT_W Set to 1 for TVHT_2W and TVHT_W+W Set to 2 for TVHT_4W and TVHT_2W+2W The value 3 is reserved. In an S1G STA: Set to 0 for 1 MHz Set to 1 for 2 MHz Set to 2 for 4 MHz Set to 3 for 8 MHz Set to 4 for 16 MHz Reserved for values 5-7 Reserved if the Rx NSS Type subfield is 1.
160/80+80 BW	This subfield, combined with the Channel Width subfield, the Supported Channel Width Set subfield and the Supported VHT-MCS and NSS Set subfield indicates whether 80+80 MHz and 160 MHz operation is supported. In a VHT STA, see Table 9-81. In a TVHT STA, this field is reserved. In a STA with dot11VHTExtendedNSSBWCapable either equal to false or not present, this field is set to 0.
No LDPC	Set to 1 to indicate that the STA transmitting this field prefers not to receive LDPC-encoded PPDUs; set to 0 otherwise.

Table 9-80—Subfield values of the Operating Mode field *(continued)*

Subfield	Description
Rx NSS	If the Rx NSS Type subfield is 0, this field, combined with other information described in 9.4.2.157.3, indicates the maximum number of spatial streams that the STA can receive. If the Rx NSS Type subfield is 1, this field indicates the maximum number of spatial streams that the STA can receive as a beamformee in an SU PPDU using a beamforming steering matrix derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the corresponding VHT Compressed Beamforming frame sent by the STA. In a non-S1G STA: Set to 0 for $N_{SS} = 1$ Set to 1 for $N_{SS} = 2$ … Set to 7 for $N_{SS} = 8$ In an S1G STA: Set to 0 for $N_{SS} = 1$ Set to 1 for $N_{SS} = 2$ Set to 2 for $N_{SS} = 3$ Set to 3 for $N_{SS} = 4$ NOTE—In a STA with dot11VHTExtendedNSSBWCapable equal to true, NSS might be further modified per Table 9-81.
Rx NSS Type	Set to 0 to indicate that the Rx NSS subfield carries the maximum number of spatial streams that the STA can receive in any PPDU. Set to 1 to indicate that the Rx NSS subfield carries the maximum number of spatial streams that the STA can receive as a beamformee in an SU PPDU using a beamforming steering matrix derived from a VHT Compressed Beamforming report with the Feedback Type subfield indicating MU in the corresponding VHT Compressed Beamforming frame sent by the STA. NOTE—An AP always sets this field to 0.

Table 9-81—Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field

Transmitted Operating Mode field		VHT Capabilities of STA transmitting the Operating Mode field		NSS support of STA transmitting the Operating Mode field as a function of the VHT PPDU (×Max VHT NSS) (see requirements R1 and R2)					Location of 160 MHz center frequency if BSS bandwidth is 160 MHz	Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz
Channel width	160/ 80+80 BW	Supported Channel Width Set	Extended NSS BW Support	20 MHz	40 MHz	80 MHz	160 MHz	80 +80 MHz		
0	0	0-2	0-3	1						
1	0	0-2	0-3	1	1

Table 9-81—Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field *(continued)*

Transmitted Operating Mode field		VHT Capabilities of STA transmitting the Operating Mode field		NSS support of STA transmitting the Operating Mode field as a function of the VHT PPDU (×Max VHT NSS) (see requirements R1 and R2)					Location of 160 MHz center frequency if BSS bandwidth is 160 MHz	Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz
Channel width	160/ 80+80 BW	Supported Channel Width Set	Extended NSS BW Support	20 MHz	40 MHz	80 MHz	160 MHz	80 +80 MHz		
2	0	0-2	0-3	1	1	1				
2	1	0	1	1	1	1	1/2		CCFS2	
2	1	0	2	1	1	1	1/2	1/2	CCFS2	CCFS2
2	1	0	3	1	1	1	3/4	3/4	CCFS2	CCFS2
2	1	1	0	1	1	1	1		CCFS1	
2	1	1	1	1	1	1	1	1/2	CCFS1	CCFS2
2	1	1	2	1	1	1	1	3/4	CCFS1	CCFS2
2	1	1	3	2	2	2	2	1	CCFS1	CCFS1
2	1	2	0	1	1	1	1	1	CCFS1	CCFS1
2	1	2	3	2	2	2	1	1	CCFS1	CCFS1

R1: NSS support is rounded down to the nearest integer.
R2: The maximum NSS supported is 8.

NOTE 1—Max VHT NSS is defined per MCS in 9.4.2.157.3.

NOTE 2—1/2× or 3/4× Max VHT NSS support might end up being 0, indicating no support.

NOTE 3—Any other combination than the ones listed in this table is reserved.

NOTE 4—CCFS1 refers to the Channel Center Frequency Segment 1 field of the most recently transmitted VHT Operation element.

NOTE 5—CCFS2 refers to the Channel Center Frequency Segment 2 field of the most recently transmitted HT Operation element.

NOTE 6—CCFS1 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is at least Max VHT NSS. CCFS2 is zero in this case.

NOTE 7—CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is less than Max VHT NSS. CCFS1 is zero in this case.

NOTE 8—At most one of CCFS1 and CCFS2 is nonzero.

NOTE 9—A supported multiple of Max VHT NSS applies to both transmit and receive.

NOTE 10—Some combinations of Supported Channel Width Set and Extended NSS BW support might not occur in practice.

NOTE 11—2× Max VHT NSS support might be used for 20 MHz or 40 MHz HT PPDU.

9.4.1.54 Membership Status Array field

The Membership Status Array field is used in the Group ID Management frame (see 9.6.22.3). The length of the field is 8 octets. A Membership Status Array field (indexed by the group ID) consists of a 1-bit Membership Status subfield for each of the 64 group IDs, as shown in Figure 9-137.

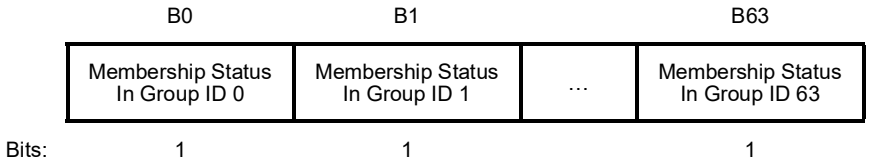

Figure 9-137—Membership Status Array field format

Within the Membership Status Array field, the 1-bit Membership Status subfield for each group ID is set as follows:

— Set to 0 if the STA is not a member of the group
— Set to 1 if STA is a member of the group

The Membership Status subfields for group ID 0 (transmissions to AP) and group ID 63 (downlink SU transmissions) are reserved.

9.4.1.55 User Position Array field

The User Position Array field is used in the Group ID Management frame (see 9.6.22.3). The length of the field is 16 octets. A User Position Array field (indexed by the Group ID) consists of a 2-bit User Position subfield for each of the 64 group IDs, as shown in Figure 9-138.

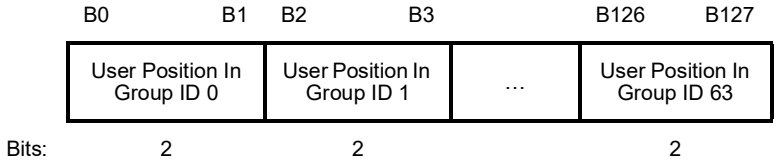

Figure 9-138—User Position Array field format

If the Membership Status subfield for a particular group ID is 1, then the corresponding User Position subfield in the User Position Array field contains the group ID's User Position.

If the Membership Status subfield for a group ID is 0 (meaning the STA is not a member of that group), then the corresponding User Position subfield in the User Position Array field is reserved.

The User Position subfields for group ID 0 (transmissions to AP) and group ID 63 (downlink SU transmissions) are reserved.

9.4.1.56 Device Location Information Body field

A Device Location Information Body field includes the location configuration information (LCI), which contains latitude, longitude, and altitude information.

The format of the Device Location Information Body field is shown in Figure 9-139.

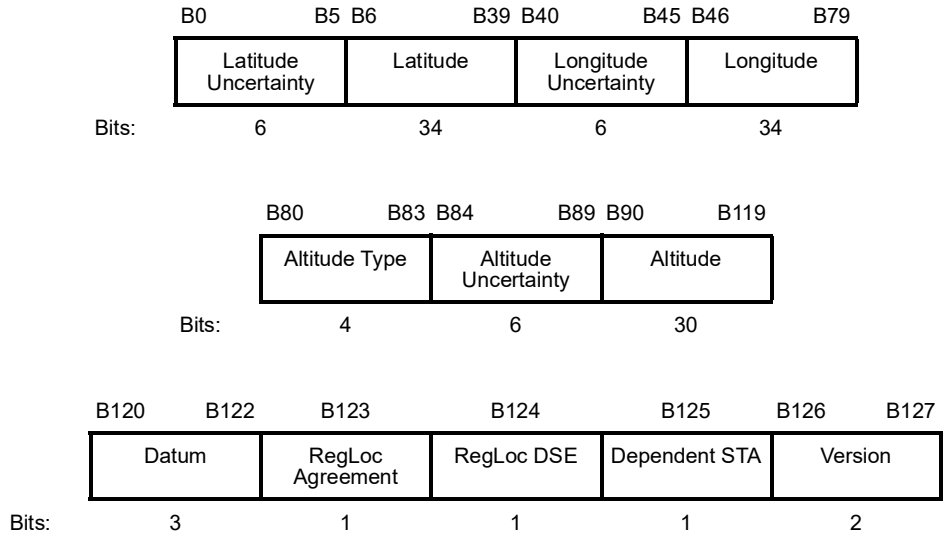

Figure 9-139—Device Location Information Body field format

The fields within the Device Location Information Body field are as defined in section 2.2 of IETF RFC 6225 except as defined in 9.4.2.51, and RegLoc Agreement and RegLoc DSE are set to 0.

9.4.1.57 WSM Type field and WSM Information field

The WSM Type field is set to a number that identifies the type of WSM information and the frequency band where the following WSM Information field is applicable. The values of WSM Types are shown in Table 9-82. The WSM Type field set to 1 indicates the WSM Information field of the WSM element contains available frequency information for operation in the TVWS. Other values are reserved.

Table 9-82—WSM Type definition

Name	WSM Type
Reserved	0
TV band WSM	1
Reserved	2–255

The WSM Information field indicates the available channel information as defined in 9.4.4.2.6.

The WSM Information field corresponding to a TV band WSM is shown in Table 9-329.

9.4.1.58 Sync Control field

The Sync Control field is present in the Sync Control frame (see 9.6.24.4). The Sync Control field is shown in Figure 9-140.

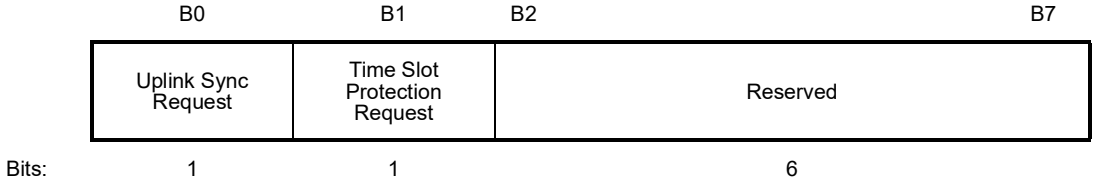

Figure 9-140—Sync Control field format

The non-AP STA transmitting this field indicates its mode of operation for the sync frame transmission. The subfields of the Sync Control field are defined in Table 9-83.

Table 9-83—Subfields of the Sync Control field

Subfield	Definition	Encoding
Uplink Sync Request	This subfield indicates request for sync frame transmission for uplink. (see 10.49)	Set to 0 if not requested. Set to 1 if requested.
Time Slot Protection Request	This subfield indicates request for a time slot protection during a time slot in a RAW (9.4.2.191) or for a duration defined in the Nominal Minimum TWT Wake Duration field for a TWT time (9.4.2.199), or for the duration of a TXOP after the expiration of wakeup timer.	Set to 0 if not requested. Set to 1 if requested.

9.4.1.59 Suspend Duration field

The format of the Suspend Duration field is shown in Figure 9-141.

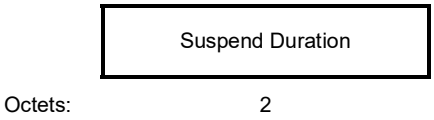

Figure 9-141—Suspend Duration field format

The Suspend Duration field contains an unsigned integer. See 10.61 for the use of this field.

9.4.1.60 TWT Information field

The TWT Information field is present in the TWT Information frame (see 9.6.24.12). The TWT Information field format is shown in Figure 9-142.

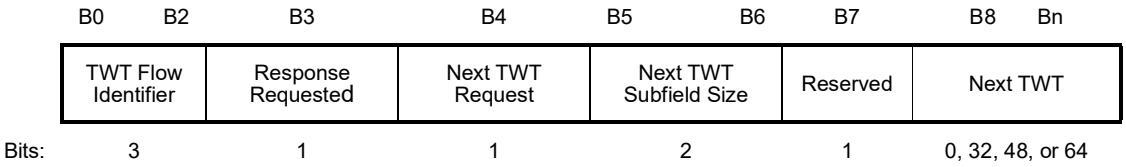

Figure 9-142—TWT Information field format

The TWT Information field size is variable and depends on the Next TWT Size field.

The TWT Flow Identifier subfield contains the TWT flow identifier for which TWT information is requested or being provided.

The Response Requested subfield indicates whether the transmitter of the frame containing the TWT Information field is requesting a TWT Information frame to be transmitted in response to this frame. The Response Requested subfield is set to 0 to request the recipient to not transmit a TWT Information frame in response to the frame. The Response Requested subfield is set to 1 to request the recipient to transmit a TWT Information frame in response to the frame.

The Next TWT Request subfield is set to 1 to indicate that the TWT Information frame is a request for the delivery of a TWT Information frame containing a nonzero length Next TWT field. Otherwise, it is set to 0.

The Next TWT Subfield Size subfield describes the size of the Next TWT subfield according to Table 9-84.

Table 9-84—Next TWT Subfield Size subfield encoding

Next TWT Subfield Size subfield value	Size of the Next TWT subfield in bits
0	0
1	32
2	48
3	64

The Next TWT subfield is of a variable size as determined by the Next TWT Subfield Size subfield value according to Table 9-84. The value contained in the Next TWT subfield is the least significant portion of the TSF at the next TWT for the TWT specified by the TWT Flow Identifier subfield.

9.4.1.61 CMMG MIMO Control field

The CMMG MIMO Control field is used to manage the exchange of CMMG MIMO channel state or transmit beamforming feedback information. It is used in the CMMG Compressed Beamforming (see 9.6.29.2).

The CMMG MIMO Control field is defined in Figure 9-143.

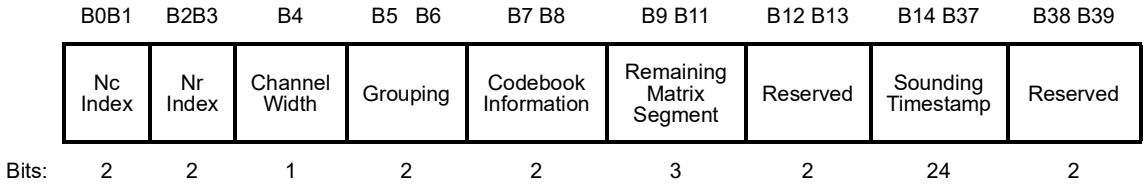

Figure 9-143—CMMG MIMO Control field format

The subfields of the CMMG MIMO Control field are defined in Table 9-85.

Table 9-85—Subfields of the CMMG MIMO Control field

Subfield	Description
Nc Index	Indicates the number of columns in the compressed beamforming feedback matrix minus 1.
Nr Index	Indicates the number of rows in the compressed beamforming feedback matrix minus 1.
Channel Width	Indicates the width of the channel in which a measurement was made: Set to 0 for 540 MHz Set to 1 for 1080 MHz
Grouping	Indicates the number of subcarriers grouped into one: Set to 0 for $N_g = 1$ (No grouping) Set to 1 for $N_g = 2$ Set to 2 for $N_g = 4$ Set to 3 for $N_g = 6$
Codebook Information	Indicates the size of codebook entries: Set to 0 for 2 bits for ψ, 4 bits for ϕ Set to 1 for 3 bits for ψ, 5 bits for ϕ The value 2 and 3 are reserved.
Remaining Matrix Segments	Contains the remaining segment number for the associated measurement report. Set to 0 for the last segment of a segmented report or the only segment of an unsegmented report.
Sounding Timestamp	Contains the lower 3 octets of the TSF timer sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the sounding PPDU that was used to generate feedback information contained in the frame.

9.4.1.62 CMMG Compressed Beamforming Report field

The CMMG Compressed Beamforming Report field is used by the CMMG Compressed Beamforming frame (see 9.6.29.2) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices V for use by a transmit CMMG beamformer to determine steering matrices Q, as described in 10.34.5 and 25.6.8.13.

The size of the CMMG Compressed Beamforming Report field depends on the values in the CMMG MIMO Control field.

The CMMG Compressed Beamforming Report field contains the channel matrix elements indexed, first, by matrix angles in the order shown in Table 9-86, second, by data subcarrier index from lowest frequency to highest frequency. The explanation of how these angles are generated from the beamforming feedback matrix *V* is given in 25.6.8.13.2.

Table 9-86—Order of angles in the CMMG Compressed Beamforming Report field

Size of *V* (*Nr* × *Nc*)	Number of angles (*Na*)	The order of angles in the compressed beamforming feedback matrix
2 × 1	2	$\varphi_{1,1}, \psi_{2,1}$
2 × 2	2	$\varphi_{1,1}, \psi_{2,1}$
3 × 1	4	$\varphi_{1,1}, \varphi_{2,1}, \psi_{2,1}, \psi_{3,1}$
3 × 2	6	$\varphi_{1,1}, \varphi_{2,1}, \psi_{2,1}, \psi_{3,1}, \varphi_{2,2}, \psi_{3,2}$
3 × 3	6	$\varphi_{1,1}, \varphi_{2,1}, \psi_{2,1}, \psi_{3,1}, \varphi_{2,2}, \psi_{3,2}$
4 × 1	6	$\varphi_{1,1}, \varphi_{2,1}, \varphi_{3,1}, \psi_{2,1}, \psi_{3,1}, \psi_{4,1}$
4 × 2	10	$\varphi_{1,1}, \varphi_{2,1}, \varphi_{3,1}, \psi_{2,1}, \psi_{3,1}, \psi_{4,1}, \varphi_{2,2}, \varphi_{3,2}, \psi_{3,2}, \psi_{4,2}$
4 × 3	12	$\varphi_{1,1}, \varphi_{2,1}, \varphi_{3,1}, \psi_{2,1}, \psi_{3,1}, \psi_{4,1}, \varphi_{2,2}, \varphi_{3,2}, \psi_{3,2}, \psi_{4,2}, \varphi_{3,3}, \psi_{4,3}$
4 × 4	12	$\varphi_{1,1}, \varphi_{2,1}, \varphi_{3,1}, \psi_{2,1}, \psi_{3,1}, \psi_{4,1}, \varphi_{2,2}, \varphi_{3,2}, \psi_{3,2}, \psi_{4,2}, \varphi_{3,3}, \psi_{4,3}$

The angles are quantized as defined in Table 9-87. All angles are transmitted LSB to MSB.

Table 9-87—Quantization of angles

Quantized ψ	Quantized φ
$\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians where $k = 0, 1, \ldots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ defined by the Codebook Information field of the CMMG MIMO Control field	$\varphi = \frac{k\pi}{2^{b_\varphi+1}} + \frac{\pi}{2^{b_\varphi+2}}$ radians where $k = 0, 1, \ldots, 2^{b_\varphi} - 1$ b_φ is the number of bits used to quantize φ defined by the Codebook Information field of the CMMG MIMO Control field

The Compressed Beamforming Report field has the structure defined in Table 9-88, where *Na* is the number of angles used for the CMMG compressed beamforming feedback matrix.

Table 9-88—Compressed Beamforming Report field

Field	Size (bits)	Meaning
Average SNR of Space-Time Stream 1	8	Signal-to-noise ratio at the beamformee for space-time stream 1 averaged over all data subcarriers
...	...	...
Average SNR of Space-Time Stream *Nc*	8	Signal-to-noise ratio at the beamformee for space-time stream *Nc* averaged over all data subcarriers.
Compressed Beamforming Feedback Matrix *V* for Subcarrier $k = scidx(0)$	$Na \times (b_{\varphi} + b_{\psi})/2$	Compressed beamforming feedback matrix
Compressed Beamforming Feedback Matrix *V* for Subcarrier $k = scidx(1)$	$Na \times (b_{\varphi} + b_{\psi})/2$	Compressed beamforming feedback matrix
Compressed Beamforming Feedback Matrix *V* for Subcarrier $k = scidx(2)$	$Na \times (b_{\varphi} + b_{\psi})/2$	Compressed beamforming feedback matrix
...	...	...
Compressed Beamforming Feedback Matrix *V* for Subcarrier $k = scidx(Ns - 1)$	$Na \times (b_{\varphi} + b_{\psi})/2$	Compressed beamforming feedback matrix
NOTE— *scidx()* is defined in Table 9-89.		

Ns is the number of subcarriers for which the CMMG compressed beamforming feedback matrix is sent back to the CMMG beamformer. *Ns* is a function of the Channel Width and Grouping subfields in the CMMG MIMO Control field. Table 9-89 lists *Ns*, the exact subcarrier indices and their order for which the compressed beamforming feedback matrix is sent back. No padding is present between angles in the CMMG compressed beamforming report information, even if they correspond to different subcarriers. If the length of the CMMG Compressed Beamforming Report field is not an integral multiple of 8 bits, up to 7 0s are appended to the end of the field to make its size an integral multiple of 8 bits.

	6	62	–177, –176, –170, –164, –158, –152, –146, –140, –134, –128, –122, –116, –110, –104, –98, –92, –86, –80,–74,–68, –62, –56, –50, –44, –38, –32, –26, –20, –14, –8, –2, 2, 8, 14, 20, 26, 32, 38, 44, 50, 56, 62, 68, 74, 80, 86, 92, 98, 104, 110, 116, 122, 128, 134, 140, 146, 152, 158, 164, 170, 176, 177

The SNR values are encoded as an 8-bit 2s complement value of 4×(SNR_average-22), where SNR_average is the sum of the values of SNR per subcarrier (in decibels) divided by the number of subcarriers represented.

The Average SNR of Space-Time Stream *i* subfield is an 8-bit 2s complement integer whose definition is shown in Table 9-90.

Table 9-90—Average SNR of Space-Time Stream *i* subfield

Average SNR of Space-Time Stream *i* subfield	$AvgSNR_i$ (dB)
–128	≤ –10
–127	–9.75
–126	–9.5
…	…
+126	53.5
+127	53.75

9.4.1.63 CMMG Operating Mode field

The CMMG Operating Mode field is present in the CMMG Operating Mode Notification frame (see 9.6.29.3) and CMMG Operating Mode Notification element (see 9.4.2.231).

The CMMG Operating Mode field is shown in Figure 9-144.

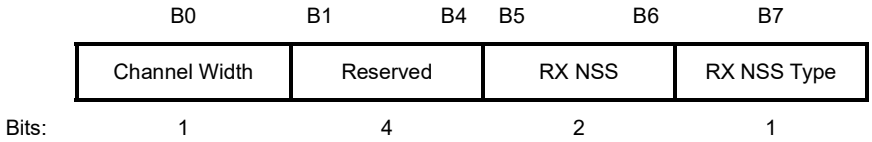

Figure 9-144—CMMG Operating Mode field format

The STA transmitting this field indicates its current operating channel width and the number of spatial streams it can receive using the settings defined in Table 9-91.

Table 9-91—Subfield values of the CMMG Operating Mode field

Subfield	Description
Channel Width	If the RX NSS Type subfield is 0, indicates the supported channel width: Set to 0 for 540 MHz Set to 1 for 1080 MHz Reserved if the Rx NSS Type subfield is 1
RX NSS	If the RX NSS Type subfield is 0, indicates the maximum number of spatial streams that the STA can receive. If the RX NSS Type subfield is 1, indicates the maximum number of spatial streams that the STA can receive as a beamformee in an SU PPDU using a beamforming steering matrix derived from a CMMG Compressed Beamforming report with the Feedback Type subfield indicating SU in the corresponding CMMG Compressed Beamforming frame sent by the STA. Set to 0 for NSS = 1 Set to 1 for NSS = 2 … Set to 3 for NSS = 4
RX NSS Type	Set to 0 to indicate that the RX NSS subfield carries the maximum number of spatial streams that the STA can receive. Set to 1 to indicate that the RX NSS subfield carries the maximum number of spatial streams that the STA can receive in an SU PPDU using a beamforming steering matrix derived from a CMMG Compressed Beamforming report with the Feedback Type subfield indicating SU in the corresponding CMMG Compressed Beamforming frame sent by the STA. NOTE—An AP always sets this field to 0.

9.4.2 Elements

9.4.2.1 General

Elements have a common general format shown in Figure 9-145.

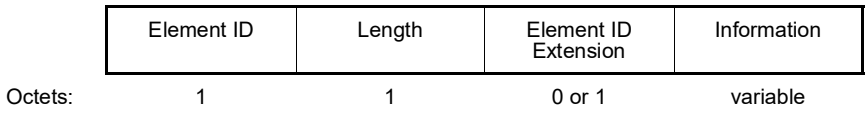

Figure 9-145—Element format

An element is identified by the Element ID field and, if present, the Element ID Extension field.

The set of valid elements is defined in Table 9-92.

If an Element ID value has an entry in Table 9-92 in the Element column of Element ID Extension present, then the Element ID Extension field is present. Otherwise, the Element ID Extension field is not present.

The Length field indicates the number of octets in the element excluding the Element ID and Length fields.

The Information field carries information specific to the element.

Table 9-92—Element IDs

Element	Element ID	Element ID Extension	Extensible	Fragmentable
SSID (see 9.4.2.2)	0	N/A	No	No
Supported Rates and BSS Membership Selectors (see 9.4.2.3)	1	N/A	No	No

Anti-Clogging Token Container (see 9.4.2.247)	255	93	No	No
Reserved	255	94–255		
NOTE—See 10.28.6 on the parsing of elements.				

A Yes in the Extensible column of an element listed in Table 9-92 indicates that the length of the element might be extended in future revisions or amendments of this standard. See 10.28.8. When the Extensible column of an element is set to Subelements, then the element might be extended in future revisions or amendments of this standard by defining additional subelements. See 10.28.9. The element is not extensible otherwise (i.e., if marked as No). An element that is not defined as extensible will not be extended in future revisions or amendments of this standard.

A Yes in the Fragmentable column listed in Table 9-92 indicates that the element information might exceed the threshold that causes the element to be fragmented (see 10.28.11).

9.4.2.2 SSID element

The SSID element indicates the identity of an ESS or IBSS. See Figure 9-146.

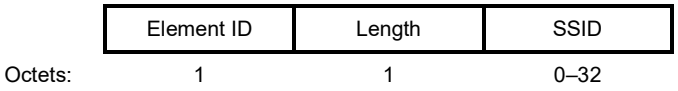

Figure 9-146—SSID element format

The Element ID and Length fields are defined in 9.4.2.1.

The length of the SSID field is between 0 and 32 octets. An SSID field of length 0 is used within Probe Request frames to indicate the wildcard SSID. The wildcard SSID is also used in Beacon and Probe Response frames transmitted by mesh STAs.

When the UTF-8 SSID subfield of the Extended Capabilities element is equal to 1 in the frame that includes the SSID element, or the Extended Capabilities of the source of the SSID information is known to include the UTF-8 SSID capability based on a previously received Extended Capabilities element, the SSID is a sequence of UTF-8 encoded code points. Otherwise, the character encoding of the octets in this SSID element is unspecified.

NOTE—If the SSID is a sequence of UTF-8 encoded code points, a terminating null might or might not be present.

9.4.2.3 Supported Rates and BSS Membership Selectors element

The Supported Rates and BSS Membership Selectors element specifies any combination of up to eight BSS membership selectors and rates in the OperationalRateSet parameter, as described in the MLME-JOIN.request and MLME-START.request primitives.

Each octet of the Supported Rates field describes a single supported rate or BSS membership selector (see Figure 9-147).

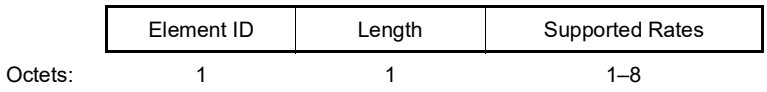

Figure 9-147—Supported Rates and BSS Membership Selectors element format

The Element ID and Length fields are defined in 9.4.2.1.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm frames, each rate contained in the BSSBasicRateSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the data rate, if necessary rounded up to the next 500 kb/s, in units of 500 kb/s (e.g., a 2.25 Mb/s rate contained in the BSSBasicRateSet parameter is encoded as X'85'). Each rate in the OperationalRateSet parameter not contained in the BSSBasicRateSet parameter is encoded with the MSB set to 0, and bits 6 to 0 are set in the same way as for a rate contained in the BSSBasicRateSet parameter (e.g., a 2 Mb/s rate not contained in the BSSBasicRateSet parameter is encoded as X'04').

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm frames, each BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the encoded value for the selector as found in Table 9-93 (e.g., an HT PHY BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as X'FF'). A BSS membership selector that has the MSB (bit 7) set to 1 in the Supported Rates and BSS Membership Selectors element is defined to be basic.

The MSB of each octet in the Supported Rates field in other management frame types is ignored by receiving STAs.

The valid values for BSS membership selectors and their associated features are shown in Table 9-93.

NOTE—Because the BSS membership selector and supported rates are carried in the same field, the BSS membership selector value cannot match the value corresponding to any valid supported rate. This allows any value to be determined as either a supported rate or a BSS membership selector.

Table 9-93—BSS membership selector value encoding

Value	Feature	Interpretation
127	HT PHY	Support for the mandatory features of Clause 19 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.
126	VHT PHY	Support for the mandatory features of Clause 21 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.

Table 9-93—BSS membership selector value encoding *(continued)*

Value	Feature	Interpretation
125	GLK	Indicates that support for the mandatory features of 11.50 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.
124	EPD	Indicates that support for EPD is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value.
123	SAE Hash to Element Only	Indicates that support for the direct hashing to element technique in SAE is required in order to join the BSS.

See 11.1.4.6.

9.4.2.4 DSSS Parameter Set element

The DSSS Parameter Set element contains information to allow channel number identification for STAs. See Figure 9-148.

	Element ID	Length	Current Channel
Octets:	1	1	1

Figure 9-148—DSSS Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

The Current Channel field is set to dot11CurrentChannel (see 15.4.4.3, 16.3.6.3, 17.3.8.4.2 and 19.3.15 for values).

9.4.2.5 TIM element

9.4.2.5.1 General

The TIM element is used to signal the timing and availability of data for associated STAs. The format of this element is shown in Figure 9-149.

	Element ID	Length	DTIM Count	DTIM Period	Bitmap Control	Partial Virtual Bitmap
Octets:	1	1	1	1	0 or 1	0 –251

Figure 9-149—TIM element format

The Element ID and Length fields are defined in 9.4.2.1.

The Length field for this element is constrained as described below.

The DTIM Count field indicates how many Beacon frames (including the current frame) appear before the next DTIM. A DTIM count of 0 indicates that the current TIM is a DTIM. The DTIM Count field is a single octet. When a TIM element is included in a TIM frame, the DTIM Count field is reserved.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The DTIM Period field indicates the number of beacon intervals or short beacon intervals between successive DTIMs. If all TIMs are DTIMs, the DTIM Period field has the value 1. The DTIM Period value 0 is reserved. The DTIM Period field is a single octet. If dot11ShortBeaconInterval is equal to true, the DTIM Period field is set to dot11ShortBeaconDTIMPeriod. If dot11ShortBeaconInterval is equal to false, the DTIM Period field is set to dot11DTIMPeriod (see 11.1.3.10.2).

The Bitmap Control field is a single octet. Bit 0 of the field contains the traffic indication virtual bitmap bit associated with AID 0. This bit is set to 1 in TIM elements with the DTIM Count field set to 0 when one or more group addressed MSDUs/MMPDUs are buffered at the AP or the mesh STA and they are not to be delivered using group AID as described in 10.55. When the TIM is carried in a non-S1G PPDU, the remaining 7 bits of the field form the Bitmap Offset as shown in Figure 9-150. When the TIM is carried in an S1G PPDU, bit 1 to bit 5 of the field form the Page Slice Number subfield, and bit 6 and bit 7 of the field form the Page Index subfield as shown in Figure 9-151.

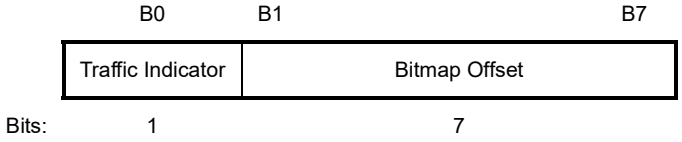

Figure 9-150—Bitmap Control field format when TIM is carried in a non-S1G PPDU

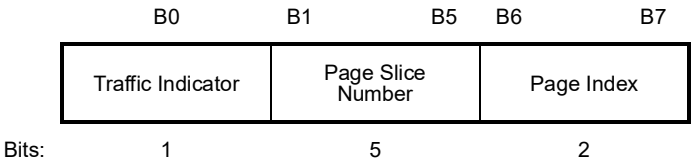

Figure 9-151—Bitmap Control field format when TIM is carried in an S1G PPDU

The Page Slice Number subfield indicates which page slice is encoded in the Partial Virtual Bitmap field (see 10.51) when the subfield is in the range of 0 to 30. If the Page Slice Number subfield is 31, then the entire page indicated by the Page Index subfield value is encoded in the Partial Virtual Bitmap field of the TIM elements with the same page index.

The Page Index subfield indicates the index of the page encoded in the Partial Virtual Bitmap field.

When the TIM is carried in a non-S1G PPDU, the traffic indication virtual bitmap, maintained by the AP or the mesh STA that generates a TIM, consists of 2008 bits, and it is organized into 251 octets such that bit number N ($0 \le N \le 2007$) in the bitmap corresponds to bit number (N mod 8) in octet number $\lfloor N / 8 \rfloor$ where the low order bit of each octet is bit number 0, and the high order bit is bit number 7. When the TIM is carried in an S1G PPDU, the traffic-indication virtual bitmap has the hierarchical structure shown in Figure 9-152. Each bit in the traffic indication virtual bitmap corresponds to traffic buffered for a specific neighbor peer mesh STA within the MBSS that the mesh STA is prepared to deliver[24] or for a STA within the BSS that the AP is prepared to deliver at the time the Beacon frame is transmitted. Bit number N indicates the status of buffered, individually addressed MSDUs/MMPDUs for the STA whose AID is N, or group addressed MSDUs/MMPDUs for the STAs whose group AID is N. It is set as follows:

— If the STA is not using APSD, and any individually addressed MSDUs/MMPDUs for that STA are buffered and the AP or the mesh STA is prepared to deliver them, then bit number N in the traffic indication virtual bitmap is 1.

[24] How the AP or mesh STA determines the traffic it is prepared to deliver is outside the scope of this standard.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— If the STA is using APSD, and any individually addressed MSDUs/MMPDUs for that STA are buffered in at least one nondelivery-enabled AC (if there exists at least one nondelivery-enabled AC), then bit number *N* in the traffic indication virtual bitmap is 1.
— If the STA is using APSD, all ACs are delivery-enabled, and any individually addressed MSDUs/MMPDUs for that STA are buffered in any AC, then bit number *N* in the traffic indication virtual bitmap is 1.
— Otherwise, bit number *N* in the traffic indication virtual bitmap is 0.

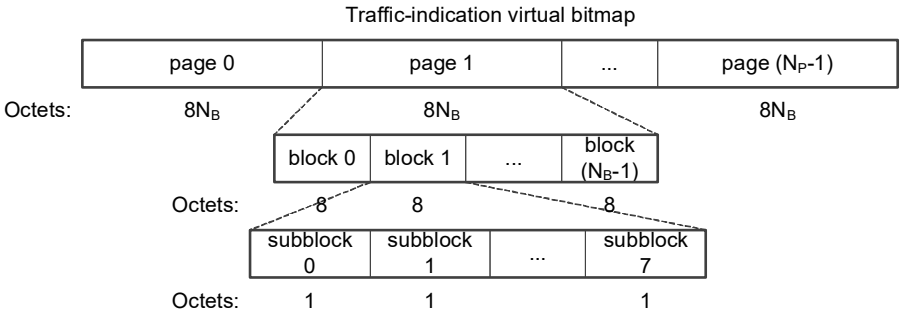

Figure 9-152—Hierarchical structure of traffic-indication virtual bitmap carried in an S1G PPDU

When dot11MultiBSSIDImplemented is false and the TIM is carried in a non-S1G PPDU, the Partial Virtual Bitmap field consists of octets numbered *N*1 to *N*2 of the traffic indication virtual bitmap, where *N*1 is the largest even number such that bits numbered 1 to (*N*1 × 8) – 1 in the traffic indication virtual bitmap are all 0 and *N*2 is the smallest number such that bits numbered (*N*2 + 1) × 8 to 2007 in the traffic indication virtual bitmap are all 0. In this case, the Bitmap Offset subfield value contains the number *N*1/2, and the Length field is set to (*N*2 – *N*1) + 4.

NOTE 1—The bit numbered 0 in the traffic indication virtual bitmap need not be included in the Partial Virtual Bitmap field even if that bit is set.

When the TIM is carried in a non-S1G PPDU, in the event that all bits other than bit 0 in the traffic indication virtual bitmap are 0, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4. When the TIM is carried in an S1G PPDU, if all bits in virtual bitmap are 0, the Partial Virtual Bitmap field is not present in the TIM element and the Length field of the TIM element is set to 3. If all bits in the virtual bitmap are 0 and all the bits of the Bitmap Control field are 0, both the Partial Virtual Bitmap field and the Bitmap Control field are not present in the TIM element and the Length field of the TIM element is set to 2. The Bitmap Control field is present if the Partial Virtual Bitmap field is present.

When dot11MultiBSSIDImplemented is true, the Partial Virtual Bitmap field of the TIM element is constructed as follows, where the maximum possible number of BSSIDs is an integer power of 2, $n = \log2$ (maximum possible number of BSSIDs).

— The bits 1 to $(2^n - 1)$ of the bitmap are used to indicate that one or more group addressed frames are buffered for each AP corresponding to a nontransmitted BSSID and are called NonTxBSS identifiers (NonTxBSS IDs). The NonTxBSS ID equals the value carried in the BSSID Index field of the Multiple BSSID-Index element carried in its nontransmitted BSSID profile (see 9.4.2.45). The AIDs from 1 to $(2^n - 1)$ are not allocated to a STA (in each page for an S1G STA). A bit position corresponding to an inactive nontransmitted BSSID is reserved and set to 0 (in each page for an S1G STA). The remaining AIDs are shared by the BSSs corresponding to the transmitted BSSID and all nontransmitted BSSIDs.

— When the DTIM Count field carried in a Multiple BSSID-Index element is 0 for a BSS that has a nontransmitted BSSID, and one or more group addressed frames are buffered at the AP for this BSS, the corresponding NonTxBSS ID bit is set to 1.

— Each bit starting from bit 2^n in the traffic indication virtual bitmap corresponds to individually addressed traffic buffered for a specific STA within any BSS corresponding to a transmitted or nontransmitted BSSID at the time the Beacon frame is transmitted. The correspondence is based on the AID of the STA.

— Based upon its knowledge of the capability of associated stations to support the multiple BSSID capability, as indicated by the corresponding field in the Extended Capabilities element and the content of the traffic indication virtual bitmap, an AP encodes the Partial Virtual Bitmap and the Bitmap Control field of the TIM element using one of the three following methods. Specifically, a non-S1G AP uses Method B when it determines that the bit for each associated non-AP STA in the traffic indication virtual bitmap that is reconstructed by each non-AP STA from the received TIM element encoded using Method B is set correctly. Otherwise, a non-S1G AP uses Method A and an S1G AP uses Method C.

Method A, Method B and Method C are described as follows:

a) Method A: The Partial Virtual Bitmap field consists of octets numbered 0 to $N2$ of the traffic indication virtual bitmap, where $N2$ is the smallest number such that bits numbered $(N2 + 1) \times 8$ to 2007 in the traffic indication virtual bitmap are all 0. If such a value $N2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N2 = 250$. When using this method, the Bitmap Offset subfield value always contains the number 0, and the Length field is $N2 + 4$.

b) Method B: The Partial Virtual Bitmap field consists of a concatenation of octets numbered 0 to $N0 - 1$ and octets numbered $N1$ to $N2$ of the traffic indication virtual bitmap, where $N0$ is the largest positive integer such that $N0 \times 8 - 2^n < 8$. If $N0$ is an odd number, then $N1$ is the largest odd number such that $N0 < N1$and each of the bits $N0 \times 8$ to $(N1 \times 8 - 1)$ is equal to 0. When $N0$ is an even number, $N1$ is the largest even number such that $N0 < N1$ and each of the bits $N0 \times 8$ to $(N1 \times 8 - 1)$ is equal to 0. If such a value $N1 > N0$ does not exist, $N1 = N0$. Additionally, $N2$ is the smallest integer value for which the values for bit $(N2+1) \times 8$ to 2007 in the traffic indication virtual bitmap are all 0. If such a value $N2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N2 = 250$. When using this method, the Bitmap Offset subfield contains $(N1 - N0)/2$, and the Length field is $N0 + N2 - N1 + 4$.

c) Method C: The Partial Virtual Bitmap field of the TIM that is carried in an S1G PPDU consists of a concatenation of Encoded Block subfields that contain NonTxBSS IDs and Encoded Block subfields that contain AIDs. When using this method, the Page Slice Number subfield is equal to 31, and the Page Index subfield is equal to the page index of the TIM to which the AIDs belong.

NOTE 2—When $N1 = N0$, Method B reduces to Method A.

For both Method A and Method B, when there are no frames buffered for any BSS corresponding to a transmitted or nontransmitted BSSID supported, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4. For Method C when the Partial Virtual Bitmap field is not present in the TIM element then the Length field is 3 and when both the Partial Virtual Bitmap field and the Bitmap Control field are not present in the TIM element then the Length field is 2. For both Method A and Method B, when there are no buffered individually addressed frames for any BSS corresponding to a transmitted or nontransmitted BSSID, but there are buffered group addressed frames for one or more of the BSSs, the Partial Virtual Bitmap field consists of the octets number 0 to $N0 - 1$ where $N0$ is the largest positive integer such that $(N0 \times 8 - 2^n < 8)$. For Method C, the Partial Virtual Bitmap field consists of Encoded Block subfields that contain the NonTxBSS IDs of the BSSs for which there are buffered group addressed frames. In this case for Method A and Method B, the Bitmap Offset subfield value contains the number 0, and the Length field is $N0+3$, while for Method C, the Length field is equal to 3 plus the size of the encoded blocks that carry the NonTxBSS IDs, which are present in the TIM element.

When the TIM with a nonzero Partial Virtual Bitmap field is carried in an S1G PPDU, the Partial Virtual Bitmap field is constructed with one or more Encoded Block subfields as shown in Figure 9-153. The Encoded Block subfield consists of the Block Control subfield, the Block Offset subfield, and the Encoded Block Information subfield as shown in Figure 9-154. When dot11MultiBSSIDImplemented is true, the Partial Virtual Bitmap field contains zero or more Encoded Block subfields that contain NonTxBSS IDs.

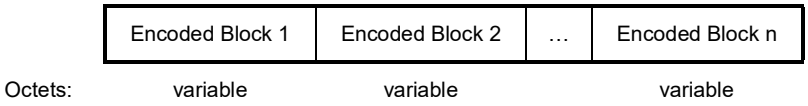

Figure 9-153—Partial Virtual Bitmap field format

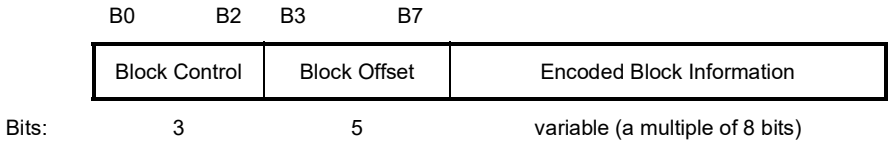

Figure 9-154—Encoded Block subfield format

The Block Control subfield indicates the encoding mode used in the Encoded Block subfield as shown in Table 9-94. The format of the Block Control subfield is as shown in Figure 9-155. The Block Control subfield consists of the Encoding Mode subfield and the Inverse Bitmap subfield.

Table 9-94—Block Control field encoding

Bit 2	Bit 1	Bit 0	Encoding mode
0	0	0	Block Bitmap
0	0	1	Single AID
0	1	0	OLB
0	1	1	ADE
1	0	0	Inverse Bitmap + Block Bitmap
1	0	1	Inverse Bitmap + Single AID
1	1	0	Inverse Bitmap + OLB
1	1	1	Inverse Bitmap + ADE

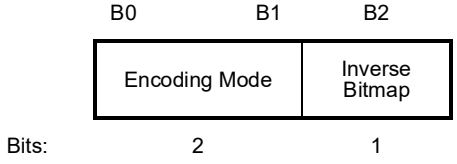

Figure 9-155—Block Control subfield format

The Inverse Bitmap subfield is set to 1, if the Encoded Block Information field is encoded based on the inverted version of the block, which inverts each bit value of the block. The Inverse Bitmap subfield is set to 0, otherwise.

The Encoding Mode subfield indicates one of the four encoding modes: the Block Bitmap mode, the Single AID mode, the offset length bitmap (OLB) mode, and the AID with differential encoding (ADE) mode. The four encoding modes are explained in the following subclauses.

The Block Offset field indicates the index of the block that is encoded in the Encoded Block subfield.

The Encoded Block Information subfield is defined depending on the Encoding Mode subfield and explained within the subclause for each of the encoding modes.

9.4.2.5.2 Block Bitmap mode

The Encoded Block Information field consists of the Block Bitmap subfield and n Subblock subfields, where n is the number of bits equal to 1 in the Block Bitmap subfield. The format of the Encoded Block Information subfield is shown in Figure 9-156.

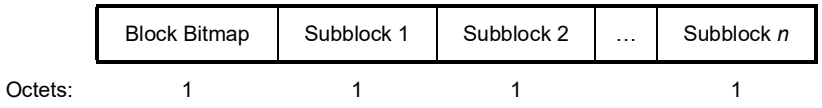

Figure 9-156—Encoded Block Information (Block Bitmap mode)

The bit in position *m* of the Block Bitmap subfield, if equal to 1, indicates that the subblock in position *m* of the Block is present in the Encoded Block Information subfield. The bit in position *m* of the Block Bitmap subfield, if equal to 0, indicates that the subblock in position *m* of the block is not present in the Encoded Block Information subfield. When *n* bits in the Block Bitmap subfield are equal to 1, *n* Subblock subfields follow the Block Bitmap field in ascending order of the subblock positions in the block.

Each Subblock subfield contains a subblock of the block, which has at least one bit position equal to 1. The bit in position *q* of the Subblock subfield, which contains the Subblock in position *m* of the block, indicates traffic buffered for the STA whose AID is *N*, where *N* is constructed by concatenating *q* (*N*[0:2]), *m* (*N*[3:5]), the Block Offset field (*N*[6:10]), and the Page Index field (*N*[11:12]) in sequence from LSB to MSB.

9.4.2.5.3 Single AID mode

The Encoded Block Information subfield consists of the Single AID subfield as shown in Figure 9-157. The Single AID subfield contains the 6 LSBs of the single AID in the block. The rest of the bits of the Encoded Block Information subfield are reserved. The value in the Single AID subfield indicates traffic buffered for the STA whose AID is *N*, where *N* is constructed by concatenating the Single AID subfield(*N*[0:5]), the Block Offset field (*N*[6:10]), and the Page Index field (*N*[11:12]) in sequence from LSB to MSB.

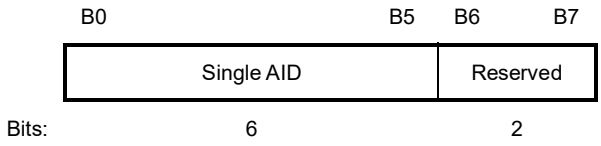

Figure 9-157—Encoded Block Information (Single AID mode)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.5.4 OLB mode

The Encoded Block Information field consists of the Length subfield and *n* Subblock subfields. The format of the Encoded Block Information field is shown in Figure 9-158.

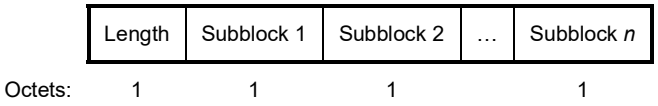

Figure 9-158—Encoded Block Information (OLB mode)

The Length subfield is 1 octet. A Length subfield equal to *n* indicates that the Encoded Block Information field contains *n* contiguous subblocks in ascending order from multiple blocks starting from the first subblock of the block in position Block Offset.

Each Subblock subfield contains a subblock of the Partial Virtual Map. A subblock *m* of the Encoded Block Information field is located in block *k* where *k* is obtained as Block Offset + $\lfloor m / 8 \rfloor$. The bit in position *q* of the subblock *m*, which is located in block *k*, when set to 1, indicates that there is traffic buffered for the STA whose AID is *N*, where *N* is constructed by concatenating *q* (*N*[0:2]), the subblock offset *m* mod 8 (*N*[3: 5]), the block *k* (*N*[6:10]), and the Page Index field (*N*[11:12]), in sequence from LSB to MSB.

9.4.2.5.5 ADE mode

The Encoded Block Information field consists of the Encoding Word Length (EWL) subfield, Length subfield, *n* AID Differential Values (ΔAID) subfields and padding subfield, where *n* is the number of paged AIDs encoded in the ADE block. The format of the Encoded Block Information field is shown in Figure 9-159.

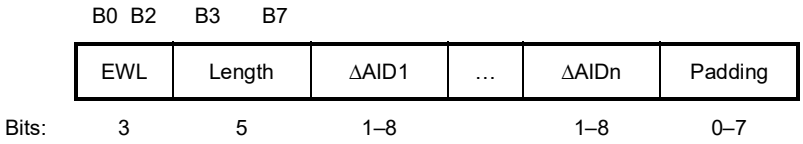

Figure 9-159—Encoded Block Information (ADE Block)

The length of each ΔAID subfields (*WL*) represents the encoded word length (the number of bits of each encoded words) of each AID. All *WL* have the same length. *WL* is indicated by EWL subfield.

The EWL subfield is 3 bits with B0 being LSB. The values of EWL subfield ranging from 0 to 7 represent *WL* being 1 to 8, respectively.

The Length subfield is 5 bits with B3 being LSB and it specifies the total length of the current ADE block in octets, excluding EWL and Length subfields.

The padding subfield contains 0–7 padding bits. The padding bits are set to 0.

To encode a list of paged AIDs, denoted as AID1, AID2 … AIDn, an AP can derive the *offset* value in the Block Offset field (9.4.2.5) for the current ADE Block by $\lfloor (\mathrm{AID}_1 \bmod 2048) / 64 \rfloor$.

The encoding procedure is as follows:

If all AIDs in the ADE blocks are paged, AP sets the Inverse Bitmap subfield to 1 and ADE block consists only EWL and Length fields, where both EWL and Length Field are set to 0s.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If all but one AIDs in the ADE blocks are paged, AP sets the Inverse Bitmap subfield to 1 and ADE block consists only one ΔAID subfield. The AP sets the EWL to 7 and the Length subfield to one. ΔAID subfield is set to (AID – (*Page Index* × 2048 + *Block Offset* × 64)).

If only one AID is paged in the ADE blocks, AP sets the Inverse Bitmap subfield to 0 and uses the Single AID mode.

For all other cases, AP sorts all AID*i*, $i = 1, 2 \ldots n$ in an ascending order (AID1 < AID2 < … < AID*n*) and then calculates the AID differential values according to the following formulas:

$$\Delta AID1 = AID1 - (Page\ Index \times 2048 + Block\ Offset \times 64)$$

$$\Delta AIDi = AIDi - AIDi{-}1,\ i = 2 \ldots n$$

Determine *WL* as the minimum bits that can represent the largest ΔAID*i* (or mathematically $\lfloor \log_2(MAX)(\Delta AID_i) \rfloor + 1$ where $MAX(\Delta AID_i)$ denotes the largest ΔAID_i), i=1,2,…,n. The EWL subfield is set to *WL*-1. For *n* AID differential values, a total of *WL* × *n* bits are required. The number of bits is less than or equal to 248 since maximum payload in an ADE block is 31 × 8=248 (31 is the maximum value in the 5-bit Length subfield). If the total number of bits *WL* × *n* is not a multiple of an octet, [*WL*×*n*/8]×8-*WL*×*n* zero bits are padded to make the ADE block end at octet boundary.

When decoding, if the Inverse Bitmap subfield is 1, and the EWL and Length subfield are 0s, then all AIDs in the ADE blocks are paged.

If the Inverse Bitmap subfield is 1, the EWL is 7 and the Length subfield is 1, then all AIDs except one in the ADE blocks are paged. The unpaged AID is ΔAID1 + *Block Offset* × 64 + *Page Index* × 2048.

For other cases, a STA can extract *Page Index* (9.4.2.5) and *Block Offset* (9.4.2.5), EWL and Length values from the respective fields. It derives *WL* by adding 1 to the value from EWL field. The paged AIDs are then derived with following formulas:

$$AID1 = \Delta AID1 + (Page\ Index \times 2048 + Block\ Offset \times 64)$$

$$AIDi = \Delta AIDi + AIDi - 1,\ i = 2, \ldots, n$$

The decoder stops the decoding of the current ADE block when either one of following conditions is satisfied:

— The number of bits left for decoding is less than WL.
— ΔAIDi is zero and $i > 1$.

AIDs from the same or different blocks can be encoded into one ADE block. A STA can derive the number of AIDs, including both paged and unpaged AIDs, encoded in one ADE block with following method:

If an ADE block is not the last encoded block in the TIM element, the decoder can derive the number of AIDs encoded by this ADE block based on the *Block offset* values in the current and the immediate next encoded blocks. For example, the offset values in the current ADE block and the next encoded block are *Offset*1 and *Offset*2. Then the AIDs encoded by this ADE block is [*Page Index* × 2048 + *Offset*1 × 64, *Page Index* × 2048 + *Offset*2×64), *Page Index*×2048 + *Offset*1 × 64 is included and *Page Index* × 2048 + *Offset*2 × 64 is excluded.

If an ADE block is the last one in the TIM element, the number of AIDs encoded by the last ADE block can be determined based on the offset value and page length or page slice length if its TIM page is sliced.

9.4.2.6 IBSS Parameter Set element

The IBSS Parameter Set element contains the set of parameters necessary to support an IBSS. See Figure 9-160.

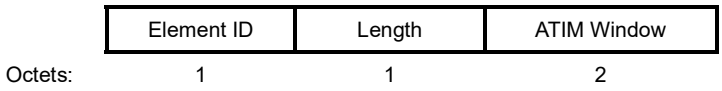

Figure 9-160—IBSS Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

The ATIM Window field contains the ATIM window length in TU.

9.4.2.7 Challenge Text element

The Challenge Text element contains the challenge text within Authentication exchanges. See Figure 9-161.

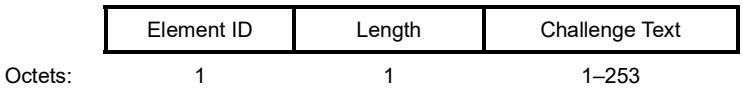

Figure 9-161—Challenge Text element format

The Element ID and Length fields are defined in 9.4.2.1.

The content of the Challenge Text field is dependent upon the authentication algorithm and the transaction sequence number as specified in 12.3.3.2.

9.4.2.8 Country element

The Country element contains the information required to allow a STA to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. The format of this element is as shown in Figure 9-162.

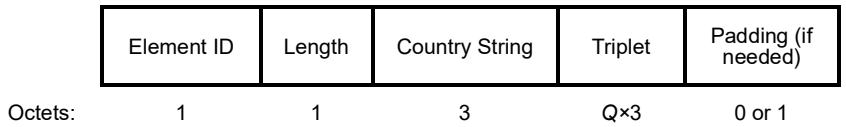

Figure 9-162—Country element format

The Element ID and Length fields are defined in 9.4.2.1. The length of the element is variable, as the element contains the variable length Triplet field.

The AP and mesh STA set the Country String field to the value contained in dot11CountryString before transmission in a Beacon or Probe Response frame. Upon reception of this element, a STA sets the dot11CountryString to the value contained in this field. The three octets of the Country String have additional structure as defined by dot11CountryString (see Annex C).

If dot11OperatingClassesRequired is false, then the Triplet field is a single Subband Triplet Sequence field, as shown in Figure 9-163, that is composed of *Q* Subband Triplet fields, where *Q* is one or more. The format of the Subband Triplet field is shown in Figure 9-164.

Copyright © 2021 IEEE. All rights reserved.

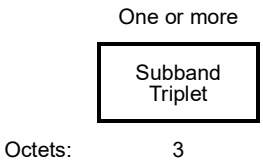

Figure 9-163—Subband Triplet Sequence format

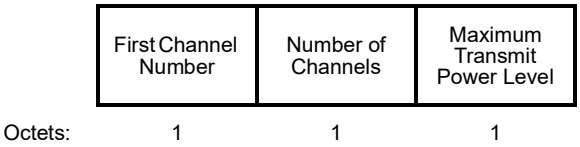

Figure 9-164—Subband Triplet field format

If dot11OperatingClassesRequired is true, then the Triplet field is composed of zero or more Subband Triplet fields followed by one or more Operating/Subband Sequences, as shown in Figure 9-165. Each Operating/Subband Sequence is composed of one Operating Triplet field followed by one Subband Triplet Sequence field, as shown in Figure 9-166. Each Subband Triplet Sequence field is composed of zero or more Subband Triplet fields. If dot11OperatingClassesRequired is true, the number of triplets in the Triplet field is $Q = N + \sum_{m=1}^{M} (1 + P(m))$, where N is the total number of Subband Triplet fields and M is the total number of Operating/Subband Sequences contained in Country element and $P(m)$ is the number of Subband Triplet fields making up Operating/Subband Sequence field m.

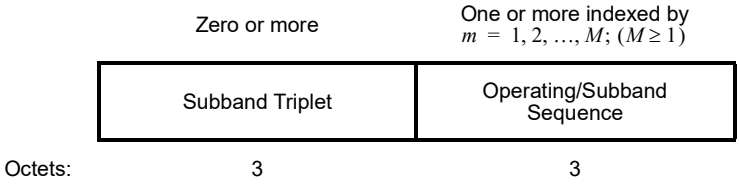

Figure 9-165—Triplet field format if dot11OperatingClassRequired is true

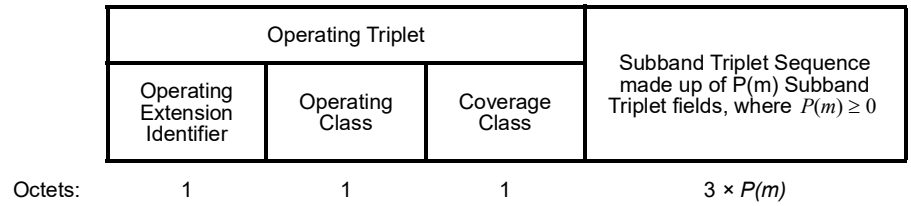

Figure 9-166—Format of *m*-th Operating/Subband Sequence field

The number Q of Subband fields or Operating triplet fields in the element is determined by the Length field.

An operating class for an 80+80 MHz channel width is expressed by two consecutive Operating/Subband Sequences, where the first Operating/Subband Sequence field contains an Operating Triplet field indicating an 80 MHz channel spacing with an 80+ behavior limit and the second Operating/Subband Sequence field contains an Operating Triplet field indicating an 80 MHz channel spacing without an 80+ behavior limit.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Operating/Subband Sequence fields that contain an Operating Class field for which the Channel spacing (MHz) column in the appropriate table in Annex E equals 80 or 160 contain zero Subband Triplet fields.

NOTE 1—Any Operating Triplet field indicating 80 MHz, 160 MHz, and 80+80 MHz can be omitted from the Country element (see 10.22.3).

NOTE 2—The Transmit Power Envelope element is always used for TPC for 80 MHz, 160 MHz, or 80+80 MHz operating classes instead of Subband Triplet fields (see 11.38.1).

The first octet in each Subband Triplet field or Operating Triplet field contains an unsigned integer and identifies the type of field. If the integer has a value less than or equal to 200, then the field is a Subband Triplet field. If the integer has a value of 201 or greater, then the field is an Operating Triplet field.

The minimum length of the element is 8 octets.

The First Channel Number field indicates the lowest channel number in the Subband Triplet field. No channel is indicated by more than one pair of First Channel Number and Number of Channels fields within a Subband Triplet Sequence field. [For example, the (First Channel Number, Number of Channels) pairs (2,4) and (5,2) in 2.4 GHz each indicate channel 5, therefore are not used within the same Subband Triplet Sequence field.] The First Channel Numbers are monotonically increasing within a Subband Triplet Sequence field. The First Channel Number and the Number of Channels pairs in a Country element are used to describe channels only in the band on which the frame containing the element is transmitted.

Outside the 2.4 GHz band, the channel numbers that are included in a group of channels are separated by the BSS bandwidth. For Subband Triplet fields that are not within an Operating/Subband Sequence field, the BSS bandwidth is 20 MHz. For Subband Triplet fields that are within an Operating/Subband Sequence field, the BSS bandwidth is as indicated by the operating class in the same Operating/Subband Sequence field. In the 2.4 GHz band, the channel numbers that are included in a group of channels are separated by 5 MHz (for both 20 and 40 MHz BSS bandwidth), except that channel 14 is treated as if it were 5 MHz above channel 13.

NOTE 3—For example, the channels 1 to 11 in the 2.4 GHz band can be represented using one Subband Triplet subfield with First Channel Number = 1 and Number of Channels = 11. The channels 36, 40, 44, and 48 with 20 MHz BSS bandwidth in the 5 GHz band can be represented using one Subband Triplet subfield with First Channel Number = 36 and Number of Channels = 4. The six channels 183, 184, 185, 187, 188, and 189 (but not 186) with 10 MHz BSS bandwidth can be represented using three Subband Triplet subfields: one with First Channel Number = 183 and Number of Channels = 4, one with First Channel Number = 184 and Number of Channels = 1 and one with First Channel Number = 188 and Number of Channels = 1.

The Maximum Transmit Power Level field is a 2s complement signed integer. The Maximum Transmit Power Level field indicates the maximum power, in dBm, allowed to be transmitted. As the method of measurement for maximum transmit power level differs by regulatory domain, the value in this field is interpreted according to the regulations applicable for the domain identified by the Country String.

An operating class is an index into a set of values for radio equipment sets of rules.

A coverage class is an index into a set of values for aAirPropagationTime. The Coverage Class field is reserved in a DMG BSS.

The Coverage Class field of the Operating Triplet field specifies the aAirPropagationTime characteristic used in BSS operation, as shown in Table 9-95. The characteristic aAirPropagationTime describes variations in actual propagation time that are accounted for in a BSS and, together with maximum transmit power level, allow control of BSS diameter.

The Padding field is used to add, if needed, a single octet (with the value 0) to the Country element so that its length is evenly divisible by 2.

Table 9-95—Coverage Class field parameters

Coverage class value	aAirPropagationTime (μs)
0–31	$n \times 3$, where n is the value of the coverage class
32–255	Reserved

9.4.2.9 Request element

This element is placed in a Probe Request frame or Information Request frame to request that the responding STA include the requested information in the Probe Response frame or Information Response frame, respectively. The format of the element is as shown in Figure 9-167.

	Element ID	Length	Requested Element IDs
Octets:	1	1	variable

Figure 9-167—Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Requested Element IDs are the list of elements that are requested to be included in the Probe Response or Information Response frame. The Requested Element IDs are listed in order of increasing element ID. The Requested Element IDs within a Request element transmitted in an Information Request frame do not include an element ID that corresponds to an element that will be included in the Information Response frame even in the absence of the Request element, as shown in Table 9-461. A given element ID is included at most once among the Requested Element IDs.

NOTE—Some implementations might unnecessarily include in a Probe Request frame a Request element that contains the element ID of an element that will be included in the Probe Response frame even in the absence of the element ID in the Request element; see the notes in Table 9-39. Some implementations might include in a Probe Request frame a Request element that contains the element ID of an element that will not be included in the Probe Response frame even in the presence of the element ID in the Request element.

The Request element does not support elements that contain an Element ID Extension field.

See 11.1.4.3.9 for additional requirements.

9.4.2.10 Extended Request element

This element is placed in a Probe Request frame or Information Request frame to request that the responding STA include the requested information in the Probe Response frame or Information Response frame, respectively. The format of the element is as shown in Figure 9-168.

	Element ID	Length	Element ID Extension	Requested Element ID	Requested Element ID Extensions
Octets:	1	1	1	1	variable

Figure 9-168—Extended Request element format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID, Element ID Extension, and Length fields are defined in 9.4.2.1.

The Requested Element ID field contains one of the Element IDs used to indicate an extended element.

The Requested Element ID Extensions field contains a list of 1-octet element ID extension values that, combined with the value of the Requested Element ID field, identify elements that are requested to be included in the Probe Response or Information Response frame. The values in this field are listed in increasing order. The requested elements within an Extended Request element transmitted in a Probe Request frame do not identify an element that will be included in the Probe Response frame even in the absence of the Request element, or will be excluded from the Probe Response frame even in the presence of the Extended Request element as described by the notes in Table 9-39. The requested elements within an Extended Request element transmitted in an Information Request frame do not identify an element that will be included in the Information Response frame even in the absence of the Extended Request element, as shown in Table 9-461. A given element ID extension value is included at most once in the Requested Element ID Extensions field.

See 11.1.4.3.9 for additional requirements.

9.4.2.11 ERP element

The ERP element contains information on the presence of Clause 15 or Clause 16 STAs in the BSS that are not capable of Clause 18 (ERP-OFDM) data rates. It also contains the requirement of the ERP element sender (AP, IBSS STA, or mesh STA) as to the use of protection mechanisms to optimize BSS performance and as to the use of long or short Barker preambles. See Figure 9-169 for a definition of the frame element.

The ERP element has the form shown in Figure 9-169.

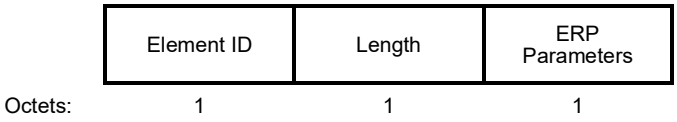

Figure 9-169—ERP element format

The Element ID and Length fields are defined in 9.4.2.1.

The ERP Parameters field is defined in Figure 9-170.

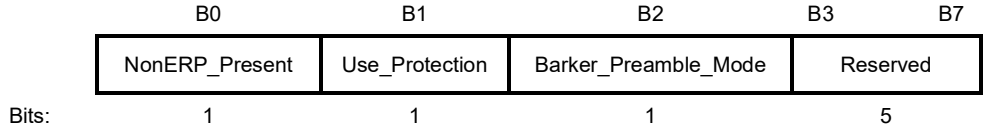

Figure 9-170—ERP Parameters field format

Recommended behavior for setting the Use_Protection bit is contained in 10.27.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.12 Extended Supported Rates and BSS Membership Selectors element

The Extended Supported Rates and BSS Membership Selectors element specifies the rates in the OperationalRateSet parameter, as described in the MLME-JOIN.request and MLME-START.request primitives, and zero or more BSS membership selectors, where these are not carried in the Supported Rates and BSS Membership Selectors element. See Figure 9-171.

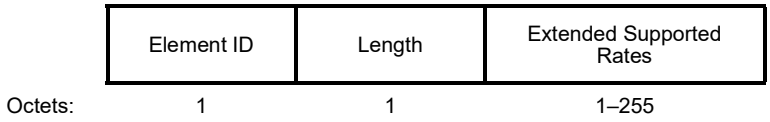

Figure 9-171—Extended Supported Rates and BSS Membership Selectors element format

The Element ID and Length fields are defined in 9.4.2.1.

The format and interpretation of each octet of the Extended Supported Rates field is the same as that of an octet in the Supported Rates field in a Supported Rates and BSS Membership Selectors element (see 9.4.2.3).

9.4.2.13 Power Constraint element

The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel. The format of the Power Constraint element is shown in Figure 9-172.

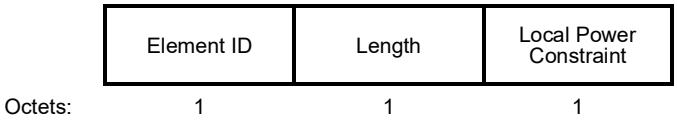

Figure 9-172—Power Constraint element format

The Element ID and Length fields are defined in 9.4.2.1.

The Local Power Constraint field is coded as an unsigned integer in units of decibels. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel (from the MIB) in the Power Constraint element.

The Power Constraint element is included in Beacon frames, as described in 9.3.3.2, and Probe Response frames, as described in 9.3.3.10. The use of Power Constraint elements is described in 11.7.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.14 Power Capability element

The Power Capability element specifies the minimum and maximum transmit powers with which a STA is capable of transmitting in the current channel. The format of the Power Capability element is shown in Figure 9-173.

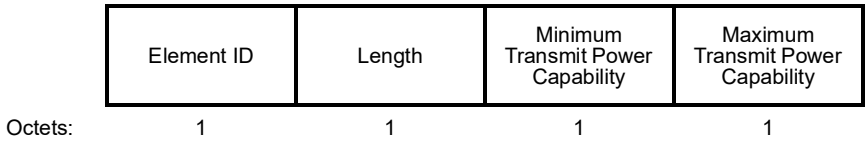

Figure 9-173—Power Capability element format

The Element ID and Length fields are defined in 9.4.2.1.

The Minimum Transmit Power Capability field is set to the nominal minimum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a 2s complement signed integer in units of decibels relative to 1 mW. Further interpretation of this field is defined in 11.7.4.

The Maximum Transmit Power Capability field is set to the nominal maximum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a 2s complement signed integer in units of decibels relative to 1 mW. Further interpretation of this field is defined in 11.7.4.

The Power Capability element is included in Association Request frames, as described in 9.3.3.5; Reassociation Request frames, as described in 9.3.3.7; and Mesh Peering Open frame, as described in 9.6.15.2.2. The use of Power Capability elements is described in 11.7.2.

9.4.2.15 TPC Request element

The TPC Request element contains a request for a STA to report transmit power and link margin information using a TPC Report element. The format of the TPC Request element is shown in Figure 9-174.

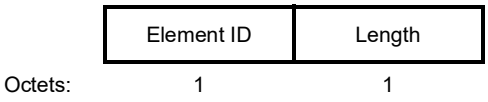

Figure 9-174—TPC Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The TPC Request element is included in TPC Request frames, as described in 9.6.2.4. The use of TPC Request elements and frames is described in 11.7.7.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.16 TPC Report element

The TPC Report element contains transmit power and link margin information sent in response to a TPC Request element or a Link Measurement Request frame. A TPC Report element is included in a Beacon frame or Probe Response frame without a corresponding request. The format of the TPC Report element is shown in Figure 9-175.

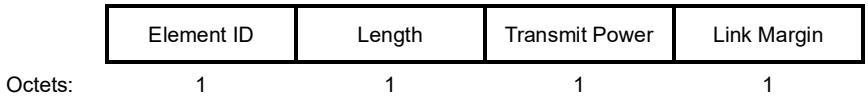

Figure 9-175—TPC Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Transmit Power field is set to the transmit power used to transmit the frame containing the TPC Report element. The field is coded as a 2s complement signed integer in units of decibels relative to 1 mW. The tolerance for the transmit power value reported in the TPC Response element is ± 5 dB. This tolerance is defined as the difference, in decibels, between the reported power value and the actual EIRP of the STA (when transmitting 1500 octet frames or maximum MPDU sized-frames, whichever is smaller).

The Link Margin field contains the link margin for the receive time and for the receive rate of the frame containing the TPC Request element or the Link Measurement Request frame. The field is coded as a 2s complement signed integer in units of decibels. The Link Margin field is reserved when a TPC Report element is included in a Beacon frame or Probe Response frame. The method used to measure the link margin is beyond the scope of this standard.

The TPC Report element is included in TPC Report frames, as described in 9.6.2.5; Link Measurement Report frames, as described in 9.6.6.5; Beacon frames, as described in 9.3.3.2; and Probe Response frames, as described in 9.3.3.10. The use of TPC Report elements and frames is described in 11.7.7.

9.4.2.17 Supported Channels element

The Supported Channels element contains a list of channel subbands (from those channels defined in 17.3.8.4.3) in which a STA is capable of operating. The format of the Supported Channels element is shown in Figure 9-176.

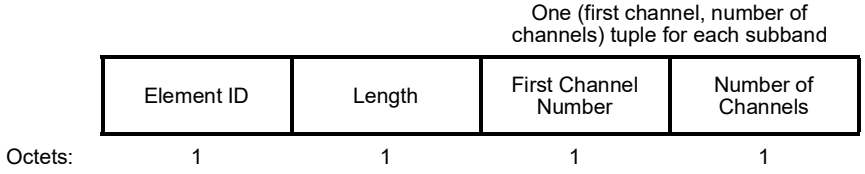

Figure 9-176—Supported Channels element format

The Element ID and Length fields are defined in 9.4.2.1.

The First Channel Number field is set to the first channel (as defined in 17.3.8.4.3) in a subband of supported channels.

The Number of Channels field is set to the number of channels in a subband of supported channels.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Supported Channels element is included in Association Request frames, as described in 9.3.3.5; Reassociation Request frames, as described in 9.3.3.7; and Mesh Peering Open frame, as described in 9.6.15.2.2. The use of the Supported Channels element is described in 11.8.2 and 11.8.8.

9.4.2.18 Channel Switch Announcement element

The Channel Switch Announcement element is used by a non-DMG AP, non-DMG IBSS STA, or mesh STA to advertise when it is changing to a new channel and the channel number of the new channel. The format of the Channel Switch Announcement element is shown in Figure 9-177.

Figure 9-177—Channel Switch Announcement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. A non-DMG AP or non-DMG IBSS STA sets the Channel Switch Mode field to either 0 or 1 on transmission. In an MBSS, the Channel Switch Mode field is reserved. See 11.8.9.

The New Channel Number field is set to the number of the channel to which the STA is moving (as defined in 17.3.8.4.3).

For nonmesh STAs, the Channel Switch Count field is set to the number of TBTTs until the STA sending the Channel Switch Announcement element switches to the new channel. The value 1 indicates that the switch occurs at the next TBTT (the ensuing Beacon frame is created assuming the new channel), and the value 0 indicates that the switch occurs at any time after the frame containing the element is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2 TU when the MSB (bit 7) is 0, or in units of 100 TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Announcement element switches to the new channel. An octet with bits 6 to 0 indicates that the switch occurs at any time after the frame containing the element is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10 TU channel switch time is encoded as X'05'.

The Channel Switch Announcement element is included in Channel Switch Announcement frames, as described in 9.6.2.6, and can be included in Beacon frames, as described in 9.3.3.2, and Probe Response frames, as described in 9.3.3.10. The use of Channel Switch Announcement elements and frames is described in 11.8.8.

9.4.2.19 Secondary Channel Offset element

The Secondary Channel Offset element is used by an AP, IBSS STA or mesh STA when changing to a new 40 MHz or wider channel. The format of the Secondary Channel Offset element is shown in Figure 9-178.

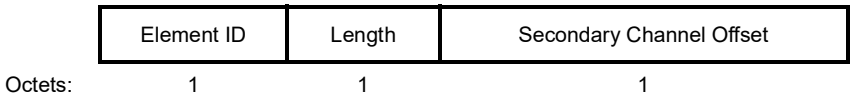

Figure 9-178—Secondary Channel Offset element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Secondary Channel Offset element is included in Channel Switch Announcement frames, as described in 9.6.2.6.

The Element ID and Length fields are defined in 9.4.2.1.

The Secondary Channel Offset field of the Secondary Channel Offset element represents the position of the secondary channel relative to the primary channel. The values of the Secondary Channel Offset field are defined in Table 9-96.

Table 9-96—Values of the Secondary Channel Offset field

Value	Name	Description
0	SCN - no secondary channel	Indicates that no secondary channel is present.
1	SCA - secondary channel above	Indicates that the secondary channel is above the primary channel.
2		Reserved.
3	SCB - secondary channel below	Indicates that the secondary channel is below the primary channel.
4–255		Reserved.

9.4.2.20 Measurement Request element

9.4.2.20.1 General

The Measurement Request element contains a request that the receiving STA undertake the specified measurement action. The Measurement Request element is included in Spectrum Measurement Request frames, as described in 9.6.2.2, or Radio Measurement Request frames, as described in 9.6.6.2. Measurement types 0, 1, and 2 are defined for spectrum management and are included only in Spectrum Measurement Request frames. The use of Measurement Request elements for spectrum management is described in 11.8.7. All other measurement types are included only in Radio Measurement Request frames. The use of Measurement Request elements for radio measurement is described in 11.10.

The format of the Measurement Request element is shown in Figure 9-179.

	Element ID	Length	Measurement Token	Measurement Request Mode	Measurement Type	Measurement Request
Octets:	1	1	1	1	1	variable

Figure 9-179—Measurement Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Measurement Token is set to a nonzero number that is unique among the Measurement Request elements in a particular Spectrum or Radio Measurement Request frame.

The Measurement Request Mode field (shown in Figure 9-180) is a bit field with the following bits defined:

— The Parallel bit (bit 0) is used to request that more than one measurement is to be started in parallel. Parallel is set to 1 to request that the measurement is to start at the same time as the measurement described by the next Measurement Request element in the same Radio Measurement Request

Copyright © 2021 IEEE. All rights reserved.

frame. Parallel is set to 0 if the measurements are to be performed in sequence. The Parallel bit is reserved when Enable is 1, in the last or only Measurement Request element in the frame, or when the Measurement Type field is 0, 1, or 2 (spectrum management measurements). See 11.10.6.

— The Enable bit (bit 1) is used to differentiate between a request to make a measurement and a request to control the measurement requests and triggered or autonomous reports generated by the destination STA. The Enable bit is further described in Table 9-97.

— Request bit (bit 2) is described in Table 9-97.

— Report bit (bit 3) is described in Table 9-97.

— The Duration Mandatory bit (bit 4) indicates whether the measurement duration contained within the measurement request is interpreted as mandatory by the STA receiving the request. A 0 indicates that the duration requested is a maximum duration, and the requesting STA accepts measurement results taken over any shorter duration. A 1 indicates that the duration requested is a mandatory duration. The Duration Mandatory bit is reserved when the Enable bit is 1, or when the Measurement Type field is 0, 1, 2, 8, or 255. See 11.10.4.

— All other bits are reserved.

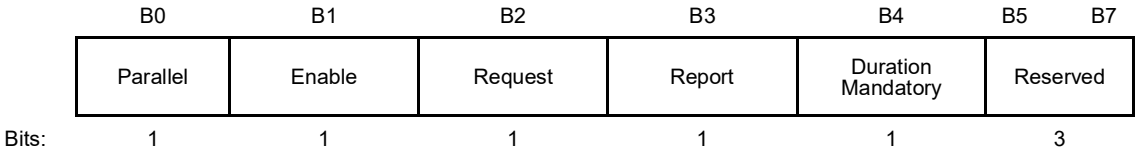

Figure 9-180—Measurement Request Mode field format

The use of the Enable, Request, and Report bits is summarized in Table 9-97. See 11.8.7 and 11.10.6 for the description of how a STA handles requests to enable or disable measurement requests and autonomous reports. See 11.10.8 for a description of the use of the Enable and Report bits in triggered reporting.

Table 9-97—Summary of use of Enable, Request, and Report bits

Bits			Meaning of bits
Enable	Request	Report	
0	Reserved	Reserved	The transmitting STA is requesting that the destination STA make a measurement of type indicated in the Measurement Type field. When Enable bit is 0, Request and Report bits are reserved.
1	0	0	The transmitting STA is requesting that the destination STA not send any measurement requests or reports of the type indicated in the Measurement Type field.
1	1	0	The transmitting STA is indicating to the destination STA that it can accept measurement requests and is requesting the destination STA not send autonomous or triggered measurement reports of the type indicated in the Measurement Type field. NOTE—This setting corresponds to the default STA behavior.
1	0	1	The transmitting STA is requesting that the destination STA not send measurement requests and indicating it accepts autonomous or triggered measurement reports of the type indicated in the Measurement Type field.
1	1	1	The transmitting STA is indicating to the destination STA that it can accept measurement requests and can accept autonomous or triggered measurement reports of the type indicated in the Measurement Type field.

The Measurement Type field is set to a number that identifies a type of measurement request or measurement report. The measurement types that have been allocated for measurement requests are shown in Table 9-98 and measurement reports are shown in Table 9-125 (in 9.4.2.21).

Table 9-98—Measurement type definitions for measurement requests

Name	Measurement type
Basic	0
Clear Channel Assessment (CCA)	1
Receive Power Indication (RPI) Histogram	2
Channel Load	3
Noise Histogram	4
Beacon	5
Frame	6
STA Statistics	7
LCI	8
Transmit Stream/Category Measurement	9
Multicast Diagnostics	10
Location Civic	11
Location Identifier	12
Directional Channel Quality	13
Directional Measurement	14
Directional Statistics	15
Fine Timing Measurement Range	16
Reserved	17–254
Measurement Pause	255

When the Enable bit is 0, the Measurement Request field contains the specification of a single measurement request corresponding to the measurement type, as described in 9.4.2.20.2 to 9.4.2.20.12. When the Enable bit is 1, the Measurement Request field is present only when requesting a triggered measurement.

9.4.2.20.2 Basic request

The Measurement Request field corresponding to a Basic request is shown in Figure 9-181. See 11.8.7.

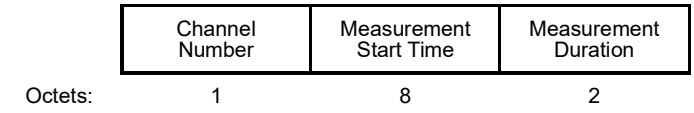

Figure 9-181—Measurement Request field format for a Basic request

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Channel Number field is set to the channel number for which the measurement request applies where the channel number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF timer at the time (± 32 μs) at which the requested Basic request measurement starts. A 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.20.3 CCA request (Clear channel access request)

The Measurement Request field corresponding to a CCA request is shown in Figure 9-182.

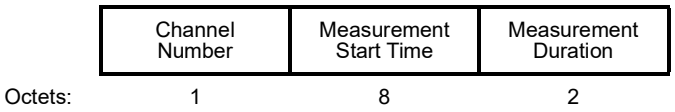

Figure 9-182—Measurement Request field format for a CCA request

The Channel Number field is set to the channel number for which the measurement request where the channel number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the requested CCA request measurement starts. A 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.20.4 RPI histogram request (Received power indicator histogram request)

The Measurement Request field corresponding to an RPI Histogram request is shown in Figure 9-183.

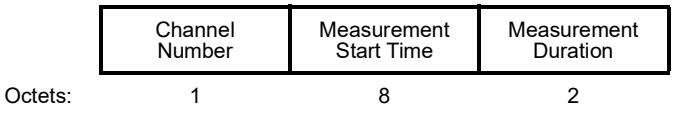

Figure 9-183—Measurement Request field format for an RPI Histogram request

The Channel Number field is set to the channel number for which the measurement request where the channel number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the requested RPI Histogram request measurement starts. A 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.20.5 Channel Load request

The Measurement Request field corresponding to a Channel Load request is shown in Figure 9-184.

	Operating Class	Channel Number	Randomization Interval	Measurement Duration	Optional Subelements
Octets:	1	1	2	2	variable

Figure 9-184—Measurement Request field format for Channel Load request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

NOTE—Examples of operating classes that encompass a primary channel but do not identify the location of the primary channel are operating classes with 80 or 160 in the Channel spacing (MHz) column in the applicable table in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class field and Channel Number field together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-99.

Table 9-99—Optional subelement IDs for Channel Load request

Subelement ID	Name	Extensible
0	Reserved	
1	Channel Load Reporting	Yes
2–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Channel Load Reporting subelement indicates the condition for issuing a Channel Load report. The Channel Load Reporting subelement Data field format is shown in Figure 9-185 and contains a 1-octet Reporting Condition subfield and a 1-octet Channel Load Reference Value subfield. The Reporting Condition subfield is described in Table 9-100. The Channel Load Reference value is a Channel Load value as defined in 11.10.9.3 and is the reference value for the indicated reporting condition.

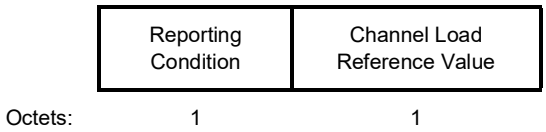

Figure 9-185—Channel Load Reporting subelement Data field format

Table 9-100—Reporting Condition subfield for Channel Load report

Condition for report to be issued	Reporting Condition
Report to be issued after each measurement (default, used when the Channel Load Reporting subelement is not included in the Channel Load request).	0
Report to be issued when the measured Channel Load is greater than or equal to the reference value.	1
Report to be issued when the measured Channel Load is less than or equal to the reference value.	2
Reserved	3–255

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.6 Noise Histogram request

The Measurement Request field corresponding to a Noise Histogram request is shown in Figure 9-186.

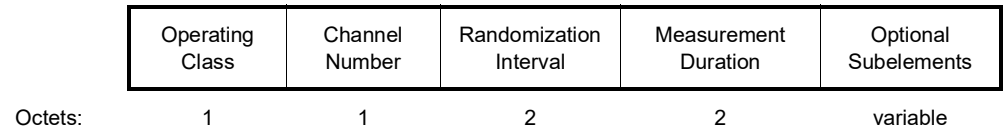

Figure 9-186—Measurement Request field format for Noise Histogram request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-101.

Table 9-101—Optional subelement IDs for Noise Histogram request

Subelement ID	Name	Extensible
0	Reserved	
1	Noise Histogram Reporting	Yes
2–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Noise Histogram Reporting subelement indicates the condition for issuing a Noise Histogram report. The Noise Histogram Reporting subelement Data field format is shown in Figure 9-187 and contains a 1-octet Reporting Condition subfield and a 1-octet ANPI Reference Value subfield. The Reporting Condition subfield is described in Table 9-102. The ANPI Reference Value is an ANPI value as defined in 11.10.9.4 and is the reference value for the indicated reporting condition.

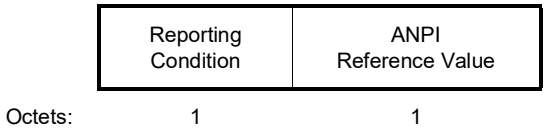

Figure 9-187—Noise Histogram Reporting subelement Data field format

Table 9-102—Reporting Condition subfield for Noise Histogram report

Condition for report to be issued	Reporting Condition
Report to be issued after each measurement (default, used when Noise Histogram Reporting subelement is not included in a Noise Histogram request).	0
Noise Histogram report to be issued when measured ANPI is greater than or equal to the reference value.	1
Noise Histogram report to be issued when measured ANPI is less than or equal to the reference value.	2
Reserved	3–255

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.7 Beacon request

The Measurement Request field corresponding to a Beacon request is shown in Figure 9-188.

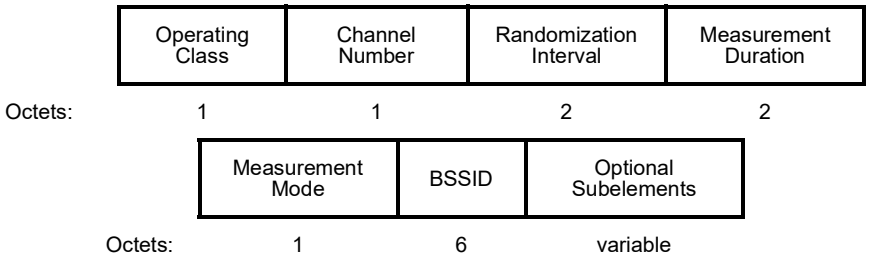

Figure 9-188—Measurement Request field format for Beacon request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E.

For operating classes that encompass a primary channel but do not identify the location of the primary channel, the Channel Number field value is either 0 or 255; otherwise, the Channel Number field value is 0, 255, or the channel number for which the measurement request applies and is defined within an operating class as shown in Annex E.

For operating classes that identify the location of the primary channel, a Channel Number field set to 0 indicates a request to make iterative measurements for all supported channels in the operating class where the measurement is permitted on the channel and the channel is valid for the current regulatory domain.

For operating classes that encompass a primary channel but do not identify the location of the primary channel, a Channel Number field set to 0 indicates a request to make iterative measurements for all primary

Copyright © 2021 IEEE. All rights reserved.

channel positions within all requested and supported channels where the measurement is permitted on the channel and the channel is valid for the current regulatory domain.

For operating classes that identify the location of the primary channel, a Channel Number field set to 255 indicates a request to make iterative measurements for all supported channels in the current operating class listed in the latest AP Channel Report received from the serving AP.

A request frame is a request to make iterative measurements for all primary channel positions in all channels listed in the frame's AP Channel Report subelement when all of the following pertain:

- The operating class indicated by the Operating Class field in that frame encompasses a primary channel.
- The frame does not identify the location of that primary channel.
- The frame's Channel Number field is 255.
- The channel is supported.
- The measurement is permitted on the channel.
- The channel is permitted in the current regulatory domain.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Measurement Mode field indicates the mode to be used for the measurement. The valid measurement modes are listed in Table 9-103. The procedures for each mode are described in 11.10.9.1.

Table 9-103—Measurement Mode definitions for Beacon request

Mode	Value
Passive	0
Active	1
Beacon Table	2
Reserved	3–255

The BSSID field indicates the BSSID of the BSS(s) for which a beacon report is requested. When requesting beacon reports for all BSSs on the channel, the BSSID field contains the wildcard BSSID; otherwise the BSSID field contains a specific BSSID for a single BSS.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined subelements are shown in Table 9-104.

Table 9-104—Optional subelement IDs for Beacon request

Subelement ID	Name	Extensible
0	SSID	No
1	Beacon Reporting	Yes
2	Reporting Detail	Yes
3–9	Reserved	
10	Request	No
11	Extended Request	No
12–50	Reserved	
51	AP Channel Report	No
52–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164	Last Beacon Report Indication Request	No
165–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The SSID subelement indicates the ESS(s) or IBSS(s) for which a beacon report is requested. When SSID is not included in a Beacon request, the default "wildcard SSID" is used; otherwise the SSID is included in the Beacon request and contains a specific SSID for a single ESS or IBSS. The wildcard SSID is used to represent all possible SSIDs. The SSID element is described in 9.4.2.2.

The Beacon Reporting subelement indicates the condition for issuing a Beacon report. The Beacon Reporting subelement is optionally present in a Beacon request for repeated measurements; otherwise it is not present. The Beacon Reporting subelement Data field format is shown in Figure 9-189 and contains a 1-octet Reporting Condition subfield and a 1-octet Threshold/Offset Reference subfield. The Reporting Condition subfield is described in Table 9-105. The Threshold/Offset Reference subfield contains either the threshold value or the offset value to be used for conditional reporting. For Reporting Condition subfield 1 and 2, the threshold value is a logarithmic function of the received signal power, as defined 9.4.2.37. For Reporting Condition subfield 3 and 4, the threshold value is a logarithmic function of the signal-to-noise ratio, as described in 9.4.2.40. For Reporting Condition subfield 5 to 10, the offset value is an 8-bit 2s complement integer in units of 0.5 dBm. The indicated reporting condition applies individually to each measured Beacon, Measurement Pilot, or Probe Response frame. Reporting conditions are further described in 11.10.9.1.

Table 9-105—Reporting Condition subfield for Beacon report

Condition for report to be issued in Repeated Measurement	Reporting Condition
Report to be issued after each measurement (default, used when the Beacon Reporting subelement is not included in a Beacon request).	0
The measured RCPI level is greater than the threshold value contained in the Threshold/Offset Reference.	1
The measured RCPI level is less than the threshold value contained in the Threshold/ Offset Reference.	2
The measured RSNI level is greater than the threshold value contained in the Threshold/Offset Reference.	3
The measured RSNI level is less than the threshold value contained in the Threshold/ Offset Reference.	4
The measured RCPI level is greater than a threshold defined by an offset from the serving AP's reference RCPI, where the offset value is contained in the Threshold/ Offset Reference.	5
The measured RCPI level is less than a threshold defined by an offset from the serving AP's reference RCPI, where the offset value is contained in the Threshold/ Offset Reference.	6
The measured RSNI level is greater than a threshold defined by an offset from the serving AP's reference RSNI, where the offset value is contained in the Threshold/ Offset Reference.	7
The measured RSNI level is less than a threshold defined by an offset from the serving AP's reference RSNI, where the offset value is contained in the Threshold/ Offset Reference.	8
The measured RCPI level is in a range bound by the serving AP's reference RCPI and an offset from the serving AP's reference RCPI, where the offset value is contained in the Threshold/Offset Reference.	9
The measured RSNI level is in a range bound by the serving AP's reference RSNI and an offset from the serving AP's reference RSNI, where the offset value is contained in the Threshold/Offset Reference.	10
Reserved	11–255

The Reporting Detail subelement contains a 1-octet Reporting Detail data field that defines the level of detail per AP to be reported to the requesting STA. The Reporting Detail values are defined in Table 9-106. The indicated reporting detail applies individually to each measured Beacon, Measurement Pilot, or Probe Response frame. If the Reporting Detail equals 1, a Request element is optionally present in the list of optional subelements. If included, the Request element lists the Element IDs of the elements requested to be reported in the Reported Frame Body of the Beacon report.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Last Beacon Report Indication Request subelement has the format defined in Figure 9-789, with a Length field set to 1. When included in a Beacon request with the Data field set to 1, it indicates that the requesting STA asks the responding STA to include an indication in the Beacon report to indicate the last frame of the sequence of frames generated as a response to a Beacon request.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-106—Reporting Detail values

Level of detail requested	Reporting Detail
No fixed-length fields or elements	0
All fixed-length fields and any requested elements in the Request element if present	1
All fixed-length fields and elements (default, used when Reporting Detail subelement is not included in a Beacon request)	2
Reserved	3–255

The Request, Extended Request, AP Channel Report, and Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.9, 9.4.2.10, 9.4.2.35, and 9.4.2.25, respectively). Zero or more AP Channel Report subelements and zero or more Vendor Specific subelements are included in the list of optional subelements. An AP Channel Report subelement containing an operating class with an 80+ behavior limit (as defined in Annex E) is interpreted in conjunction with following AP Channel Report elements as defined in 11.10.9.1.

If one or more AP Channel Report elements are included, they indicate that iterative measurements are requested first on the channel(s) indicated by the Operating Class and Channel Number fields included in the Beacon request, and second on the channel(s) indicated by the Operating Class and Channel List fields of each AP Channel Report element included in the Beacon request. The procedures for iterative measurements on multiple channels are described in 11.10.9.1.

9.4.2.20.8 Frame request

The Measurement Request field corresponding to a Frame request is shown Figure 9-190.

	Operating Class	Channel Number	Randomization Interval	Measurement Duration	Frame Request Type	MAC Address	Optional subelements
Octets:	1	1	2	2	1	6	variable

Figure 9-190—Measurement Request field format for Frame request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Frame Request Type indicates the subelements requested in the Frame report. A 1 signifies that a Frame Count Report is requested. The values 0 and 2 to 255 are reserved.

The MAC Address field indicates the TA field to match against Data and Management frames in order to count toward the Frame report generated in response to this Frame request.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-107.

Table 9-107—Optional subelement IDs for Frame request

Subelement ID	Name	Extensible
0–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.9 STA Statistics request

The Measurement Request field corresponding to a STA Statistics request is shown in Figure 9-191.

	Peer MAC Address	Randomization Interval	Measurement Duration	Group Identity	Optional Subelements
Octets:	6	2	2	1	variable

Figure 9-191—Measurement Request field format for STA Statistics request

The Peer MAC Address field is the RA or TA MAC address for the frame statistics of this measurement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Measurement Duration field is set to the duration of the requested measurement in TUs except when triggered reporting is used. When triggered reporting is used, the measurement duration is 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Group Identity field indicates the requested statistics group according to Table 9-108.

Table 9-108—Group Identity for a STA Statistics request

Statistics Group Name	Group Identity
STA Counters from dot11CountersTable	0
STA Counters from dot11MacStatistics group	1
QoS STA Counters for UP0 from dot11QosCountersTable	2
QoS STA Counters for UP1 from dot11QosCountersTable	3
QoS STA Counters for UP2 from dot11QosCountersTable	4
QoS STA Counters for UP3 from dot11QosCountersTable	5
QoS STA Counters for UP4 from dot11QosCountersTable	6
QoS STA Counters for UP5 from dot11QosCountersTable	7
QoS STA Counters for UP6 from dot11QosCountersTable	8
QoS STA Counters for UP7 from dot11QosCountersTable	9
BSS Average Access Delays as described in 9.4.2.38 and 9.4.2.43	10
STA Counters from dot11CountersGroup3 (A-MSDU)	11
STA Counters from dot11CountersGroup3 (A-MPDU)	12
STA Counters from dot11CountersGroup3 (BlockAckReq, Channel Width, PSMP)	13
STA Counters from dot11CountersGroup3 (RD, dual CTS)	14
STA Counters from dot11CountersGroup3 (beamforming and STBC)	15
RSNA Counters	16
Reserved	17–255

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-109.

Table 9-109—Optional subelement IDs for STA Statistics request

Subelement ID	Name	Extensible
0	Reserved	
1	Triggered Reporting	No
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Triggered Reporting subelement is used to specify trigger conditions and thresholds for triggered STA Statistics measurements. It is present when setting up triggered reporting from STA Counters, QoS STA Counters, or RSNA Counters; see 11.10.9.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Triggered Reporting subelement for STA Counters is shown in Figure 9-192. The fields marked as optional are only present if the appropriate bit in the STA Counter Trigger Condition field is 1.

	Measurement Count	Trigger Timeout	STA Counter Trigger Condition	dot11FailedCount Threshold (optional)	dot11FCS ErrorCount Threshold (optional)
Octets:	4	2	2	0 or 4	0 or 4

	dot11Multiple RetryCount Threshold (optional)	dot11Frame DuplicateCount Threshold (optional)	dot11RTS FailureCount Threshold (optional)	dot11Ack FailureCount Threshold (optional)	dot11RetryCount Threshold (optional)
Octets:	0 or 4	0 or 4	0 or 4	0 or 4	0 or 4

Figure 9-192—Triggered Reporting subelement format for STA Counters

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The STA Counter Trigger Condition field specifies trigger values used when requesting triggered STA Statistics reporting. The format of the STA Counter Trigger Condition field is shown in Figure 9-193.

	B0	B1	B2	B3	B4	B5	B6	B7	B15
	dot11FailedCount	dot11FCSError Count	dot11Multiple RetryCount	dot11Frame DuplicateCount	dot11RTS FailureCount	dot11Ack FailureCount	dot11RetryCount	Reserved	
Bits	1	1	1	1	1	1	1	9	

Figure 9-193—STA Counter Trigger Condition field format

For each bit in the STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-192) in the Triggered Reporting subelement for STA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding STA counter defined in 9-237 and 9-238 (in 9.4.2.21.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 11.10.9.5. One or more trigger conditions are set with specified thresholds. In the triggered STA Statistics request, the Group Identity field is either 0 or 1. When the Group Identity field of the triggered STA Statistics request is 0, B2–B6 in the STA Counter Trigger Condition field are set to 0. When the group identity of the triggered STA Statistics request is 1, B0 and B1 in the STA Counter Trigger Condition field are set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Triggered Reporting subelement for QoS STA Counters is shown in Figure 9-194. The fields marked as optional are only present if the appropriate bit in the QoS STA Counter Trigger Condition subfield is 1.

	Measurement Count	Trigger Timeout	QoS STA Counter Trigger Condition	dot11QoSFailed Count Threshold (optional)	dot11QoSRetry Count Threshold (optional)
Octets:	4	2	2	0 or 4	0 or 4

	dot11QoSMultiple RetryCount Threshold (optional)	dot11QoSFrame DuplicateCount Threshold (optional)	dot11QoSRTSC ount Failure Threshold (optional)	dot11QoSAck FailureCount Threshold (optional)	dot11QoSDisca rdedCount Threshold (optional)
Octets:	0 or 4	0 or 4	0 or 4	0 or 4	0 or 4

Figure 9-194—Triggered Reporting subelement format for QoS STA Counters

The UP of the QoS STA Counters for triggered QoS Statistics measurement is determined by the group identity of the Measurement Request field for a STA Statistics request as defined in 9-108.

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STAs that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The QoS STA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the QoS STA Counter Trigger Condition field is shown in Figure 9-195.

	B0	B1	B2	B3
	dot11QoS FailedCount	dot11QoS RetryCount	dot11QoSMultiple RetryCount	dot11QoSFrame DuplicateCount
Bits:	1	1	1	1

	B4	B5	B6	B7-B15
	dot11QoSRTS FailureCount	dot11QoSAck FailureCount	dot11QoS DiscardedCount	Reserved
Bits:	1	1	1	9

Figure 9-195—QoS STA Counter Trigger Condition field format

For each bit in the QoS STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-194) in the Triggered Reporting subelement for QoS STA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding QoS STA counter defined in Figure 9-239 (in 9.4.2.21.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 11.10.9.5. One or more trigger conditions are set with specified thresholds.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Triggered Reporting subelement for RSNA Counters is shown in Figure 9-196. The fields marked as optional are only present if the appropriate bit in the RSNA Trigger Condition subfield is 1.

	Measurement Count	Trigger Timeout	RSNA Counter Trigger Condition	dot11RSNAStats CMACICVErrors Threshold (optional)	dot11RSNA StatsCMACReplays Threshold (optional)
Octets:	4	2	2	0 or 4	0 or 4

	dot11RSNA StatsRobustMgmt CCMPReplays Threshold (optional)	dot11RSNAStats TKIPICVErrors Threshold (optional)	dot11RSNAStats TKIPReplays Threshold (optional)	dot11RSNAStats CCMPDecryptErrors Threshold (optional)	dot11RSNAStats CCMPReplays Threshold (optional)
Octets:	0 or 4	0 or 4	0 or 4	0 or 4	0 or 4

Figure 9-196—Triggered Reporting subelement format for RSNA Counters

The value in the Measurement Count field specifies the number of MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The RSNA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the RSNA Trigger Condition field is shown in Figure 9-197.

	B0	B1	B2	B3
	dot11RSNAStats CMACICVErrors	dot11RSNA StatsCMACReplays	dot11RSNAStats RobustMgmt CCMPReplays	dot11RSNAStats TKIPICVErrors
Bits:	1	1	1	1

	B4	B5	B6	B7	B15
	dot11RSNAStats TKIPReplays	dot11RSNAStats CCMPDecryptErrors	dot11RSNAStats CCMPReplays	Reserved	
Bits:	1	1	1	9	

Figure 9-197—RSNA Trigger Condition field format

For each bit in the RSNA Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-196) in the Triggered Reporting subelement for RSNA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding RSNA counter defined in Figure 9-241 (in 9.4.2.21.9) exceeds the value of the specified threshold, within the total number of MPDUs indicated in the Measurement Count field. See 11.10.9.5. One or more trigger conditions are set with specified thresholds.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.10 LCI request (Location configuration information request)

The Measurement Request field corresponding to an LCI request is shown in Figure 9-198.

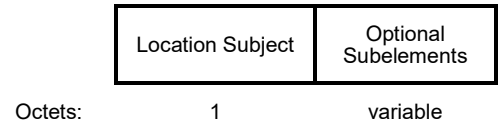

Figure 9-198—Measurement Request field format for LCI request

The Location Subject field of an LCI request is 1 octet. See Table 9-110.

Table 9-110—Location Subject field definition

Value	Location Subject
0	Location Subject Local
1	Location Subject Remote
2	Location Subject Third Party
3–255	Reserved

The term Local refers to the location of the requesting STA, and Remote refers to the location of the reporting STA.

NOTE 1—A measurement request with its Location Subject value Location Subject Local is used by a requesting STA to obtain its own location, asking "Where am I?" The Measurement Request with its Location Subject value Location Subject Remote is used by a requesting STA to obtain the location of the reporting STA, asking "Where are you?"

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-111.

Table 9-111—Optional subelement IDs for LCI request

Subelement ID	Name	Extensible
0	Reserved	
1	Azimuth Request	Yes
2	Originator Requesting STA MAC Address	No
3	Target MAC Address	No
4	Maximum Age	Yes
5–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Azimuth Request subelement is present when requesting azimuth information. The Azimuth Request subelement is as shown in Figure 9-199.

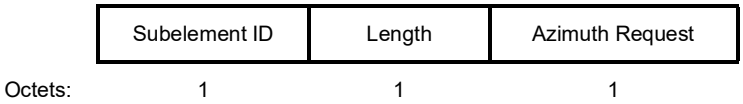

Figure 9-199—Azimuth Request subelement format

The Subelement ID field is defined in Table 9-111.

The Length field is defined in 9.4.3.

The Azimuth Request field of an Azimuth Request subelement is shown in Figure 9-200.

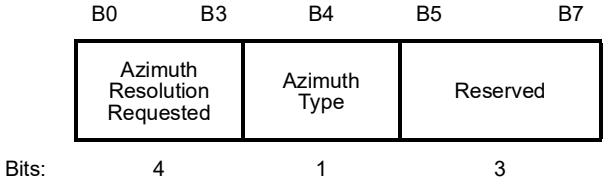

Figure 9-200—Azimuth Request field format

Azimuth Resolution Requested is the number of valid most significant bits requested for the fixed-point value of Azimuth, reported in integer degrees. Values above 9 are reserved.

Azimuth Type (bit 4) is set to 1 to request a report of the Azimuth of radio reception and is set to 0 to request a report of the Azimuth of front surface of the reporting STA.

NOTE 2—A geographic feature is an abstraction of a real-world phenomenon; it is a geographic feature if it is associated with a location relative to the Earth. The designation of a horizontal plane is relative to the Earth. The designation of the "front surface" of a station is arbitrary, but refers to an orientable surface (possessing a centerline) of the station. It is common to use a direction cosine matrix to convert from one coordinate system to another, i.e., body-centered coordinates to earth-centered coordinates.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-201.

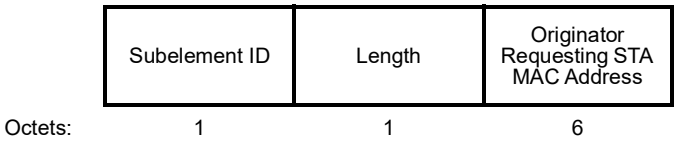

Figure 9-201—Originator Requesting STA MAC Address subelement format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC Address subelement is shown in Figure 9-202.

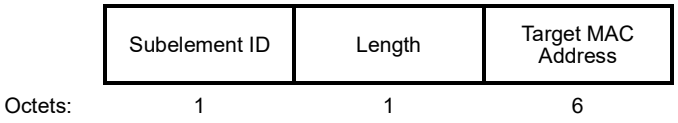

Figure 9-202—Target MAC Address subelement format

The Maximum Age subelement indicates the maximum age of the requested LCI. The format of the Maximum Age subelement is defined in Figure 9-203. The absence of a Maximum Age subelement indicates that an LCI determined at or after the LCI request is received is requested.

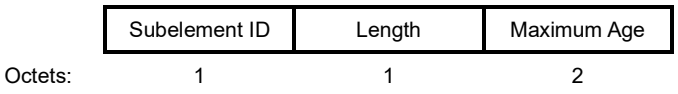

Figure 9-203—Maximum Age subelement format

The Length field is defined in 9.4.3.

The Maximum Age field of a Maximum Age subelement indicates the maximum elapsed time between when an LCI is determined and when an LCI request is received, within which the LCI satisfies the LCI request. The Maximum Age field is encoded as an unsigned integer with units of 0.1 s. The value of 0 is reserved. The value of 65 535 indicates that any LCI age is acceptable.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.11 Transmit Stream/Category Measurement request

The Transmit Stream/Category Measurement applies to TIDs for traffic streams associated with TSPECs and also to TIDs for traffic categories for QoS traffic without TSPECs. The Measurement Request field corresponding to a Transmit Stream/Category Measurement request is shown in Figure 9-204.

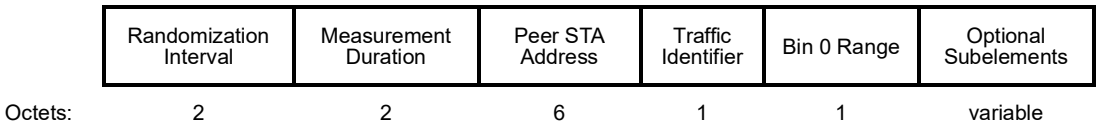

Figure 9-204—Measurement Request field format for Transmit Stream/Category Measurement Request

The Randomization Interval field is set to the maximum random delay in the measurement start time, in units of TUs. The use of the Randomization Interval field is described in 11.10.3. When requesting a triggered Transmit Stream/Category Measurement, the randomization interval is not used and the Randomization Interval field is reserved. See 11.10.9.8.

The Measurement Duration is set to the duration of the requested measurement, in units of TUs except when setting up a triggered QoS measurement, when it is not used and is set to 0.

The Peer STA Address contains a MAC address indicating the RA in the MSDUs to be measured.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Traffic Identifier field contains the TID subfield as shown in Figure 9-205.

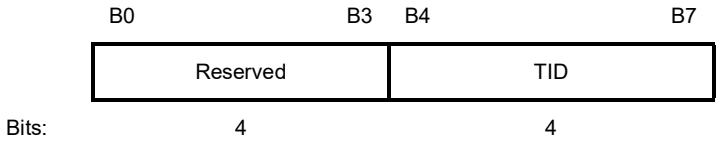

Figure 9-205—Traffic Identifier field format

The TID subfield indicates the TC or TS for which traffic is to be measured.

Bin 0 Range indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, in units of TUs. The Bin 0 Range value is used to calculate the delay ranges of the other 5 bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as described in 9.4.2.21.11.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-112.

Table 9-112—Optional subelement IDs for Transmit Stream/Category Measurement Request

Subelement ID	Name	Extensible
0	Reserved	
1	Triggered Reporting	Yes
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Triggered Reporting subelement is used to specify measurement trigger thresholds. It is present only if requesting triggered transmit stream/category measurement reporting. The Triggered Reporting subelement format is shown in Figure 9-206.

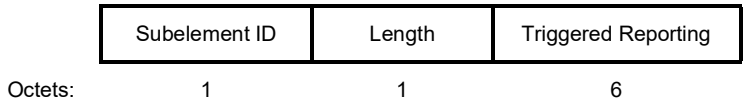

Figure 9-206—Triggered Reporting subelement format

The Subelement ID field is defined in Table 9-112.

The Length field is defined in 9.4.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Triggered Reporting field is as shown in Figure 9-207.

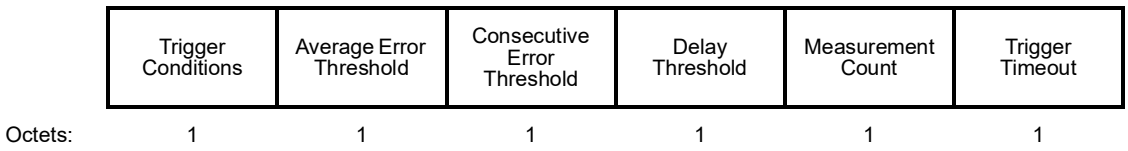

Figure 9-207—Triggered Reporting field format

Trigger Conditions is a bit-field that specifies reporting triggers when requesting a triggered transmit stream/category measurement. The format of the Trigger Conditions bit-field is shown in Figure 9-208.

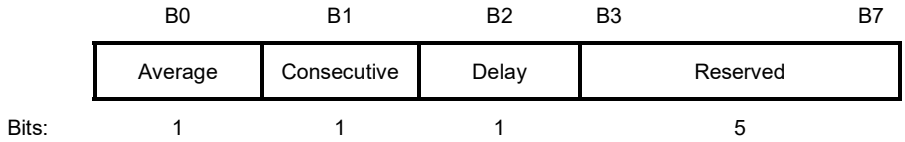

Figure 9-208—Trigger Conditions bit-field format

— The Average bit is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded out of the number of preceding MSDUs specified in Measurement Count is greater than or equal to the value given in Average Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit, or due to the MSDU lifetime having been reached, are counted.

— The Consecutive bit is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded in succession is greater than or equal to the value given in Consecutive Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit, or due to the MSDU lifetime having been reached, are counted.

— The Delay bit is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of consecutive MSDUs for the TC or TS given by the TID that experience a transmit delay greater than or equal to the value specified in the Delay Threshold subfield is greater than or equal to the value given in Delayed MSDU Count. Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used.

The Average Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the Average trigger condition. The field is reserved if the Average Error Threshold subfield of the Trigger Conditions bit-field is 0.

The Consecutive Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the consecutive trigger condition. The field is reserved if the Consecutive Error Threshold subfield of the Trigger Conditions bit-field is 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Delay Threshold field contains two subfields as shown in Figure 9-209. The Delay Threshold field is reserved if the Delay Threshold subfield of the Trigger Conditions bit-field is 0.

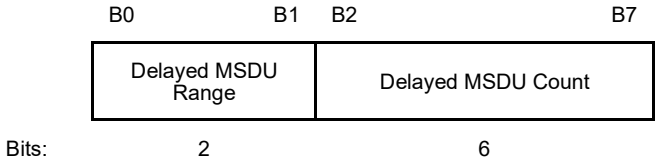

Figure 9-209—Delay Threshold subfield format

The Delayed MSDU Range field contains a value representing the MSDU transmit delay at or above which an MSDU is counted toward the Delayed MSDU Count threshold. The Delayed MSDU Range field is encoded as a value representing the lower bound of a bin in the Transmit Delay Histogram as shown in Table 9-113. The Transmit Delay Histogram is defined in 9.4.2.21.11.

Table 9-113—Delayed MSDU Range Definitions

Delayed MSDU Range	Condition
0	Transmit Delay = Lower Bound of Bin 2
1	Transmit Delay = Lower Bound of Bin 3
2	Transmit Delay = Lower Bound of Bin 4
3	Transmit Delay = Lower Bound of Bin 5

The Delayed MSDU Count field contains a value representing the number of MSDUs to be used as the threshold value for the delay trigger condition.

The Measurement Count field contains a number of MSDUs. This value is used to calculate an average discard count for the average trigger condition. It is also used in place of measurement duration in determining the scope of the reported results when a report is triggered; see 11.10.9.8.

The Trigger Timeout field contains a value, in units of 100 TU, during which a measuring STA does not generate further triggered transmit stream/category measurement reports after a trigger condition has been met. See 11.10.9.8.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.12 Measurement Pause request

The Measurement Request field corresponding to a Measurement Pause request is shown in Figure 9-210. The Measurement Pause request cannot be processed in parallel with any other measurement request. See 11.10.9.7.

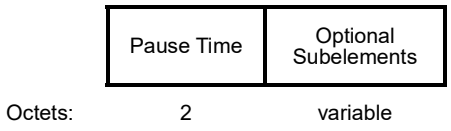

Figure 9-210—Measurement Request field format for Measurement Pause request

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Pause Time field contains a number between 1 and 65 535 representing the time period for which measurements are suspended or paused. The time unit for the Pause Time is 10 TUs. The Pause Time value 0 is reserved. Measurement Pause requests are used to provide time delays between the execution times of Measurement Request elements in a Radio Measurement Request frame.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-114.

Table 9-114—Optional subelement IDs for Measurement Pause request

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.13 Multicast Diagnostics request

The Measurement Request field corresponding to a Multicast Diagnostics request is shown in Figure 9-211. The response to a Multicast Diagnostics request is a Multicast Diagnostics report.

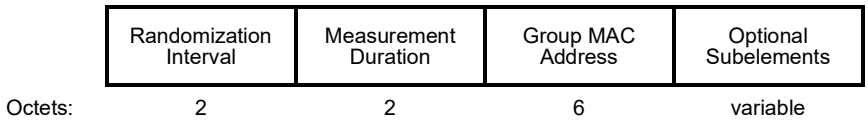

Figure 9-211—Measurement Request field format for a Multicast Diagnostics request

The Randomization Interval field is the upper limit of random delay before the measurement begins, expressed in TUs. The use of the Randomization Interval field is described in 11.11.3. When requesting a triggered multicast diagnostic report, the Randomization Interval field is reserved.

The Measurement Duration field is the duration of the requested measurement, expressed in TUs. When requesting a triggered multicast diagnostic report, the Measurement Duration field is reserved.

A Group MAC Address field with bit 0 set to 1 contains the MAC address of the group addressed frames to which the measurement request relates. A Group MAC Address field with bit 0 set to 0 indicates that all group addressed frames, apart from the broadcast address, are requested.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined subelements are shown in Table 9-115.

Table 9-115—Optional subelement IDs for STA Multicast Diagnostics request

Subelement ID	Name	Extensible
0	Reserved	
1	Multicast Triggered Reporting	No
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Multicast Triggered Reporting subelement is used to specify trigger conditions and thresholds. It is present only when requesting triggered multicast diagnostic reporting. The format of Multicast Triggered Reporting subelement is shown in Figure 9-212.

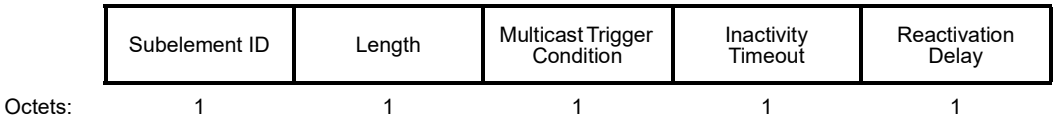

Figure 9-212—Multicast Triggered Reporting subelement format

The Multicast Trigger Condition field specifies reporting triggers for triggered management diagnostic reporting. The format of the Multicast Trigger Condition field is shown in Figure 9-213.

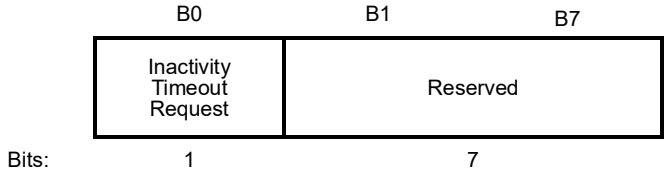

Figure 9-213—Multicast Trigger Condition field format

The Inactivity Timeout Request field is 1 to request that a multicast triggered report be generated when no group addressed frames with the monitored group address are received in a time equal to the value given in the Inactivity Timeout field. The Inactivity Timeout Request field is 0 when a multicast reception timeout is not requested.

The Inactivity Timeout field contains a time value in units of 100 TUs to be used as the threshold value for the inactivity timeout trigger condition.

The Reactivation Delay field contains a value in units of 100 TUs during which a measuring STA does not generate further multicast triggered reports after a trigger condition has been met.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25).

The use of Multicast Diagnostics request is defined in 11.10.19.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.20.14 Location Civic request

The Measurement Request field corresponding to a Location Civic request is shown in Figure 9-214. The response to a Location Civic request is a Location Civic report.

	Location Subject	Civic Location Type	Location Service Interval Units	Location Service Interval	Optional Subelements
Octets:	1	1	1	2	variable

Figure 9-214—Location Civic Request field format

The Location Subject field is 1 octet and is defined in Table 9-110.

The Civic Location Type field contains the format of location information in the Location Civic report, as indicated in Table 9-116.

Table 9-116—Civic Location Type field values

Civic Location Type field value	Name	Description
0	IETF RFC 4776	Starting at the country code field (i.e., excluding the GEOCONF_CIVIC/ OPTION_GEOCONF_CIVIC, N/option-len and what fields); includes all subsequent RFCs that define additional civic address Types
1	Vendor Specific	
2–255	Reserved	

When the Civic Location Type value is Vendor Specific, a Vendor Specific subelement is included in the list of optional subelements that identifies the Organization Identifier corresponding to the Civic Location Type field.

The Location Service Interval Units field contains the units for the Location Service Interval field, as indicated in Table 9-117.

Table 9-117—Location Service Interval Units

Location Service Interval Units value	Description
0	Seconds
1	Minutes
2	Hours
3–255	Reserved

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Civic reports. A Location Service Interval of 0 indicates that only a single Location Civic report is requested.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-118.

Table 9-118—Optional subelement IDs for Location Civic request

Subelement ID	Name	Extensible
0	Reserved	
1	Originator Requesting STA MAC Address	No
2	Target MAC Address	No
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting for the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-201.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC Address subelement is shown in Figure 9-202.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25).

9.4.2.20.15 Location Identifier request

The Measurement Request field corresponding to a Location Identifier request is shown in Figure 9-215. The response to a Location Identifier request is a Location Identifier report.

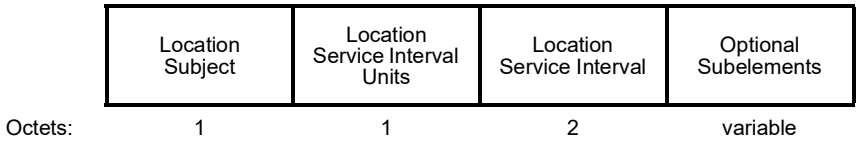

Figure 9-215—Location Identifier request field format

The Location Subject field is 1 octet and is defined in Table 9-110.

The Location Service Interval Units field is defined in Table 9-117.

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Identifier reports. A Location Service Interval of 0 indicates that only a single Location Identifier report is requested.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-119.

Table 9-119—Optional subelement IDs for Location Identifier request

Subelement ID	Name	Extensible
0	Reserved	
1	Originator Requesting STA MAC Address	No
2	Target MAC Address	No
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-201.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC Address subelement is shown in Figure 9-202.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25).

9.4.2.20.16 Directional Channel Quality request

The Measurement Request field corresponding to a Directional Channel Quality request is shown in Figure 9-216. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform measurements toward a Target STA.

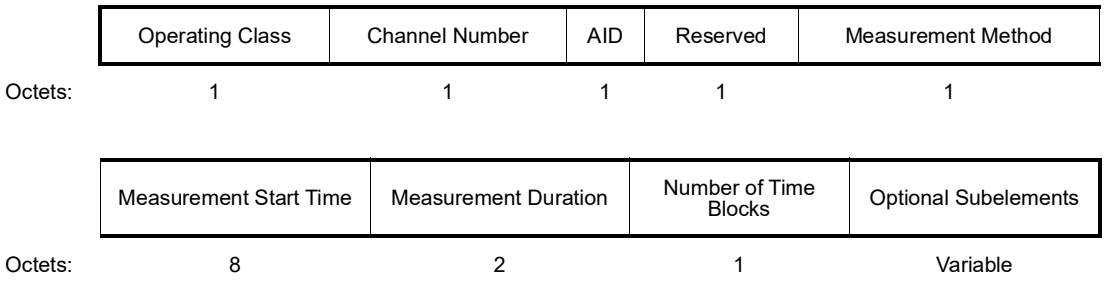

Figure 9-216—Measurement Request field format for Directional Channel Quality request

The Operating Class field indicates the channel set for which the measurement request applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The AID field contains the AID assigned to the Target STA by the AP or PCP.

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this field is set to 0, it indicates ANIPI. If this field is set to 1, it indicates RSNI. Other values are reserved.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A 0 indicates that the measurement starts immediately.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.10.4.

The Number of Time Blocks field indicates the number of time blocks within the Measurement Duration. The ratio (Measurement Duration/Number of Time Blocks) provides the duration of an individual measurement unit.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-120.

Table 9-120—Optional subelement IDs for Directional Channel Quality request

Subelement ID	Name	Extensible
0	Reserved	
1	Directional Channel Quality Reporting	Yes
2–220	Reserved	No
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Directional Channel Quality Reporting subelement indicates the condition for issuing a Directional Channel Quality report. The Directional Channel Quality Reporting subelement Data field format is shown in Figure 9-217 and contains a 1-octet Reporting Condition subfield and a 1-octet Directional Channel Quality Reference Value subfield. The Reporting Condition subfield is described in Table 9-121. The Directional Channel Quality Reference value is a Directional Channel Quality value and is the reference value for the indicated reporting condition.

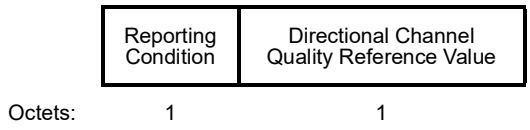

Figure 9-217—Directional Channel Quality Reporting subelement Data field format

Table 9-121—Reporting Condition subfield for Directional Channel Quality report

Condition for report to be issued	Reporting condition
Report to be issued after each measurement (default, used when Directional Channel Quality Reporting subelement is not included in Directional Channel Quality Request).	0
Report to be issued when measured ANIPI or RSNI is greater than or equal to the reference value.	1
Report to be issued when measured ANIPI or RSNI is less than or equal to the reference value.	2
Reserved	3–255

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.17 Directional Measurement request

The Measurement Request field corresponding to a Directional Measurement request is shown in Figure 9-218. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform directional channel measurements in all sectored receiving directions.

	Operating Class	Channel Number	Measurement Start Time	Measurement Duration per Direction	Measurement Method	Optional Subelements
Octets	1	1	8	2	1	Variable

Figure 9-218—Measurement Request field format for Directional Measurement request

The Operating Class field indicates the channel set for which the measurement request applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A 0 indicates that the measurement starts immediately.

The Measurement Duration per Direction field is set to the preferred or mandatory duration of the requested measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this field is set to 0, it indicates ANIPI. If this field is set to 1, it indicates RCPI. If the field is set to 2, it indicates Channel Load. Other values are reserved.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-122.

Copyright © 2021 IEEE. All rights reserved.

Table 9-122—Optional subelement IDs for Directional Measurement request

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.18 Directional Statistics request

The Measurement Request field corresponding to a Directional Statistics request is shown in Figure 9-219. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform directional channel measurements in all sectored receiving directions.

	Operating Class	Channel Number	Measurement Start Time	Measurement Duration per Direction	Measurement Method	Directional Statistics Bitmap	Optional Subelements
Octets	1	1	8	2	1	1	Variable

Figure 9-219—Measurement Request field format for Directional Statistics request

The Operating Class field indicates the channel set for which the measurement request applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A 0 indicates that the measurement starts immediately.

The Measurement Duration per Direction field is set to the preferred or mandatory duration of the requested measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this field is set to 0, it indicates ANIPI. If this field is set to 1, it indicates RCPI. If the field is set to 2, it indicates Channel Load. Other values are reserved.

The Directional Statistics Bitmap field format is shown in Figure 9-220. The Maximum field set to 1 indicates that the maximum measurement result among all directions is expected in the measurement report. The Minimum field set to 1 indicates that the minimum measurement result among all directions is expected in the measurement report. The Average field set to 1 indicates that the average measurement result among all directions is expected in the measurement report. The Variance field set to 1 indicates that the variance of measurement results among all directions is expected in the measurement report. Other bits are reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

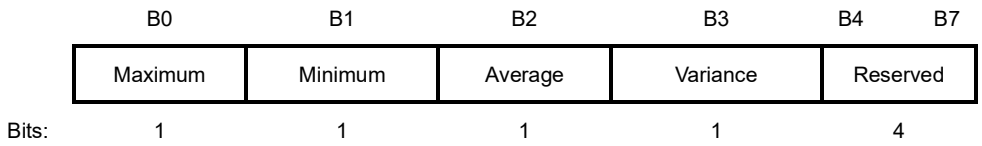

Figure 9-220—Directional Statistics Bitmap field format

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-123.

Table 9-123—Optional subelement IDs for Directional Statistics request

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.20.19 Fine Timing Measurement Range request

The Measurement Request field corresponding to a Fine Timing Measurement Range request is shown in Figure 9-221.

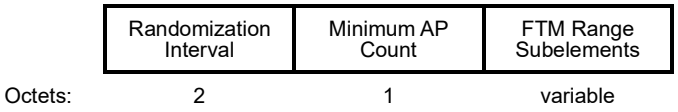

Figure 9-221—Measurement Request field format for a Fine Timing Measurement Range request

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.10.3.

The Minimum AP Count field specifies the minimum number of FTM ranges between the requested STA and the APs listed in the Neighbor Report subelements that are requested. The value 0 and values above 15 are reserved.

The FTM Range Subelements field contains one or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The FTM Range subelements are listed in Table 9-124.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement IDs for subelements in the Fine Timing Measurement Range request are defined in Table 9-124. The number of Neighbor Report subelements included in the FTM Range Subelements field is at least the value of the Minimum AP Count field. Each Neighbor Report subelement has the same format as the Neighbor Report element and contains the Wide Bandwidth Channel subelement. See Table 9-124 and 9.4.2.36. The Neighbor Report subelements specify a set of nearby APs; the requested STA is requested to perform the FTM procedure with a subset of these APs (see 11.10.9.11).

Table 9-124—FTM Range subelement IDs for Fine Timing Measurement Range request

Subelement ID	Name	Extensible
0–3	Reserved	
4	Maximum Age	Yes
5–51	Reserved	
52	Neighbor Report	Subelements
53–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Maximum Age subelement indicates the maximum age of the requested FTM ranges. The format of the Maximum Age subelement is defined in Figure 9-203. The absence of a Maximum Age subelement indicates that FTM ranges determined at or after the Fine Timing Measurement Range request is received are requested.

The Subelement ID field is defined in Table 9-124.

The Length field is defined in 9.4.3.

The Maximum Age field of the Maximum Age subelement indicates the maximum elapsed time between when FTM ranges are determined and when a Fine Timing Measurement Range request is received, within which the FTM ranges satisfy the Fine Timing Measurement Range request. The Maximum Age field is encoded as an unsigned integer with units of 0.1 s. The value 0 is reserved. The value 65 535 indicates that FTM ranges determined at any time are acceptable.

The Vendor Specific subelement has the same format as the corresponding element (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21 Measurement Report element

9.4.2.21.1 General

The Measurement Report element contains a measurement report. The format of the Measurement Report element is shown in Figure 9-222. The Measurement Report element is included in Measurement Report frames, as described in 9.6.2.3, or Radio Measurement Report frames, as described in 9.6.6.3. Measurement Types 0, 1, and 2 are used for spectrum management and are included only in Measurement Report frames. All other Measurement Types are included only in Radio Measurement Report frames. The use of

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Measurement Report elements and frames for spectrum management is described in 11.8.7. The use of Measurement Report elements and frames for radio measurement is described in 11.10.

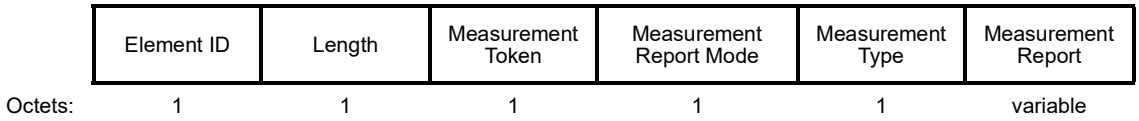

Figure 9-222—Measurement Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Measurement Token field is set to the value of the Measurement Token field in the corresponding Measurement Request element. If the Measurement Report element is being sent autonomously, then the Measurement Token is set to 0. If the Measurement Report element is being sent in a Location Track Notification frame, then the Measurement Token field is set to the same value as the Location Configuration Request frame Dialog Token field that configured the STA to send the Location Track Notification frames.

The Measurement Report Mode field (shown in Figure 9-223) is used to indicate the reason for a failed or rejected measurement request. The Measurement Report Mode is a bit field with the following bits defined:

— Late bit (bit 0) indicates whether this STA is unable to carry out a measurement request because it received the request after the requested measurement time. The Late bit is set to 1 to indicate the request was too late. The Late bit is set to 0 to indicate the request was received in time for the measurement to be executed. The Late bit only applies to spectrum management measurement and is set to 0 in all measurement report elements for radio measurement types (see Table 9-125).

— Incapable bit (bit 1) indicates whether this STA is incapable of generating a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Incapable bit is set to 1 to indicate the STA is incapable. The Incapable bit is set to 0 to indicate the STA is capable or the report is autonomous.

— Refused bit (bit 2) indicates whether this STA is refusing to generate a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Refused bit is set to 1 to indicate the STA is refusing. The Refused bit is set to 0 to indicate the STA is not refusing or the report is autonomous.

— All other bits are reserved.

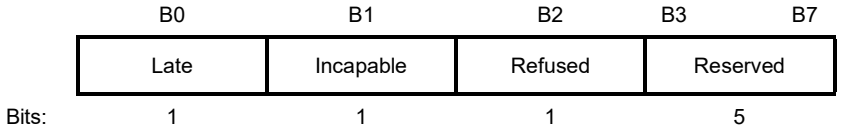

Figure 9-223—Measurement Report Mode field format

No more than one bit is set to 1 within a Measurement Report Mode field. All bits within the Measurement Mode field are set to 0 if the results of a successful measurement request or an autonomous measurement are being reported.

The Measurement Type field is set to a number that identifies the measurement report. The Measurement Types that have been allocated are shown in Table 9-125.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-125—Measurement Type field definitions for measurement reports

Name	Measurement Type
Basic	0
CCA	1
RPI Histogram	2
Channel Load	3
Noise Histogram	4
Beacon	5
Frame	6
STA Statistics	7
LCI	8
Transmit Stream/Category Measurement	9
Multicast Diagnostics	10
Location Civic	11
Location Identifier	12
Directional Channel Quality	13
Directional Measurement	14
Directional Statistics	15
Fine Timing Measurement Range	16
Reserved	17–255

The Measurement Report field is not present when the Late bit is equal to 1, the Incapable bit is equal to 1, or the Refused bit is equal to 1. Otherwise, it contains a single measurement report, as described in 9.4.2.21.2 to 9.4.2.21.11.

References in this standard to a '<name> report', where <name> corresponds to one of the Measurement Types in Table 9-125 is equivalent to (according to context) a) 'a Measurement Report frame or Radio Measurement Report frame carrying a Measurement Report element with the Measurement Type field equal to <name>' or b) 'a Measurement Report element with the Measurement Type field equal to <name>'.

ANIPI is set to the average noise plus interference power value measured during the indicated Measurement Duration, using the same units and accuracy as defined for ANPI in 11.10.9.4.

RCPI is a logarithmic indication of the received channel power of the corresponding Link Measurement Request frame, as defined in 9.4.2.37.

RSNI is the ratio of the received signal power to the noise plus interference power, as defined in 9.4.2.40.

Channel Load is measured and reported as defined in 11.10.9.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.21.2 Basic report

The format of the Measurement Report field corresponding to a Basic report is shown in Figure 9-224.

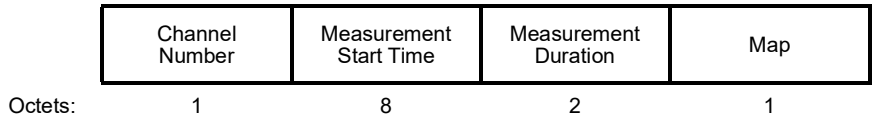

Figure 9-224—Measurement Report field format for a Basic report

The Channel Number field is set to the channel number to which the Basic report applies where the Channel Number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the Basic report measurement started.

The Measurement Duration field is set to the duration over which the Basic report was measured, expressed in TUs.

The Map field is coded as a bit field, as shown in Figure 9-225, and contains the following bits:

— BSS bit, which is set to 1 when at least one valid MPDU was received in the channel during the measurement period from another BSS. Otherwise, the BSS bit is set to 0.

— OFDM Preamble bit, which is set to 1 when at least one sequence of short training symbols, as defined in 17.3.3, was detected in the channel during the measurement period without a subsequent valid SIGNAL field (see 17.3.4). This indicates the presence of an OFDM preamble, such as high-performance RLAN/2 (HIPERLAN/2). Otherwise, the OFDM Preamble bit is set to 0.

— Unidentified Signal bit, which is set to 1 when, in the channel during the measurement period, there is significant power detected that is not characterized as radar, an OFDM preamble, or a valid MPDU. Otherwise, the Unidentified Signal bit is set to 0. The definition of significant power is implementation dependent.

— Radar bit, which is set to 1 when radar was detected operating in the channel during the measurement period. The radar detection algorithm that satisfies regulatory requirements is outside the scope of this standard. Otherwise, the Radar bit is set to 0.

— Unmeasured bit, which is set to 1 when this channel has not been measured. Otherwise, the Unmeasured bit is set to 0. When the Unmeasured field is equal to 1, all of the other bit fields are set to 0.

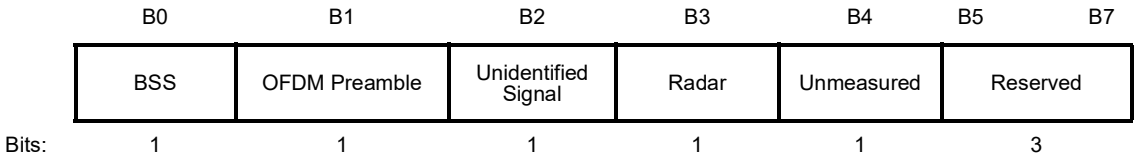

Figure 9-225—Map field format

9.4.2.21.3 CCA report

The format of the Measurement Report field corresponding to a CCA report is shown in Figure 9-226.

	Channel Number	Measurement Start Time	Measurement Duration	CCA Busy Fraction
Octets:	1	8	2	1

Figure 9-226—Measurement Report field format for a CCA report

The Channel Number field contains the channel number to which the CCA report applies where the Channel Number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the CCA report measurement started.

The Measurement Duration field is set to the duration over which the CCA report was measured, expressed in TUs.

The CCA Busy Fraction field contains the fractional duration over which CCA indicated the channel was busy during the measurement duration. The resolution of the CCA busy measurement is in microseconds. The CCA Busy Fraction value is defined as

$$\left\lceil \frac{255 \times t_{\text{busy}}}{1024 \times t_{\text{MD}}} \right\rceil$$

where

t_{busy} is the duration CCA indicated channel was busy (μs)
t_{MD} is the measurement duration (TUs)

9.4.2.21.4 RPI histogram report

The format of the Measurement Report field corresponding to an RPI histogram report is shown in Figure 9-227.

	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	8	2

	RPI 0 density	RPI 1 density	RPI 2 density	RPI 3 density	RPI 4 density	RPI 5 density	RPI 6 density	RPI 7 density
Octets:	1	1	1	1	1	1	1	1

Figure 9-227—Measurement Report field format for an RPI histogram report

The Channel Number field is set to the channel number to which the RPI histogram report applies where the Channel Number is a value from the Channel set column in Table E-4, in a row having the same value in the Channel spacing (MHz) column as the width of the primary channel.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the RPI histogram report measurement started.

The Measurement Duration field is set to the duration over which the RPI histogram report was measured, expressed in TUs.

The RPI histogram report contains the RPI densities observed in the channel for the eight RPI levels defined in Table 9-126. See 11.10.12.

Table 9-126—RPI definitions for an RPI histogram report

RPI	Power observed at the antenna connector (dBm)
0	Power ≤ –87
1	–87 < Power ≤ –82
2	–82 < Power ≤ –77
3	–77 < Power ≤ –72
4	–72 < Power ≤ –67
5	–67 < Power ≤ –62
6	–62 < Power ≤ –57
7	–57 < Power

The RPI histogram report provides an additional mechanism for a STA to gather information on the state of a channel from other STAs. The STA might use this information to assist in the choice of new channel, to help avoid false radar detections, and to assess the general level of interference present on a channel.

9.4.2.21.5 Channel Load report

The format of the Measurement Report field corresponding to a Channel Load report is shown in Figure 9-228.

	Operating Class	Channel Number	Actual Measurement Start Time	Measurement Duration	Channel Load	Optional Subelements
Octets:	1	1	8	2	1	variable

Figure 9-228—Measurement Report field format for Channel Load report

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE—Examples of operating classes that encompass a primary channel but do not identify the location of the primary channel are operating classes with a value of 80 or 160 in the Channel Spacing (MHz) column of the applicable table in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration over which the Channel Load report was measured, in units of TUs.

The Channel Load field contains the proportion of measurement duration for which the measuring STA determined the channel to be busy. Procedure for Channel Load measurement and definition of channel load values are found in 11.10.9.3.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-127.

Table 9-127—Optional subelement IDs for Channel Load report

Subelement ID	Name	Extensible
0–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.21.6 Noise Histogram report

The format of the Measurement Report field of a Noise Histogram report is shown in Figure 9-229.

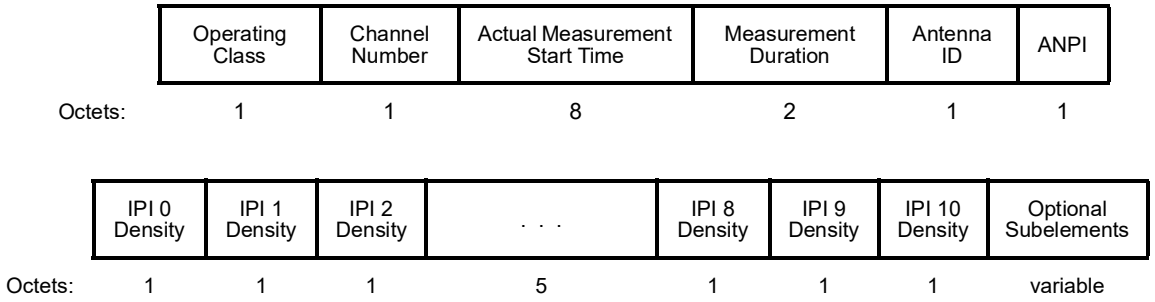

Figure 9-229—Measurement Report field format for Noise Histogram report

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration over which the Noise Histogram report was measured, in units of TUs.

The Antenna ID field is set to the identifying number for the antenna(s) or DMG antenna(s) used for this measurement. The antenna ID or DMG antenna ID is defined in 9.4.2.39.

The ANPI field is set to the average noise plus interference power value measured during the indicated measurement duration while the indicated channel is idle as described in 11.10.9.4.

The Noise Histogram report contains the IPI densities, as defined in 11.10.9.4, observed in the channel for the eleven IPI levels defined in Table 9-128.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-128—IPI Definitions for a Noise Histogram report

IPI Level	IPI Measured Power (dBm)
0	IPI ≤ –92
1	–92 < IPI ≤ –89
2	–89 < IPI ≤ –86
3	–86 < IPI ≤ –83
4	–83 < IPI ≤ –80
5	–80 < IPI ≤ –75
6	–75 < IPI ≤ –70
7	–70 < IPI ≤ –65
8	–65 < IPI ≤ –60
9	–60 < IPI ≤ –55
10	–55 < IPI

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-129.

Table 9-129—Optional subelement IDs for Noise Histogram report

Subelement ID	Name	Extensible
0–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21.7 Beacon report

The format of the Measurement Report field corresponding to a Beacon report is shown in Figure 9-230.

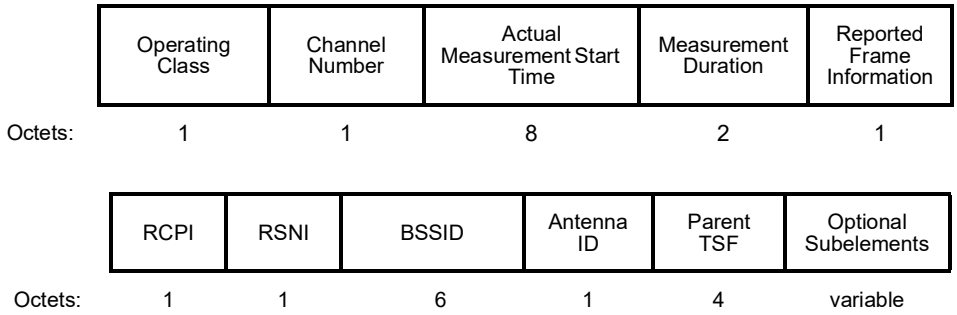

Figure 9-230—Measurement Report field format for Beacon report

The Operating Class field indicates the operating class that identifies the channel set of the received Beacon or Probe Response frame. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing of the received Beacon or Probe Response frame. Valid operating classes are listed in Annex E.

The Channel Number field indicates the channel number of the received Beacon or Probe Response frame. Channel number is defined within an operating class as shown in Annex E.

If the PPDU carrying the received frame comprises noncontiguous frequency segments, the Operating Class and Channel Number fields identify the center frequency of frequency segment 0, and a Wide Bandwidth Channel Switch subelement is included to identify the center frequency of frequency segment 1 (the other fields in the subelement indicate 80+80 bandwidth and the same center frequency of frequency segment 0 as the Operating Class and Channel Number fields); otherwise the Wide Bandwidth Channel Switch subelement is not included.

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration over which the Beacon report was measured, in units of TUs.

The Reported Frame Information field contains two subfields as shown in Figure 9-231.

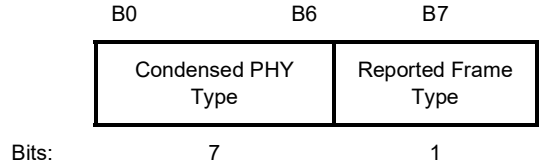

Figure 9-231—Reported Frame Information field format

The Condensed PHY Type subfield indicates the physical medium type on which the Beacon, Measurement Pilot, or Probe Response frame being reported was received. It has an integer value between 0 and 127 coded according to dot11PHYType.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Reported Frame Type subfield indicates the type of frame reported. A 0 indicates a Beacon or Probe Response frame; a 1 indicates a Measurement Pilot frame.

The RCPI field indicates the received channel power of the Beacon, Measurement Pilot, or Probe Response frame, which is a logarithmic function of the received signal power, as defined 9.4.2.37.

The RSNI field indicates the received signal-to-noise indication for the Beacon, Measurement Pilot, or Probe Response frame, as described in 9.4.2.40.

The BSSID field contains the BSSID from the Beacon, Measurement Pilot, or Probe Response frame being reported.

The Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used for this measurement. The antenna ID or DMG antenna ID is defined in 9.4.2.39.

The Parent TSF field contains the value of the 4 least significant octets of the measuring STA's TSF timer at the start of reception of the first octet of the Timestamp field of the reported Beacon, Measurement Pilot, or Probe Response frame at the time the Beacon, Measurement Pilot, or Probe Response frame being reported was received.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-130.

Table 9-130—Optional subelement IDs for Beacon report

Subelement ID	Name	Extensible
0	Reserved	
1	Reported Frame Body	No
2	Reported Frame Body Fragment ID	No
3–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164	Last Beacon Report Indication	No
165-220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Reported Frame Body subelement contains the requested fields and elements of the frame body of the reported Beacon, Measurement Pilot, or Probe Response frame. If the Reporting Detail subelement of the corresponding Beacon request equals 0, the Reported Frame Body subelement is not included in the Beacon report. If the Reporting Detail subelement equals 1, all fields and any elements identified in a Request element or Extended Request element in the corresponding Beacon request are included in the Reported Frame Body subelement, in the order that they appeared in the reported frame.

If the Reporting Detail field equals 2, all fields and elements are included in the order they appeared in the reported frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Some elements in the Reported Frame Body subelement, or the Reported Frame Body subelement itself, might be large. In this case, some of the elements included in the Reported Frame Body subelement might be truncated, and the subelement itself might be truncated or fragmented over multiple Beacon Reports when its size exceeds the maximum element size, as described below:

— Reported TIM elements might be truncated such that only the first 4 octets of the element are reported and the element Length field is modified to indicate the truncated length of 4.

— Reported IBSS DFS elements might be truncated so that only the lowest and highest channel number map are reported and the element Length field is modified to indicate the truncated length of 13.

— Reported RSNEs might be truncated so that only the first 4 octets of the element are reported and the element Length field is modified to indicate the truncated length of 4.

— If the length of the Reported Frame Body subelement would cause the Measurement Report element to exceed the maximum element size, when Reported Frame Body subelement fragmentation is not supported, then the Reported Frame Body subelement is truncated so that the last element in the Reported Frame Body subelement is a complete element.

— If the length of the Reported Frame Body subelement would cause the Measurement Report element to exceed the maximum element size, when Reported Frame Body subelement fragmentation is supported, then the Reported Frame Body subelement is fragmented over multiple Beacon Reports. When the Reported Frame Body subelement is fragmented, then the Reported Frame Body Fragment ID subelement is present in each Beacon Report frame that contains a fragment of this Reported Frame Body subelement. When the Reported Frame Body Fragment ID subelement is present, the reporting STA does not truncate any of the elements included into the Reported Frame Body subelement.

The format of the Data field of the Reported Frame Body Fragment ID subelement is shown in Figure 9-232.

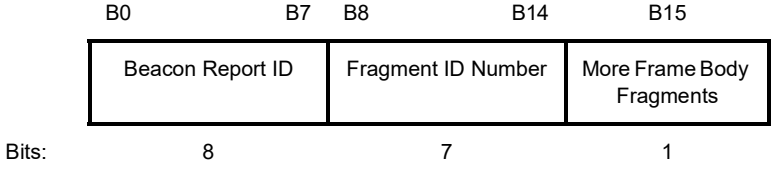

Figure 9-232—Data field format

The Beacon Report ID field identifies the Beacon Report instance sent as a response to a Beacon Request. The responding STA sets the Fragment ID Number field to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment Reported Frame Body subelement of a Beacon Report identified by the Beacon Report ID.

The More Frame Body Fragments field is set to 0 whenever the final fragment of a Reported Frame Body subelement is being transmitted, otherwise it is set to 1.

The Reported Frame Body subelement is fragmented so that the last element in every Reported Frame Body subelement fragment is a complete element.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Last Beacon Report Indication subelement has the format defined in Figure 9-789, with a Length field set to 1. When the Data field is set to 1, it indicates that this Beacon report is the last frame sent as a response to a Beacon request. A 0 indicates that there are more frames expected.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21.8 Frame report

The format of the Measurement Report field corresponding to a Frame report is shown in Figure 9-233.

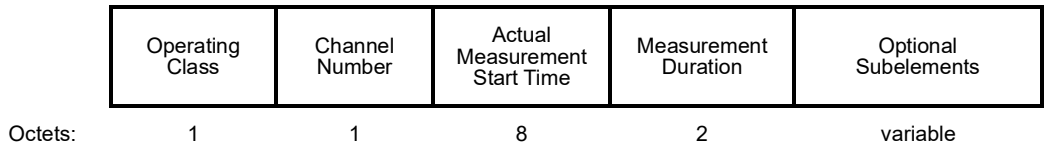

Figure 9-233—Measurement Report field format for Frame report

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration over which the Frame report was measured, in units of TUs.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-131.

Table 9-131—Optional subelement IDs for Frame report

Subelement ID	Name	Extensible
0	Reserved	
1	Frame Count Report	No
2–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

The Frame Count Report subelement is used to report information about frames sent by a transmitter. The Frame Count Report subelement is as shown in Figure 9-234.

	Subelement ID	Length	Frame Report Entries
Octets:	1	1	$n \times 19$

Figure 9-234—Frame Count Report subelement format

The Subelement ID field is defined in Table 9-131.

The Length field is defined in 9.4.3.

The Frame Report Entries field contains zero or more (n) Frame Report Entry fields. The format of a Frame Report Entry field is shown in Figure 9-235.

	Transmitter Address	BSSID	PHY Type	Average RCPI	Last RSNI	Last RCPI	Antenna ID	Frame Count
Octets:	6	6	1	1	1	1	1	2

Figure 9-235—Frame Report Entry field format

The Transmitter Address field contains the transmitter address (TA) from the frames being reported.

The BSSID field contains the BSSID from the frames being reported.

The PHY Type field indicates the physical medium type for the frame(s) being reported. Valid entries are coded according to dot11PHYType.

The Average RCPI field indicates the average value for the received channel power of frames received and counted in this Frame Report Entry field, as described in 11.10.9.2. Average RCPI is a logarithmic function of the received signal power, as defined 9.4.2.37.

The Last RSNI field indicates the received signal-to-noise indication of the most recently measured frame counted in this Frame Report Entry field, as described in 9.4.2.40.

The Last RCPI field indicates the received channel power of the most recently measured frame counted in this Frame Report Entry field. Last RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.37.

The Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used to receive the most recently measured frame counted in this Frame Report Entry field. The antenna ID or DMG antenna ID is defined in 9.4.2.39.

The Frame Count field is a count of the Data and Management frames received with the indicated transmitter address and BSSID during the measurement duration. The value 65 535 indicates a count of 65 535 or more.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21.9 STA Statistics report

The format of the Measurement Report field of a STA Statistics report is shown in Figure 9-236.

	Measurement Duration	Group Identity	Statistics Group Data	Optional Subelements
Octets:	2	1	variable	variable

Figure 9-236—Measurement Report field format for STA Statistics report

The STA Statistics report reports the change in, or current values of, the requested statistics group data measured within the measurement duration.

The Measurement Duration field is set to the duration over which the change in statistics group data was measured and reported, in units of TUs. A Measurement Duration field set to 0 indicates a report of the current values of the statistics group data.

The Group Identity field indicates the requested statistics group describing the Statistics Group Data field according to Table 9-132.

The Statistics Group Data field contains the requested statistics from the MIB in Annex C related to the interface on which the request was received according to Table 9-132. Units used for reporting a statistic or change in statistic are the units used to define the statistic in Annex C. When the Measurement Duration field is nonzero, the reported data values for statistics that are not counters are the current values of the statistics data at the end of the measurement duration. When the Measurement Duration field is zero the current values of the requested statistics group data are reported, rather than the change.

Table 9-132—Group Identity for a STA Statistics report

Group Identity Requested	Statistics Group Data field length (octets)	Statistics Returned
0	28	dot11Counters Group for the Interface on which the STA Statistics request was received (with the exception of WEPUndecryptableCount and those counters listed in Group Identity 1): dot11TransmittedFragmentCount (Counter32), dot11GroupTransmittedFrameCount (Counter32), dot11FailedCount (Counter32), dot11ReceivedFragmentCount (Counter32), dot11GroupReceivedFrameCount (Counter32), dot11FCSErrorCount (Counter32), dot11TransmittedFrameCount (Counter32)

The format of the Measurement Report field for dot11QosCounters Group for UPx is shown in Figure 9-239, where x is 0 – 7 and where the listed variables are obtained from the column of the QoS Counters Table indexed by x + 1. For example, the variables for dot11QosCounters Group for UP2 are from the third column of the dot11QosCountersTable, obtained from the dot11QosCountersEntry in which dot11QosCountersIndex is equal to 3.

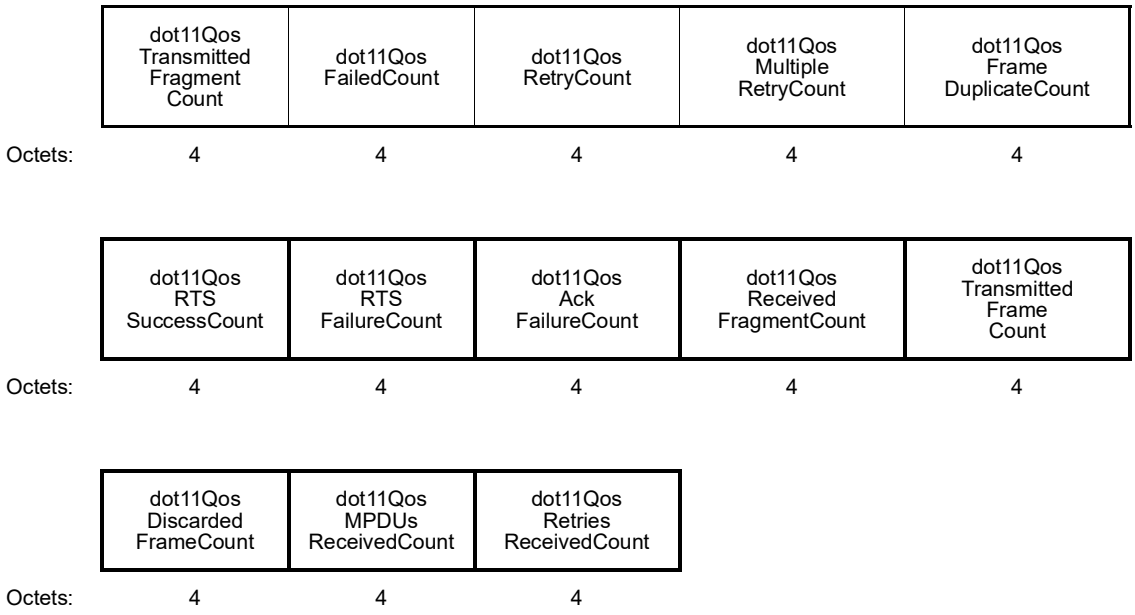

Figure 9-239—Measurement Report field format for dot11QosCounters Group for UPx

The format of the Measurement Report field for dot11BSSAverageAccessDelay Group is shown in Figure 9-240. Non-QoS APs set dot11STAStatisticsAverageAccessDelayBestEffort, dot11STAStatisticsAverageAccessDelayBackGround, dot11STAStatisticsAverageAccessDelayVideo, and dot11STAStatisticsAverageAccessDelayVoice to 255 (not available).

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-133.

Table 9-133—Optional subelement IDs for STA Statistics report

Subelement ID	Name	Extensible
0	Reserved	
1	Reporting Reason	No
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The format of the Measurement Report field for RSNA Counters Group is shown in Figure 9-241.

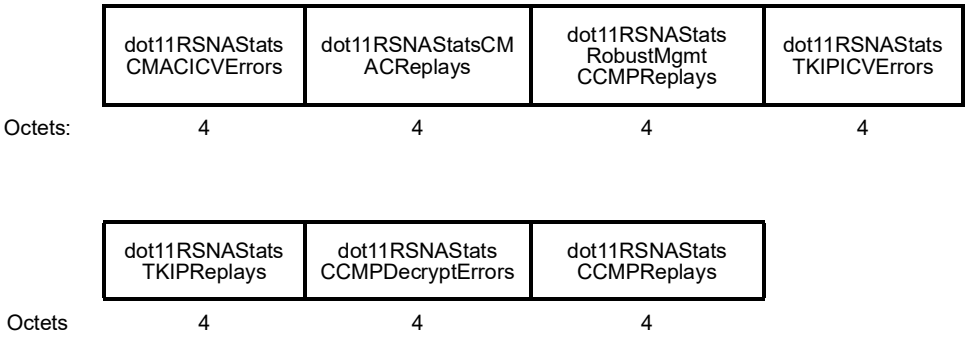

Figure 9-241—Measurement Report field format for RSNA Counters Group

The Reporting Reason subelement indicates the reason why the measuring STA sent the STA Statistics report. It is present if Statistics Group Name is from STA Counters, QoS STA Counters, or RSNA Counters (see 11.10.9.5).

In a nontriggered STA Statistics report, all subfields of the Data field of the Reporting Reason subelement are set to 0.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21.10 LCI report (Location configuration information report)

An LCI report for a known LCI includes latitude, longitude, altitude, and related information. An unknown LCI is indicated by the Length field of the LCI subelement being set to 0 and there being no following subelements. The LCI report field format is shown in Figure 9-245.

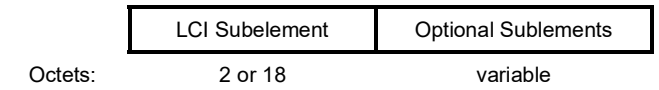

Figure 9-245—Format of Location Configuration Information Report

The subelements in the LCI report are defined in Table 9-134.

Table 9-134—Subelement IDs for LCI Report

Subelement ID	Name	Extensible
0	LCI	No
1	Azimuth Report	Yes
2	Originator Requesting STA MAC Address	No
3	Target MAC Address	No
4	Z	Subelements
5	Relative Location Error	Yes
6	Usage Rules/Policy	Yes
7	Co-Located BSSID List	Yes
8–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The LCI Subelement field contains an LCI subelement. The LCI subelement is formatted as shown in Figure 9-246.

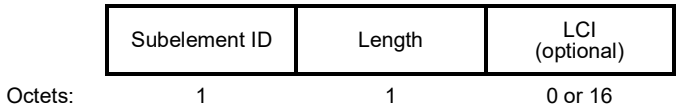

Figure 9-246—LCI subelement format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field is equal to the value for LCI in Table 9-134.

The Length field is defined in 9.4.3.

The LCI field is formatted as shown in Figure 9-247.

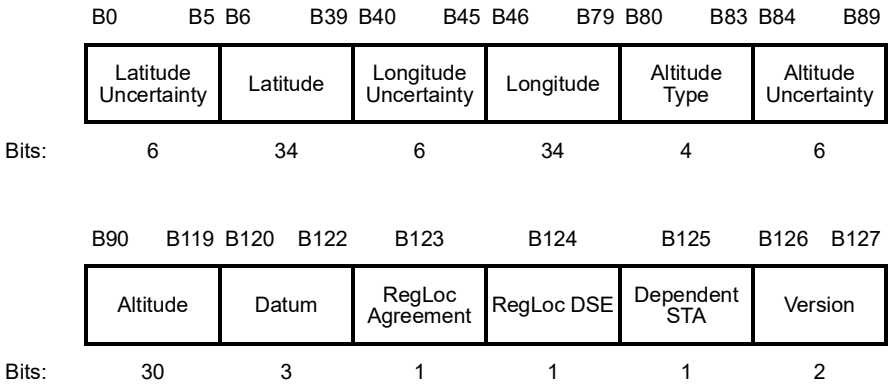

Figure 9-247—LCI field format

The definitions of fields within the LCI field are as specified in Section 2.2 of IETF RFC 6225 (July 2011) or as defined herein. This structure and information fields are based on the LCI format described in IETF RFC 6225.

NOTE 1—This example shows how to encode the coordinates of the Sydney Opera House using the encoding defined in IETF RFC 6225. The building is a polygon with the following (latitude, longitude) coordinates:

(–33.856 625°, +151.215 906°)
(–33.856 299°, +151.215 343°)
(–33.856 326°, +151.214 731°)
(–33.857 533°, +151.214 495°)
(–33.857 720°, +151.214 613°)
(–33.857 369°, +151.215 375°)

Latitude ranges from –33.857 720° to –33.856 299°; longitude ranges from +151.214 495° to +151.215 906°.

For this example, the point that is encoded is chosen by finding the middle of each range, that is (–33.857 009 5°, +151.215 200 5°), which is encoded as (1110111100010010010011011000001101,

01001011100110111000101110110000011) (2s complement, 9 bits before binary point, 25 after, MSB first).

These values can be derived as 2^{34} – Round (33.857 009 5 × 2^{25}) and Round (151.215 200 5 × 2^{25}), respectively.

The latitude uncertainty (LatUnc) is given by inserting the difference between the center value and the outer value into the formula from Section 2.3.2 of IETF RFC 6225. This gives:

LatUnc = $8 - \lceil \log2(-33.8570095 - (-33.857720)) \rceil$. The result is 18, which is encoded as 010010.

Similarly, longitude uncertainty (LongUnc) is given by the formula:

LongUnc = $8 - \lceil \log2(151.2152005 - 151.214495) \rceil$. The result is also 18, which is encoded as 010010.

The top of the building is 67.4 meters above sea level, and a starting altitude of 0 meters above sea level is assumed. At the GPS coordinates of the Sydney Opera House, the sea level is approximately 22.5 m below the WGS84 ellipsoid. Therefore, the lowest altitude of the building is –22.5 m, while the highest altitude is (67.4 – 22.5) = 44.9 m from the WGS84 ellipsoid. The middle of the range is (44.9 – 22.5)/2 = 11.2 m, which is encoded as 0000000000000000000101100110011 (22 bits before binary point, 8 after, MSB first).

Altitude uncertainty is given by the height of the building. Since the building is 67.4 m above sea level and basement is assumed to be at sea level, the uncertainty to be encoded is half of 67.4 m.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Altitude uncertainty (AltUnc) uses the formula from Section 2.4.5 from IETF RFC 6225:

AltUnc = $21 - \lceil \log2(33.7 - 0) \rceil$, the result is 15, which is encoded as 001111 (MSB first).

The Altitude Type field is set to 1, indicating that the altitude is specified in meters.

The Datum field is set to 1, indicating WGS84 coordinates.

The RegLoc Agreement field is set to 0 for this example.

The RegLoc DSE field is set to 0 for this example.

The Dependent STA field is set to 0 for this example.

The Version field is set to 1, as that is the only value currently defined in IETF RFC 6225.

The LCI configuration information report for this example is encoded as (where underscores are used as field or octet delimiters):

010010_1110111100010010010011011000001101_010010_0100101110011011100010111011000011_0001_001111_000000000000000000101100110011_001_0_0_0_01 (binary, MSB first per field)

010010_1011000001101100100100100011110111_010010_1100001101110100011101100111010010_1000_111100_1100110011010000000000000000000_100_0_0_0_10 (binary, LSB first per field)

01001010_11000001_10110010_01001000_11110111_01001011_00001101_11010001_11011001_11010010_10001111_00110011_00110100_00000000_00000000_10000010 (binary, rearranged into octets, with LSB first per octet)

01010010_10000011_01001101_00010010_11101111_11010010_10110000_10001011_10011011_01001011_11110001_11001100_00101100_00000000_00000000_01000001 (binary, MSB first, per octet)

52 83 4d 12 ef d2 b0 8b 9b 4b f1 cc 2c 00 00 41 (order over the PHY SAP, see 8.3.5 and 9.2.2)

The RegLoc Agreement field is set to 1 to report that the STA is operating within a national policy area or an international agreement area near a national border (see 11.11.3); otherwise, it is 0.

The RegLoc DSE field is set to 1 to report that the enabling STA is enabling the operation of STAs with DSE; otherwise, it is 0.

The Dependent STA field is set to 1 to report that the STA is operating with the enablement of the enabling STA whose LCI is being reported; otherwise, it is 0.

The Version field is defined in IETF RFC 6225, and the use is described in IETF RFC 6225.

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-134. The subelement format and ordering of subelements are defined in 9.4.3.

The Azimuth Report subelement is used to report an azimuth. The Azimuth Report subelement is as shown in Figure 9-248.

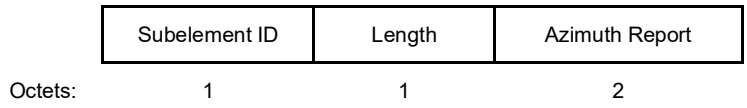

Figure 9-248—Azimuth Report subelement format

The Subelement ID field is defined in Table 9-134.

The Length field is defined in 9.4.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Azimuth Report field of an Azimuth Report subelement contains three subfields as shown in Figure 9-249.

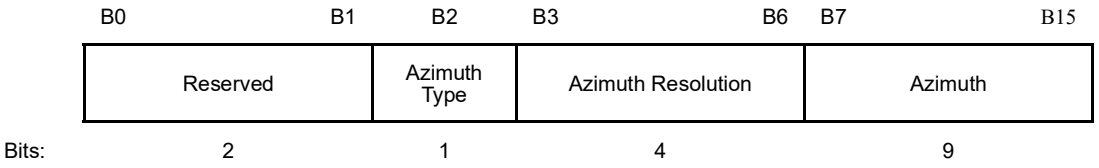

Figure 9-249—Azimuth Report subfield format

The Azimuth Type field is set to 1 to report the Azimuth of the bearing of the requester with respect to the responder and is set to 0 to report the Azimuth of front surface of the reporting STA.

The Azimuth Resolution field is 4 bits, indicating the number of valid most significant bits in the Azimuth.

The Azimuth field is an unsigned integer value in degrees from true north, of the type defined by the Azimuth Type field.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the corresponding LCI request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-201.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding LCI request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-202.

The Z subelement is used to report the floor and location of the STA with respect to the floor level. The format of the Z subelement is shown in Figure 9-250.

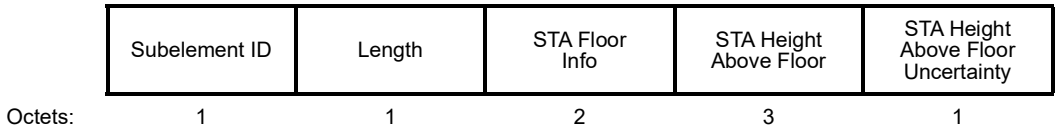

Figure 9-250—Z subelement format

The Subelement ID field is equal to the value for Z in Table 9-134.

The Length field is defined in 9.4.3.

The format of the STA Floor Info field is defined in Figure 9-250.

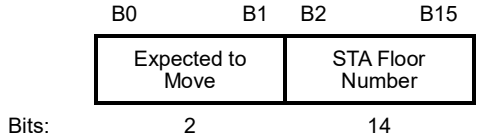

Figure 9-251—STA Floor Info field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Expected to Move field indicates whether the STA is expected to change its location. The value 1 indicates that the STA is expected to change its location. The value 0 indicates that the STA is not expected to change its location. The value 2 indicates that the STA's movement patterns are unknown. The value 3 is reserved.

NOTE 2—Examples of STAs that are expected to move include a) battery-powered STAs, b) STAs installed within trains/vehicles, c) STAs installed for temporary events.

The STA Floor Number field indicates the floor number of the STA. A higher value indicates a higher floor, and the integer approximates the floor number labels used at the venue (e.g., in stairwells and elevators, if present). The field is encoded as a 2s complement integer with units of $1/16^{th}$ of a floor. The value –8192 indicates an unknown floor number. The value 8191 indicates the STA's floor is 8191/16 floors or more. The value –8191 indicates the STA's floor is –8191/16 floors or less.

NOTE 3—For example, a building with floors labeled as Basement 1, Ground, Mezzanine, 1, and 2 might have the floors identified by STA Floor Number values equal –16, 0, 8, 16 and 32 respectively.

The STA Height Above Floor field indicates the height of the STA above the floor. The field is coded as a 2s complement integer with units of 1/4096 m. The value –8 388 608 indicates an unknown STA height above floor. The value –8 388 607 indicates the height of the STA above the floor is –8 388 607/4096 m or less. The value 8 388 607 indicates the height of the STA above the floor is 8 388 607/4096 m or more.

A STA Height Above Floor Uncertainty field set to 0 indicates an unknown STA height above floor uncertainty. Values 25 or higher are reserved. A STA Height Above Floor Uncertainty field set from 1 to 24 indicates that the actual STA height above floor, a, is bounded according to:

$$h - 2^{11-u} \le a \le h + 2^{11-u}$$

where

h is the value in units of 1/4096 m of the STA Height Above Floor field
u is the value of the STA Height Above Floor Uncertainty field

If the STA Height Above Floor field indicates an unknown STA height above floor, the STA Height Above Floor Uncertainty field is set to 0.

The Relative Location Error subelement is used to report the location error of STAs with respect to a reference STA (rather than with respect to an absolute geographic location). The format of the Relative Location Error subelement is defined in Figure 9-252.

	Subelement ID	Length	Reference STA	Relative Location Error
Octets:	1	1	6	1

Figure 9-252—Relative Location Error subelement format

The Subelement ID field is equal to the value for Relative Location Error in Table 9-134.

The Length field is defined in 9.4.3.

The Reference STA field contains the MAC address of the reference STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Relative Location Error field is defined in Figure 9-253.

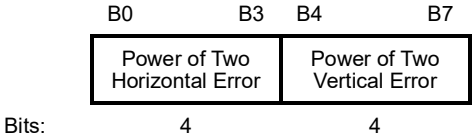

Figure 9-253—Relative Location Error field format

The Power Of Two Horizontal Error field contains an upper bound on the error between the horizontal location of the Reference STA and the Latitude and Longitude fields in the LCI subelement. The Power Of Two Horizontal Error field indicates a relative horizontal error of 2^{p-8} m, where p is the value of the Power of Two Horizontal Error field in the range 0 to 13. The value 14 indicates a relative horizontal error of greater than 32 m. The value 15 indicates an unknown relative horizontal error.

The Power Of Two Vertical Error field contains an upper bound on the error between the vertical location of the Reference STA and the Altitude field in the LCI subelement. The Power Of Two Vertical Error field indicates a relative vertical error of 2^{p-8} m, where p is the value of the Power Of Two Vertical Error field in the range 0 to 13. The value 14 indicates a relative vertical error of greater than 32 m. The value 15 indicates an unknown relative vertical error.

The Usage Rules/Policy subelement is used to report the usage rules of the reporting STA and whether additional STA or neighboring STA location information is available if the additional information can be transferred more securely. The format of the Usage Rules/Policy subelement is defined in Figure 9-254.

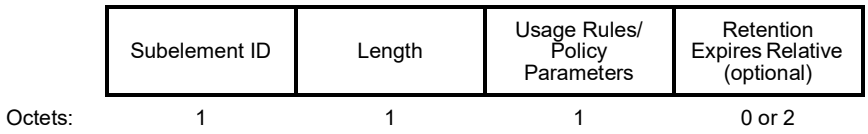

Figure 9-254—Usage Rules/Policy subelement format

The Subelement ID field is equal to the value for Usage Rules/Policy in Table 9-134.

The Length field is defined in 9.4.3.

The Usage Rules/Policy Parameters field is defined in Figure 9-255.

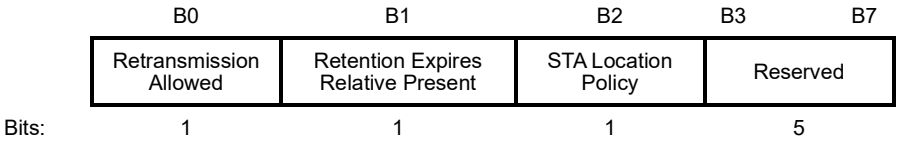

Figure 9-255—Usage Rules/Policy Parameters field format

The Retransmission Allowed field definition is the same as the definition for the retransmission-allowed element in IETF RFC 4119, except that the “no” and “yes” text encoding specified in IETF RFC 4119 is replaced by 0 and 1, respectively.

The Retention Expires Relative Present field indicates whether Retention Expires Relative field is present. The value 1 indicates that the Retention Expires Relative field is present; otherwise the Retention Expires Relative field is not present. If the Retention Expires Relative field is not present, it indicates that the retention duration of the LCI report field is unbounded.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The STA Location Policy field indicates whether additional STA or neighboring STA location information is available if the additional information can be transferred more securely. The security of the transfer is (from lowest to highest): unassociated, associated without RSNA established, associated with RSNA established but without management frame protection negotiated, and associated with both RSNA established and management frame protection negotiated. The additional information might be one or more of (1) the STA's location with reduced uncertainty and (2) the location of additional neighbor APs, if the STA Location Policy field is carried within a Neighbor Report Response frame. A STA Location Policy field set to 1 indicates additional STA or neighboring STA location information is available. A STA Location Policy field set to 0 indicates no additional STA or neighboring STA location information is available.

The definition of the Retention Expires Relative field is the same as the definition for the retention-expires element in IETF RFC 4119, except that the absolute time text encoding specified in IETF RFC 4119 is replaced by a relative binary encoding: the Retention Expires Relative field is encoded as a number of hours in the future relative to the time of transmission of the Usage Rules/Policy subelement.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

The Co-Located BSSID List subelement is used to report the list of BSSIDs of the BSSs sharing the same antenna connector with the reporting STA if the subelement is contained within a Fine Time Measurement frame, otherwise the BSSs that are co-located within the same physical device as the reporting STA.

The format of the Co-Located BSSID List subelement is shown in Figure 9-256.

	Subelement ID	Length	MaxBSSID Indicator	BSSID List (optional)
Octets:	1	1	1	$n \times 6$

Figure 9-256—Co-Located BSSID List subelement format

The Subelement ID field is equal to the value for Co-Located BSSID list in Table 9-134.

The Length field is defined in 9.4.3.

The MaxBSSID Indicator field is defined in 9.4.2.45. When set to a nonzero value, it indicates the maximum possible number of BSSs, including the reference BSS, which share the same antenna connector and have the same 48 bits (BSSID[0:(47-n)]) of the BSSIDs. When the BSSIDs of the co-located BSSs are configured at the reporting STA but not represented by the MaxBSSID Indicator field, the BSSID List field is present in the Co-located BSSID List subelement to provide an explicit list of such BSSID values.

When the MaxBSSID Indicator field is equal to 0, the BSSID List field contains one or more (n) BSSID values of the BSSs sharing the same antenna connector with the reporting STA.

NOTE 4—For example, if there are 4 BSSs sharing the same antenna connector and their BSSIDs end with 16, 24, 30, and 31, and the range of MAC addresses ending with 16-31 are not assigned to other BSSs using a different antenna connector, then this list of 4 BSSIDs can be indicated with a MaxBSSID Indicator field set to 5. Otherwise, the MaxBSSID Indicator field is set to 0 and the BSSIDs are listed separately.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.21.11 Transmit Stream/Category Measurement report

The Transmit Stream/Category Measurement report applies to TIDs for Traffic Streams associated with TSPECs and also to TIDs for Traffic Categories for QoS traffic without TSPECs. The format of the Measurement Report field corresponding to a Transmit Stream/Category Measurement report is shown in Figure 9-257.

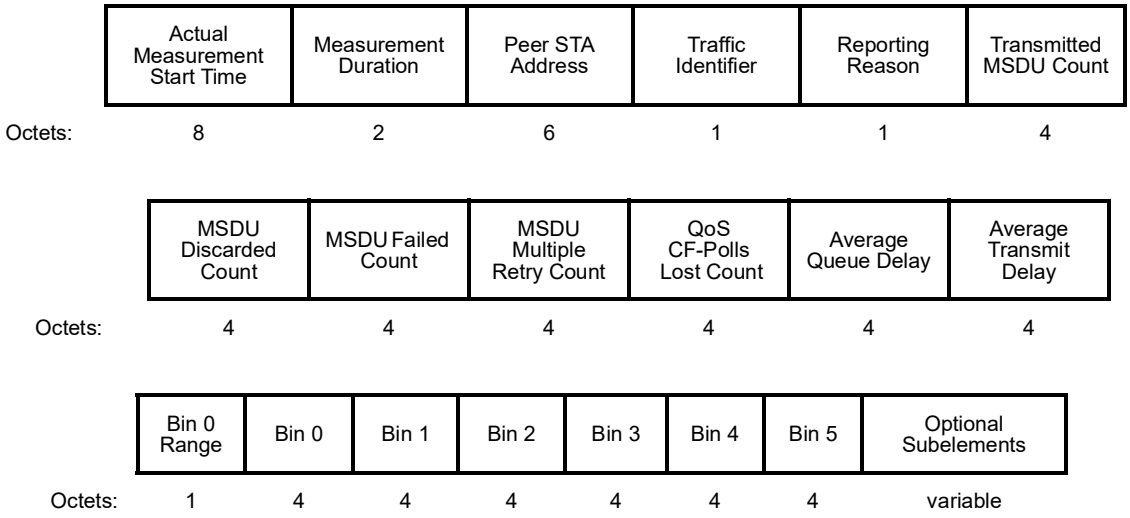

Figure 9-257—Measurement Report field format for Transmit Stream/Category Measurement report

The Actual Measurement Start Time field is set to the TSF at the time at which the measurement started, or for a triggered Transmit Stream/Category Measurement report, the TSF value at the reporting QoS STA when the trigger condition was met.

The Measurement Duration field is set to the duration over which the Transmit Stream/Category Measurement report was measured, in units of TUs. In a triggered Transmit Stream/Category Measurement report, metrics are reported over a number of transmitted MSDUs rather than a duration; hence Measurement Duration is set to 0; see 11.10.9.8.

The Peer STA Address field contains a MAC address indicating the RA for the measured frames.

The Traffic Identifier field contains the TID subfield as shown in Figure 9-204. The TID subfield indicates the TC or TS for which traffic was measured.

The Reporting Reason field is a bit field indicating the reason that the measuring QoS STA sent the transmit stream/category measurement report. The Reporting Reason field is shown in Figure 9-258.

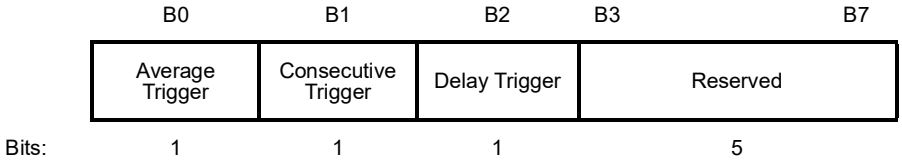

Figure 9-258—Reporting Reason field format

— The Average Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the Average Error trigger.
— The Consecutive Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the Consecutive Error trigger.
— The Delay Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the delay exceeding the Delay Threshold.

When a Transmit Stream/Category Measurement report is sent as a direct response to a Transmit Stream/Category Measurement request and not as a triggered Transmit Stream/Category Measurement report, all bit fields in the Reporting Reason field are set to 0. This is termed a requested Transmit Stream/Category Measurement report. Within a triggered Transmit Stream/Category Measurement report, more than one bit field in the Reporting Reason field might be set to 1 if more than one trigger condition was met.

The Transmitted MSDU Count, MSDU Failed Count, MSDU Discarded Count, MSDU Multiple Retry Count, QoS CF-Polls Lost Count, Average Queue Delay, Average Transmit Delay, and delay histogram fields relate to transmissions to the QoS STA given in the Peer STA Address field. Metrics are reported over the Measurement Duration, or for triggered transmit stream/category measurements, over the Measurement Count. Any counter that increments to a value of 2^{32}–1 terminates the measurement.

The Transmitted MSDU Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted.

The MSDU Discarded Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due either to the number of transmit attempts exceeding dot11ShortRetryLimit, or due to the MSDU lifetime having been reached.

The MSDU Failed Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit.

The MSDU Multiple Retry Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted after more than one retransmission attempt.

The QoS CF-Polls Lost Count field contains the number of QoS (+)CF-Poll frames that were transmitted where there was no response from the QoS STA. QoS CF-Polls Lost Count are returned only if the reporting QoS STA is contained within an AP and the TID is for a TS. This field is set to 0 when QoS CF-Polls Lost Count is not returned.

The Average Queue Delay field is the average queuing delay of the frames (MSDUs) that are passed to the MAC for the indicated peer STA address and the indicated traffic identifier. Queue Delay is expressed in TUs and is measured from the time the MSDU is passed to the MAC until the point at which the first or only corresponding MPDU begins transmission.

The Average Transmit Delay field is the average delay of the frames (MSDUs) that are successfully transmitted for the indicated Peer STA Address and TID. Average Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used. Average Transmit delay is expressed in units of TUs.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Bin 0 Range field value indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, in units of TUs. It is also used to calculate the delay ranges of the other five bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as follows:

Bin 0 range: $0 \le \text{Delay} < B_0$ = Bin 0 Range field value

Bin i range: $2^{i-1} \times B_0 \le \text{Delay} < 2^i \times B_0$, for $1 \le i \le 4$

Bin 5 range: $16 \times B_0 \le \text{Delay}$

For example, if the Bin 0 Range field value is 10 TUs, the bin delay ranges are as defined in Table 9-135.

Table 9-135—Delay definitions for a Transmit Stream/Category Measurement report for a Bin 0 Range field value of 10 TU

Bin	Measured MSDU Transmit Delay (TUs)
0	Delay < 10
1	10 ≤ Delay < 20
2	20 ≤ Delay < 40
3	40 ≤ Delay < 80
4	80 ≤ Delay < 160
5	160 ≤ Delay

To compute the value reported in Bin i (i.e., B_i for i = 0, 1...5 of the Transmit Delay Histogram), the STA initializes all bin values to 0. For each MSDU successfully transmitted, the measured MSDU Transmit Delay determines the bin to be incremented. If the measured delay has a duration t within Bin i, then Bin i is increased by one. MSDU Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used. The sum of the values in all six bins is equal to the value reported in the Transmitted MSDU Count.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-136.

Table 9-136—Optional subelement IDs for Transmit Stream/Category Measurement report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21.12 Multicast Diagnostics report

The format of the Measurement Report field of a Multicast Diagnostics report is shown in Figure 9-259.

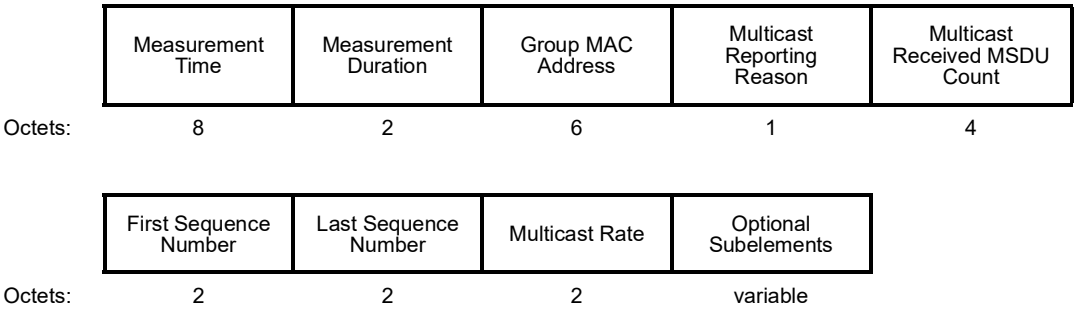

Figure 9-259—Measurement Report field format for a Multicast Diagnostics report

The Measurement Time field is the value of the STA TSF timer at the time the measurement started. In a triggered Multicast Diagnostics report, this is the TSF value at the reporting STA when the trigger condition was met. When the reason for sending the report is Performance Measurement and the Multicast Received MSDU Count is nonzero, the Measurement Time field is the value of the STA TSF timer at the time of the first group addressed MSDU received during the measurement interval.

The Measurement Duration field specifies the period over which the Multicast Diagnostic report was generated, in units of TUs.

The Group MAC Address field contains the value from the Group MAC Address field from the Multicast Diagnostics request to which the report relates.

The Multicast Reporting Reason field indicates the reason why the measuring STA sent the Multicast Diagnostics report. The Multicast Reporting Reason field is shown in Figure 9-260.

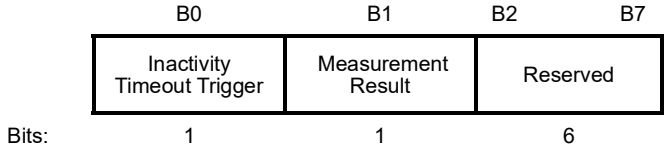

Figure 9-260—Multicast Reporting Reason field format

The subfields of the Multicast Reporting Reason field are defined as follows:

— The Inactivity Timeout Trigger field set to 1 indicates that Multicast Diagnostics report was generated as a triggered report due to the timeout of the multicast diagnostic timer.

— The Measurement Result field set to 1 indicates that the Multicast Diagnostic report contains the result of completing a Multicast Diagnostic request that did not contain a Multicast Triggered Reporting subelement.

All of the bits in the Multicast Reporting Reason field are independent.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated multicast MAC address that were received during the measurement duration. For a triggered multicast diagnostics measurement, the Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated multicast MAC address that were received between the acceptance of the multicast diagnostics measurement request and the occurrence of the trigger condition.

When bit 0 of the Multicast MAC address field in the Multicast Diagnostics request is 1, the twelve LSBs of the First Sequence Number field contain the sequence number of the first frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When bit 0 of the Multicast MAC address field in the Multicast Diagnostics request is 0, the twelve LSBs of the First Sequence Number field contain the sequence number of the first group addressed frame, that does not have the broadcast address as its destination, received during the measurement period. The four most significant bits of the First Sequence Number field are set to 0.

When bit 0 of the Multicast MAC address field in the Multicast Diagnostics request is 1, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When bit 0 of the Multicast MAC address field in the Multicast Diagnostics request is 0, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last group addressed frame, that does not have the broadcast address as its destination, received during the measurement period. The four most significant bits of the Last Sequence Number field are set to 0.

The First Sequence Number field and the Last Sequence Number field are set to 0 if the Multicast Received MSDU Count is 0.

The Multicast Rate field specifies the highest data rate, in 0.5 Mb/s units, at which the STA has received a group addressed frame during the measurement period. The Multicast Rate field is encoded with the MSB set to 1 to indicate that the data rate is in the basic rate set, and set to 0 to indicate that the data rate is not in the basic rate set. The remaining 15 bit value is multiplied by 0.5 Mb/s to indicate the data rate. The Multicast Rate field is 0 by the STA to indicate that it has not received a group addressed frame during the measurement period.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-137.

Table 9-137—Optional subelement IDs for Multicast Diagnostics report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25).

The summary of fields used in the STA Multicast Diagnostics report is shown in Table 9-138.

Table 9-138—Summary of fields used in the STA Multicast Diagnostics report

Field	Measurement Result	Triggered Report
Measurement Time	Yes	Yes
Measurement Duration	Yes	Yes
Group MAC Address	Yes	Yes
Multicast Reporting Reason	Yes	Yes
Multicast Received MSDU Count	Yes	Yes
First Sequence Number	Yes	Yes
Last Sequence Number	Yes	Yes
Multicast Rate	Yes	Yes
Optional Subelements	Optional	Optional

The use of Multicast Diagnostics report is defined in 11.10.19.

9.4.2.21.13 Location Civic report

The Location Civic report includes the location information defined in civic format for the location subject provided in the Location Civic request, as shown in Figure 9-261.

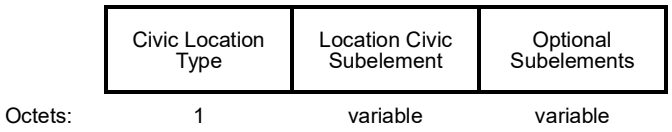

Figure 9-261—Location Civic report field format

The Civic Location Type field contains the format of location information in the Civic Location field, as indicated in Table 9-116.

The subelement IDs of the Location Civic report are defined in Table 9-139.

Table 9-139—Subelement IDs for Location Civic report

Subelement ID	Name	Extensible
0	Location Civic	No
1	Originator Requesting STA MAC Address	No
2	Target MAC Address	No
3	Location Reference	No
4	Location Shape	No
5	Map Image	No

Table 9-139—Subelement IDs for Location Civic report *(continued)*

Subelement ID	Name	Extensible
6	Reserved	
7	Co-Located BSSID List	Yes
8–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Location Civic Subelement field contains a Location Civic subelement. The Location Civic subelement of the Location Civic report (see Figure 9-261) is formatted according to Figure 9-262.

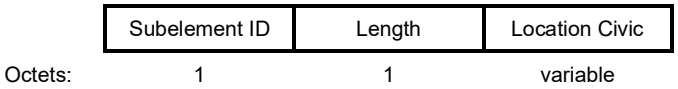

Figure 9-262—Location Civic subelement format

The Subelement ID is equal to Location Civic as defined in Table 9-139.

The Location Civic field contains the location information in the format as indicated in the Civic Location Type field. When the Civic Location Type field is IETF RFC 4776:

— The Location Civic field is formatted according to IETF RFC 4776 starting at the country code field (i.e., excluding the GEOCONF_CIVIC/ OPTION_GEOCONF_CIVIC, N/option-len and what fields)
— An unknown civic location is indicated by a subelement Length of 0 and a zero-length Location Civic field
— The Civic Location field follows the little-endian octet ordering

When the Civic Location Type field is IETF RFC 4776, the list of optional subelements optionally includes the Location Reference, Location Shape, Map Image, and Vendor Specific subelements as defined in Table 9-139.

When the Civic Location Type field value is Vendor Specific, a Vendor Specific subelement is included in the list of optional subelements that identifies the Organization Identifier corresponding to the Civic Location Type field.

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-139. The subelement format and ordering of subelements are defined in 9.4.3.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the corresponding Location Civic request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-201.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding Location Civic request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-202.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Location Reference subelement is shown in Figure 9-263.

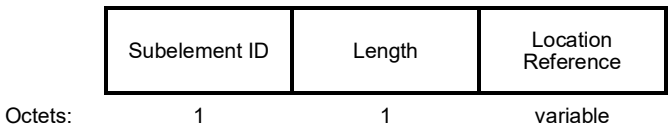

Figure 9-263—Location Reference subelement format

The Location Reference field is an ASCII string that defines a position on a floor from which the relative location contained in the Location Shape subelement is offset. A Location Reference subelement set to 0 indicates that the position of the Location Shape is top north west corner (i.e., 0,0) of the floor plan on which the Location Shape is defined.

The format of the Location Shape subelement is shown in Figure 9-264.

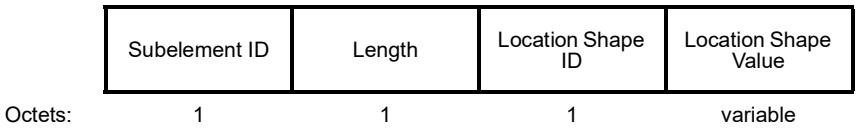

Figure 9-264—Location Shape subelement format

The Location Shape subelement defines the position in meters, including uncertainty, of the entity being located. A Shape is specified with respect to either a 2-Dimensional or 3-Dimensional Coordinate Reference System where each point in the shape defines the direction from the Location Reference value's starting point. A positive X-axis value corresponds to an easterly direction relative to the Location Reference value's starting point; a negative X-axis value corresponds to a westerly direction relative to the Location Reference value's starting point; a positive Y-axis value corresponds to a northerly direction relative to the Location Reference value's starting point; a negative Y-axis value corresponds to a southerly direction relative to the Location Reference value's starting point and the Z-axis value corresponds to the altitude above the horizontal plane at the Location Reference value's starting point.

The Location Shape ID field contains a 1-octet identifier that defines the shape contained in the subelement and is one of the values defined in Table 9-140.

Table 9-140—Location Shape IDs

Location Shape ID	Name
0	Reserved
1	2-Dimension Point
2	3-Dimension Point
3	Circle
4	Sphere
5	Polygon
6	Prism
7	Ellipse
8	Ellipsoid
9	Arcband

The Location Shape Value field contains the location shape value for each corresponding Location Shape ID. The formats of Location Shape Values are described in the following text.

All shape field value units that are 4-octet single precision floating point values are in meters and are represented by binary32 floating point values as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field.

The format of the 2-Dimension Point Location Shape Value field is defined in Figure 9-265.

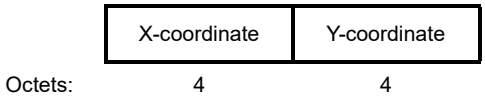

Figure 9-265—2-Dimension Point Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The format of the 3-Dimension Point Location Shape Value field is defined in Figure 9-266.

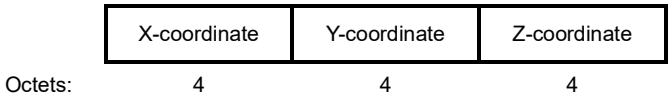

Figure 9-266—3-Dimension Point Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The format of the Circle Location Shape Value field is defined in Figure 9-267.

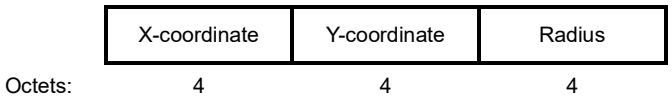

Figure 9-267—Circle Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Radius field contains a 4-octet single precision floating point value.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Sphere Location Shape Value field is defined in Figure 9-268.

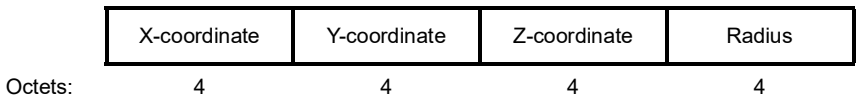

Figure 9-268—Sphere Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The Radius field contains a 4-octet single precision floating point value.

The format of the Polygon Location Shape Value field is defined in Figure 9-269.

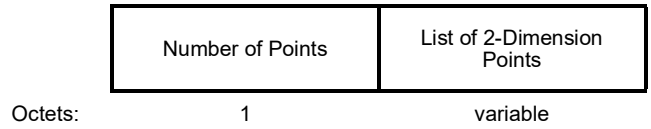

Figure 9-269—Polygon Location Shape Value format

The Number of Points field is an unsigned integer that specifies the number of points defined in the polygon. The value 0 is reserved.

The List of 2-Dimension Points field is a sequence of 2D Point field values that define the closed polygon.

The format of the Prism Location Shape Value field is defined in Figure 9-270.

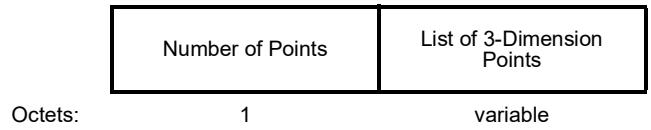

Figure 9-270—Prism Location Shape Value format

The Number of Points field is an unsigned integer that specifies the number of points defined in the prism. The value 0 is reserved.

The List of 3-Dimension Points field is a sequence of 3-Dimension Point field values that define the closed prism.

The format of the Ellipse Location Shape Value field is defined in Figure 9-271.

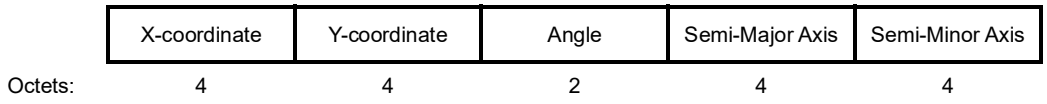

Figure 9-271—Ellipse Location Shape Value format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Angle field contains an unsigned integer between 0 and 359°.

The Semi-Major Axis field contains a 4-octet single precision floating point value.

The Semi-Minor Axis field contains a 4-octet single precision floating point value.

The format of the Ellipsoid Location Shape Value field is defined in Figure 9-272.

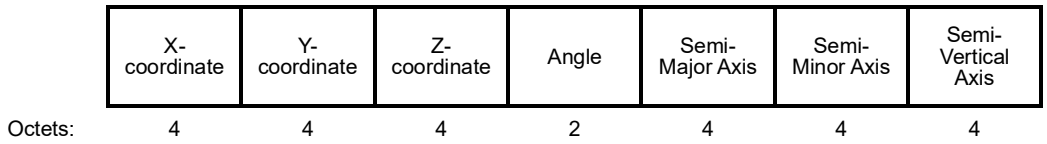

Figure 9-272—Ellipsoid Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The Angle field contains an unsigned integer between 0 and 359°.

The Semi-Major Axis field contains a 4-octet single precision floating point value.

The Semi-Minor Axis field contains a 4-octet single precision floating point value.

The Semi-Vertical Axis field contains a 4-octet single precision floating point value.

The format of the Arcband Location Shape Value field is defined in Figure 9-273.

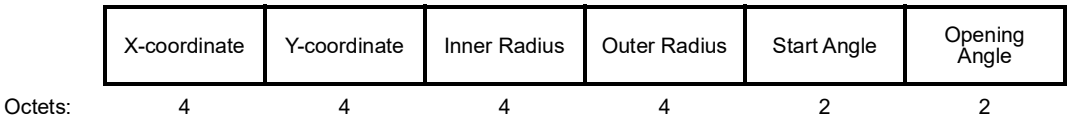

Figure 9-273—Arcband Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Inner Radius field contains a 4-octet single precision floating point value.

The Outer Radius field contains a 4-octet single precision floating point value.

The Start Angle field contains an unsigned integer between 0 and 359.

The Opening Angle field contains an unsigned integer between 0 and 359.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Map Image subelement contains a map reference that is used in combination with the Location Reference and Location Shape subelements. The format of the Map Image subelement is shown in Figure 9-274.

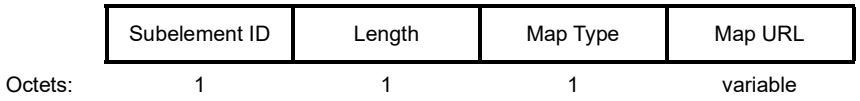

Figure 9-274—Map Image subelement format

The Map Type field is an unsigned integer that defines the type of map referred to by the Map URL field, as defined in Table 9-141.

Table 9-141—Map types

Map Type Value	Name
0	URL Defined
1	png
2	gif
3	jpeg
4	svg
5	dxf
6	dwg
7	dwf
8	cad
9	tiff
10	gml
11	kml
12	bmp
13	pgm
14	ppm
15	xbm
16	xpm
17	ico
18–255	Reserved

The Map Type field value “URL Defined” indicates the Map URL field value has a file extension, and that the type of map referred to by the Map URL field is to be determined from this.

The Map URL field is a variable length field formatted in accordance with IETF RFC 3986 and provides the location of a floor map.

The Co-Located BSSID List subelement is used to report the list of BSSIDs of the BSSs sharing the same antenna connector with the reporting STA if the subelement is contained within a Fine Time Measurement

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

frame, otherwise the BSSs that are co-located within the same physical device as the reporting STA. The Co-Located BSSID List subelement is described in 9.4.2.21.10.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25).

9.4.2.21.14 Location Identifier report

The Location Identifier report includes an indirect reference to the location information for the location subject provided in the Location Identifier request, as shown in Figure 9-275.

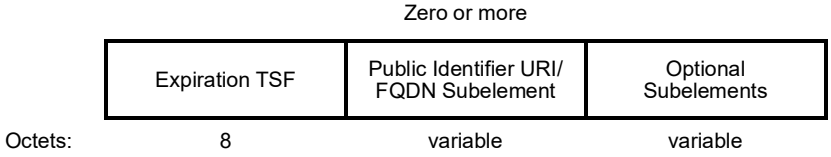

Figure 9-275—Location Identifier report field format

The Expiration TSF field is the value of the TSF when the Public Identifier URI/FQDN subelement(s) that indicate a location object are no longer valid. The Expiration TSF field set to 0 indicates the Public Identifier URI/FQDN subelement(s) that indicate a location object do not expire.

The Public Identifier URI/FQDN Subelement field contains zero or more Public Identifier URI/FQDN subelements.

The subelement IDs for the Location Identifier report are shown in Table 9-142.

Table 9-142—Subelement IDs for Location Identifier report

Subelement ID	Name	Extensible
0	Public Identifier URI/FQDN	No
1	Originator Requesting STA MAC Address	No
2	Target MAC Address	No
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Public Identifier URI/FQDN subelement of the Location Identifier report (see Figure 9-275) is formatted according to Figure 9-276.

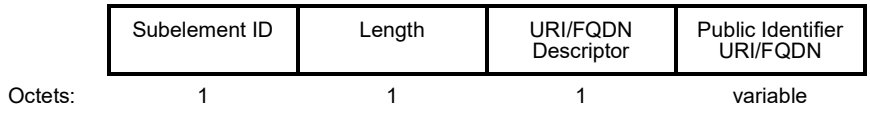

Figure 9-276—Public Identifier URI/FQDN subelement format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID is equal to Public Identifier URI/FQDN as defined in Table 9-142.

The URI/FQDN Descriptor field describes the Public Identifier URI/FQDN field. The URI/FQDN Descriptor field is defined in Table 9-143.

Table 9-143—URI/FQDN Descriptor field values

Value	Usage
0	Reserved
1	The uniform resource locator (URI) of the Hypertext Transfer Protocol (HTTP) enabled location delivery (HELD) location object [IETF RFC 5985]
2	Fully qualified domain name of D-SLP SUPL server (excludes port number) [OMA-TS-ULP-V2_0_1] (or higher version)
3–255	Reserved

The Public Identifier URI/FQDN field contains a URI as a UTF-8 string, formatted in accordance with IETF RFC 3986, that points to a location object or an FQDN that identifies a location server.

A Public Identifier URI/FQDN field that points to a location object can be used to return the location value for the requesting STA. The format of the location value returned when the URI is dereferenced is dependent on the provider of the URI as indicated by the URI/FQDN Descriptor field. The Public Identifier URI field confirms the validity of the location estimate to an external agent when a STA forwards a location estimate to that agent. The protocol used to query the infrastructure for a location report based on the Public Identifier URI field is beyond the scope of this standard.

A Public Identifier URI/FQDN field that points to a location server can be used to discover the location server and establish communications with it. The protocol used with the location server is indicated by the URI/FQDN Descriptor field.

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-142. The subelement format and ordering of subelements are defined in 9.4.3.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the corresponding Location Identifier request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-201.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding Location Identifier request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-202.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.21.15 Directional Channel Quality report

The format of the Measurement Report field of a Directional Channel Quality report is shown in Figure 9-277.

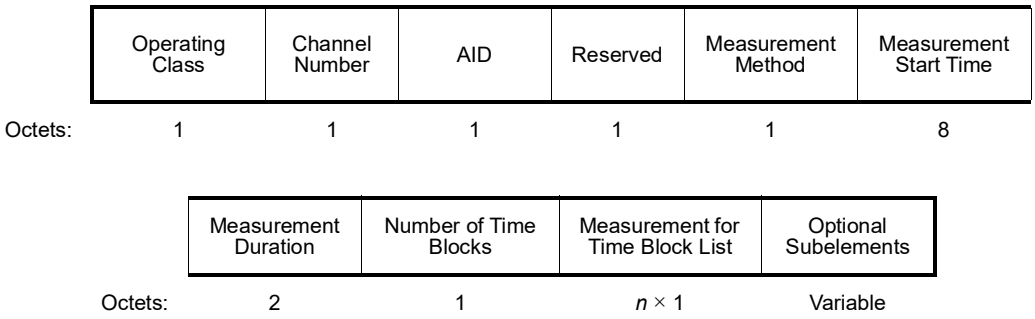

Figure 9-277—Measurement report field format for Directional Channel Quality report

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement report applies. The channel number is defined within an Operating Class as shown in Annex E.

The AID field contains the AID assigned to the Target STA by the AP or PCP.

The Measurement Method field indicates the method used by the STA to carry out this measurement request and the format of the Measurement for Time Block field(s). If this field is set to 0, it indicates that the Measurement for Time Block fields are expressed in ANIPI. If this field is set to 1, it indicates that the Measurement for Time Block fields are expressed in RSNI. Other values are reserved.

Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration of the measurement, in units of TUs.

The Number of Time Blocks field indicates the number of time blocks, *n*, within the measurement duration. The ratio (Measurement Duration/Number of Time Blocks) provides the duration of an individual measurement unit.

The Measurement for Time Block List field contains one or more (*n*) Measurement for Time Block fields.

Each Measurement for Time Block field is set to the ANIPI or RSNI value measured during each (Measurement Duration/Number of Time Blocks) measurement units. The measurement units are set in the report in increasing order of start times.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-144.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-144—Optional subelement IDs for Directional Channel Quality report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21.16 Directional Measurement report

The format of the Measurement Report field of a Directional Measurement report is shown in Figure 9-278.

	Operating Class	Channel Number	Measurement Start Time	Measurement Duration per Direction	Measurement Method	Measurement Results	Optional Subelements
Octets	1	1	8	2	1	Variable	Variable

Figure 9-278—Measurement Report field format for Directional Measurement report

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement report applies. The channel number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration per Direction field is set to the duration of the measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method used by the STA to carry out the measurement request and the format of values in the Measurement for Direction fields. If this field is set to 0, it indicates that the values in the Measurement for Direction fields are expressed in ANIPI. If this field is set to 1, it indicates that the values in the Measurement for Direction fields are expressed in RCPI. If this field is set to 2, it indicates that the values in the Measurement for Direction fields are expressed in Channel Load. Other values are reserved.

The format of the Measurement Results field is shown in Figure 9-279.

	Number of Directions	Measurement for Direction List
Octets:	1	variable

Figure 9-279—Measurement Results field format

The Number of Directions field is set to the number of measurement directions, *n*.

The Measurement for Direction List field contains one or more (*n*) Measurement for Direction fields.

Each Measurement for Direction field is set to the format of values specified in the Measurement Method field.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-145.

Table 9-145—Optional subelement IDs for Directional Measurement report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21.17 Directional Statistics report

The format of the Measurement Report field of a Directional Statistics report is shown in Figure 9-280.

	Operating Class	Channel Number	Measurement Start Time	Measurement Duration per Direction	Measurement Method	Directional Statistics Bitmap	Measurement Results	Optional Subelements
Octets	1	1	8	2	1	1	Variable	Variable

Figure 9-280—Measurement Report field format for Directional Statistics report

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the measurement report applies. The channel number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration per Direction field is set to the duration of the measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method used by the STA to carry out the measurement request and the format of values in the Measurement Results field. If this field is set to 0, it indicates that the values in the Measurement Results field are expressed in ANIPI. If this field is set to 1, it indicates that the values in

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

the Measurement Results field are expressed in RCPI. If this field is set to 2, it indicates that the values in the Measurement Results field are expressed in Channel Load. Other values are reserved.

The Directional Statistics Bitmap field format is described in 9.4.2.20.18. When the Maximum field is set, it indicates that the maximum measurement result among all directions is included in the Measurement Results field. When the Minimum field is set, it indicates that the minimum measurement result among all directions is included in the Measurement Results field. If the Average field is set, it indicates that the average measurement result among all directions is included in the Measurement Results field. If the Variance field is set, it indicates that the variance of measurement results among all directions is included in the Measurement Results field. Other bits are reserved.

The Measurement Results field is set based on the values in the Measurement Method field and the Directional Statistics Bitmap field. If two or more subfields in the Directional Statistics Bitmap are set to 1, the corresponding measurement results are included in the Measurement Results field in the same sequence as they appear in the Directional Statistics Bitmap field.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-146.

Table 9-146—Optional subelement IDs for Directional Statistics report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.21.18 Fine Timing Measurement Range report

The format of the Measurement Report field corresponding to a Fine Timing Measurement Range report is shown in Figure 9-281.

	Range Entry Count	Range Entry	Error Entry Count	Error Entry	Optional Subelements
Octets:	1	*M* x 15	1	*N* x 11	variable

Figure 9-281—Measurement Report field format for a Fine Timing Measurement Range report

The Range Entry Count field indicates the number of Range Entry fields (i.e., *M* in Figure 9-281).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Range Entry field indicates parameters relating to a successful range measurement with a single AP and is formatted according to Figure 9-282.

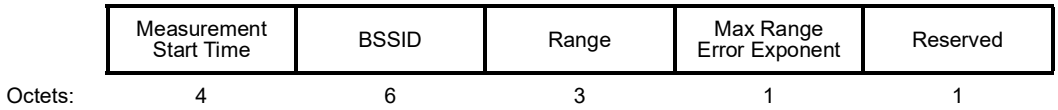

Figure 9-282—Range Entry field format

The Measurement Start Time field contains the least significant 4 octets of the TSF (synchronized with the associated AP) at the time (± 32 μs) at which the first Fine Timing Measurement frame within the first burst (FTM_2 in Figure 11-35. FTM_1 in Figure 11-36 and FTM_1 in Figure 11-37) was transmitted where the timestamps of both the frame and response frame were successfully measured.

The BSSID field contains the BSSID of the BSS of the AP whose range is being reported.

The Range field indicates the estimated range between the requested STA and the AP using the FTM procedure, in units of 1/4096 m. A value of 2^{24}–1 indicates a range of (2^{24}–1)/4096 m or higher. See 11.10.9.11.

The Max Range Error Exponent field contains an upper bound for the error in the value specified in the Range field. A Max Range Error Exponent field set to 0 indicates an unknown error. A nonzero value indicates a maximum range error of $2^{(Max\ Range\ Error\ Exponent\ -\ 13)}$ m. The Max Range Error Exponent field has a maximum value of 25. Values in the range 26–255 are reserved. A Max Range Error Exponent field set to 25 indicates a maximum range error of 4096 m or higher. For example, a Max Range Error Exponent field set to 14 indicates that the Range field has a maximum error of ± 2 m.

The Error Entry Count field indicates the number of Error Entry fields (i.e., *N* in Figure 9-281).

The Error Entry field indicates parameters relating to a failed range measurement with a single AP and is formatted according to Figure 9-283.

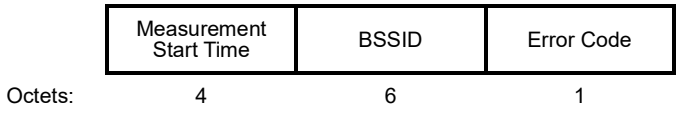

Figure 9-283—Error Entry field format

The Measurement Start Time field contains the least significant 4 octets of the TSF (synchronized with the associated AP) at the time (± 32 μs) at which the FTM failure was first detected.

The BSSID field contains the BSSID of the BSS of the AP whose range was attempted to be measured.

The Error Code field is defined in Table 9-147.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-147—Error Code field values

Error code	Meaning
0–1	Reserved
2	AP reported “Request incapable”
3	AP reported “Request failed. Do not send new request for a specified period”
4–7	Reserved
8	Unable to successfully transmit to AP
9–255	Reserved

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-148.

Table 9-148—Optional subelement IDs for Fine Timing Measurement Range report

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.22 Quiet element

The Quiet element defines an interval during which no transmission occurs in the current channel. This interval might be used to assist in making channel measurements without interference from other STAs in the BSS. The format of the Quiet element is shown in Figure 9-284.

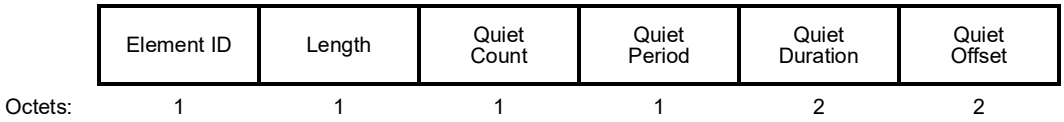

Figure 9-284—Quiet element format

The Element ID and Length fields are defined in 9.4.2.1.

The Quiet Count field is set to the number of TBTTs until the beacon interval during which the next quiet interval starts. The value of 0 is reserved.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Quiet Period field is set to the number of beacon intervals between the start of regularly scheduled quiet intervals defined by this Quiet element. A Quiet Period field set to 0 indicates that no periodic quiet interval is defined.

The Quiet Duration field is set to the duration of the quiet interval, expressed in TUs.

The Quiet Offset field is set to the offset of the start of the quiet interval from the TBTT specified by the Quiet Count field, expressed in TUs. The value of the Quiet Offset field is less than one beacon interval.

The Quiet element is optionally present in Beacon frames, as described in 9.3.3.2, and Probe Response frames, as described in 9.3.3.10. The use of Quiet elements is described in 11.8.3.

9.4.2.23 IBSS DFS element

The IBSS DFS element contains information for DFS operation in an IBSS. The format of the IBSS DFS element is shown in Figure 9-285.

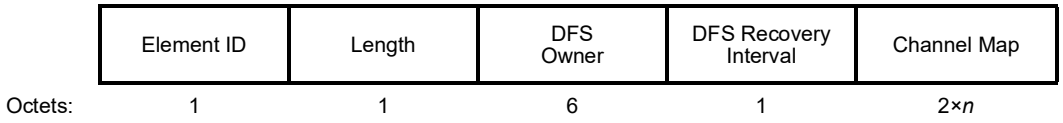

Figure 9-285—IBSS DFS element format

The Element ID and Length fields are defined in 9.4.2.1.

The DFS Owner field is set to the individual IEEE MAC address of the STA that is the currently known DFS Owner in the IBSS.

The DFS Recovery Interval field indicates the time interval that is used for DFS owner recovery, expressed as an integer number of beacon intervals. The DFS Recovery Interval value is static throughout the lifetime of the IBSS and is determined by the STA that starts the IBSS.

The Channel Map field shown in Figure 9-286 contains a Channel Number field and a Map field (see 9.4.2.21.2) for each channel supported by the STA transmitting the IBSS DFS element. Note that *n* in Figure 9-285 is the number of channels supported by the STA.

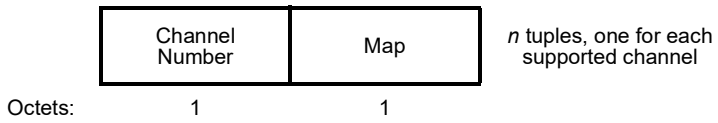

Figure 9-286—Channel Map field format

The IBSS DFS element is optionally present in Beacon frames, as described in 9.3.3.2, and Probe Response frames, as described in 9.3.3.10. The use of IBSS DFS elements is described in 11.8.8.3.

9.4.2.24 RSNE

9.4.2.24.1 General

The RSNE field contains the information required to establish an RSNA. The format of the RSNE field is defined in Figure 9-287.

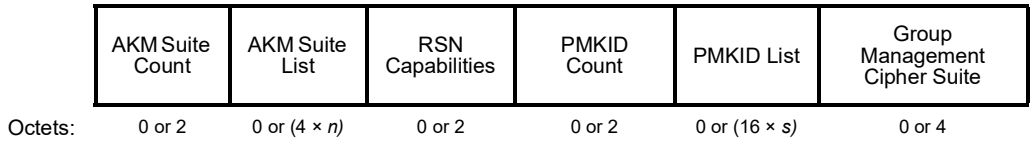

Figure 9-287—RSNE format

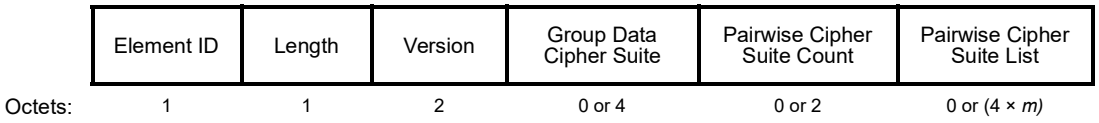

The Element ID and Length fields are defined in 9.4.2.1.

The size of the RSNE field is limited by the size of an element, which is 255 octets. Therefore, the number of pairwise cipher suites, AKM suites, and PMKIDs is limited.

In Figure 9-287, *m* denotes the pairwise cipher suite count, *n* the AKM suite count, and *s* the PMKID count.

All fields use the bit convention from 9.2.2. The RSNE field contains up to and including the Version field. All fields after the Version field are optional. If any nonzero-length field is absent, then none of the subsequent fields are included.

The Version field indicates the version number of the RSN protocol. Version 1 is defined in this standard. Other values are reserved.

NOTE—The following represent sample elements:

IEEE 802.1X authentication, CCMP-128 pairwise and group data cipher suites (WEP-40, WEP-104, and TKIP not allowed):

30, // element id, 48 expressed as hexadecimal value
14, // length in octets, 20 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 04, // CCMP-128 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP-128 as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
00 00 // No capabilities

IEEE 802.1X authentication, CCMP-128 pairwise and group data cipher suites (WEP-40, WEP-104 and TKIP not allowed), preauthentication supported:

30, // element id, 48 expressed as hexadecimal value
14, // length in octets, 20 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 04, // CCMP-128 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP-128 as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
01 00 // Preauthentication capabilities

IEEE 802.1X authentication, Use GTK for pairwise cipher suite, WEP-40 group data cipher suites, optional RSN Capabilities field omitted:

30, // element id, 48 expressed as hexadecimal value
12, // length in octets, 18 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 01, // WEP-40 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 00, // Use group cipher suite as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication

IEEE 802.1X authentication, Use CCMP-128 for pairwise cipher suite, CCMP-128 group data cipher suites, preauthentication and a PMKID:

30, // element id, 48 expressed as hexadecimal value
26 // length in octets, 38 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 04, // CCMP-128 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP-128 as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
01 00 // Preauthentication capabilities
01 00 // PMKID Count
01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F 10 // PMKID

IEEE 802.1X authentication, CCMP-128 pairwise and group data cipher suites (WEP-40, WEP-104, and TKIP are not allowed), and management frame protection with BIP-CMAC-128 as the group management suite selector.

30, // element id, 48 expressed as hexadecimal value
1A, // length in octets, 26 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 04, // CCMP-128 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP-128 as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
80 00 // management frame protection is enabled but not required
00 00 // No PMKIDs
00 0F AC 06, // BIP-CMAC-128 as the broadcast/multicast management cipher suite

9.4.2.24.2 Cipher suites

The Group Data Cipher Suite field contains the cipher suite selector used in the BSS to protect group addressed Data frames.

The Pairwise Cipher Suite Count field indicates the number of pairwise cipher suite selectors that are contained in the Pairwise Cipher Suite List field. The value 0 is reserved.

The Pairwise Cipher Suite List field contains a series of cipher suite selectors that indicate the pairwise cipher suites used in the BSS to protect individually addressed Data frames.

The Group Management Cipher Suite field contains the cipher suite selector used by the BSS to protect group addressed robust Management frames.

When management frame protection is negotiated, the negotiated pairwise cipher suite is used to protect individually addressed robust Management frames, and the group management cipher suite is used to protect group addressed robust Management frames. Use of BIP-CMAC-128, BIP-GMAC-128, BIP-GMAC-256, and BIP-CMAC-256 is not valid as a data cipher suite.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A suite selector has the format shown in Figure 9-288.

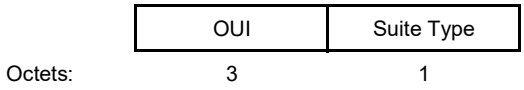

Figure 9-288—Suite selector format

The OUI field contains an OUI or CID. The order of the OUI field is described in 9.2.2.

Table 9-149 provides the cipher suite selectors defined by this standard.

Table 9-149—Cipher suite selectors

OUI	Suite type	Meaning
00-0F-AC	0	Use group cipher suite
00-0F-AC	1	WEP-40
00-0F-AC	2	TKIP
00-0F-AC	3	Reserved
00-0F-AC	4	CCMP-128
00-0F-AC	5	WEP-104
00-0F-AC	6	BIP-CMAC-128
00-0F-AC	7	Group addressed traffic not allowed
00-0F-AC	8	GCMP-128
00-0F-AC	9	GCMP-256
00-0F-AC	10	CCMP-256
00-0F-AC	11	BIP-GMAC-128
00-0F-AC	12	BIP-GMAC-256
00-0F-AC	13	BIP-CMAC-256
00-0F-AC	14–255	Reserved
Other OUI or CID	Any	Vendor-specific

In non-DMG RSNA, the cipher suite selector 00-0F-AC:4 (CCMP-128) is the default group cipher suite for Data frames when the Group Data Cipher Suite field is not included in the RSNE field.

In non-DMG RSNA, the cipher suite selector 00-0F-AC:4 (CCMP-128) is the default pairwise cipher suite when the Pairwise Cipher Suite List field is not included in the RSNE field.

In DMG RSNA, the cipher suite selector 00-0F-AC:8 (GCMP-128) is the default group cipher suite for Data frames when the Group Data Cipher Suite field is not included in the RSNE field.

In DMG RSNA, the cipher suite selector 00-0F-AC:8 (GCMP-128) is the default pairwise cipher suite when the Pairwise Cipher Suite List field is not included in the RSNE field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In an RSNA with management frame protection enabled, the cipher suite selector 00-0F-AC:6 (BIP-CMAC-128) is the default group cipher suite for Management frames when the Group Management Cipher Suite field is not included in the RSNE field.

The cipher suite selectors 00-0F-AC:1 (WEP-40) and 00-0F-AC:5 (WEP-104) are only valid as a group cipher suite in a transition security network (TSN) to allow pre-RSNA STAs to join an IBSS or to associate with an infrastructure BSS.

Use of any group cipher suite other than TKIP, WEP-104, or WEP-40 with TKIP as the pairwise cipher suite is not supported.

The cipher suite selector 00-0F-AC:0 (Use group cipher suite) is valid only as the pairwise cipher suite. An AP specifies the selector 00-0F-AC:0 (Use group cipher suite) for a pairwise cipher suite if it does not support any pairwise cipher suites. If an AP specifies 00-0F-AC:0 (Use group cipher suite) as the pairwise cipher selection, this is the only pairwise cipher selection the AP advertises.

If any cipher suite other than TKIP, WEP-104, or WEP-40 is enabled, then the AP supports pairwise keys, and thus the suite selector 00-0F-AC:0 (Use group cipher suite) is not a valid option.

Table 9-150 indicates the circumstances under which each cipher suite is used.

Table 9-150—Cipher suite usage

Cipher suite selector	GTK	PTK	IGTK or BIGTK
Use group cipher suite	No	Yes	No
WEP-40	Yes	No	No
WEP-104	Yes	No	No
TKIP	Yes	Yes	No
CCMP-128	Yes	Yes	No
BIP-CMAC-128	No	No	Yes
GCMP-128	Yes	Yes	No
GCMP-256	Yes	Yes	No
CCMP-256	Yes	Yes	No
BIP-GMAC-128	No	No	Yes
BIP-GMAC-256	No	No	Yes
BIP-CMAC-256	No	No	Yes

9.4.2.24.3 AKM suites

The AKM Suite Count field indicates the number of AKM suite selectors that are contained in the AKM Suite List field. The value 0 is reserved.

The AKM Suite List field contains a series of AKM suite selectors. In an IBSS only a single AKM suite selector is specified because IBSS STAs use the same AKM suite and because there is no mechanism to negotiate the AKMP in an IBSS (see 12.6.5).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Each AKM suite selector specifies an AKMP. Table 9-151 gives the AKM suite selectors defined by this standard. An AKM suite selector has the format shown in Figure 9-288.

Table 9-151—AKM suite selectors

OUI	Suite type	Meaning			Authentication algorithm numbers (see 9.4.1.1)
		Authentication type	Key management type	Key derivation type	
00-0F-AC	0	Reserved	Reserved	Reserved	Reserved
00-0F-AC	1	Authentication negotiated over IEEE Std 802.1X	RSNA key management as defined in 12.7	Defined in 12.7.1.2	0 (open)
00-0F-AC	2	PSK	RSNA key management as defined in 12.7	Defined in 12.7.1.2	0 (open)
00-0F-AC	3	FT authentication negotiated over IEEE Std 802.1X	FT key management as defined in 12.7.1.6	Defined in 12.7.1.6.2 using SHA-256	2 (FT) for FT protocol reassociation as defined in 13.5 0 (open) for FT Initial Mobility Domain Association over IEEE Std 802.1X or PMKSA caching

00-0F-AC	17	FT authentication over FILS with SHA-384 and AES-SIV-512, or authentication negotiated over IEEE Std 802.1X	FT key management as defined in 12.7.1.6	Defined in 12.7.1.6.2 using SHA-384	4, 5 or 6 (FILS) for FT Initial Mobility Domain Association over FILS 2 (FT) for FT protocol reassociation as defined in 13.5 0 (open) for FT Initial Mobility Domain Association over IEEE Std 802.1X or PMKSA caching
00-0F-AC	18	Reserved	Reserved	Reserved	Reserved
00-0F-AC	19	FT authentication using PSK	FT key management as defined in 12.7.1.6	Defined in 12.7.1.6.2 using SHA-384	2 (FT) for FT protocol reassociation as defined in 13.5 0 (open) for FT Initial Mobility Domain Association using PSK
00-0F-AC	20	PSK	RSNA key management as defined in 12.7	Defined in 12.7.1.6.2 using SHA-384	0 (open)
00-0F-AC	21–255	Reserved	Reserved	Reserved	Reserved
Other OUI or CID	Any	Vendor-specific	Vendor-specific	Vendor-specific	Vendor-specific

The AKM suite selector value 00-0F-AC:1 (i.e., Authentication negotiated over IEEE Std 802.1X with RSNA key management as defined in 12.7 is the default AKM suite when the AKM Suite List field is not included in the RSNE.

NOTE 1—The selector value 00-0F-AC:1 specifies only that IEEE Std 802.1X-2010 is used as the authentication transport. IEEE Std 802.1X-2010 selects the authentication mechanism.

The AKM suite selector value 00-0F-AC:8 (i.e., SAE authentication with SHA-256 is used when either a password or PSK is used with RSNA key management.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—Selector values 00-0F-AC:1 and 00-0F-AC:8 can simultaneously be enabled by an Authenticator.

The AKM suite selector value 00-0F-AC:2 (PSK) is used when an alternate form of PSK is used with RSNA key management.

NOTE 3—Selector values 00-0F-AC:1 and 00-0F-AC:2 can simultaneously be enabled by an Authenticator.

The AKM suite selector value 00-0F-AC:11 is used only with cipher suite selector values 00-0F-AC:8 (GCMP-128) and 00-0F-AC:11 (BIP-GMAC-128). The AKM suite selector value 00-0F-AC:12 is used only with cipher suite selector values 00-0F-AC:9 (GCMP-256), 00-0F-AC:10 (CCMP-256), 00-0F-AC:13 (BIP-CMAC-256), and 00-0F-AC:12 (BIP-GMAC-256). The AKM suite selector value 00-0F-AC:13 is used only with cipher suite selector values 00-0F-AC:9 (GCMP-256), 00-0F-AC:10 (CCMP-256), 00-0F-AC:13 (BIP-CMAC-256), and 00-0F-AC:12 (BIP-GMAC-256).

NOTE 4—The AKM suite selector value 00-0F-AC:11 is deprecated.

NOTE 5—The usage of selector values with authentication algorithms is defined in the Authentication algorithm numbers column of Table 9-151; see 9.4.1.1.

A PMKSA established using a given AKM selector value may be cached and used in a subsequent (re)association as defined in 12.6.10.3.

9.4.2.24.4 RSN capabilities

The RSN Capabilities field indicates requested or advertised capabilities. If the RSN Capabilities field is not present, the default value of 0 is used for all of the capability subfields.

The length of the RSN Capabilities field is 2 octets. The format of the RSN Capabilities field is as shown in Figure 9-289 and described after the figure.

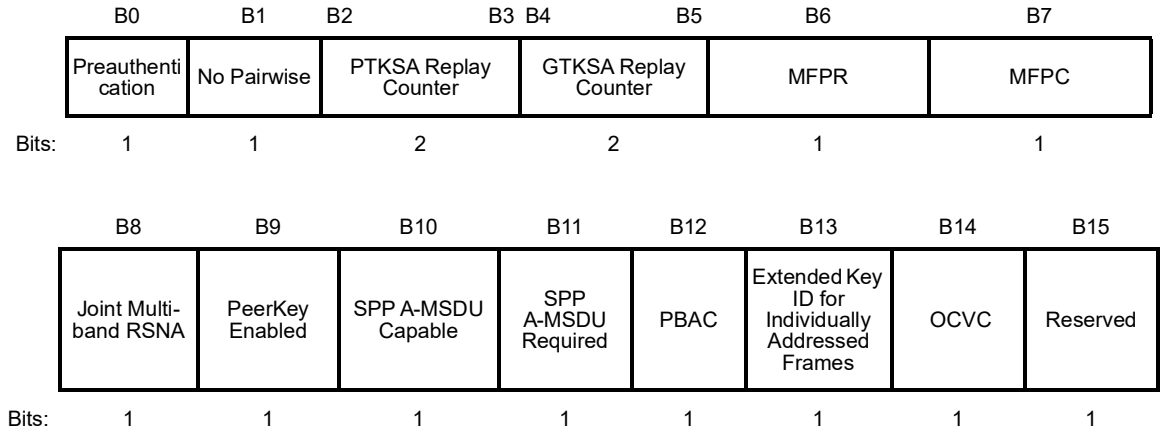

Figure 9-289—RSN Capabilities field format

— Bit 0: Preauthentication. An AP sets the Preauthentication subfield of the RSN Capabilities field to 1 to signal it supports preauthentication (see 12.6.10.2) and sets the subfield to 0 when it does not support preauthentication. A non-AP STA sets the Preauthentication subfield to 0.

— Bit 1: No Pairwise. If a STA supports WEP default key 0 simultaneously with a pairwise key (see 12.7.1), then the STA sets the No Pairwise subfield of the RSN Capabilities field to 0.

If a STA does not support WEP default key 0 simultaneously with a pairwise key (see 12.7.1), then the STA sets the No Pairwise subfield of the RSN Capabilities field to 1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The No Pairwise subfield describes a capability of a non-AP STA. IBSS STAs and APs set the No Pairwise subfield to 0.

The No Pairwise subfield is set to 1 only in a TSN and when the pairwise cipher suite selected by the STA is TKIP.

— Bits 2–3: PTKSA Replay Counter. A STA sets the PTKSA Replay Counter subfield of the RSN Capabilities field to the value contained in dot11RSNAConfigNumberOfPTKSAReplayCounters. The least significant bit (LSB) of dot11RSNAConfigNumberOfPTKSAReplayCounters is put in bit 2. See 12.5.2.6 and 12.5.3.4.4. The meaning of the value in the PTKSA/GTKSA Replay Counter subfield is defined in Table 9-152.

Table 9-152—PTKSA/GTKSA replay counters usage

Replay counter value	Meaning
0	1 replay counter per PTKSA/GTKSA
1	2 replay counters per PTKSA/GTKSA
2	4 replay counters per PTKSA/GTKSA
3	16 replay counters per PTKSA/GTKSA/

— Bits 4–5: GTKSA Replay Counter. A STA sets the GTKSA Replay Counter subfield of the RSN Capabilities field to the value contained in dot11RSNAConfigNumberOfGTKSAReplayCounters. The LSB of dot11RSNAConfigNumberOfGTKSAReplayCounters is put in bit 4. See 12.5.2.6 and 12.5.3.4.4. The meaning of the value in the GTKSA Replay Counter subfield is defined in Table 9-152.

— Bit 6: MFPR. A STA sets this bit to 1 to advertise that protection of robust Management frames is mandatory. A STA sets this bit to 1 when dot11RSNAProtectedManagementFramesActivated is true and dot11RSNAUnprotectedManagementFramesAllowed is false; otherwise it sets this bit to 0. If a STA sets this bit to 1, then that STA only allows RSNAs with STAs that provide Management Frame Protection.

— Bit 7: MFPC . A STA sets this bit to 1 when dot11RSNAProtectedManagementFramesActivated is true to advertise that protection of robust Management frames is enabled.

— Bit 8: Joint Multi-band RSNA. A STA sets the Joint Multi-band RSNA subfield to 1 to indicate that it supports the Joint Multi-band RSNA (12.6.22). Otherwise, this subfield is set to 0.

— Bits 9: PeerKey Enabled. An AP sets the PeerKey Enabled subfield of the RSN Capabilities field to 1 to signal it supports PeerKey handshake (see 12.7.8). Otherwise, this subfield is set to 0.

— Bit 10: SPP A-MSDU Capable. A STA sets the SPP A-MSDU Capable subfield of the RSN Capabilities field to 1 to signal that it supports signaling and payload protected A-MSDUs (SPP A-MSDUs) (see 10.11). Otherwise, this subfield is set to 0.

— Bit 11: SPP A-MSDU Required. A STA sets the SPP A-MSDU Required subfield of the RSN Capabilities field to 1 when it allows only SPP A-MSDUs (i.e., does not send or receive payload protected A-MSDUs (PP A-MSDUs) (see 10.11). Otherwise, this subfield is set to 0.

— Bit 12: PBAC (protected block ack agreement capable). A STA sets the PBAC subfield of RSN Capabilities field to 1 to indicate it is PBAC. Otherwise, this subfield is set to 0.

— Bit 13: Extended Key ID for Individually Addressed Frames. This subfield is set to 1 to indicate that the STA supports Key ID values in the range 0 to 1 for a PTKSA when the cipher suite is CCMP or GCMP. Bit 13 set to 0 indicates that the STA only supports Key ID 0 for a PTKSA.

— Bit 14: OCVC. This subfield is set to 1 to indicate that the STA supports operating channel validation by including Operating Channel Information (OCI) in RSNA exchanges and validates the information when received from another STA that indicated this capability.

— Bits 15: Reserved. The remaining subfields of the RSN Capabilities field are reserved.

9.4.2.24.5 PMKID

The PMKID Count field indicates the number of PMKIDs that are contained in the PMKID List field. The PMKID List field contains a series (possibly empty) of PMKIDs.

When one or more PMKIDs are included in a (Re)Association Request frame or FILS Authentication frame to an AP, they identify PMKSAs that the STA believes to be valid for the destination AP. When a PMKID is included in a FILS Authentication frame to a STA, it identifies a PMKID that the AP has selected.

A PMKID in the PMKID List field can refer to

a) The PMKID of a cached PMKSA that has been obtained through preauthentication with the target AP
b) The PMKID of a cached PMKSA from an EAP, FILS, or SAE authentication
c) The PMKID of a PMKSA derived from a PSK for the target AP
d) The PMKR0Name of a PMK-R0 security association derived as part of an FT initial mobility domain association
e) The PMKR1Name of a PMK-R1 security association derived as part of an FT initial mobility domain association or as part of a fast BSS transition.

See 12.7.1.3 and 12.7.1.6.3 for the construction of the PMKID, 13.8 for the population of PMKID List for fast BSS transitions, 12.6.10.3 for the population of PMKID List when using PMKSA caching, 13.4 for the population of PMKID List for FT initial mobility domain association, 12.11.2 for the population of PMKID List with FILS authentication, and 12.7.1.6 for the construction of PMKR0Name and PMKR1Name.

NOTE—A STA need not insert a PMKID in the PMKID List field if the STA will not be using that PMKSA.

9.4.2.25 Vendor Specific element

The Vendor Specific element is used to carry information not defined in this standard within a single defined format, so that reserved element IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The element is in the format shown in Figure 9-290.

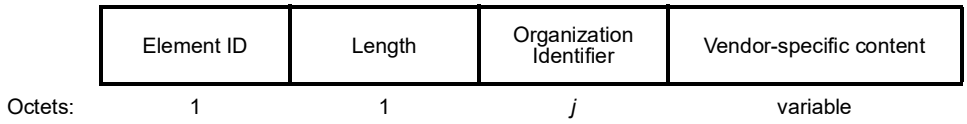

Figure 9-290—Vendor Specific element format

The Element ID and Length fields are defined in 9.4.2.1.

The Organization Identifier field identifies (see 9.4.1.31) the entity that has defined the content of the particular Vendor Specific element. See 9.4.1.31 for the definition of *j*.

9.4.2.26 Extended Capabilities element

The Extended Capabilities element carries information about the capabilities of a STA that augment the capabilities specified in the Capability Information field. The format of this element is shown in Figure 9-291.

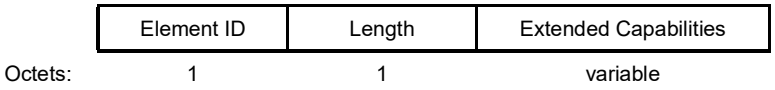

Figure 9-291—Extended Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The Extended Capabilities field is a bit field indicating the extended capabilities being advertised by the STA transmitting the element. The length of the Extended Capabilities field is variable. If fewer bits are received in an Extended Capabilities field than shown in Table 9-153, the rest of the Extended Capabilities field bits are assumed to be zero. The Extended Capabilities field is shown in Table 9-153.

Table 9-153—Extended Capabilities field

Bit	Information	Notes
0	20/40 BSS Coexistence Management Support	The 20/40 BSS Coexistence Management Support field indicates support for the 20/40 BSS Coexistence Management frame and its use. The 20/40 BSS Coexistence Management Support field is set to 1 to indicate support for the communication of STA information through the transmission and reception of the 20/40 BSS Coexistence Management frame. The 20/40 BSS Coexistence Management Support field is set to 0 to indicate a lack of support for the communication of STA information through the transmission and reception of the 20/40 BSS Coexistence Management frame.
1	GLK	The STA sets the GLK field to 1 when dot11GLKImplemented is true and sets it to 0 otherwise.
2	Extended Channel Switching	The Extended Channel Switching field is 1 to indicate support for the communication of channel switching information through the transmission and reception of the Extended Channel Switch Announcement element and Management frame, as described in 9.6.7.7. The Extended Channel Switching field is 0 to indicate a lack of support for extended channel switching.
3	GLK-GCR	The STA sets the GLK-GCR field to 1 when dot11GLKGCRImplemented is true and sets it to 0 otherwise.
4	PSMP Capability	This field indicates support for PSMP operation. See 10.30. Set to 0 if the STA does not support PSMP operation Set to 1 if the STA supports PSMP operation.
5	Reserved	
6	S-PSMP Support	Indicates support for scheduled PSMP. When the PSMP Capability field is equal to 0, the S-PSMP Support field is set to 0. When the PSMP Capability field is equal to 1, the S-PSMP Support field is defined as follows: Set to 0 if STA does not support S-PSMP Set to 1 if STA supports S-PSMP

Table 9-153—Extended Capabilities field *(continued)*

Bit	Information	Notes
7	Event	The STA sets the Event field to 1 when dot11EventsActivated is true, and sets it to 0 otherwise. See 11.21.2.
8	Diagnostics	The STA sets the Diagnostics field to 1 when dot11DiagnosticsActivated is true, and sets it to 0 otherwise. See 11.21.3.
9	Multicast Diagnostics	The STA sets the Multicast Diagnostics field to 1 when dot11MulticastDiagnosticsActivated is true, and sets it to 0 otherwise. See 11.21.3.
10	Location Tracking	The STA sets the Location Tracking field to 1 when dot11LocationTrackingActivated is true, and sets it to 0 otherwise. See 11.21.4.
11	FMS	The STA sets the FMS field to 1 when dot11FMSActivated is true, and sets it to 0 otherwise. See 11.2.3.14 and 11.21.8.
12	Proxy ARP Service	The AP sets the Proxy ARP Service field to 1 when dot11ProxyARPActivated is true, and sets it to 0 otherwise. See 11.21.14. A non-AP STA sets the Proxy ARP Service field to 0.
13	Collocated Interference Reporting	The STA sets the Collocated Interference Reporting field to 1 when dot11CoLocIntfReportingActivated is true, and sets it to 0 otherwise. See 11.21.9.
14	Civic Location	The STA sets the Civic Location field to 1 when dot11RMCivicConfigured is true, and sets it to 0 otherwise. See 11.10.9.9.
15	Geospatial Location	The STA sets the Geospatial Location field to 1 when dot11RMLCIConfigured is true, and sets it to 0 otherwise. See 11.10.9.6.
16	TFS	The STA sets the TFS field to 1 when dot11TFSActivated is true, and sets it to 0 otherwise. See 11.21.12.
17	WNM Sleep Mode	The STA sets the WNM Sleep Mode field to 1 when dot11WNMSleepModeActivated is true, and sets it to 0 otherwise. See 11.2.3.16.
18	TIM Broadcast	The STA sets the TIM Broadcast field to 1 when dot11TIMBroadcastActivated is true, and sets it to 0 otherwise. See 11.2.3.15.
19	BSS Transition	The STA sets the BSS Transition field to 1 when dot11BSSTransitionActivated is true, and sets it to 0 otherwise. See 11.21.7.
20	QoS Traffic Capability	The STA sets the QoS Traffic Capability field to 1 when dot11QoSTrafficCapabilityActivated is true, and sets it to 0 otherwise. See 11.21.10.
21	AC Station Count	The STA sets the AC Station Count field to 1 when dot11ACStationCountActivated is true, and sets it to 0 otherwise. See 11.21.11.
22	Multiple BSSID	The STA sets the Multiple BSSID field to 1 when dot11MultiBSSIDImplemented is true, and sets it to 0 otherwise. See 11.10.14 and 11.1.3.8.
23	Timing Measurement	The STA sets the Timing Measurement field to 1 when dot11TimingMsmtActivated is true, and sets it to 0 otherwise. See 11.21.5.
24	Channel Usage	The STA sets the Channel Usage field to 1 when dot11ChannelUsageActivated is true and sets it to 0 otherwise. See 11.21.15.

Table 9-153—Extended Capabilities field *(continued)*

Bit	Information	Notes
25	SSID List	The STA sets the SSID List field to 1 when dot11SSIDListActivated is true, and sets it to 0 otherwise. See 11.1.4.
26	DMS	The STA sets the DMS field to 1 when dot11DMSActivated is true and sets it to 0 otherwise. See 11.21.16.
27	UTC TSF Offset	The STA sets the UTC TSF Offset field to 1 when dot11UTCTSFOffsetActivated is true and sets it to 0 otherwise. See 11.19.3.
28	TPU Buffer STA Support	The TPU Buffer STA Support subfield indicates support for the TPU buffer STA function, as defined in 11.2.3.13. When dot11TDLSPeerUAPSDBufferSTAActivated is true, and to indicate support for TPU on this link, the TPU Buffer STA Support subfield is set to 1. Otherwise, the TPU Buffer STA Support subfield is set to 0 to indicate that this capability is not supported on this link.
29	TDLS Peer PSM Support	The TDLS Peer PSM Support subfield indicates support for TDLS peer PSM, as defined in 11.2.3.12. When dot11TDLSPeerPSMActivated is true, and to indicate support for TDLS peer PSM on this link, the TDLS Peer PSM Support subfield is set to 1. Otherwise, the TDLS Peer PSM Support subfield is set to 0 to indicate that this capability is not supported on this link.
30	TDLS channel switching	When dot11TDLSChannelSwitchingActivated is true, and to indicate that the STA supports TDLS with TDLS channel switching on this link as described in 11.20, the TDLS Channel Switching subfield is set to 1. Otherwise, the TDLS Channel Switching subfield is set to 0 to indicate that this capability is not supported on this link.
31	Interworking	When dot11InterworkingServiceActivated is true, the Interworking field is set to 1 to indicate the STA supports interworking service as described in 11.22. When dot11InterworkingServiceActivated is false, the Interworking field is set to 0 to indicate the STA does not support this capability.
32	QoS Map	When dot11QosMapActivated is true, the QoS Map field is set to 1 to indicate the STA supports QoS Map service as described in 11.22.9. When dot11QosMapActivated is false, the QoS Map field is set to 0 to indicate the STA does not support this capability.
33	EBR	When dot11EBRActivated is true, the EBR field is set to 1 to indicate the STA supports EBR operation as described in 11.4. When dot11EBRActivated is false, the EBR field is set to 0 to indicate the STA does not support this capability.
34	SSPN Interface	When dot11SSPNInterfaceActivated is true, the SSPN Interface field is set to 1 to indicate the AP supports SSPN Interface service as described in 11.22.5. When dot11SSPNInterfaceActivated is false, the SSPN Interface is set to 0 to indicate the AP does not support this capability. Non-AP STAs set this field to 0.
35	Reserved	
36	MSGCF Capability	When dot11MSGCFActivated is true, the MSGCF Capability field is set to 1 to indicate the non-AP STA supports the MSGCF in 6.4. When dot11MSGCFActivated is false, the MSGCF Capability is set to 0 to indicate the non-AP STA does not support this capability. APs set this field to 0.
37	TDLS Support	The TDLS Support subfield indicates support for TDLS, as defined in 11.20. When dot11TunneledDirectLinkSetupImplemented is true, this field is set to 1 to indicate support for TDLS. The field is set to 0 otherwise, to indicate that TDLS is not supported.

Table 9-153—Extended Capabilities field *(continued)*

Bit	Information	Notes
38	TDLS Prohibited	The TDLS Prohibited subfield indicates whether the use of TDLS is prohibited. The field is set to 1 to indicate that TDLS is prohibited and to 0 to indicate that TDLS is allowed.
39	TDLS Channel Switching Prohibited	The TDLS Channel Switching Prohibited subfield indicates whether the use of TDLS Channel Switching is prohibited. The field is set to 1 to indicate that TDLS Channel Switching is prohibited and to 0 to indicate that TDLS Channel Switching is allowed.
40	Reject Unadmitted Frame	When dot11RejectUnadmittedTraffic is true, the Reject Unadmitted Frame bit is set to 1 to indicate that the STA does not transmit frames belonging to an unadmitted TS. When dot11RejectUnadmittedTraffic is false, the Reject Unadmitted Frame bit is set to 0 to indicate that the STA might transmit frames belonging to an unadmitted TS. When dot11RejectUnadmittedTraffic is not present, the Reject Unadmitted frame bit is set to 0.
41-43	Service Interval Granularity	Duration of the shortest service interval (SI). Used for scheduled PSMP only. This field is defined when the S-PSMP Support field is set to 1; otherwise, it is reserved. See 11.4.6. Set to 0 for 5 ms Set to 1 for 10 ms Set to 2 for 15 ms Set to 3 for 20 ms Set to 4 for 25 ms Set to 5 for 30 ms Set to 6 for 35 ms Set to 7 for 40 ms
44	Identifier Location	The STA sets the Identifier Location field to 1 when dot11RMIdentifierMeasurementActivated is true, and sets it to 0 otherwise. See 11.10.9.10.
45	U-APSD Coexistence	The STA sets the U-APSD Coexistence field to 1 when dot11UAPSDCoexistenceActivated is true and sets it to 0 otherwise. See 11.2.3.5.2.
46	WNM Notification	The STA sets the WNM Notification field to 1 when dot11WNMNotificationActivated is true and sets it to 0 otherwise. See 11.21.17.
47	QAB Capability	Set to 1 if AP supports QAB Set to 0 otherwise
48	UTF-8 SSID	The SSID in this BSS is a sequence of UTF-8 encoded code points
49	QMFActivated	The STA sets the QMFActivated field to 1 when dot11QMFActivated is true and sets it to 0 otherwise. See 11.24.
50	QMFReconfigurationActivated	The STA sets the QMFReconfigurationActivated field to 1 when dot11QMFActivated is true and sets it to 0 otherwise. See 11.24.

Table 9-153—Extended Capabilities field *(continued)*

Bit	Information	Notes
51	Robust AV Streaming	The STA sets the Robust AV Streaming field to 1 when dot11RobustAVStreamingImplemented is true and sets it to 0 otherwise. See 11.25.
52	Advanced GCR	The STA sets the Advanced GCR field to 1 when dot11AdvancedGCRActivated is true and sets it to 0 otherwise. See 11.21.16.3.
53	Mesh GCR	The STA sets the mesh GCR field to 1 when dot11MeshGCRActivated is true and sets it to 0 otherwise. See 11.21.16.3.
54	SCS	The STA sets the SCS field to 1 when dot11SCSActivated is true and sets it to 0 otherwise. See 11.25.2.
55	QLoad Report	The STA sets the QLoad Report field to 1 when dot11QLoadReportActivated is true and sets it to 0 otherwise. See 11.26.2.
56	Alternate EDCA	The STA sets the Alternate EDCA field to 1 when dot11AlternateEDCAActivated is true and sets it to 0 otherwise. See 10.2.3.2.
57	Unprotected TXOP Negotiation	The STA sets the Unprotected TXOP Negotiation field to 1 when dot11PublicTXOPNegotiationActivated is true and sets it to 0 otherwise. See 11.26.3.
58	Protected TXOP Negotiation	The STA sets the Protected TXOP Negotiation field to 1 when dot11ProtectedTXOPNegotiationActivated is true and sets it to 0 otherwise. See 11.26.3.
59	Reserved	
60	Protected QLoad Report	The STA sets the Protected QLoad Report field to 1 when dot11ProtectedQLoadReportActivated is true and sets it to 0 otherwise. See 11.26.2.
61	TDLS Wider Bandwidth	The TDLS Wider Bandwidth subfield indicates whether the STA supports a wider bandwidth than the BSS bandwidth for a TDLS direct link with a primary channel equal to the base channel. The field is set to 1 to indicate that the STA supports a wider bandwidth and to 0 to indicate that the STA does not support a wider bandwidth. A 160 MHz bandwidth is defined to be identical to an 80+80 MHz bandwidth (i.e., one is not wider than the other).
62	Operating Mode Notification	If dot11OperatingModeNotificationImplemented is true, the Operating Mode Notification field is set to 1 to indicate support for reception of the Operating Mode Notification element and the Operating Mode Notification frame. If dot11OperatingModeNotificationImplemented is false or not present, the Operating Mode Notification field is set to 0 to indicate lack of support for reception of the Operating Mode Notification element and the Operating Mode Notification frame.
63–64	Max Number Of MSDUs In A-MSDU	Indicates the maximum number of MSDUs in an A-MSDU that the STA is able to receive from a VHT STA: Set to 0 to indicate that no limit applies. Set to 1 for 32. Set to 2 for 16. Set to 3 for 8 Reserved if A-MSDU is not supported or if the STA is not an HT STA.
65	Channel Schedule Management	The STA sets the Channel Schedule Management field to 1 when dot11ChannelScheduleManagementActivated is true and sets it to 0 otherwise. See 11.42.5.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-153—Extended Capabilities field *(continued)*

Bit	Information	Notes
66	Geodatabase Inband Enabling Signal	The STA sets the Geodatabase Inband Enabling Signal field to 1 when dot11GDDActivated is true and the STA permits GDD dependent STAs to operate. See 11.42.2.
67	Network Channel Control	The STA sets the Network Channel Control field to 1 when dot11NetworkChannelControlActivated is true and sets it to 0 otherwise. See 11.42.7.
68	White Space Map	The STA sets the White Space Map field to 1 when dot11WhiteSpaceMapActivated is true and sets it to 0 otherwise. See 11.42.8.
69	Channel Availability Query	The STA sets the Channel Availability Query field to 1 when dot11GDDActivated is true and sets it to 0 otherwise. See 11.42.4.
70	Fine Timing Measurement Responder	The STA sets the Fine Timing Measurement Responder field to 1 when dot11FineTimingMsmtRespActivated is true and sets it to 0 otherwise. See 11.21.6.
71	Fine Timing Measurement Initiator	The STA sets the Fine Timing Measurement Initiator field to 1 when dot11FineTimingMsmtInitActivated is true and sets it to 0 otherwise. See 11.21.6.
72	FILS Capability	The FILS Capability field is set to 1 if dot11FILSActivated is true. Otherwise, the FILS Capability field is 0.
73	Extended Spectrum Management Capable	The STA sets the Extended Spectrum Management Capable field to 1 when dot11ExtendedSpectrumManagementImplemented is true and dot11VHTOptionImplemented is false, and sets it to 0 otherwise.
74	Future Channel Guidance	The STA sets the Future Channel Guidance field to 1 when dot11FutureChannelGuidanceActivated is true and sets it to 0 otherwise. See 11.8.10.
75	PAD	Indicates support for PAD (see 11.23).
76–79	Reserved	
80	Complete List of NonTxBSSID Profiles	This field is reserved for a non-AP STA or when the AP has dot11MultiBSSIDImplemented set to false. When set to 1, indicates that the frame carrying this element includes a complete list of nontransmitted BSSID profiles. When set to 0, there is no indication about the completeness of the list of nontransmitted BSSID profiles in the frame. Also see 11.1.3.8.
81	SAE Password Identifiers In Use	The AP sets the SAE Password Identifiers In Use field to 1 when any password in the dot11RSNAConfigPasswordValueTable has a password identifier and sets it to 0 otherwise. See 12.4.3.
82	SAE Password Identifiers Used Exclusively	The AP sets the SAE Password Identifiers Used Exclusively field to 1 when every password in the dot11RSNAConfigPasswordValueTable has a password identifier and sets it to 0 otherwise. See 12.4.3.
83	Reserved	
84	Beacon Protection Enabled	The AP sets the Beacon Protection Enabled field to 1 when dot11BeaconProtectionEnabled is true. Otherwise, it is set to 0. This field is reserved for a non-AP STA. See 11.52.

Table 9-153—Extended Capabilities field *(continued)*

Bit	Information	Notes
85	Mirrored SCS	The STA sets the Mirrored SCS field to 1 when dot11MSCSActivated is true and sets it to 0 otherwise.
86	Reserved	
87	Local MAC Address Policy	When dot11LocalMACAddressPolicyActivated is true, the Local MAC Address Policy subfield is set to 1. When dot11LocalMACAddressPolicyActivated is false, the Local MAC Address Policy subfield is set to 0.
88–*n*	Reserved	

If a STA does not support any of capabilities defined in the Extended Capabilities element, then the STA is not required to transmit the Extended Capabilities element.

NOTE—The fields of the Extended Capabilities element are not dynamic. They are determined by the parameters of the MLME-START.request or MLME-JOIN.request primitive that caused the STA to start or join its current BSS, and they remain unchanged until the next MLME-START.request or MLME-JOIN.request primitive.

9.4.2.27 BSS Load element

The BSS Load element contains information on the current STA population and traffic levels in the BSS. The element information format is defined in Figure 9-292. This element might be used by the STA for vendor-specific AP selection algorithm when roaming.

	Element ID	Length	Station Count	Channel Utilization	Available Admission Capacity
Octets:	1	1	2	1	2

Figure 9-292—BSS Load element format

The Element ID and Length fields are defined in 9.4.2.1.

The STA Count field is interpreted as an unsigned integer that indicates the total number of STAs currently associated with this BSS.

The Channel Utilization field is defined as the percentage of time, linearly scaled with 255 representing 100%, that the AP sensed the medium was busy, as indicated by either the physical or virtual carrier sense (CS) mechanism. When more than one channel is in use for the BSS, the Channel Utilization field value is calculated only for the primary channel. This percentage is computed using the following formula:

$$\text{Channel Utilization} = \left\lfloor \frac{\text{channel busy time}}{\text{dot11ChannelUtilizationBeaconIntervals} \times \text{dot11BeaconPeriod} \times 1024} \times 255 \right\rfloor$$

where

channel busy time is defined to be the number of microseconds during which the CS mechanism, as defined in 10.3.2.1, has indicated a channel busy indication,

dot11ChannelUtilizationBeaconIntervals represents the number of consecutive beacon intervals during which the channel busy time is measured.

The Available Admission Capacity field contains an unsigned integer that specifies the remaining amount of medium time available via explicit admission control, in units of 32 μs/s. The field is helpful for roaming

STAs to select an AP that is likely to accept future admission control requests, but it does not represent an assurance that the HC admits these requests.

9.4.2.28 EDCA Parameter Set element

The EDCA Parameter Set element provides information needed by STAs for proper operation of the QoS facility. The format of the EDCA Parameter Set element is defined in Figure 9-293.

	Element ID	Length	QoS Info	Update EDCA Info	AC_BE Parameter Record	AC_BK Parameter Record	AC_VI Parameter Record	AC_VO Parameter Record
Octets:	1	1	1	1	4	4	4	4

Figure 9-293—EDCA Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

For an infrastructure BSS, the EDCA Parameter Set element is used by the AP to establish policy (by changing default MIB attribute values), to change policies when accepting new STAs or new traffic, or to adapt to changes in offered load. The most recent EDCA parameter set element received by a STA is used to update the appropriate MIB values.

The format of the QoS Info field is defined in 9.4.1.17. The QoS Info field contains the EDCA Parameter Set Update Count subfield, which is initially set to 0 and is incremented each time any of the announced EDCA parameters change. This subfield is used by non-AP STAs to determine whether the EDCA parameter set has changed and requires updating the appropriate MIB attributes.

The Update EDCA Info field is reserved for non-S1G STAs. For S1G STAs, it is shown in Figure 9-294.

	B0	B1 B2	B3 B4	B5 B6	B7
	Override	PS-Poll ACI	RAW ACI	STA Type	Reserved
Bits:	1	2	2	2	1

Figure 9-294—Update EDCA Info field format

The Override field is used by S1G APs to indicate to S1G STAs that this element overrides previously stored EDCA parameters as described in 10.2.3.2.

The PS-Poll ACI field is used by S1G APs to inform the S1G STAs of the access category for sending a PS-Poll frame. The mapping between the PS-Poll ACI field and AC is identical to the one defined in Table 9-154.

The RAW ACI field is used by S1G APs to inform the S1G STAs of the access category for accessing the WM in the RAW as described in 10.23.5.5. The mapping between the RAW ACI field and AC is identical to the one defined in Table 9-154.

The STA Type field indicates the type of STA for which the information in the element is provided. The S1G AP sets the STA Type field to

— 0 to indicate that the information provided by this element is valid for STAs (i.e., both sensor STAs and non-sensor STAs)

— 1 to indicate that the information is valid for sensor STAs

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— 2 to indicate that the information provided by this element is valid for non-sensor STAs
— 3 to indicate a reserved value

NOTE—An S1G STA that transmits a (NDP) PS-Poll frame within a RAW uses the access category indicated by PS-Poll ACI subfield rather than the access category indicated by the RAW ACI subfield.

The formats of AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record fields are identical and are shown in Figure 9-295.

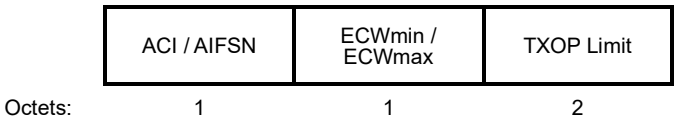

Figure 9-295—AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record field format

The format of the ACI/AIFSN field is shown in Figure 9-296.

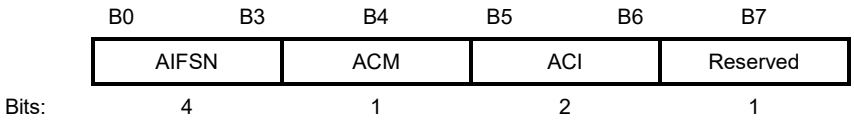

Figure 9-296—ACI/AIFSN field format

The value of the AC index (ACI) references the AC to which all parameters in this record correspond. The mapping between ACI and AC is defined in Table 9-154. The ACM (admission control mandatory) subfield indicates that admission control is required for the AC. If the ACM subfield is equal to 0, then there is no admission control for the corresponding AC. If the ACM subfield is set to 1, admission control has to be used prior to transmission using the access parameters specified for this AC. The AIFSN subfield indicates the number of slots after a SIFS a STA defers before either invoking a backoff or starting a transmission. The minimum value of the AIFSN subfield is 2.

Table 9-154—ACI-to-AC coding

ACI	AC	Description
0	AC_BE	Best effort
1	AC_BK	Background
2	AC_VI	Video
3	AC_VO	Voice

The ECWmin/ECWmax field is shown in Figure 9-297.

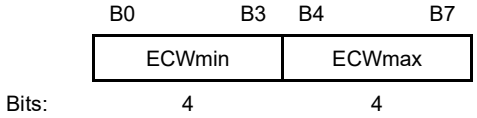

Figure 9-297—ECWmin/ECWmax field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The ECWmin and ECWmax subfields encode the values of CWmin and CWmax, respectively, in an exponent form. The ECWmin and ECWmax values are defined so that

$$CWmin = 2^{ECWmin} - 1$$

$$CWmax = 2^{ECWmax} - 1$$

Hence the minimum encoded value of CWmin and CWmax is 0, and the maximum value is 32 767.

The TXOP Limit field is specified as an unsigned integer, in units of 32 μs. A TXOP Limit field set to 0 has a special meaning (see 10.23.2.9).

Table 9-155 defines the default EDCA parameter values used by a non-AP STA if dot11OCBActivated is false.[25]

Table 9-155—Default EDCA Parameter Set element parameter values if dot11OCBActivated is false or the STA is a non-sensor STA

AC	CWmin	CWmax	AIFSN	TXOP limit				
				For PHYs defined in Clause 15 and Clause 16	For PHYs defined in Clause 17, Clause 18, Clause 19, and Clause 21	For PHY defined in Clause 22	Clause 23	Other PHYs
AC_BK	aCWmin	aCWmax	7	3.264 ms	2.528 ms	0	15.008 ms	0
AC_BE	aCWmin	aCWmax	3	3.264 ms	2.528 ms	0	15.008 ms	0
AC_VI	(aCWmin+1)/ 2 – 1	aCWmin	2	6.016 ms	4.096 ms	22.56 ms (BCU: 6 or 7 MHz), 16.92 ms (BCU: 8 MHz)	15.008 ms	0
AC_VO	(aCWmin+1)/ 4 – 1	(aCWmin+1)/ 2 – 1	2	3.264 ms	2.080 ms	11.28 ms (BCU: 6 or 7 MHz), 8.46 ms (BCU: 8 MHz)	15.008 ms	0

[25] The default values for TXOP limit are expressed in milliseconds and are multiples of 32 μs.

If dot11OCBActivated is true, the default EDCA parameter set for STAs transmitting QoS frames is given in Table 9-156.

Table 9-156—Default EDCA parameter set for STA operation if dot11OCBActivated is true

AC	CWmin	CWmax	AIFSN	TXOP limit
AC_BK	aCWmin	aCWmax	9	0
AC_BE	aCWmin	aCWmax	6	0
AC_VI	aCWmin	aCWmax	4	0
AC_VO	(aCWmin+1)/4–1	(aCWmin+1)/2–1	2	0

The default EDCA parameter set used by sensor STAs is given in Table 9-157.

Table 9-157—Default EDCA Parameter Set element parameter values if the STA is a sensor STA

AC	CWmin	CWmax	AIFSN	TXOP limit
AC_BK	aCWmin	aCWmax	7	0
AC_BE	(aCWmin+1)/4 – 1	aCWmin	2	0
AC_VI	(aCWmin+1)/2 – 1	aCWmin	5	0
AC_VO	(aCWmin+1)/2 – 1	aCWmin	4	0

9.4.2.29 TSPEC element

The TSPEC element contains the set of parameters that define the characteristics and QoS expectations of a traffic flow, in the context of a particular STA, for use by the HC or PCP and STA(s) or a mesh STA and its peer mesh STAs in support of QoS traffic transfer using the procedures defined in 11.4 and 11.21.16.3. The element information format comprises the items as defined in this subclause, and the structure is defined in Figure 9-298.

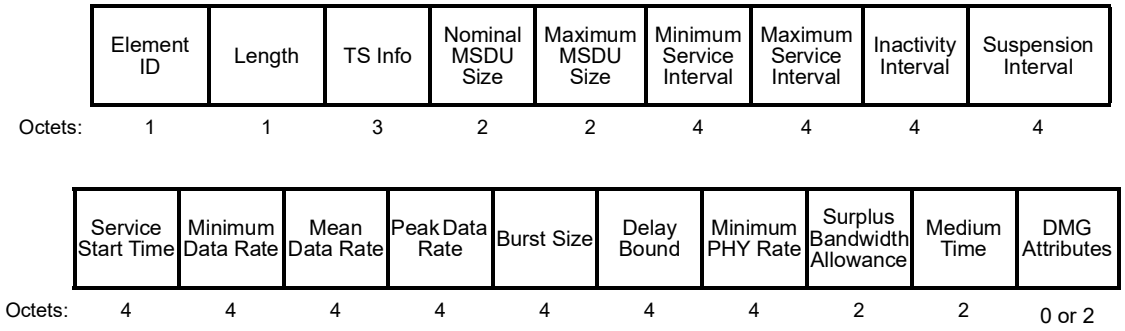

Figure 9-298—TSPEC element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TSPEC element allows a set of parameters more extensive than might be needed, or might be available, for any particular instance of parameterized QoS traffic. Unless indicated otherwise, fields that follow the TS Info field are set to 0 for any unspecified parameter values. STAs set any parameters to unspecified if they have no information for setting that parameter.

The structure of the TS Info field is defined in Figure 9-299.

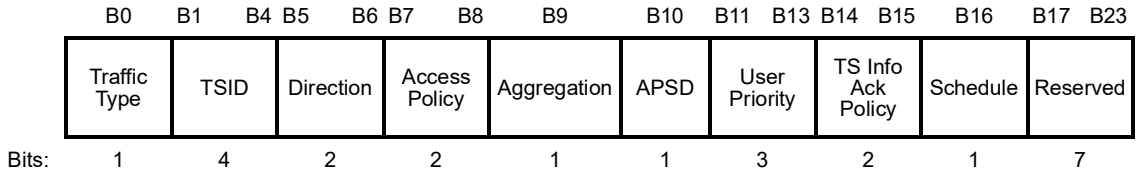

Figure 9-299—TS Info field format

The subfields of the TS Info field are defined as follows:

— The Traffic Type subfield is set to 1 for a periodic traffic pattern (e.g., isochronous TS of MSDUs or A-MSDUs, with constant or variable sizes, that are originated at fixed rate) or set to 0 for an aperiodic, or unspecified, traffic pattern (e.g., asynchronous TS of low-duty cycles).

— The TSID subfield contains a value that is a TSID. Note that the MSB (bit 4 in TS Info field) of the TSID subfield is always set to 1 when the TSPEC element is included within an ADDTS Response frame.

— The Direction subfield specifies the direction of data carried by the TS as defined in Table 9-158.

Table 9-158—Direction subfield encoding

Bit 5	Bit 6	Usage
0	0	Uplink, defined as follows: — Non-DMG BSS: MSDUs or A-MSDUs are sent from the non-AP STA to HC — DMG BSS: MSDUs or A-MSDUs are sent by the originator of the ADDTS Request frame
1	0	Downlink, defined as follows: — Non-DMG BSS: MSDUs or A-MSDUs are sent from the HC to the non-AP STA — DMG BSS: MSDUs or A-MSDUs are sent by the recipient of the ADDTS Request frame
0	1	Direct link (MSDUs or A-MSDUs are sent from the non-AP STA to another non-AP STA)
1	1	Bidirectional link (equivalent to a downlink request plus an uplink request, each direction having the same parameters). The fields in the TSPEC element specify resources for a single direction. Double the specified resources are required to support both streams.

— The Access Policy subfield specifies the access method to be used for the TS, and is defined in Table 9-159.

— The Aggregation subfield is valid only when the access method is HCCA or SPCA or when the access method is EDCA and the Schedule subfield is equal to 1. It is set to 1 by a non-AP STA to indicate that an aggregate schedule is required. It is set to 1 by the AP if an aggregate schedule is being provided to the STA. It is set to 0 otherwise. In all other cases, the Aggregation subfield is reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-159—Access Policy subfield

Bit 7	Bit 8	Usage
0	0	Reserved
1	0	Contention based channel access (EDCA)
0	1	Controlled channel access (HCCA for non-DMG STAs and SPCA for DMG STAs)
1	1	Controlled and contention based channel access (HCCA, EDCA mixed mode (HEMM) for non-DMG STAs; SPCA, EDCA mixed mode (SEMM) for DMG STAs)

— The APSD subfield is set to 1 to indicate that automatic PS delivery is to be used for the traffic associated with the TSPEC and set to 0 otherwise.

— The UP subfield indicates the actual value of the UP to be used for the transport of MSDUs or A-MSDUs belonging to this TS when relative prioritization is required. When the TCLAS element is present in the request, the UP subfield in TS Info field of the TSPEC element is reserved.

— The TS Info Ack Policy subfield indicates whether MAC acknowledgments are required for MPDUs or A-MSDUs belonging to this TSID and the form of those acknowledgments. The encoding of the TS Info Ack Policy subfield is shown in Table 9-160.

Table 9-160—TS Info Ack Policy subfield encoding

Bit 14	Bit 15	Usage
0	0	Normal Acknowledgment The addressed recipient returns an Ack or QoS +CF-Ack frame after a SIFS, according to the procedures defined in 10.3.2.11 and 10.23.3.5.
1	0	No Ack: The recipient(s) do not acknowledge the transmission.
0	1	Reserved
1	1	Block Ack: A separate block ack mechanism described in 10.25 is used.

— The Schedule subfield specifies the requested type of schedule. The setting of the subfield when the access policy is EDCA is shown in Table 9-161. When the Access Policy subfield is equal to any value other than EDCA, the Schedule subfield is reserved. When the Schedule and APSD subfields are equal to 1, the AP sets the Aggregation subfield to 1, indicating that an aggregate schedule is being provided to the STA.

Table 9-161—Setting of Schedule subfield

APSD	Schedule	Usage
0	0	No Schedule
1	0	Unscheduled APSD
0	1	Scheduled PSMP or GCR-SP
1	1	Scheduled APSD

The Nominal MSDU Size field contains an unsigned integer that specifies the nominal size, in octets, of MSDUs or (where A-MSDU aggregation is employed) A-MSDUs belonging to the TS under this TSPEC element and is defined in Figure 9-300. If the Fixed subfield is equal to 1, then the size of the MSDU or A-MSDU is fixed and is indicated by the Size subfield. If the Fixed subfield is equal to 0, then the size of the MSDU or A-MSDU might not be fixed and the Size subfield indicates the nominal MSDU size. If both the Fixed and Size subfields are equal to 0, then the nominal MSDU or A-MSDU size is unspecified.

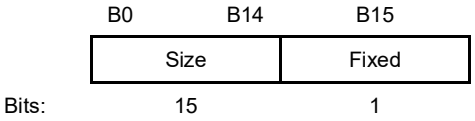

Figure 9-300—Nominal MSDU Size field format

The Maximum MSDU Size field contains an unsigned integer that specifies the maximum size, in octets, of MSDUs or A-MSDUs belonging to the TS under this TSPEC element.

The Minimum Service Interval field contains an unsigned integer that specifies the minimum interval, in microseconds, between the start of two successive SPs. If the TSPEC element is included within a GCR Request subelement that has the GCR delivery method equal to GCR-SP, a Minimum Service Interval field set to 0 indicates that SPs up to the maximum service interval are requested, including the continuous SP used by the GCR-A delivery method.

The Maximum Service Interval field contains an unsigned integer that, when the TSPEC element is for the admitting of HCCA streams, specifies the maximum interval, in microseconds, between the start of two successive SPs. If the TSPEC element is intended for EDCA Admission Control, the Maximum Service Interval field is used to indicate a latency limit, which limits the amount of aggregation (A-MSDU or A-MPDU) used, so that excessive latency does not occur (see K.4.3.1). The Maximum Service Interval field is greater than or equal to the Minimum Service Interval field. If the TSPEC element is included within a GCR Request subelement that has the GCR delivery method equal to GCR-SP, a Maximum Service Interval field set to 0 indicates that the continuous SP used by the GCR-A delivery method is requested.

K.4.3.2 provides guidance on the use of the Maximum Service Interval field to determine the limit of aggregation of nominal MSDUs.

The Inactivity Interval field contains an unsigned integer that specifies the minimum amount of time, in microseconds, that can elapse without arrival or transfer of an MPDU belonging to the TS before this TS is deleted by the MAC entity at the HC.

The Suspension Interval field contains an unsigned integer that specifies the minimum amount of time, in microseconds, that can elapse without arrival or transfer of an MSDU belonging to the TS before the generation of successive QoS(+)CF-Poll is stopped for this TS. A value of 4 294 967 295 ($= 2^{32} - 1$) disables the suspension interval, indicating that polling for the TS is not to be interrupted based on inactivity. The suspension interval is always less than or equal to the inactivity interval.

The Service Start Time field contains an unsigned integer that specifies the time, expressed in microseconds, when the first scheduled SP starts. The service start time indicates to the AP the time when a STA first expects to be ready to send frames and a power saving STA needs to be awake to receive frames. This might help the AP to schedule service so that the MSDUs encounter small delays in the MAC and help the power saving STAs to reduce power consumption. The field represents the four lower order octets of the TSF timer at the start of the SP. If APSD and Schedule subfields are 0, this field is also set to 0 (unspecified).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Minimum Data Rate field indicates the lowest data rate specified at the MAC SAP, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC element. The field is encoded as a piecewise linear function described as follows:

$$R_{min} = \begin{cases} F_{min}, & F_{min} \le 2^{31} \\ 1024 \times (F_{min} - 2^{31}) + 2^{31}, & F_{min} > 2^{31} \end{cases}$$

where

R_{min} is the minimum data rate (in units of bits per second)
F_{min} is the value of the Minimum Data Rate field

The Mean Data Rate[26] field indicates the average data rate specified at the MAC SAP, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC element. The field is encoded as a piecewise linear function described as follows:

$$R_{mean} = \begin{cases} F_{mean}, & F_{mean} \le 2^{31} \\ 1024 \times (F_{mean} - 2^{31}) + 2^{31}, & F_{mean} > 2^{31} \end{cases}$$

where

R_{mean} is the mean data rate (in units of bits per second)
F_{mean} is the value of the Mean Data Rate field

The Peak Data Rate field indicates the maximum allowable data rate specified at the MAC SAP for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC element. The field is encoded as a piecewise linear function described as follows:

$$R_{peak} = \begin{cases} F_{peak}, & F_{peak} \le 2^{31} \\ 1024 \times (F_{peak} - 2^{31}) + 2^{31}, & F_{peak} > 2^{31} \end{cases}$$

where

R_{peak} is the peak data rate (in units of bits per second)
F_{peak} is the value of the Peak Data Rate field

If p is the peak rate in bits per second, then the maximum amount of data, belonging to this TS, arriving in any time interval $[t1,t2]$, where $t1 < t2$ and $t2 - t1 > 1$ TU, does not exceed $p \times (t2 - t1)$ bits.

The Minimum, Mean and Peak Data Rates do not include the MAC and PHY overheads incurred in transporting the MSDUs or A-MSDUs, with the exception of the MAC overheads specific to A-MSDUs (A-MSDU subframe header and padding). K.4.4 provides guidance on how to determine the standard deviation of the TS and how to calculate the total traffic when there are multiple TSs.

[26] The mean data rate, the peak data rate, and the burst size are the parameters of the token bucket model, which provides standard terminology for describing the behavior of a traffic source. The token bucket model is described in IETF RFC 2212 [B27], IETF RFC 2215 [B28], and IETF RFC 3290 [B36].

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Burst Size field contains an unsigned integer that specifies the maximum burst, in octets, of the MSDUs or A-MSDUs belonging to this TS that arrive at the MAC SAP at the peak data rate. A Burst Size field set to 0 indicates that there are no bursts.

The Delay Bound field contains an unsigned integer that specifies the maximum amount of time, in microseconds, allowed to transport an MSDU or A-MSDU belonging to the TS in this TSPEC element, measured between the time marking the arrival of the MSDU, or the first MSDU of the MSDUs constituting an A-MSDU, at the local MAC sublayer from the local MAC SAP and the time of completion of the successful transmission or retransmission of the MSDU or A-MSDU to the destination. The completion of the MSDU or A-MSDU transmission includes the relevant acknowledgment frame transmission time, if present.

The Minimum PHY Rate field indicates the minimum PHY rate for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC element.[27] See 11.4.2 for constraints on the selection of this field. The field is encoded as a piecewise linear function described as follows:

$$R_{minphy} = \begin{cases} F_{minphy}, & F_{minphy} \le 2^{31} \\ 1024 \times (F_{minphy} - 2^{31}) + 2^{31}, & F_{minphy} > 2^{31} \end{cases}$$

where

R_{minphy} is the minimum PHY rate (in units of bits per second)
F_{minphy} is the value of the Minimum PHY Rate field

The Surplus Bandwidth Allowance field specifies the excess allocation of time (and bandwidth) over and above the stated application rates required to transport an MSDU or A-MSDU belonging to the TS in this TSPEC. This field is represented as an unsigned binary number and, when specified, is greater than 0. The 13 least significant bits (LSBs) indicate the decimal part while the three MSBs indicate the integer part of the number. This field takes into account the retransmissions, as the rate information does not include retransmissions. It represents the ratio of over-the-air bandwidth (i.e., time that the scheduler allocates for the transmission of MSDUs or A-MSDUs at the required rates) to bandwidth of the transported MSDUs or A-MSDUs required for successful transmission (i.e., time that would be necessary at the minimum PHY rate if there were no errors on the channel) to meet throughput and delay bounds under this TSPEC, when specified. As such, it should be greater than unity. A Surplus Bandwidth Allowance field set to 1 indicates that no additional allocation of time is requested. K.4.2 provides guidance on how to calculate the value for Surplus Bandwidth Allowance element.

The Medium Time field is an unsigned integer and contains the amount of time admitted to access the medium, in units of 32 μs/s. This field is reserved in the ADDTS Request frame and is set by the HC in the ADDTS Response frame. The derivation of this field is described in K.2.2. This field is not used for controlled channel access.

The UP, Minimum Data Rate, Mean Data Rate, Peak Data Rate, Burst Size, Minimum PHY Rate, and Delay Bound fields in a TSPEC element express the QoS expectations requested by a STA, if this TSPEC element was issued by that STA, or provided by the HC, if this TSPEC element was issued by the HC, when these fields are specified with nonzero values. Unspecified parameters in these fields as indicated by a value of 0 indicate that the STA does not have specific requirements for these parameters if the TSPEC element was issued by that STA or that the HC does not provide any specific values for these parameters if the TSPEC

[27] This rate information is intended to confirm that the TSPEC parameter values resulting from an admission control negotiation are sufficient to provide the required throughput for the TS. In a typical implementation, a TS is admitted only if the defined traffic volume can be accommodated at the specified rate within an amount of WM occupancy time that the admissions control entity is willing to allocate to this TS.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

element was issued by the HC. Annex K provides guidance on the use of the TSPEC element and the settings of values of the various fields.

The DMG Attributes field is defined in Figure 9-301. The DMG Attributes field is present in a TSPEC element when the BSS to which the TSPEC element applies is a DMG BSS; otherwise absent.

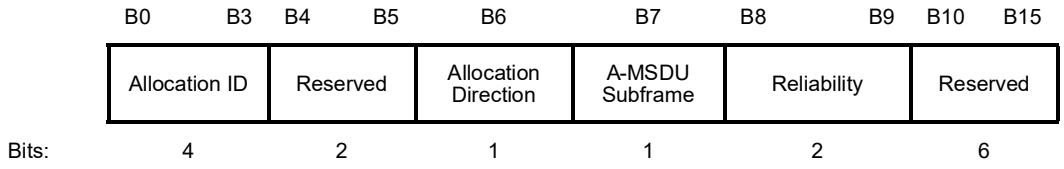

Figure 9-301—DMG Attributes field format

— Traffic streams can share an allocation through TSPEC aggregation (see Annex V). The Allocation ID subfield is used as follows:
  — When setting up a TS, the DMG STA that transmits an ADDTS Request frame containing a TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value to identify the allocation it requires to carry the TS. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate any CBAP allocation with the broadcast AID as Source AID.
  — When setting up a TS, the DMG STA that transmits the ADDTS Response frame containing the TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value that identifies the allocation carrying the TS. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate any CBAP allocation with the broadcast AID as Source AID and Destination AID.
  — When deleting a TS, the DMG STA that transmits the DELTS frame containing a TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value to identify the allocation that is carrying the TS to be deleted. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate no allocation exists to carry the TS to be deleted.
— The Allocation Direction subfield is equal to 1 when the originator of the ADDTS request is also the source of the allocation identified by the Allocation ID subfield and is equal to 0 otherwise. The Allocation Direction subfield is equal to 0 when the Allocation ID subfield is equal to 0.
— The A-MSDU Subframe subfield contains a value that indicates the A-MSDU subframe structure to be used for this TS. The A-MSDU Subframe subfield is set to 0 to indicate the Basic A-MSDU subframe structure and set to 1 to indicate the Short A-MSDU subframe structure.
— The Reliability subfield contains an expected reliability index. The reliability index refers to the PHY PER (PSDU error rate as in 20.3.3.8). The relation between the reliability index and the PER is shown in Table 9-162.

Table 9-162—Reliability subfield values

Reliability index	PER
0	Not specified
1	10^{-2}
2	10^{-3}
3	10^{-4}

The Reliability subfield in an ADDTS Request frame that has the Direction subfield set to downlink or in an ADDTS Response frame that has the Direction field set to uplink indicates the expectation of the PER of the destination DMG STA for this TS. The Reliability subfield in an ADDTS Request frame that has the Direction subfield set to uplink or in an ADDTS Response frame that has the Direction field set to downlink is reserved. The reliability information is provided by the SME using the MLME-ADDTS.request primitive and MLME-ADDTS.response primitives. Together with the link margin (10.42.9) and other implementation-specific information, this value can be used by the source DMG STA of this TS to estimate the MCS to be used for this particular TS.

9.4.2.30 TCLAS element

The TCLAS element contains a set of parameters necessary to identify various kinds of PDU or incoming MSDU (from a higher layer in all STAs or from the DS in an AP) that belong to a particular TS. The TCLAS element is also used when the traffic does not belong to a TS, for example, by the FMS, DMS, and TFS services. If required, the TCLAS element is provided in ADDTS Request and ADDTS Response frames only for the downlink or bidirectional links. The TCLAS element is always included when a PTP TSPEC is transmitted to a peer STA via an AP or PCP. The structure of this element is shown in Figure 9-302.

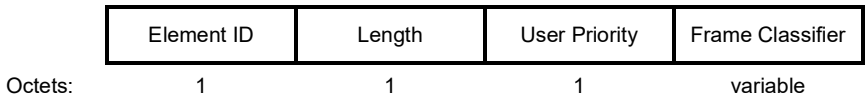

Figure 9-302—TCLAS element format

The Element ID and Length fields are defined in 9.4.2.1.

When the UP field contains a value that is less than or equal to 7, the value specifies the UP of the associated MSDUs. When the UP field contains a value that is greater than or equal to 8 and less than or equal to 11, the value specifies the access category of the associated MPDUs. The UP field value 255 is reserved and indicates that the UP of the MSDU and the access category of the MPDU are not compared as part of the traffic filter. The encoding of the contents of the User Priority field of an TCLAS element is specified in Table 9-163.

Table 9-163—User Priority field of TCLAS element

User Priority	Meaning
0–7	The User Priority value of an MSDU.
8	The AC value of an MPDU is AC-VO.
9	The AC value of an MPDU is AC-VI.
10	The AC value of an MPDU is AC-BE.
11	The AC value of an MPDU is AC-BK.
12–254	Reserved.
255	The User Priority field is not used for comparison.

The Frame Classifier field is defined in Figure 9-303.

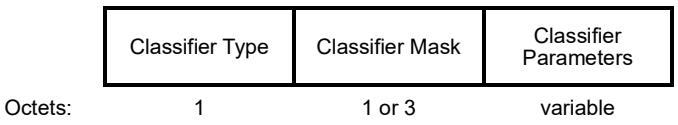

Figure 9-303—Frame Classifier field format

The Frame Classifier field comprises the following subfields: Classifier Type, Classifier Mask, and Classifier Parameters. The Classifier Type subfield specifies the type of classifier parameters in this TCLAS element as defined in Table 9-164.

Table 9-164—Frame classifier type

Classifier type	Classifier parameters
0	Ethernet parameters
1	TCP/UDP IP parameters
2	IEEE 802.1Q parameters
3	Filter Offset parameters
4	IP and higher layer parameters
5	IEEE 802.1D/Q parameters
6	IEEE 802.11 MAC header parameters
7	IEEE Std 802.11 downlink PV1 MPDU MAC header parameters (From DS field of the Frame Control field equal to 1)
8	IEEE Std 802.11 nondownlink PV1 MPDU MAC header parameters (From DS field of the Frame Control field equal to 0)
9	IEEE Std 802.11 PV1 MPDU Full Address MAC header parameters
10	IP extensions and higher layer parameters
11–255	Reserved

When the classifier type is a value less than or equal to 5, but not equal to 3, the Classifier Mask subfield specifies a bitmap in which bits that have the value 1 identify a subset of the classifier parameters whose values need to match those of the corresponding parameters in a given MSDU for that MSDU to be classified to the TS of the affiliated TSPEC element. The bitmap is ordered from the LSB to the MSB, with each bit pointing to one of the classifier parameters of the same relative position as shown in this subclause based on classifier type. When there are more bits in the bitmap than classifier parameters that follow, the MSBs that do not point to any classifier parameters are reserved.

A Classifier Type subfield set to 6 applies only to frames with the Protocol Version subfield of the Frame Control field of the MAC header equal to 0.

A Classifier Type subfield set to 7 applies only to frames with the Protocol Version subfield of the Frame Control field of the MAC header equal to 1, the Type subfield of the Frame Control field of the MAC header equal to 0 or 1, and the From DS subfield of the Frame Control field of the MAC header equal to 1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A Classifier Type subfield set to 8 applies only to frames with the Protocol Version subfield of the Frame Control field of the MAC header equal to 1, the Type subfield of the Frame Control field of the MAC header equal to 0 or 1, and the From DS subfield of the Frame Control field of the MAC header equal to 0.

A Classifier Type subfield set to 9 applies only to frames with the Protocol Version subfield of the Frame Control field of the MAC header equal to 1 and the Type subfield of the Frame Control field of the MAC header equal to 3.

When the Classifier Type subfield is equal to 6, 7, 8, or 9, the Classifier Mask subfield is 3 octets in length and contains a sequence of 2-bit Classifier Mask Control subfields. Each Classifier Mask Control subfield applies to a specific target field of the MAC header of an MPDU and determines whether the target field is included in the comparison and whether an additional bitmask (the target field filter mask) is present. When the target field filter mask is present, it determines the bits of the target field that are used in the comparison.

The Classifier Mask Control subfield values are interpreted as follows:

— Setting the LSB of the two bits to 1 indicates the use of the corresponding MAC Header field for comparison, and setting the LSB of the two bits to 0 indicates the corresponding MAC header field is not used for comparison, and the corresponding Match Specification is not included in the Classifier.

— Setting the MSB of the two bits to 1 indicates the inclusion of the corresponding MAC Header Filter (a bit mask) in the corresponding Match Specification, and setting the MSB of the two bits to 0 indicates the MAC Header Filter is not included in the corresponding Match Specification and every bit of the Match Specification, if included in the Classifier Parameter, needs to be compared.

— If an optional MAC Header field needs to be compared, the LSB of the two bits in the Classifier Mask corresponding to the optional MAC header field is set to 1, and an MPDU that does not include the optional field is not a matching MPDU.

Table 9-165, Table 9-166, Table 9-167, and Table 9-168 specify the interpretation of the Classifier Mask Control subfield for each of the Classifier Type values 6, 7, 8, and 9, respectively.

Table 9-165—Classifier Mask for Classifier Type 6

For Classifier Type 0, the classifier parameters are the following parameters contained in an Ethernet frame header: Source Address, Destination Address, and Type ("Ethernet" [B9]). The endianness of the Type field is defined in "Ethernet" [B9]. The Frame Classifier field for Classifier Type 0 is defined in Figure 9-304. It has a length of 16 octets.

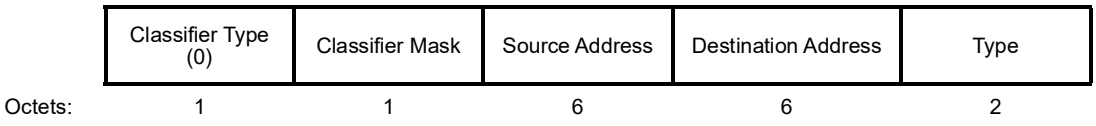

Figure 9-304—Frame Classifier field format of Classifier Type 0

For Classifier Type 1, frame classifier is defined for both IPv4 and IPv6, shown in Figure 9-305 and Figure 9-306, and distinguished by the Version field. Use of Classifier Type 1 for IPv6 is deprecated and replaced by Classifier Type 4. The subfields in the classifier parameters are represented and transmitted in the big-endian format. The classifier parameters are the following parameters:

— In the IP header: Source Address, Destination Address and Version.
— In a TCP or UDP header: Source Port and Destination Port, plus
— One of the following:
  — In an IPv4 header: Differentiated Services Code Point (DSCP) (IETF RFC 2474 [B30]) and Protocol, or
  — In an IPv6 header: Flow Label.

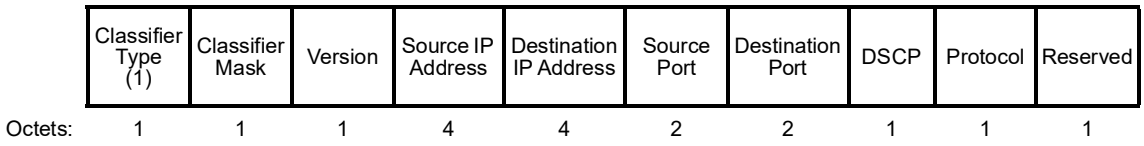

Figure 9-305—Frame Classifier field format of Classifier Type 1 for traffic over IPv4

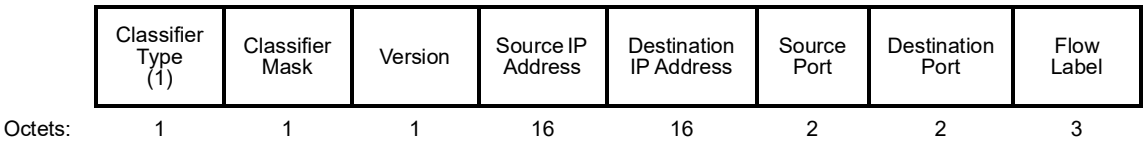

Figure 9-306—Frame Classifier field format of Classifier Type 1 for traffic over IPv6

The DSCP field contains a value in the 6 LSBs, and the 2 MSBs are set to 0. The 2 MSBs of the DSCP field are ignored for frame classification.

The value in the Version subfield is the value specified in IETF RFC 791 or IETF RFC 8200.

For Classifier Type 2, the Classifier Parameter is the IEEE 802.1Q-2003 VLAN Tag TCI. The endianness of the IEEE 802.1Q VLAN TCI field is defined in IEEE Std 802.1Q for the VLAN Tag TCI. The Frame Classifier field for Classifier Type 2 is defined in Figure 9-307. Classifier Type 2 is deprecated.

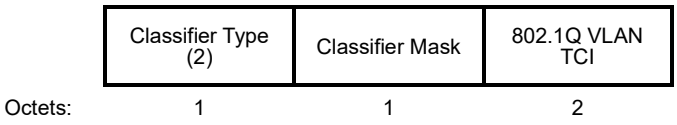

Figure 9-307—Frame Classifier field format of Classifier Type 2

For Classifier Type 3, the classifier parameters are defined by a Filter Offset subfield, a Filter Value subfield and a Filter Mask subfield. The Frame Classifier subfield of Classifier Type 3 is defined in Figure 9-308. It has a variable length.

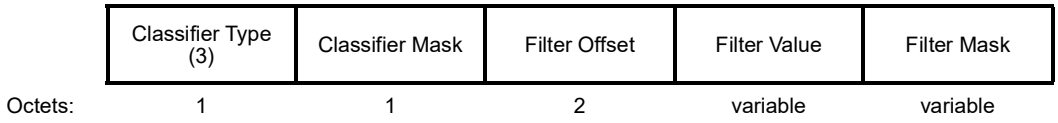

Figure 9-308—Frame Classifier field format of Classifier Type 3

The Classifier Mask subfield is reserved.

The Filter Offset subfield is set to the number of octets from the beginning of the MSDU or MMPDU at which the Filter Value is compared.

The length of the Filter Value and Filter Mask subfields is (*Length* – 5)/2, where *Length* is the value in the Length field of the TCLAS element.

The Filter Value subfield is an octet string that is compared to the MSDU or MMPDU content, beginning at the octet indicated by the Filter Offset.

The Filter Mask subfield is an octet string that is used to indicate the bits in the Filter Value subfield to be compared. The length of the Filter Mask subfield is equal to the length of the Filter Value subfield. A bit in the Filter Value subfield is compared only if the matching bit in the Filter Mask subfield is 1.

For Classifier Type 4, frame classifier is defined for both IPv4 and IPv6, shown in Figure 9-309 (with the Classifier Type subfield set to 4) and Figure 9-310, and distinguished by the Version subfield. The classifier parameters represent corresponding values in a received IPv4 or IPv6 frame and are defined in Table 9-170. The subfields in the classifier parameters are represented and transmitted in big-endian format.

Table 9-170—Classifier parameters for Classifier Type 4

Subfield	Included in IPv4	IPv4 field length (octets)	Included in IPv6	IPv6 field length (octets)
Version	Yes	1	Yes	1
Source IP Address	Yes	4	Yes	16
Destination IP Address	Yes	4	Yes	16
Source Port	Yes	2	Yes	2
Destination Port	Yes	2	Yes	2
DSCP	Yes	1	Yes	1
Protocol	Yes	1	No	n/a
Next Header	No	n/a	Yes	1
Flow Label	No	n/a	Yes	3

The Frame Classifier subfield of Classifier Type 4 for traffic over IPv4 is shown in Figure 9-309.

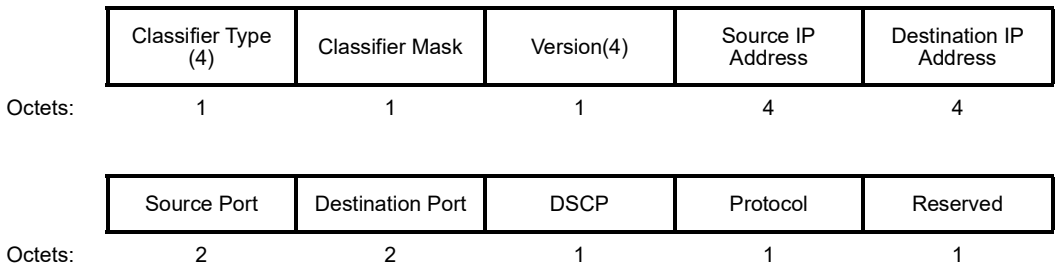

Figure 9-309—Frame Classifier subfield format of Classifier Type 4 for traffic over IPv4

The Frame Classifier subfield of Classifier Type 4 for traffic over IPv6 is shown in Figure 9-310.

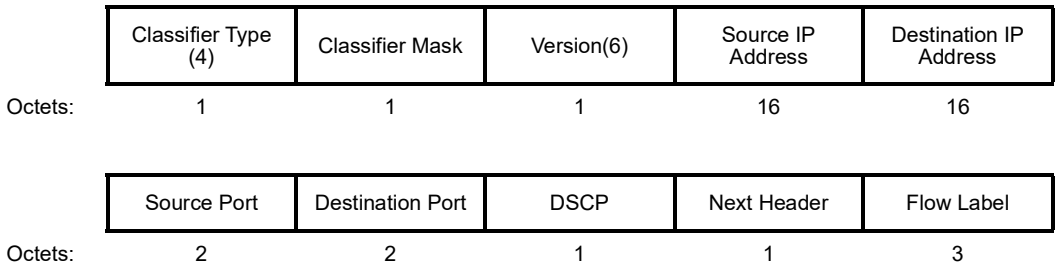

Figure 9-310—Frame Classifier subfield format of Classifier Type 4 for traffic over IPv6

NOTE 1—Frame classification when extension headers are used is supported only if the TCLAS does not classify on ports (Classifier Mask has the Source and Destination Port bits set to 0).

The value in the Version subfield is the value specified in IETF RFC 791 or IETF RFC 8200.

The DSCP subfield contains the value as described in IETF RFC 2474 [B30] in the 6 least significant bits. The 2 most significant bits are reserved. For an IPv6 packet, this corresponds to the Traffic Class subfield of the IPv6 header.

The Source IP Address and Destination IP Address correspond to the identically named fields of the IPv4 and IPv6 headers.

The Source Port and Destination Port correspond to the identically named fields of various protocol headers that are encapsulated within an IPv4 or IPv6 packet.

The Next Header subfield contains the next encapsulated protocol which is either the value specified in the IPv4 header's Protocol field or the value in the Next Header field of the IPv6 header. In the presence of options in the IPv6 header, the Next Header field specifies the presence of one or more extension headers as registered in "IPv6 Extension Header Types" [B50] and defined by the corresponding IETF RFCs.

The Flow Label subfield contains the value in the 20 least significant bits. The 4 most significant bits are reserved.

NOTE 2—For example, the flow label 0x12345 is represented as the octet sequence 0x01, 0x23, 0x45.

A TCLAS element is valid when the Classifier Mask Version bit is 1.

For Classifier Type 5 when used to match an IEEE 802.1D-2004 frame [B18], the classifier parameter is only the User Priority, and the DEI and VID parameters are ignored. For Classifier Type 5 when used to match an IEEE 802.1Q frame, the classifier parameters are: Priority Code Point, Drop Eligibility Indicator (DEI), and VLAN ID (VID).

The Frame Classifier field for Classifier Type 5 is defined in Figure 9-311.

	Classifier Type (5)	Classifier Mask	802.1D UP/ 802.1Q Priority Code Point	802.1Q DEI	802.1Q VID
Octets:	1	1	1	1	2

Figure 9-311—Frame Classifier field format of Classifier Type 5

The subfields in the classifier parameters are represented and transmitted in big-endian format.

The 802.1D UP/802.1Q Priority Code Point subfield contains the value to be matched to the appropriate type frame header in the 4 LSBs; the 4 MSBs are reserved.

The 802.1Q DEI subfield contains the value to match against an IEEE 802.1Q frame header, in the LSB; the 7 MSBs are reserved. When matching an IEEE 802.1D-2004 frame header, this subfield is ignored.

The 802.1Q VID subfield contains the value to match against an IEEE 802.1Q frame header, in the 12 LSBs; the 4 MSBs are reserved. When matching an IEEE 802.1D-2004 frame header, this subfield is ignored.

For Classifier Type 6, the format of the Frame Classifier field of a TCLAS element is shown in Figure 9-312.

	Classifier Type (6)	Classifier Mask	Frame Control Match Specification	Duration Match Specification	Address 1 Match Specification	Address 2 Match Specification
Octets:	1	3	0 or 2 or 4	0 or 2 or 4	0 or 6 or 12	0 or 6 or 12

Address 3 Match Specification	Sequence Control Specification	Address 4 Specification	QoS Control Specification	HT Control Specification
0 or 6 or 12	0 or 2 or 4	0 or 6 or 12	0 or 2 or 4	0 or 4 or 8

Figure 9-312—Frame Classifier field format of Classifier Type 6

For Classifier Type 6, the formats of the Frame Control Match Specification subfield, Duration/ID Match Specification subfield, Address 1 Match Specification subfield, Address 2 Match Specification subfield, Address 3 Match Specification subfield, Sequence Control Match Specification subfield, Address 4 Match Specification subfield, QoS Control Match Specification subfield and HT Control Match Specification subfield of the Frame Classifier field of a TCLAS element are shown in Figure 9-313, Figure 9-314, Figure 9-315, Figure 9-316, Figure 9-317, Figure 9-318, Figure 9-319, Figure 9-320, and Figure 9-321, respectively. The Match Specification subfield contains the match specification (i.e., the parameters) of the corresponding MAC header field with which an MPDU is compared. When the corresponding Filter Mask is not present, every bit in a Match Specification is compared; otherwise, only the bits with the same bit positions as the bits that are equal to 1 in the corresponding Filter Mask subfield are compared.

For Classifier Type 8, the format of the Frame Classifier field of a TCLAS element is shown in Figure 9-324.

	Classifier Type (8)	Classifier Mask	Frame Control Match Specification	Address 1 (BSSID) Match Specification	Address 2 (SID) Match Specification	Sequence Control Match Specification	Address 3 Match Specification	Address 4 Match Specification
Octets:	1	3	0, 2, or 4	0, 6, or 12	0, 2, or 4	0, 2, or 4	0, 6, or 12	0, 6, or 12

Figure 9-324—Frame Classifier field format of Classifier Type 8

For Classifier Type 8, the formats of the Frame Control Match Specification subfield, Address 1 (BSSID) subfield, Address 2 (SID) subfield, Sequence Control subfield, and Address 3 subfield are shown in Figure 9-313, Figure 9-315, Figure 9-325, Figure 9-318, Figure 9-317, and Figure 9-319, respectively. The Match Specification subfield contains the match specification (i.e., the parameters) of the corresponding MAC header field with which an MPDU needs to be compared. When the corresponding Filter Mask subfield is not present, every bit in a Match Specification subfield needs to be compared; otherwise, only the bits with the same bit positions as the bits that are equal to 1 in the corresponding Filter Mask subfield are compared.

	Address 2(SID) Match Specification	Address 2 Filter Mask
Octets:	2	0, or 2

Figure 9-325—Address 2 (SID) Match Specification subfield format of Classifier Type 8

For Classifier Type 9, the format of the Frame Classifier field of a TCLAS element is shown in Figure 9-326.

	Classifier Type (9)	Classifier Mask	Frame Control Match Specification	Address 1 Match Specification	Address 2 Match Specification	Sequence Control Match Specification
Octets:	1	3	0, 2, or 4	0, 6, or 12	0, 6, or 12	0, 2, or 4

Figure 9-326—Frame Classifier field format of Classifier Type 9

For Classifier Type 9, the formats of the Frame Control Match Specification subfield, Address 1 subfield, Address 2 subfield, and Sequence Control subfield are shown in Figure 9-313, Figure 9-315, Figure 9-316, and Figure 9-318, respectively. The Match Specification subfield contains the match specification (i.e., the parameters) of the corresponding MAC header field with which an MPDU needs to be compared. When the corresponding Filter Mask subfield is not present, every bit in a Match Specification subfield needs to be compared; otherwise, only the bits with the same bit positions as the bits that are set to 1 in the corresponding Filter Mask subfield are compared.

For Classifier Type 10, the Frame Classifier field for IP extensions and higher layer parameters is defined for packets using IPv4 and IPV6 as shown in Figure 9-327. The subfields in the classifier parameters are represented and transmitted in the big-endian format.

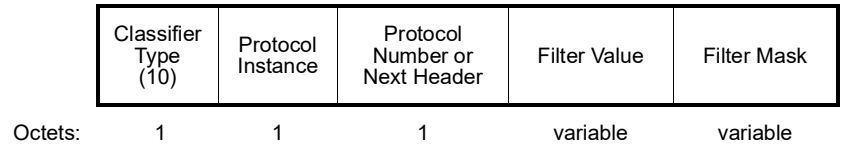

Figure 9-327—Frame Classifier field format of Classifier Type 10 for packets using IPV4 or IPV6

The Protocol Instance subfield indicates the instance number of the protocol identified by the Protocol Number or Next Header subfield. A value of 0 in this field matches the first instance of the Protocol Number or Next Header. A value of 1 matches the second instance, and so on. The only value of Protocol Number or Next Header subfield that is allowed to appear more than once within an IP packet is the Destination Options extension header of IPv6.

The Protocol Number or Next Header subfield contains an IPv4 Protocol Number or an IPv6 Next Header value, which share a common interpretation also known as an IP Protocol Number. The Protocol Number or Next Header subfield value is compared against the Protocol field value of an IPv4 header and to all Next Header field values in an IPv6 packet. This is also true for an IPv6 packet that is encapsulated within an IPv4 packet. This matching operation is not maskable.

The lengths of the Filter Value and Filter Mask subfields are the same and are each equal to (Length – 4)/2 octets, where Length is the value in the Length field of the TCLAS element.

The Filter Value subfield is an octet string that is compared to the MSDU content, beginning at the first octet of the protocol information which is identified by the Protocol Number or Next Header subfield.

The Filter Mask subfield is an octet string that is used to indicate which bits in the Filter Value subfield are compared. A bit in the Filter Value subfield is compared only if the matching bit in the Filter Mask subfield is 1.

Figure 9-328 shows an example of how the Filter Value subfield is applied to an IPv4 packet.

When the Protocol Number or Next Header subfield value of the Frame Classifier matches the value in the Protocol subfield of the IPv4 header, in this case the identifier that corresponds to protocol XYZ, then the first Filter Value octet is compared to Protocol XYZ octet 0 and so on.

Figure 9-329 shows an example of how the Filter Value subfield is applied to an IPv6 packet that contains multiple extension headers.

When the Protocol Number or Next Header subfield value of the Frame Classifier matches the value of a Next Header field of any IPv6 Header or IPv6 Extension Header, then the first Filter Value octet is compared to the first octet of the header of of the payload that is identified by the matching Protocol Number or Next Header subfield value and so on. For example, if the Protocol Number or Next Header subfield value of a Frame Classifier of Classifier Type 10 contains the identifier for IPv6 Extension Header GHI, then this value matches the first entry of the seventh row in the figure and the Filter Value comparison begins at the first octet indicated on the ninth row of the figure. The comparison stops after the first match of a Next Header field.

9.4.2.31 TS Delay element

The TS Delay element is used in an ADDTS Response frame transmitted by an HC and indicates the time after which the ADDTS can be retried; see 11.4.7. The TS Delay element is defined in Figure 9-330.

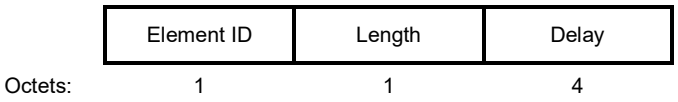

Figure 9-330—TS Delay element format

The Element ID and Length fields are defined in 9.4.2.1.

The Delay field specifies the amount of time, in TUs, a STA should wait before it reinitiates setup of a TS.

The Delay field is set to 0 when an AP does not expect to serve any TSPECs for an indeterminate time and does not know this time a priori.

9.4.2.32 TCLAS Processing element

The TCLAS Processing element is present in ADDTS Request, ADDTS Response, FMS Request, FMS Response, DMS Request, DMS Response, TFS Request and SCS Descriptor frames if there are multiple TCLAS elements associated with the request, response or descriptor. It is optionally present in the ADDTS Request and ADDTS Response frames if there are no TCLAS elements. Together with the TCLAS element(s), if present, it indicates how a PDU or MSDU should be processed by the classifier. The TCLAS Processing element is defined in Figure 9-331.

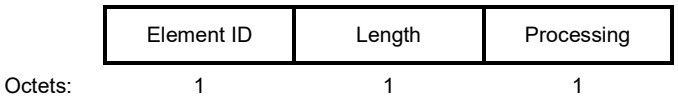

Figure 9-331—TCLAS Processing element format

The Element ID and Length fields are defined in 9.4.2.1.

The encoding of the Processing subfield is shown in Table 9-171.

Table 9-171—Encoding of Processing subfield

Processing subfield value	Meaning
0	PDU contents or MSDU parameters have to match to the parameters in all of the associated TCLAS elements.
1	PDU contents or MSDU parameters have to match to at least one of the associated TCLAS elements.
2	PDUs or MSDUs that do not belong to any other TS are classified to the TS for which this TCLAS Processing element is used. In this case, there are no associated TCLAS elements.
3–255	Reserved

9.4.2.33 Schedule element

The Schedule element is transmitted by the HC to a STA to announce the schedule that the HC follows for admitted streams originating from or destined to that STA, or GCR-SP streams destined to that STA, in the future. The information in this element might be used by the STA for power management, internal scheduling, or any other purpose. The element information format is shown in Figure 9-332.

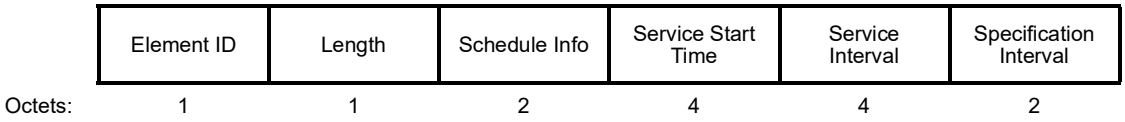

Figure 9-332—Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The Schedule Info field is shown in Figure 9-333.

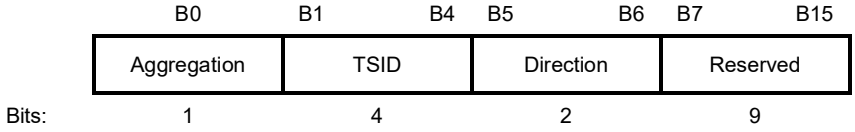

Figure 9-333—Schedule Info field format

The Aggregation subfield is set to 1 if the schedule is an aggregate schedule for all TSIDs associated with the STA to which the frame is directed. It is set to 0 otherwise. The TSID subfield contains a value allowed for a TSID, as defined in 9.2.4.5.2, and indicates the TSID for which this schedule applies. The TSID subfield is reserved when the Schedule element is included within a GCR Response subelement. The Direction subfield is defined in 9.4.2.29 and defines the direction of the TSPEC associated with the schedule. In a Schedule element sent within a GCR Response subelement, the Direction subfield is set to "Downlink." The TSID and Direction subfields are valid only when the Aggregation subfield is 0. If the Aggregation subfield is 1, the TSID and Direction subfields are reserved.

The Service Start Time field indicates the anticipated time, expressed in microseconds, when service starts and represents the lower order 4 octets of the TSF timer value at the start of the first SP. The AP uses this field to confirm or modify the service start time indicated in the TSPEC request.

The Service Interval field indicates the time, expressed in microseconds, between two successive SPs and represents the measured time from the start of one SP to the start of the next SP. If the Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP, the Service Interval field set to 0 indicates the delivery method is GCR-A.

The Specification Interval field contains an unsigned integer that specifies the time interval, in TUs, to verify schedule compliance.

The HC can set the Service Start Time field and the Service Interval field to 0 (unspecified) for nonpowersaving STAs, except when the Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP (see 11.21.16.3.8). When the Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP, the Service Start Time field is not set to 0 and the Service Interval field might be set to 0.

9.4.2.34 QoS Capability element

The QoS Capability element contains a number of subfields that are used to advertise optional QoS capabilities at a QoS STA. The QoS Capability element is defined in Figure 9-334.

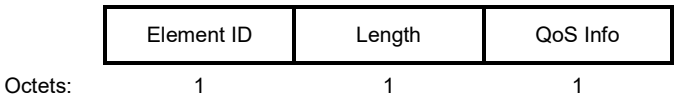

Figure 9-334—QoS Capability element format

The Element ID and Length fields are defined in 9.4.2.1.

The QoS Info field is defined in 9.4.1.17.

9.4.2.35 AP Channel Report element

The AP Channel Report element contains a list of channels where a STA is likely to find an AP. The format of the AP Channel Report element is shown in Figure 9-335. See 11.10.18 for details.

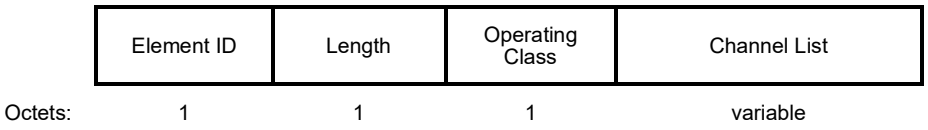

Figure 9-335—AP Channel Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Class field contains an enumerated value from Annex E, specifying the operating class in which the Channel List field is valid. An AP Channel Report only reports channels for a single operating class. Multiple AP Channel Report elements are present when reporting channels in more than one operating class.

The Channel List field contains a variable number of octets, where each octet describes a single channel number. Channel numbering is dependent on Operating Class according to Annex E.

9.4.2.36 Neighbor Report element

The Neighbor Report element describes an AP. The format of the Neighbor Report element is shown in Figure 9-336.

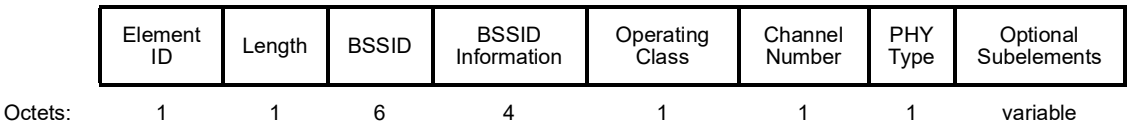

Figure 9-336—Neighbor Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The value of the BSSID field is the BSSID of the BSS being reported. The subsequent fields in the Neighbor Report element pertain to this BSS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The BSSID Information field can be used to help determine neighbor service set transition candidates. The format of the BSSID Information field is shown in Figure 9-337.

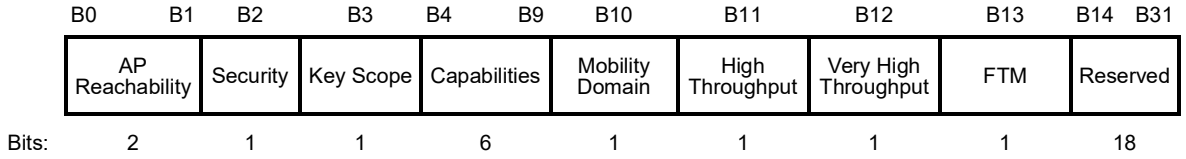

Figure 9-337—BSSID Information field format

The AP Reachability field indicates whether the AP identified by this BSSID is reachable by the STA that requested the neighbor report. For example, the AP identified by this BSSID is reachable for the exchange of preauthentication frames as described in 12.6.10.2. The values are shown in Table 9-172.

Table 9-172—Reachability field

Value	Reachability	Usage
0	Reserved	Not used.
1	Not Reachable	A station sending a preauthentication frame to the BSSID will not receive a response even if the AP indicated by the BSSID is capable of preauthentication.
2	Unknown	The AP is unable to determine if the value Reachable or Not Reachable is to be returned.
3	Reachable	The station sending a preauthentication frame to the BSSID can receive a response from an AP that is capable of preauthentication.

The Security bit, if 1, indicates that the AP identified by this BSSID supports the same security provisioning as used by the STA in its current association. If the bit is 0, it indicates either that the AP does not support the same security provisioning or that the security information is not available at this time.

The Key Scope bit, when set, indicates the AP indicated by this BSSID has the same authenticator as the AP sending the report. If this bit is 0, it indicates a distinct authenticator or the information is not available.

The Capabilities subfield contains selected capability information for the AP indicated by this BSSID. The bit fields within this subfield have the same meaning and are set to the equivalent bits within the Capability Information field (see 9.4.1.4) being sent in the beacons by the AP being reported. The format of the Capabilities subfield is shown in Figure 9-338.

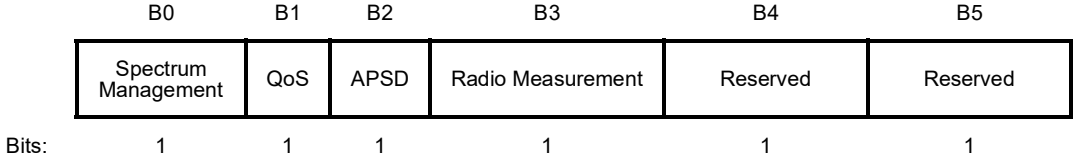

Figure 9-338—Capabilities subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Mobility Domain bit is set to 1 to indicate that the AP represented by this BSSID is including an MDE in its Beacon frames and that the contents of that MDE are identical to the MDE advertised by the AP sending the report.

The High Throughput bit is set to 1 to indicate that the AP represented by this BSSID is an HT AP including the HT Capabilities element in its Beacons, and that the contents of that HT Capabilities element are identical to the HT Capabilities element advertised by the AP sending the report.

The Very High Throughput bit is set to 1 to indicate that the AP represented by this BSSID is a VHT AP and that the VHT Capabilities element, if included as a subelement in the report, is identical in content to the VHT Capabilities element included in the AP's Beacon.

The FTM field is set to 1 to indicate that the AP represented by this BSSID is an AP that has set the Fine Timing Measurement Responder field of the Extended Capabilities element to 1. The FTM field is set to 0 to indicate either that the reporting AP has dot11FineTimingMsmtRespActivated equal to false, or the reported AP has not set the Fine Timing Measurement Responder field of the Extended Capabilities element to 1 or that the Fine Timing Measurement Responder field of the reported AP is not available to the reporting AP at this time.

Bits 14–31 are reserved.

The Operating Class field indicates the channel set of the AP indicated by this BSSID. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for the channel on which the Beacon frames are being transmitted for the BSS being reported. Valid operating classes are listed in Annex E.

The Channel Number field indicates the last known primary channel of the AP indicated by this BSSID. Channel number is defined within an operating class as shown in Annex E.

The PHY Type field indicates the PHY type of the AP indicated by this BSSID. It is an integer value coded according to the value of the dot11PHYType.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-173.

Table 9-173—Optional subelement IDs for Neighbor Report

Subelement ID	Name	Extensible
0	Reserved	
1	TSF Information	Yes
2	Condensed Country String	Yes
3	BSS Transition Candidate Preference	No
4	BSS Termination Duration	No
5	Bearing	No
6	Wide Bandwidth Channel	Yes
7–38	Reserved	
39	Measurement Report	Subelements

Copyright © 2021 IEEE. All rights reserved.

Table 9-173—Optional subelement IDs for Neighbor Report *(continued)*

Subelement ID	Name	Extensible
40–44	Reserved	
45	HT Capabilities subelement	Yes
46–60	Reserved	
61	HT Operation subelement	Yes
62	Secondary Channel Offset subelement	No
63–65	Reserved	
66	Measurement Pilot Transmission	Subelements
67–69	Reserved	
70	RM Enabled Capabilities	Yes
71	Multiple BSSID	Subelements
72–190	Reserved	
191	VHT Capabilities	Yes
192	VHT Operation	Yes
193–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The TSF subelement contains TSF Offset and Beacon Interval subfields as shown in Figure 9-339.

	Subelement ID	Length	TSF Offset	Beacon Interval
Octets:	1	1	2	2

Figure 9-339—TSF subelement format

The Length field is defined in 9.4.3.

The TSF Offset subfield contains the neighbor AP's TSF timer offset. This is the time difference, in TUs, between the serving AP and a neighbor AP. This offset is given modulo the neighbor AP's Beacon Interval and rounded to the nearest TU boundary.

The Beacon Interval field is the beacon interval of the Neighbor AP indicated by this BSSID. This field is defined in 9.4.1.3 and in Figure 9-84.

The Condensed Country String subelement's Data field contains the first two octets of the value contained in dot11CountryString. This subelement is present only if the country of the neighbor AP indicated by the BSSID differs from the country of the AP that sent this neighbor report.

The Measurement Pilot Transmission subelement has the same format as the Measurement Pilot Transmission element (see 9.4.2.41). The Measurement Pilot Transmission subelement is not included if the reported AP is not transmitting Measurement Pilot frames or if the measurement pilot interval of the reported AP is unknown.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A Measurement Report subelement with the Measurement Type field equal to LCI (see Table 9-125) is optionally present. If present, the subelement has the same format as the Measurement Report element with Measurement Type field equal to LCI.The subelement indicates the LCI of the neighbor STA and further includes the Z subelement, or the subelement indicates an unknown LCI (see 11.21.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Co-Located BSSID List subelement is present in the Measurement Report subelement of the Neighbor Report element, when there is at least one other BSS that is co-located within the same physical device as the reporting BSS.

A Measurement Report subelement with the Measurement Type field equal to Location Civic (see Table 9-125) is optionally present. If present, the subelement has the same format as the Measurement Report element with Measurement Type field equal to Location Civic, and the subelement indicates the civic address of the transmitting STA or an unknown civic address (see 11.21.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Co-Located BSSID List subelement is present in the Measurement Report subelement of the Neighbor Report element, when there is at least one other BSS which is co-located within the same physical device as the reporting BSS. When a Measurement Report subelement with Measurement Type field equal to LCI that includes a Co-Located BSSID List subelement is present, the Co-Located BSSID List subelement is not present in the Measurement Report subelement with Measurement Type field equal to Location Civic.

The HT Capabilities subelement is the same as the HT Capabilities element as defined in 9.4.2.55.

The HT Operation subelement is the same as the HT Operation element as defined in 9.4.2.56.

The Secondary Channel Offset subelement is the same as the Secondary Channel Offset element as defined in 9.4.2.19.

The RM Enabled Capabilities subelement has the same format as the RM Enabled Capabilities element (see 9.4.2.44).

The Multiple BSSID subelement has the same format as the Multiple BSSID element (see 9.4.2.45). The reference BSSID for the Multiple BSSID subelement is the BSSID field in the Neighbor Report element. This subelement is not present if the neighbor AP is not a member of a multiple BSSID set with two or more members or its membership is unknown. (see 11.10.14).

The format of the BSS Transition Candidate Preference subelement is shown in Figure 9-340.

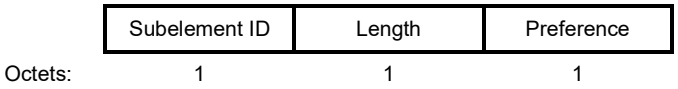

Figure 9-340—BSS Transition Candidate Preference subelement format

The Length field is defined in 9.4.3.

The Preference field indicates the network preference for BSS transition to the BSS listed in this BSS Transition Candidate List Entries field in the BSS Transition Management Request frame, BSS Transition Management Query frame, and BSS Transition Management Response frame. The Preference field value is a number ranging from 0 to 255, as defined in Table 9-174, indicating an ordering of preferences for the BSS transition candidates for this STA. Additional details describing use of the Preference field are provided in 11.21.7.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-174—Preference field values

Preference field value	Description
0	Excluded BSS; reserved when present in the BSS Transition Management Query or BSS Transition Management Response frames.
1–255	Relative values used to indicate the preferred ordering of BSSs, with 255 indicating the most preferred candidate and 1 indicating the least preferred candidate.

The BSS Termination TSF field contained in the BSS Termination Duration subelement is the TSF time of the BSS transmitting the neighbor report that corresponds to the time when termination of the neighbor BSS occurs. How the BSS determines the neighbor BSS termination time is out of scope of the standard. The format of the BSS Termination Duration subelement is shown in Figure 9-341.

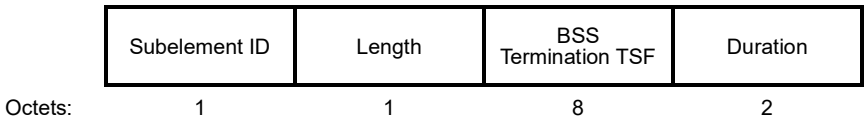

Figure 9-341—BSS Termination Duration subelement format

The Length field is defined in 9.4.3.

The BSS Termination TSF field indicates the value of the TSF timer when BSS termination will occur in the future. A BSS Termination TSF field set to 0 indicates that termination of the BSS will occur imminently. Prior to termination of the BSS, all associated STAs are disassociated by the AP.

The Duration field is an unsigned 2-octet integer that indicates the number of minutes for which the BSS is not present. A Duration field set to 0 is reserved. A Duration field set to 65 535 when the BSS is terminated for a period longer than or equal to 65 535 minutes.

The format of the Bearing subelement is shown in Figure 9-342.

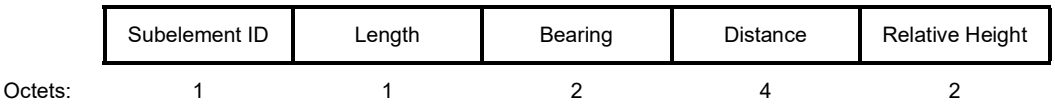

Figure 9-342—Bearing subelement format

The Length field is defined in 9.4.3.

The Bearing field specifies the direction that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned, relative to the reporting BSS and defined in relation to true north, increasing clockwise, measured in degrees from 0° to 359°. If the Bearing value is unknown, the subelement is not included.

The Distance field specifies the distance that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned relative to the reporting BSS as a 4-octet single precision floating point value represented by a binary32 floating point value as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field, in meters. If the Distance field value is unknown the field is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Relative Height field, defined by a 2s complement signed integer, specifies the relative height in meters that the neighbor is positioned, relative to the reporting BSS. If the relative height is unknown or at the same height as the reporting BSS, the field is 0.

The format of the Wide Bandwidth Channel subelement is shown in Figure 9-343.

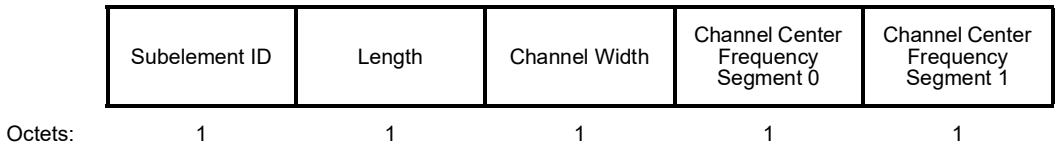

Figure 9-343—Wide Bandwidth Channel subelement format

The Length field is defined in 9.4.3.

The Channel Width, Channel Center Frequency Segment 0, and Channel Center Frequency Segment 1 subfields are defined in Table 9-175.

Table 9-175—HT/VHT Operation Information subfields

Field	Definition	Encoding
Channel Width	This field defines the BSS bandwidth (see 11.38.1).	Set to 0 for 20 MHz BSS bandwidth. Set to 1 for 40 MHz BSS bandwidth. Set to 2 for 80 MHz BSS bandwidth. Set to 3 for 160 MHz BSS bandwidth. Set to 4 for 80+80 MHz BSS bandwidth. Values in the range 5 to 255 are reserved.
Channel Center Frequency Segment 0	Defines the channel center frequency for an HT or VHT BSS or the frequency segment 0 channel center frequency for an 80+80 MHz VHT BSS. See 21.3.14.	For 20, 40, 80, or 160 MHz BSS bandwidth, indicates the channel center frequency index for the channel on which the HT or VHT BSS operates. For 80+80 MHz BSS bandwidth, indicates the channel center frequency index for the 80 MHz channel of frequency segment 0 on which the VHT BSS operates.
Channel Center Frequency Segment 1	Defines the frequency segment 1 channel center frequency for an 80+80 MHz VHT BSS. See 21.3.14.	For an 80+80 MHz BSS bandwidth, indicates the channel center frequency index of the 80 MHz channel of frequency segment 1 on which the VHT BSS operates. The channel center frequency index of segment 1 differs by more than 16 from the channel center frequency index of segment 0 (i.e., the channel center frequencies are more than 80 MHz apart). Reserved otherwise.

The VHT Capabilities subelement is the same as the VHT Capabilities element as defined in 9.4.2.157.

The VHT Operation subelement is the same as the VHT Operation element as defined in 9.4.2.158.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.37 RCPI element

The RCPI element indicates the received frame power level at the receiving STA as shown in Figure 9-344.

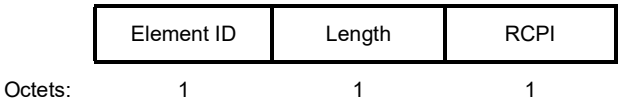

Figure 9-344—RCPI element format

The Element ID and Length fields are defined in 9.4.2.1.

The RCPI field contains an RCPI value, which is an indication of the received RF power in the selected channel for a received frame.

The value of the RCPI field is a monotonically increasing, logarithmic function of the received power level. The allowed values for the RCPI field are defined in Table 9-176, where P is the received power level in dBm.

Table 9-176—RCPI values

RCPI Value	Description
0	Represents $P < -109.5$ dBm
1–219	Power levels in the range $-109.5 \le P < 0$ are represented by $\text{RCPI} = \lfloor 2 \times (P + 110) \rfloor$
220	Represents $P \ge 0$ dBm
221–254	Reserved
255	Measurement not available

9.4.2.38 BSS Average Access Delay element

The BSS Average Access Delay element contains the AP Average Access Delay, which is a measure of load in the BSS and is available in both QoS APs and non-QoS APs. The format of the BSS Average Access Delay element is defined in Figure 9-345.

Figure 9-345—BSS Average Access Delay element format

The Element ID and Length fields are defined in 9.4.2.1.

The AP Average Access Delay is a scalar indication of the relative level of loading at an AP. A low value indicates more available capacity than a higher value. If the AP is not currently transmitting any DCF or EDCAF traffic, the AP Average Access Delay is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for all DCF and EDCAF transmitted frames measured from the time the DCF or EDCAF MPDU is ready for transmission (i.e., begins CSMA/CA access) until the

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

actual frame transmission start time. Non-QoS APs average the access delays for all DCF transmitted frames. QoS APs average the access delays for all EDCA transmitted frames of all ACs. The AP Average Access Delay values are scaled as follows:

0:	Access Delay < 8 μs
1:	8 μs ≤ Access Delay < 16 μs
2 ≤ n ≤ 14:	n × 8 μs ≤ Access Delay < (n + 1) × 8 μs
15:	120 μs ≤ Access Delay < 128 μs
16:	128 μs ≤ Access Delay < 144 μs
17 ≤ n ≤ 106:	(n × 16) – 128 μs ≤ Access Delay < ((n + 1) × 16) – 128 μs
107:	1 584 μs ≤ Access Delay < 1 600 μs
108:	1 600 μs ≤ Access Delay < 1 632 μs
109 ≤ n ≤ 246:	(n × 32) – 1 856 μs ≤ Access Delay < ((n + 1) × 32) – 1 856 μs
247:	6 048 μs ≤ Access Delay < 6 080 μs
248:	6 080 μs ≤ Access Delay < 8 192 μs
249:	8 192 μs ≤ Access Delay < 12 288 μs
250:	12 288 μs ≤ Access Delay < 16 384 μs
251:	16 384 μs ≤ Access Delay < 20 480 μs
252:	20 480 μs ≤ Access Delay < 24 576 μs
253:	24 576 μs ≤ Access Delay
254:	Service unable to access channel
255:	Measurement not available

The values 0–253 indicate the average access delay when one or more frames were transmitted during the measurement window. The value 254 indicates that the DCF is or the EDCAFs are currently unable to access the channel due to continuous carrier sense mechanism deferral and that no frames were transmitted during the measurement window. The AP measures and averages the medium access delay for all transmit frames using the DCF or the EDCAFs over a continuous 30 s measurement window. See 11.10.16 for accuracy requirements.

9.4.2.39 Antenna element

The Antenna element contains the Antenna ID field as shown in Figure 9-346.

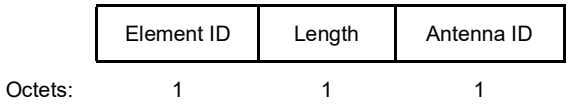

Figure 9-346—Antenna element format

The Element ID and Length fields are defined in 9.4.2.1.

The Antenna ID field contains the identifying number for the relevant antenna(s) or DMG antenna.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For a non-DMG STA, the antenna ID identifies the antenna(s) used to transmit the frame the Antenna element is contained in, or the antenna(s) used to receive an earlier frame, depending on the frame the antenna ID is contained in. A specific antenna has an antenna ID between 1 and 254. The value 0 indicates that the antenna ID is unknown. The value 255 indicates that this transmission was made with multiple antennas, i.e., antennas were switched during the transmission. If during frame reception different antennas are used to receive the preamble and body, the antenna ID identifies the antenna that receives the frame body. In these cases, the value 255 is not used. Antenna IDs are assigned to each antenna and each antenna configuration as consecutive integers starting with 1. Each antenna ID number represents a unique antenna or unique configuration of multiple antennas characterized by a fixed relative position, a fixed relative direction, and a fixed peak gain for that position and direction.

For a DMG STA, the DMG antenna ID identifies the DMG antenna used to transmit the frame the Antenna element is contained in, or the DMG antenna used to receive an earlier frame, depending on the frame the DMG antenna ID is contained in. A specific DMG antenna has a DMG antenna ID between 0 and 3. DMG antenna IDs are assigned to each DMG antenna as consecutive integers starting with 0.

9.4.2.40 RSNI element

The RSNI element contains an RSNI value, as shown in Figure 9-347.

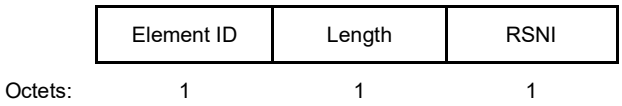

Figure 9-347—RSNI element format

The Element ID and Length fields are defined in 9.4.2.1.

The value of the RSNI field is in steps of 0.5 dB. RSNI is calculated by the ratio of the received signal power (RCPI-ANPI) to the noise plus interference power (ANPI) using the expression:

$$RSNI = (10 \times \log10((RCPI_{power} - ANPI_{power}) / ANPI_{power})+10) \times 2$$

where $RCPI_{power}$ and $ANPI_{power}$ indicate power domain values for RCPI and ANPI and not dB domain values. RSNI in dB is scaled in steps of 0.5 dB to obtain 8-bit RSNI values, which cover the range from –10 dB to +117 dB. The value 255 indicates that RSNI is not available. See 11.10.9.4 for details and procedures for measuring ANPI.

9.4.2.41 Measurement Pilot Transmission element

The Measurement Pilot Transmission element contains a Measurement Pilot Transmission field as shown in Figure 9-348.

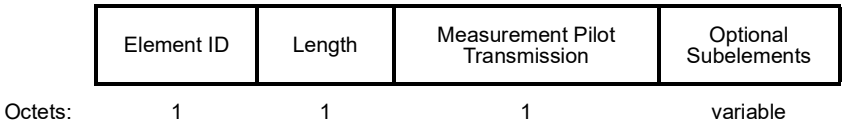

Figure 9-348—Measurement Pilot Transmission element format

The Element ID and Length fields are defined in 9.4.2.1.

The Measurement Pilot Transmission field contains the measurement pilot interval as specified in 9.4.1.18.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-177.

Table 9-177—Optional subelement IDs for Measurement Pilot Transmission

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.42 BSS Available Admission Capacity element

The BSS Available Admission Capacity element contains a list of Available Admission Capacity fields at different User Priorities and Access Categories as shown in Figure 9-349.

NOTE—The BSS Available Admission Capacity element is helpful for roaming QoS STAs to select a QoS AP that is likely to accept future admission control requests, but it does not provide an assurance that the HC will admit these requests.

	Element ID	Length	Available Admission Capacity Bitmask	Available Admission Capacity List
Octets:	1	1	2	2 × (total number of nonzero bits in Available Admission Capacity Bitmask)

Figure 9-349—BSS Available Admission Capacity element format

The Element ID and Length fields are defined in 9.4.2.1. The Length field is set to $2 + 2N_{nz}$, where N_{nz} equals the total number of nonzero bits in Available Admission Capacity Bitmask.

The Available Admission Capacity Bitmask field indicates the UP values that have an Available Admission Capacity specified in the Available Admission Capacity List field. The format of the Available Admission Capacity Bitmask is defined in Table 9-178.

Each bit in the Available Admission Capacity Bitmask is set to 1 to indicate that the Available Admission Capacity for the corresponding traffic type is present in the Available Admission Capacity List field. The bit is set to 0 to indicate that the Available Admission Capacity for the corresponding traffic type is not present in the Available Admission Capacity List field.

The Available Admission Capacity List comprises a sequence of Available Admission Capacity fields corresponding respectively to the nonzero bits in the Available Admission Capacity Bitmask field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-178—Available Admission Capacity Bitmask definition

Bit	Available Admission Capacity Reported
0	UP 0
1	UP 1
2	UP 2
3	UP 3
4	UP 4
5	UP 5
6	UP 6
7	UP 7
8	AC 0
9	AC 1
10	AC 2
11	AC 3
12–15	Reserved

Each Available Admission Capacity field is 2 octets long and contains an unsigned integer that specifies the amount of medium time available using explicit admission control for the corresponding UP or AC traffic, in units of 32 μs per 1 s. See 11.10.17 for furthers details.

9.4.2.43 BSS AC Access Delay element

The BSS AC Access Delay element contains an Access Category Access Delay field, as shown in Figure 9-350.

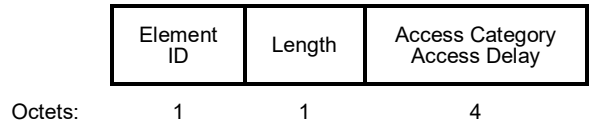

Figure 9-350—BSS AC Access Delay element format

The Element ID and Length fields are defined in 9.4.2.1.

The Access Category Access Delay field is formatted as four subfields as shown in Figure 9-351. The value of the AC Access Delay field is a scalar indication of the average access delay at a QoS AP for services for each of the indicated access categories. If the QoS AP is not currently transmitting any traffic using the indicated AC, the value of Average Access Delay field for that AC is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for transmitted frames in the indicated AC measured from the time the EDCA MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. The AC Access Delay values are scaled as follows:

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

0:	Access Delay < 8 μs
1:	8 μs ≤ Access Delay < 16 μs
2 ≤ n ≤ 14:	n × 8 μs ≤ Access Delay < (n + 1) × 8 μs
15:	120 μs ≤ Access Delay < 128 μs
16:	128 μs ≤ Access Delay < 144 μs
17 ≤ n ≤ 106:	(n × 16) – 128 μs ≤ Access Delay < ((n + 1) × 16) – 128 μs
107:	1584 μs ≤ Access Delay < 1600 μs
108:	1600 μs ≤ Access Delay < 1632 μs
109 ≤ n ≤ 246:	(n × 32) – 1856 μs ≤ Access Delay < ((n + 1) × 32) – 1856 μs
247:	6048 μs ≤ Access Delay < 6080 μs
248:	6080 μs ≤ Access Delay < 8192 μs
249:	8192 μs ≤ Access Delay < 12 288 μs
250:	12 288 μs ≤ Access Delay < 16 384 μs
251:	16 384 μs ≤ Access Delay < 20 480 μs
252:	20 480 μs ≤ Access Delay < 24 576 μs
253:	24 576 μs ≤ Access Delay
254:	Service unable to access channel
255:	Measurement not available

The values 0–253 indicate the average access delay when one or more frames were transmitted during the measurement window. The value 254 indicates that the EDCAF is currently unable to access the channel due to continuous carrier sense mechanism deferral to higher priority AC transmissions and that no frames were transmitted during the measurement window. The QoS AP measures and averages the medium access delay for all transmit frames of the indicated AC using EDCA mechanism over a continuous 30 s measurement window. See 11.10.16 for accuracy requirements.

9.4.2.44 RM Enabled Capabilities element

The RM Enabled Capabilities element signals support for radio measurements in a STA. The element is shown in Figure 9-352.

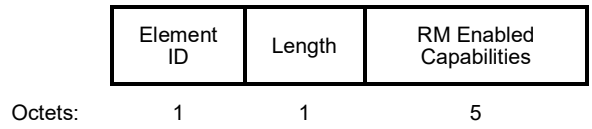

Figure 9-352—RM Enabled Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The RM Enabled Capabilities field is an octet string. Each subfield of this field indicates whether the corresponding capability listed in Table 9-179 is enabled.

Table 9-179—RM Enabled Capabilities definition

Bit position in the RM Enabled Capabilities field	Field name	Notes
0	Link Measurement Capability Enabled	A STA sets the Link Measurement Capability Enabled field to 1 when dot11RMLinkMeasurementActivated is true and sets it to 0 otherwise.
1	Neighbor Report Capability Enabled	A STA sets the Neighbor Report Capability Enabled field to 1 when dot11RMNeighborReportActivated is true and sets it to 0 otherwise.
2	Parallel Measurements Capability Enabled	A STA sets the Parallel Measurements Capability Enabled field to 1 when dot11RMParallelMeasurementsActivated is true and sets it to 0 otherwise.
3	Repeated Measurements Capability Enabled	A STA sets the Repeated Measurements Capability Enabled field to 1 when dot11RMRepeatedMeasurementsActivated is true and sets it to 0 otherwise.
4	Beacon Passive Measurement Capability Enabled	A STA sets the Beacon Passive Measurement Capability Enabled field to 1 when dot11RMBeaconPassiveMeasurementActivated is true and sets it to 0 otherwise.
5	Beacon Active Measurement Capability Enabled	A STA sets the Beacon Active Measurement Capability Enabled field to 1 when dot11RMBeaconActiveMeasurementActivated is true and sets it to 0 otherwise.
6	Beacon Table Measurement Capability Enabled	A STA sets the Beacon Table Measurement Capability Enabled field to 1 when dot11RMBeaconTableMeasurementActivated is true and sets it to 0 otherwise.
7	Beacon Measurement Reporting Conditions Capability Enabled	A STA sets the Beacon Measurement Reporting Conditions Capability Enabled field to 1 when dot11RMBeaconMeasurementReportingConditionsActivated is true and sets it to 0 otherwise.

Table 9-179—RM Enabled Capabilities definition *(continued)*

Bit position in the RM Enabled Capabilities field	Field name	Notes
8	Frame Measurement Capability Enabled	A STA sets the Frame Measurement Capability Enabled field to 1 when dot11RMFrameMeasurementActivated is true and sets it to 0 otherwise.
9	Channel Load Measurement Capability Enabled	A STA sets the Channel Load Measurement Capability Enabled field to 1 when dot11RMChannelLoadMeasurementActivated is true and sets it to 0 otherwise.
10	Noise Histogram Measurement Capability Enabled	A STA sets the Noise Histogram Measurement Capability Enabled field to 1 when dot11RMNoiseHistogramMeasurementActivated is true and sets it to 0 otherwise.
11	Statistics Measurement Capability Enabled	A STA sets the Statistics Measurement Capability Enabled field to 1 when dot11RMStatisticsMeasurementActivated is true and sets it to 0 otherwise.
12	LCI Measurement Capability Enabled	A STA sets the LCI Measurement Capability Enabled field to 1 when dot11RMLCIMeasurementActivated is true and sets it to 0 otherwise.
13	LCI Azimuth Capability Enabled	A STA sets the LCI Azimuth Capability Enabled field to 1 when dot11RMLCIAzimuthActivated is true and sets it to 0 otherwise.
14	Transmit Stream/ Category Measurement Capability Enabled	A STA sets the Transmit Stream/Category Measurement Capability Enabled field to 1 when dot11RMTransmitStreamCategoryMeasurementActivated is true and sets it to 0 otherwise.
15	Triggered Transmit Stream/Category Measurement Capability Enabled	A STA sets the Triggered Transmit Stream/Category Measurement Capability Enabled field to 1 when dot11RMTriggeredTransmitStreamCategoryMeasurementActivated is true and sets it to 0 otherwise.
16	AP Channel Report Capability Enabled	A STA sets the AP Channel Report Capability Enabled field to 1 when dot11RMAPChannelReportActivated is true and sets it to 0 otherwise.
17	RM MIB Capability Enabled	A STA sets the RM MIB Capability Enabled field to 1 when dot11RMMIBActivated is true and sets it to 0 otherwise.
18–20	Operating Channel Max Measurement Duration	A STA sets the Operating Channel Max Measurement Duration field to equal dot11RMMaxMeasurementDuration. See 11.10.4.
21–23	Nonoperating Channel Max Measurement Duration	A STA sets the Nonoperating Channel Max Measurement Duration field to equal dot11RMNonOperatingChannelMaxMeasurementDuration. See 11.10.4.
24–26	Measurement Pilot Capability	A STA sets the Measurement Pilot Capability field to equal dot11RMMeasurementPilotActivated. See Table 11-10 in 11.10.15.

Table 9-179—RM Enabled Capabilities definition *(continued)*

Bit position in the RM Enabled Capabilities field	Field name	Notes
27	Measurement Pilot Transmission Information Capability Enabled	A STA sets the Measurement Pilot Transmission Capability Enabled field to 1 when dot11RMMeasurementPilotTransmissionInformationActivated is true and sets it to 0 otherwise.
28	Neighbor Report TSF Offset Capability Enabled	A STA sets the Neighbor Report TSF Offset Capability Enabled field to 1 when dot11RMNeighborReportTSFOffsetActivated is true and sets it to 0 otherwise.
29	RCPI Measurement Capability Enabled	A STA sets the RCPI Measurement Capability Enabled field to 1 when dot11RMRCPIMeasurementActivated is true and sets it to 0 otherwise.
30	RSNI Measurement Capability Enabled	A STA sets the RSNI Measurement Capability Enabled field to 1 when dot11RMRSNIMeasurementActivated is true and sets it to 0 otherwise.
31	BSS Average Access Delay Capability Enabled	A STA sets the BSS Average Access Delay Capability Enabled field to 1 when dot11RMBSSAverageAccessDelayActivated is true and sets it to 0 otherwise (see NOTE).
32	BSS Available Admission Capacity Capability Enabled	A STA sets the BSS Available Admission Capacity Capability Enabled field to 1 when dot11RMBSSAvailableAdmissionCapacityActivated is true and sets it to 0 otherwise.
33	Antenna Capability Enabled	A STA sets the Antenna Capability Enabled field to 1 when dot11RMAntennaInformationActivated is true and sets it to 0 otherwise.
34	FTM Range Report Capability Enabled	A STA sets the FTM Range Report Capability Enabled field to 1 when dot11RMFineTimingMsmtRangeRepActivated is true and sets it to 0 otherwise.
35	Civic Location Measurement Capability Enabled	A STA sets the Civic Location Measurement Capability Enabled field to 1 when dot11RMCivicMeasurementActivated is true and sets it to 0 otherwise.
36–39	Reserved	

NOTE—At a QoS AP dot11RMBSSAverageAccessDelayActivated is true indicates that the AP BSS AC Access Delay capability is also enabled.

9.4.2.45 Multiple BSSID element

The format of the Multiple BSSID element is shown in Figure 9-353.

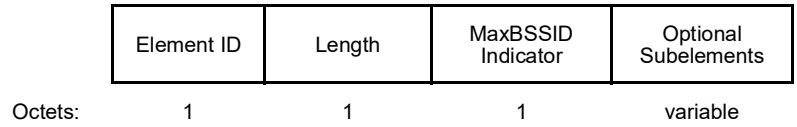

Figure 9-353—Multiple BSSID element format

The Element ID and Length fields are defined in 9.4.2.1.

The MaxBSSID Indicator field contains a value assigned to n, where 2^n is the maximum number of BSSIDs in the multiple BSSID set, including the reference BSSID (see 11.10.14). The maximum value of n is 8. The actual number of BSSIDs in the multiple BSSID set is not explicitly signaled. BSSID(i) corresponding to the i^{th} BSSID in the multiple BSSID set is derived as follows:

A0-A1-A2-A3-A4-A5 = Reference BSSID

$B = A5 \bmod 2^n$

$A5(i) = A5 - B + ((B + i) \bmod 2^n)$

BSSID(i) = A0-A1-A2-A3-A4-A5(i)

NOTE 1—For example, for n = 3 and Reference BSSID = 8c-fd-0f-7f-1e-f5:

A5 = f5
B = 5
A5(5) = f2 and BSSID(5) = 8c-fd-0f-7f-1e-f2
A5(2) = f7 and BSSID(2) = 8c-fd-0f-7f-1e-f7

NOTE 2—This definition uses the hexadecimal address representation defined in IEEE Std 802.

NOTE 3—The BSSID index as defined in 9.4.2.73 cannot be larger than 255, which effectively limits n to 8.

When the Multiple BSSID element is transmitted in a Beacon, DMG Beacon, or Probe Response frame, the reference BSSID is the BSSID field of the frame. The AP or DMG STA determines the number of Multiple BSSID elements. The AP or DMG STA does not fragment a nontransmitted BSSID profile subelement for a single BSSID across two Multiple BSSID elements unless the length of the nontransmitted BSSID profile subelement exceeds 255 octets. When the Multiple BSSID element is transmitted as a subelement in a Neighbor Report element, the reference BSSID is the BSSID field in the Neighbor Report element.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined subelements are shown in Table 9-180.

Table 9-180—Optional subelement IDs for Multiple BSSID

Subelement ID	Name	Extensible
0	Nontransmitted BSSID Profile	No
1–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Nontransmitted BSSID Profile subelement contains a list of elements for one or more APs or DMG STAs that have nontransmitted BSSIDs and is defined as follows:

— For each nontransmitted BSSID, the Nontransmitted BSSID Capability element (see 9.4.2.71) is the first element included, followed by a variable number of elements, in the order defined in Table 9-32 for a non-DMG non-S1G AP, Table 9-45 for a DMG AP or Table 9-46 for a S1G AP.

— The SSID element (see 9.4.2.2) and Multiple BSSID-Index element (see 9.4.2.73) are included in the Nontransmitted BSSID Profile subelement.

— The FMS Descriptor element is included in the Nontransmitted BSSID Profile subelement if the Multiple BSSID element is included in a Beacon frame.

— The Timestamp and Beacon Interval fields, DSSS Parameter Set, IBSS Parameter Set, Country, Channel Switch Announcement, Extended Channel Switch Announcement, Wide Bandwidth Channel Switch, Transmit Power Envelope, Supported Operating Classes, IBSS DFS, ERP Information, HT Capabilities, HT Operation, VHT Capabilities, VHT Operation, S1G Beacon Compatibility, Short Beacon Interval, S1G Capabilities, and S1G Operation elements are not included in the Nontransmitted BSSID Profile subelement; the values of these elements for each nontransmitted BSSID are always the same as the corresponding transmitted BSSID element values.

— When included in the Nontransmitted BSSID Profile subelement for this nontransmitted BSSID, the Non-Inheritance element (see 9.4.2.240) appears as the last element in the profile and carries a list of elements that are not inherited by this nontransmitted BSSID from the transmitted BSSID.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

The Multiple BSSID element is included in Beacon frames (as described in 9.3.3.2), in DMG Beacon frames (as described in 9.3.4.2), and Probe Response frames (as described in 9.3.3.10). The use of the Multiple BSSID element is described in 11.10.14. Nontransmitted BSSID advertisement procedures are described in 11.1.3.8.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.46 Mobility Domain element (MDE)

The MDE contains the MDID (Mobility Domain Identifier) field and the FT Capability and Policy field. The AP uses the MDE to advertise that it is included in the group of APs that constitute a mobility domain, to advertise its support for FT capability, and to advertise its FT policy information. The format for this element is shown in Figure 9-354.

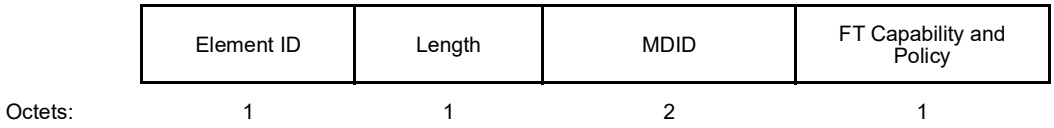

Figure 9-354—Mobility Domain element format

The Element ID and Length fields are defined in 9.4.2.1.

The MDID field is a 2-octet value that is an identifier that names a mobility domain.

The FT Capability and Policy field is 1 octet. The FT Capability and Policy field is defined in Figure 9-355.

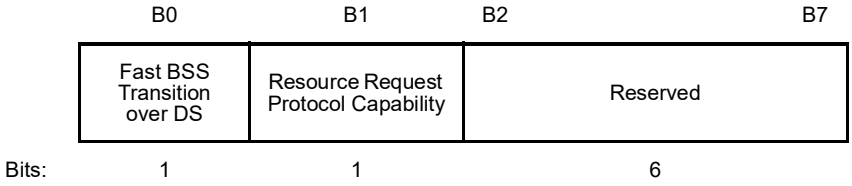

Figure 9-355—FT Capability and Policy field format

Bits 0–1 of the FT Capability and Policy field control the behavior of STAs performing fast BSS transitions (see 13.3). The STA might use information from the MDE to determine the transition methods recommended by the AP and protocols supported by the AP. The choice of executing any specific transition method is outside the scope of this standard.

If the Resource Request Protocol Capability subfield is 1, then the STA might perform the FT resource request protocol as described in 13.6.

When sent by a STA to a target AP, the FT Capability and Policy field matches the value advertised by that target AP. See 13.8.

9.4.2.47 Fast BSS Transition element (FTE)

The FTE includes information needed to perform the FT authentication sequence or FILS authentication during a fast BSS transition in an RSN. This element is shown in Figure 9-356.

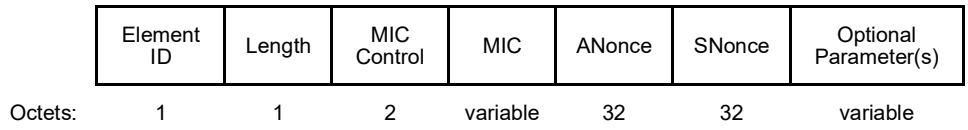

Figure 9-356—FTE format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MIC Control field is 2 octets and is defined in Figure 9-357.

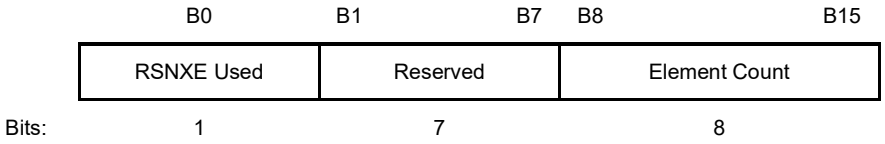

Figure 9-357—MIC Control field format

The RSNXE Used subfield of the MIC Control field is used in the third and fourth messages of the FT authentication sequence to indicate whether the STA transmitting the frame containing the FTE includes an RSNXE in other frames. This subfield is set to 0 in other frames.

The Element Count subfield of the MIC Control field contains the number of elements that are included in the message integrity code (MIC) calculation.

When the Element Count subfield has a value greater than 0, the MIC field contains a MIC that is calculated using the algorithm specified in 13.8.4 and 13.8.5. Otherwise, the MIC field is set to 0.

The length of the MIC field depends on the negotiated AKM selector and is specific in Table 12-10.

The ANonce field contains a value chosen by the R1KH.

The SNonce field contains a value chosen by the S1KH.

The format of the Optional Parameter(s) field is shown in Figure 9-358.

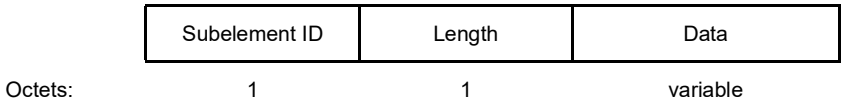

Figure 9-358—Optional Parameter(s) field format

The Subelement ID field is defined in Table 9-181:

Table 9-181—Subelement IDs

Value	Contents of Data field
0	Reserved
1	PMK-R1 key holder identifier (R1KH-ID)
2	GTK
3	PMK-R0 key holder identifier (R0KH-ID)
4	IGTK
5	Operating Channel Information (OCI)
6	BIGTK
7–255	Reserved

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

R1KH-ID indicates the identity of the R1KH, which is used by the S0KH and the R0KH for deriving the PMK-R1s.

The GTK subelement contains the GTK, which is encrypted (see procedures in 13.8.5) and is defined in Figure 9-359.

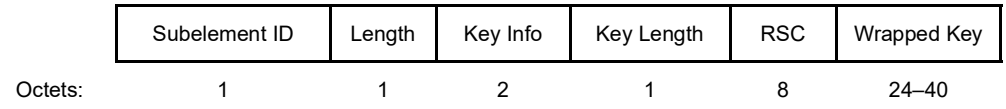

Figure 9-359—GTK subelement format

The GTK subelement Key Info subfield is defined in Figure 9-360.

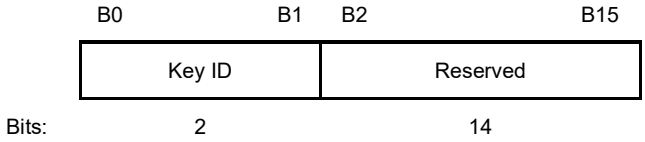

Figure 9-360—GTK subelement's Key Info subfield format

The Key Length field is the length of the Key field in octets, not including any padding (see 13.8.5).

The RSC field contains the current receive sequence counter (RSC) for the GTK being installed to allow a STA to identify replayed MPDUs. If the RSC is less than 8 octets in length, it is stored in the first octets and the remaining octets are set to 0. The least significant octet of the RSC is in the first octet of the RSC field. The RSC for TKIP is the TKIP sequence counter (TSC); for CCMP and GCMP it is the packet number (PN); see Table 12-8.

For WEP, the RSC value is reserved.

The Wrapped Key field contains the wrapped GTK as described in 13.8.5.

When sent by a non-AP STA, the R0KH-ID indicates the R0KH with which the S0KH negotiated the PMK-R0 it is using for this transition. When sent by an AP, the R0KH-ID indicates the R0KH that the S0KH will be using to generate a PMK-R0 security association. It is encoded following the conventions from 9.2.2.

The IGTK subelement contains the IGTK, used for protecting robust Management frames. The IGTK subelement format is shown in Figure 9-361.

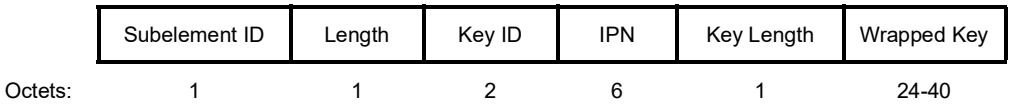

Figure 9-361—IGTK subelement format

The Key ID field indicates the value of the BIP key identifier.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The IPN field contains the current RSC for the IGTK being installed, to allow a STA to identify replayed protected group addressed robust Management frames. The RSC for an IGTK is the IGTK packet number (IPN).

The Key Length field is the length of IGTK in octets, not including any padding (see 13.8.5).

The Wrapped Key field contains the wrapped IGTK being distributed.

The OCI subelement contains the operating channel information that is integrity protected (see procedures in 13.7) as defined in Figure 9-362.

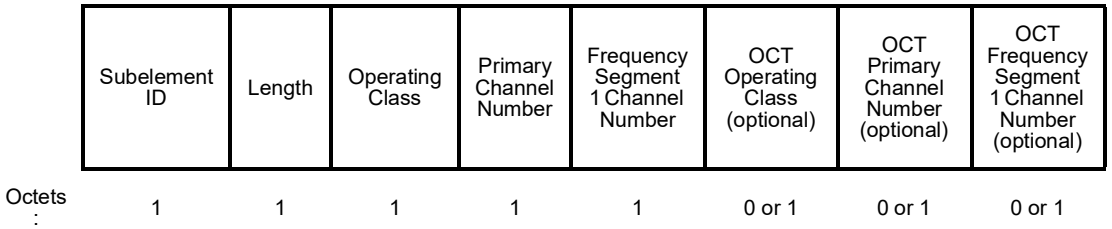

Figure 9-362—OCI subelement format

The definitions of the Operating Class, Primary Channel Number, Frequency Segment 1 Channel Number, OCT Operating Class, OCT Primary Channel Number and OCT Frequency Segment 1 Channel Number fields are the same as those described in 9.4.2.236.

The OCT Operating Class, OCT Primary Channel Number and OCT Frequency Segment 1 fields are present if the OCI subelement is contained in a frame sent using the OCT procedure, i.e., an MMPDU included in an MLME-OCTunnel.request or MLME-OCTunnel.response primitive (see 11.31.5); otherwise they are not present.

The BIGTK subelement contains the BIGTK, used for protecting Beacon frames. The BIGTK subelement format is shown in Figure 9-363.

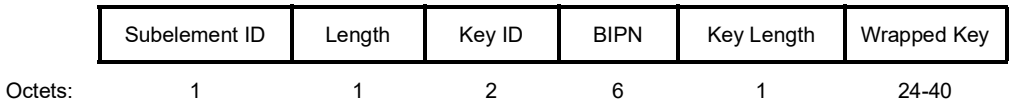

Figure 9-363—BIGTK subelement format

The Key ID field indicates the value of the BIGTK identifier.

The BIPN field contains the current RSC for the BIGTK being installed, to allow a STA to identify replayed Beacon frames. The RSC for a BIGTK is the BIGTK packet number (BIPN).

The Key Length field is the length of the BIGTK in octets, not including any padding (see 13.8.5).

The Wrapped Key field contains the wrapped BIGTK being distributed.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.48 Timeout Interval element (TIE)

The TIE specifies time intervals and timeouts. Figure 9-364 shows this element.

	Element ID	Length	Timeout Interval Type	Timeout Interval Value
Octets:	1	1	1	4

Figure 9-364—TIE format

The Element ID and Length fields are defined in 9.4.2.1.

The Timeout Interval Type field is defined in Table 9-182.

Table 9-182—Timeout Interval Type field value

Timeout Interval Type	Meaning	Units
0	Reserved	
1	Reassociation deadline interval	Time units (TUs)
2	Key lifetime interval	Seconds
3	Association Comeback time	Time units (TUs)
4	Time-to-Start (see 11.31.3.1)	Time units (TUs)
5–255	Reserved	

The Timeout Interval Value field contains an unsigned 32-bit integer. It is encoded according to the conventions in 9.2.2.

A reassociation deadline interval set to 0 indicates no deadline exists. A key lifetime interval set to 0 is reserved.

9.4.2.49 RIC Data element (RDE)

The RIC refers to a collection of elements that are used to express a resource request and to convey responses to the corresponding requests.

A RIC is a sequence of one or more Resource Requests, or a sequence of one or more Resource Responses. Each Resource Request or Response consists of an RDE, followed by one or more elements that describe that resource. See 13.11 for examples and procedures.

The RDE format is shown in Figure 9-365.

	Element ID	Length	RDE Identifier	Resource Descriptor Count	Status Code
Octets:	1	1	1	1	2

Figure 9-365—RDE format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The RDE Identifier field has an arbitrary 8-bit value, chosen by the resource requester to uniquely identify the RDE within the RIC.

The Resource Descriptor Count field indicates the number of alternative Resource Descriptors that follow this RDE.

The Status Code field is used in Resource Responses to indicate the result of the request. Valid values for the Status Code field are given in 9.4.1.9. When an RDE is included in a Resource Request, the Status Code field is reserved.

9.4.2.50 RIC Descriptor element

The RIC Descriptor element is used with an RDE during a fast BSS transition to negotiate resources that are not otherwise described by elements. See 13.11 for procedures for including this element in a RIC.

Figure 9-366 shows the format of this element.

	Element ID	Length	Resource Type	Variable parameters
Octets:	1	1	1	variable

Figure 9-366—RIC Descriptor element format

The Element ID and Length fields are defined in 9.4.2.1.

The Resource Type field is defined in Table 9-183.

Table 9-183—Resource type code in RIC Descriptor element

Resource type value	Meaning	Variable parameters
1	Block Ack	Block Ack Parameter Set field value as defined in 9.4.1.13, Block Ack Timeout field value as defined in 9.4.1.14, and Block Ack Starting Sequence Control subfield value as defined in 9.3.1.7.
0, 2–255	Reserved	

Variable parameters contain any additional data based on the resource type.

9.4.2.51 DSE Registered Location element

A DSE Registered Location element includes DSE location configuration information (LCI), which contains latitude, longitude, and altitude information. The DSE Registered Location element format is shown in Figure 9-367.

	Element ID	Length	DSE Registered Location Information
Octets:	1	1	20

Figure 9-367—DSE Registered Location element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The structure and information fields are based on the LCI format described in IETF RFC 6225.

The DSE Registered Location Information field is shown in Figure 9-368.

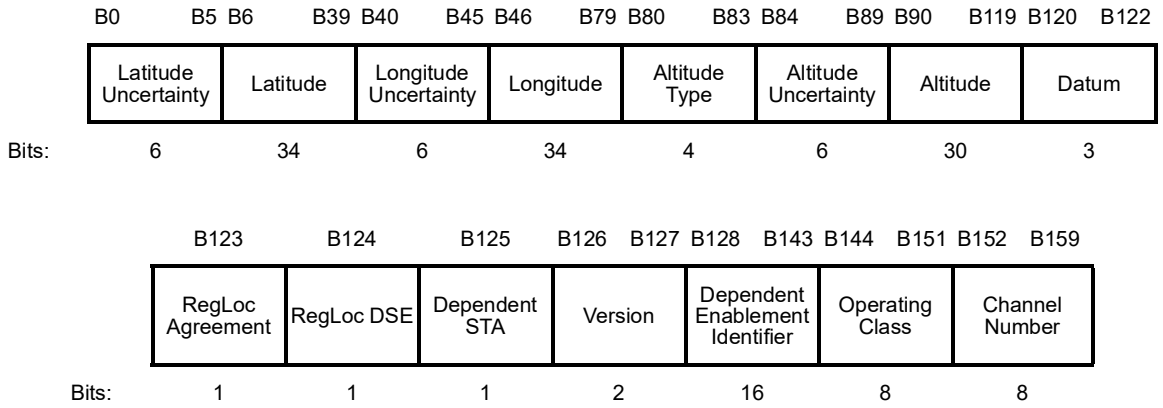

Figure 9-368—DSE Registered Location Information field format

The fields within the DSE Registered Location Information field are defined in section 2.2 of IETF RFC 6225 (July 2011) except as defined in this standard.

With an Altitude Type field set to 3 (i.e., height above ground is in meters), the altitude is defined to be in meters and is formatted in 2s complement, fixed-point, 22-bit integer part with 8-bit fraction.

The Datum field is defined in IETF RFC 6225, and the codes used are as defined in IETF RFC 6225.

The RegLoc Agreement bit field is set to 1 to report that the STA is operating within a national policy area or an international agreement area near a national border (see 11.11.3); otherwise, it is 0.

The RegLoc DSE bit field is set to 1 to report that the enabling STA is enabling the operation of STAs with DSE; otherwise, it is 0.

The Dependent STA bit field is set to 1 to report that the STA is operating with the enablement of the enabling STA whose LCI is being reported; otherwise, it is 0.

The Version field is defined in IETF RFC 6225, and the use is described in IETF RFC 6225.

The Dependent Enablement Identifier field is a value set by the enabling STA via the DSE Enablement frame; otherwise, it is set to 0.

The Operating Class field indicates the channel set for which the enablement request, report, or announcement applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the report applies. Valid values for the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the enablement request, report, or announcement applies. The channel number is defined within an operating class as shown in Annex E.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.52 Extended Channel Switch Announcement element

The Extended Channel Switch Announcement element is used by an AP, PCP, IBSS STA, or mesh STA to advertise when the BSS is changing to a new channel in the same or a new operating class. The announcement includes both the operating class and the channel number of the new channel. The element is present only when an extended channel switch is pending. The format of the Extended Channel Switch Announcement element is shown in Figure 9-369.

	Element ID	Length	Channel Switch Mode	New Operating Class	New Channel Number	Channel Switch Count
Octets:	1	1	1	1	1	1

Figure 9-369—Extended Channel Switch Announcement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. An AP, PCP, or an IBSS STA sets the Channel Switch Mode field to either 0 or 1 on transmission as specified in 11.8.8.2 and 11.8.8.3. The Channel Switch Mode field is reserved in an MBSS.

The New Operating Class field is set to the number of the operating class after the channel switch, as defined in Annex E.

The New Channel Number field is set to the number of the channel after the channel switch. The channel number is a channel from the STA's new operating class as defined in Annex E.

For nonmesh STAs, the Channel Switch Count field indicates the number of target beacon transmission times (TBTTs) until the STA sending the Channel Switch Count field switches to the new channel. A Channel Switch Count field set to 1 indicates that the switch occurs immediately before the next TBTT. A Channel Switch Count field set to 0 indicates that the switch occurs any time after the frame containing the Channel Switch Count field is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2 TU when the MSB (bit 7) is 0, or in units of 100 TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Count field switches to the new channel. Bits 6 to 0 set to 0 indicates that the switch occurs at any time after the frame containing the Channel Switch Count field is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10 TU channel switch time is encoded as X'05'.

9.4.2.53 Supported Operating Classes element

The Supported Operating Classes element is used by a STA to advertise the operating classes within which it is currently configured to operate. The format of the Supported Operating Classes element is shown in Figure 9-370.

	Element ID	Length	Current Operating Class	Operating Classes	Current Operating Class Extension Sequence (optional)	Operating Class Duple Sequence (optional)
Octets:	1	1	1	variable	variable	variable

Figure 9-370—Supported Operating Classes element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Current Operating Class field, concatenated with the Current Operating Class Extension field within the Current Operating Class Extension Sequence field if present, indicates the operating class in use for transmission and reception. If the operating class in use is a single octet, the Current Operating Class Extension Sequence field is not present. If the operating class in use is more than a single octet, then the Current Operating Class Extension Sequence field is present, and the concatenation of the Current Operating Class field with the Current Operating Class Extension Sequence field comprises N (where $N \geq 0$) Operating Class octets with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E).

The Operating Classes field lists, in descending order of preference, all 1-octet operating classes within which the STA is currently configured to operate. The Operating Classes field terminates immediately before a OneHundredAndThirty Delimiter (see Figure 9-371), a Zero Delimiter (see Figure 9-372), or the end of the element.

The format of the optional Current Operating Class Extension Sequence field is shown in Figure 9-371.

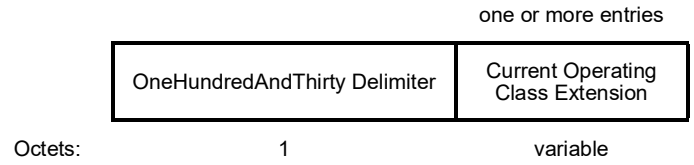

Figure 9-371—Current Operating Class Extension Sequence field format

The OneHundredAndThirty Delimiter field is set to 130.

The Current Operating Class Extension field comprises N (where $N \geq 0$) Operating Class octets with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E).

The format of the Operating Class Duple Sequence field is shown in Figure 9-372.

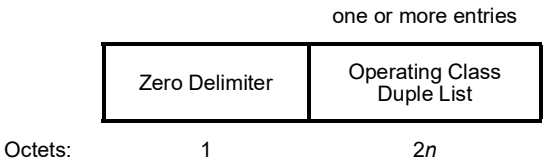

Figure 9-372—Operating Class Duple Sequence field format

The Zero Delimiter element is set to 0.

The Operating Class Duple List subfield lists all 2-octet operating classes within which the STA is currently configured to operate. Each operating class in the Operating Class Duple List subfield contains an Operating Class octet with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E). Operating classes are transmitted in ascending order using the first octet in the operating class as the primary sort key and then the second octet in the operating class as the secondary sort key. If there are no 2-octet operating classes within which the STA is currently configured to operate, then the Operating Class Duple Sequence field is omitted from the Supported Operating Classes element. The Operating Class Duple List subfield terminates immediately before another zero octet or the end of the element.

The use of this element is described in 11.9.2 and 11.10.9.1.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.54 Management MIC element

The MME provides message integrity and protects group addressed robust Management frames and protected Beacon frames from forgery and replay. Figure 9-373 shows the MME format.

	Element ID	Length	Key ID	IPN/BIPN	MIC
Octets:	1	1	2	6	8 or 16

Figure 9-373—Management MIC element format

The Element ID and Length fields are defined in 9.4.2.1.

The Key ID field identifies the IGTK or BIGTK used to compute the MIC. Bits 0–11 define a value in the range 0–4095. Bits 12–15 are reserved. The IGTK Key ID is either 4 or 5. The BIGTK Key ID is either 6 or 7. The remaining Key IDs are reserved.

The IPN/BIPN field contains a 6-octet value, interpreted as an unsigned integer and used to detect replay of protected group addressed robust Management frames and protected Beacon frames. For protected group addressed robust Management frames, the IPN/BIPN field contains the IPN. For protected Beacon frames, the IPN/BIPN field contains the BIPN.

The MIC field contains a message integrity code calculated over the robust Management frame or protected Beacon frame as specified in 12.5.4.5 and 12.5.4.6. The length of the MIC field depends on the specific cipher negotiated and is either 8 octets (for BIP-CMAC-128) or 16 octets (for BIP-CMAC-256, BIP-GMAC-128, and BIP-GMAC-256).

9.4.2.55 HT Capabilities element

9.4.2.55.1 HT Capabilities element structure

An HT STA declares that it is an HT STA by transmitting the HT Capabilities element.

The HT Capabilities element contains a number of fields that are used to advertise optional HT capabilities of an HT STA. The HT Capabilities element is present in Beacon, Association Request, Association Response, Reassociation Request, Reassociation Response, Probe Request, Probe Response, Mesh Peering Open, and Mesh Peering Close frames. The HT Capabilities element is defined in Figure 9-374.

	Element ID	Length	HT Capability Information	A-MPDU Parameters	Supported MCS Set	HT Extended Capabilities	Transmit Beamforming Capabilities	ASEL Capabilities
Octets:	1	1	2	1	16	2	4	1

Figure 9-374—HT Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.55.2 HT Capability Information field

The HT Capability Information field of the HT Capabilities element contains capability information bits. The structure of this field is defined in Figure 9-375.

Figure 9-375—HT Capability Information field format

The subfields of the HT Capability Information field are defined in Table 9-184.

Table 9-184—Subfields of the HT Capability Information field

Subfield	Definition	Encoding
LDPC Coding Capability	Indicates support for receiving LDPC coded PPDUs	Set to 0 if not supported Set to 1 if supported
Supported Channel Width Set	Indicates the channel widths supported by the STA. See 11.15.	Set to 0 if only 20 MHz operation is supported Set to 1 if both 20 MHz and 40 MHz operation is supported This field is reserved when the transmitting or receiving STA is operating in an operating class that includes 20 in the Channel spacing (MHz) column of the appropriate table in Annex E.
SM Power Save	Indicates the spatial multiplexing power save mode that is in operation immediately after (re)association. See 11.2.6.	Set to 0 for static SM power save mode Set to 1 for dynamic SM power save mode Set to 3 for SM power save disabled or not supported The value 2 is reserved Only valid in a (Re)Association Request frame sent to an AP. Otherwise this subfield is set to 0 or 3 upon transmission and is ignored upon reception. NOTE—This subfield indicates the operational state immediately after (re)association as well as (if not set to 3) a capability.
HT-Greenfield	Indicates support for the reception of PPDUs with HT-greenfield format. See 19.1.4.	Set to 0 if not supported Set to 1 if supported

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-184—Subfields of the HT Capability Information field *(continued)*

Subfield	Definition	Encoding
Short GI for 20 MHz	Indicates short GI support for the reception of HT PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and, for a VHT STA, for the reception of VHT PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20	Set to 0 if not supported Set to 1 if supported
Short GI for 40 MHz	Indicates short GI support for the reception of HT PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40 and, for a VHT STA, for the reception of VHT PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH equal to CBW40	Set to 0 if not supported Set to 1 if supported
Tx STBC	Indicates support for the transmission of PPDUs using STBC	Set to 0 if not supported Set to 1 if supported This field is reserved for a mesh STA.
Rx STBC	Indicates support for the reception of PPDUs using STBC	Set to 0 for no support Set to 1 for support of one spatial stream Set to 2 for support of one and two spatial streams Set to 3 for support of one, two and three spatial streams This field is reserved for a mesh STA.
Maximum A-MSDU Length	Indicates maximum A-MSDU length. See 10.11.	Set to 0 for 3839 octets Set to 1 for 7935 octets
DSSS/CCK Mode in 40 MHz	Indicates the BSS is operating in a mode that allows transmission of DSSS/CCK PPDUs, when the operating channel width is 40 MHz. See 11.15.	In Beacon and Probe Response frames: Set to 0 if the BSS is operating in a mode that does not allow transmission of DSSS/CCK PPDUs Set to 1 if the BSS is operating in a mode that allows transmission of DSSS/CCK PPDUs Otherwise: Set to 0 if the STA supports neither transmission nor reception of DSSS/CCK PPDUs when the operating channel width is 40 MHz Set to 1 if the STA supports transmission and reception of DSSS/CCK PPDUs when the operating channel width is 40 MHz See 11.15.8 for operating rules
Forty MHz Intolerant	Indicates whether APs receiving this information or reports of this information are required to prohibit 40 MHz transmissions (see 11.15.12).	Set to 1 by an HT STA to prohibit a receiving AP from operating that AP's BSS as a 20/40 MHz BSS; otherwise, set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.55.3 A-MPDU Parameters field

The structure of the A-MPDU Parameters field of the HT Capabilities element is shown in Figure 9-376.

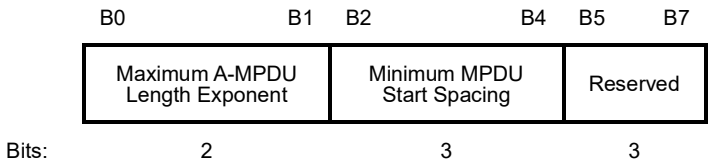

Figure 9-376—A-MPDU Parameters field format

The subfields of the A-MPDU Parameters field are defined in Table 9-185.

Table 9-185—Subfields of the A-MPDU Parameters field

Subfield	Definition	Encoding
Maximum A-MPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive.	The length defined by this field is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets.
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP. See 10.12.3.	Set to 0 for no restriction Set to 1 for 1/4 μs Set to 2 for 1/2 μs Set to 3 for 1 μs Set to 4 for 2 μs Set to 5 for 4 μs Set to 6 for 8 μs Set to 7 for 16 μs

9.4.2.55.4 Supported MCS Set field

The Supported MCS Set field of the HT Capabilities element indicates the HT-MCSs a STA supports.

An MCS is identified by an MCS index, which is represented by an integer in the range 0 to 76. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the HT PHY, see 19.5.

The structure of the MCS Set field is defined in Figure 9-377.

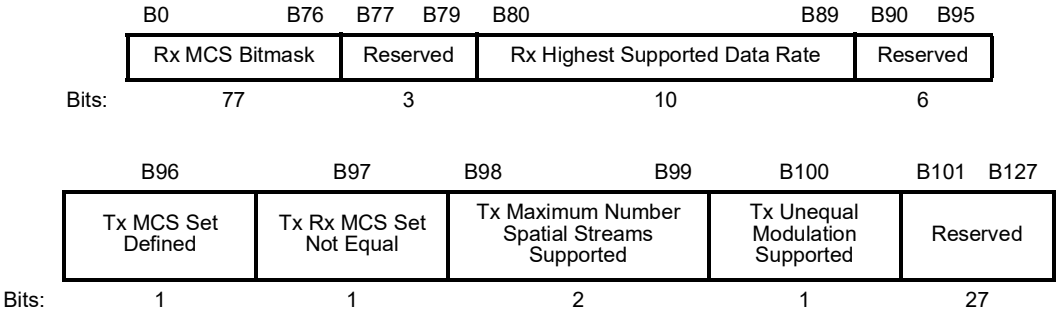

Figure 9-377—Supported MCS Set field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Rx MCS Bitmask subfield of the Supported MCS Set field defines a set of MCS index values, where bit B0 corresponds to MCS 0 and bit B76 corresponds to MCS 76.

NOTE—An HT STA includes the mandatory MCS values defined in 19.1 in the Rx MCS Bitmask subfield.

The Rx Highest Supported Data Rate subfield of the Supported MCS Set field defines the highest HT PPDU data rate that the STA is able to receive, in units of 1 Mb/s in the range 1 to 1023. If the maximum data rate expressed in Mb/s is not an integer, then the value is rounded down to the next integer. The value 0 indicates that this subfield does not specify the HT PPDU highest data rate that the STA is able to receive; see 10.6.6.5.3.

The Tx MCS Set Defined, Tx Rx MCS Set Not Equal, Tx Maximum Number Spatial Streams Supported, and Tx Unequal Modulation Supported subfields of the Supported MCS Set field indicate the transmit-supported MCS set, as defined in Table 9-186.

Table 9-186—Transmit MCS Set

Condition	Tx MCS Set Defined	Tx Rx MCS Set Not Equal	Tx Maximum Number Spatial Streams Supported	Tx Unequal Modulation Supported
No Tx MCS set is defined	0	0	0	0
The Tx MCS set is defined and is equal to the Rx MCS set	1	0	0	0
The Tx MCS set is defined and is not necessarily equal to the Rx MCS set	1	1	Indicates the maximum number of spatial streams supported when transmitting: Set to 0 for 1 spatial stream Set to 1 for 2 spatial streams Set to 2 for 3 spatial streams Set to 3 for 4 spatial streams	Indicates whether transmit unequal modulation (UEQM) is supported: Set to 0 for UEQM not supported Set to 1 for UEQM supported

9.4.2.55.5 HT Extended Capabilities field

The structure of the HT Extended Capabilities field of the HT Capabilities element is defined in Figure 9-378.

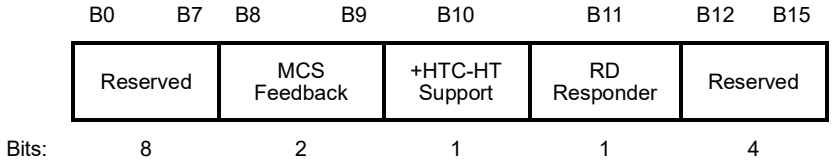

Figure 9-378—HT Extended Capabilities field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The subfields of the HT Extended Capabilities field are defined in Table 9-187.

Table 9-187—Subfields of the HT Extended Capabilities field

Subfield	Definition	Encoding
MCS Feedback	Indicates whether the STA can provide MFB	Set to 0 (No Feedback) if the STA does not provide MFB Set to 2 (Unsolicited) if the STA provides only unsolicited MFB Set to 3 (Both) if the STA can provide MFB in response to MRQ (either Delayed or Immediate, see 10.32.1) as well as unsolicited MFB The value 1 is reserved
+HTC-HT Support	Indicates support of the HT variant HT Control field. See 10.8	Set to 0 if not supported Set to 1 if supported
RD Responder	Indicates support for acting as a reverse direction responder, i.e., the STA might use an offered RDG to transmit data to an RD initiator using the reverse direction protocol described in 10.29.	Set to 0 if not supported Set to 1 if supported

9.4.2.55.6 Transmit Beamforming Capabilities

The structure of the Transmit Beamforming Capabilities field is defined in Figure 9-379.

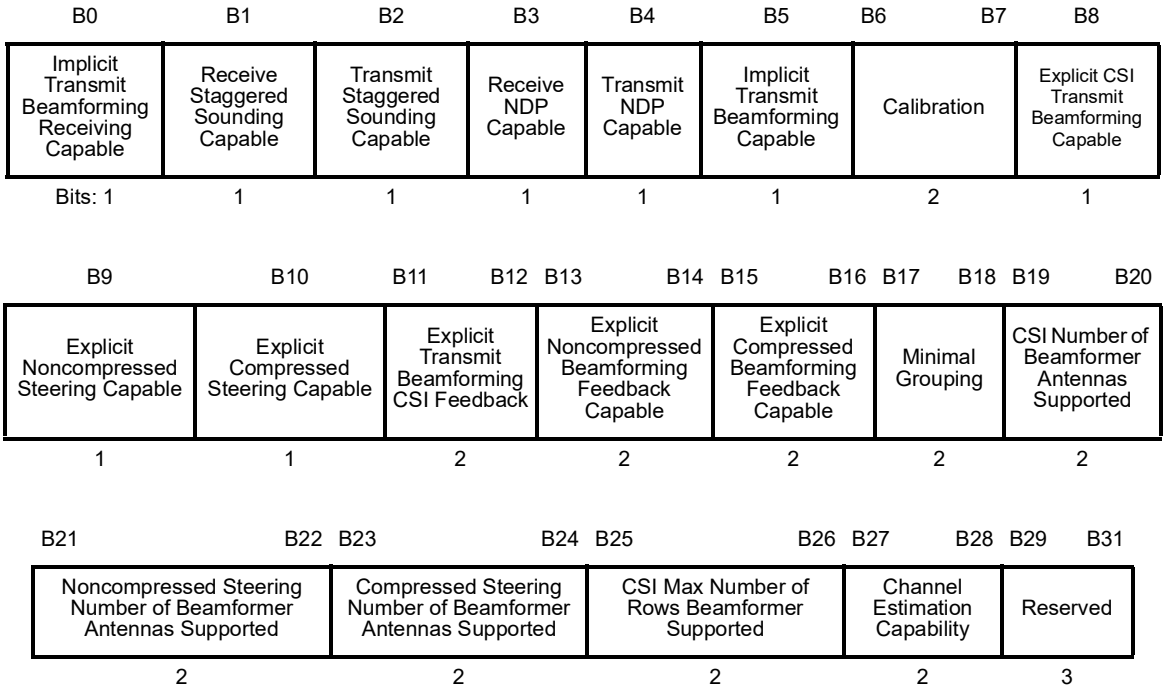

Figure 9-379—Transmit Beamforming Capabilities field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The subfields of the Transmit Beamforming Capabilities field are defined in Table 9-188.

Table 9-188—Subfields of the Transmit Beamforming Capabilities field

Subfield	Definition	Encoding
Implicit Transmit Beamforming Receiving Capable	Indicates whether this STA can receive Transmit Beamforming steered frames using implicit feedback	Set to 0 if not supported Set to 1 if supported
Receive Staggered Sounding Capable	Indicates whether this STA can receive staggered sounding frames.	Set to 0 if not supported Set to 1 if supported
Transmit Staggered Sounding Capable	Indicates whether this STA can transmit staggered sounding frames.	Set to 0 if not supported Set to 1 if supported
Receive NDP Capable	Indicates whether this receiver can interpret null data PPDUs as sounding frames.	Set to 0 if not supported Set to 1 if supported
Transmit NDP Capable	Indicates whether this STA can transmit null data PPDUs as sounding frames.	Set to 0 if not supported Set to 1 if supported
Implicit Transmit Beamforming Capable	Indicates whether this STA can apply implicit transmit beamforming.	Set to 0 if not supported Set to 1 if supported
Calibration	Indicates whether the STA can participate in a calibration procedure initiated by another STA that is capable of generating an immediate response sounding PPDU and can provide a CSI report in response to a sounding PPDU.	Set to 0 if not supported Set to 1 if the STA can respond to a calibration request using the CSI report, but cannot initiate calibration The value 2 is reserved Set to 3 if the STA can both initiate and respond to a calibration request
Explicit CSI Transmit Beamforming Capable	Indicates whether this STA can apply transmit beamforming using CSI explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Noncompressed Steering Capable	Indicates whether this STA can apply transmit beamforming using noncompressed beamforming feedback matrix explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Compressed Steering Capable	Indicates whether this STA can apply transmit beamforming using compressed beamforming feedback matrix explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Transmit Beamforming CSI Feedback	Indicates whether this receiver can return CSI explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-188—Subfields of the Transmit Beamforming Capabilities field *(continued)*

Subfield	Definition	Encoding
Explicit Noncompressed Beamforming Feedback Capable	Indicates whether this receiver can return noncompressed beamforming feedback matrix explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback
Explicit Compressed Beamforming Feedback Capable	Indicates whether this receiver can return compressed beamforming feedback matrix explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback
Minimal Grouping	Indicates the minimal grouping used for explicit feedback reports	Set to 0 if the STA supports groups of 1 (no grouping) Set to 1 indicates groups of 1, 2 Set to 2 indicates groups of 1, 4 Set to 3 indicates groups of 1, 2, 4
CSI Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the HT beamformee can support when CSI feedback is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding
Noncompressed Steering Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the HT beamformee can support when noncompressed beamforming feedback matrix is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding
Compressed Steering Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the HT beamformee can support when compressed beamforming feedback matrix is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding
CSI Max Number of Rows Beamformer Supported	Indicates the maximum number of rows of CSI explicit feedback from the HT beamformee or calibration responder or transmit ASEL responder that an HT beamformer or calibration initiator or transmit ASEL initiator can support when CSI feedback is required.	Set to 0 for a single row of CSI Set to 1 for 2 rows of CSI Set to 2 for 3 rows of CSI Set to 3 for 4 rows of CSI
Channel Estimation Capability	Indicates the maximum number of space-time streams (columns of the MIMO channel matrix) for which channel dimensions can be simultaneously estimated when receiving an NDP sounding PPDU or the extension portion of the HT Long Training fields (HT-LTFs) in a staggered sounding PPDU. See NOTE.	Set 0 for 1 space-time stream Set 1 for 2 space-time streams Set 2 for 3 space-time streams Set 3 for 4 space-time streams

NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the HT-LTFs corresponding to the data portion of the PPDU is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the HT Capability Information field. Both fields are part of the HT Capabilities element.

9.4.2.55.7 ASEL Capability field

The structure of the ASEL Capability field of the HT Capabilities element is defined in Figure 9-380.

	B0	B1	B2	B3	B4	B5	B6	B7
	Antenna Selection Capable	Explicit CSI Feedback Based Transmit ASEL Capable	Antenna Indices Feedback Based Transmit ASEL Capable	Explicit CSI Feed-back Capable	Antenna Indices Feedback Capable	Receive ASEL Capable	Transmit Sounding PPDUs Capable	Reserved
Bits:	1	1	1	1	1	1	1	1

Figure 9-380—ASEL Capability field format

The subfields of the ASEL Capability field are defined in Table 9-189.

Table 9-189—ASEL Capability field subfields

Subfield	Definition	Encoding
Antenna Selection Capable	Indicates whether this STA supports ASEL	Set to 0 if not supported Set to 1 if supported
Explicit CSI Feedback Based Transmit ASEL Capable	Indicates whether this STA supports transmit ASEL based on explicit CSI feedback	Set to 0 if not supported Set to 1 if supported
Antenna Indices Feedback Based Transmit ASEL Capable	Indicates whether this STA supports transmit ASEL based on antenna indices feedback	Set to 0 if not supported Set to 1 if supported
Explicit CSI Feedback Capable	Indicates whether this STA can compute CSI and provide CSI feedback in support of ASEL	Set to 0 if not supported Set to 1 if supported
Antenna Indices Feedback Capable	Indicates whether this STA can compute an antenna indices selection and return an antenna indices selection in support of ASEL	Set to 0 if not supported Set to 1 if supported
Receive ASEL Capable	Indicates whether this STA supports receive ASEL	Set to 0 if not supported Set to 1 if supported
Transmit Sounding PPDUs Capable	Indicates whether this STA can transmit sounding PPDUs for ASEL training on request	Set to 0 if not supported Set to 1 if supported

9.4.2.56 HT Operation element

The operation of HT STAs in the BSS is controlled by the HT Operation element. The structure of this element is defined in Figure 9-381.

	Element ID	Length	Primary Channel	HT Operation Information	Basic HT-MCS Set
Octets:	1	1	1	5	16

Figure 9-381—HT Operation element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the HT Operation Information field is shown in Figure 9-382.

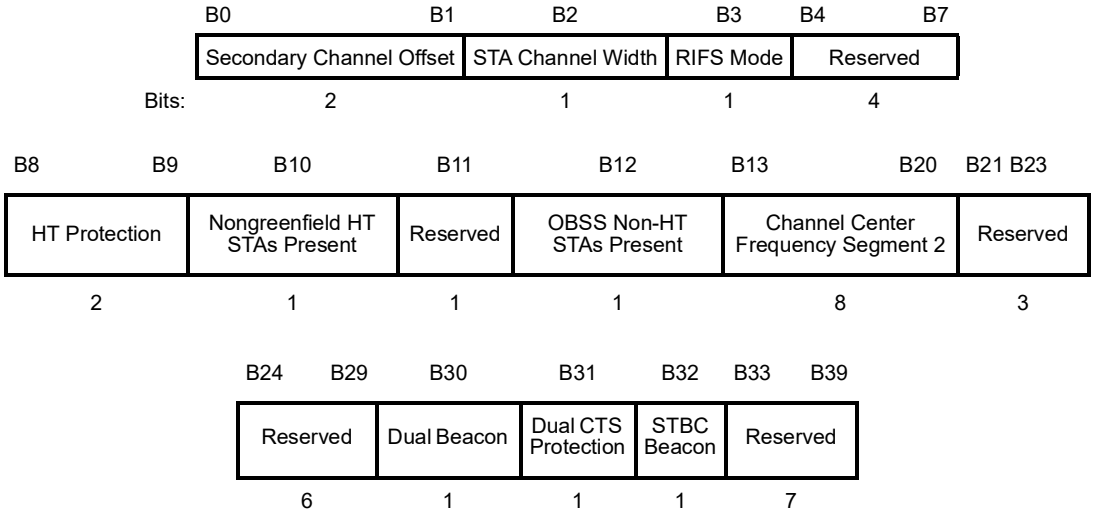

Figure 9-382—HT Operation Information field format

The Primary Channel field, subfields of the HT Operation Information field, and the Basic HT-MCS Set field are defined in Table 9-190. The "Reserved in IBSS?" column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an IBSS. The "Reserved in MBSS?" column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an MBSS.

Table 9-190—HT Operation element fields and subfields

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
Primary Channel	Indicates the channel number of the primary channel. See 11.15.2.	Channel number of the primary channel	N	N
Secondary Channel Offset	Indicates the offset of the secondary channel relative to the primary channel.	Set to 1 (SCA) if the secondary channel is above the primary channel Set to 3 (SCB) if the secondary channel is below the primary channel Set to 0 (SCN) if no secondary channel is present The value 2 is reserved	N	N

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-190—HT Operation element fields and subfields *(continued)*

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
STA Channel Width	Defines the channel widths that can be used to transmit to the STA. See 11.15.12	Set to 0 for a 20 MHz channel width Set to 1 allows use of any channel width in the Supported channel width set This field is reserved when the transmitting or receiving STA is operating in an operating class that does not include a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E. See NOTE 1.	N	N
RIFS Mode	Indicates whether the use of reduced interframe space is permitted within the BSS. See 10.3.2.3.2 and 10.27.3.3	Set to 0 if use of RIFS is prohibited Set to 1 if use of RIFS is permitted	Y	Y
HT Protection	Indicates protection requirements of HT transmissions. See 10.27.3.	Set to 0 for no protection mode Set to 1 for nonmember protection mode Set to 2 for 20 MHz protection mode Set to 3 for non-HT mixed mode	Y	N
Nongreenfield HT STAs Present	AP indicates if any HT STAs that are not HT-greenfield capable have associated. Mesh STA indicates if it establishes a mesh peering with an HT STA that is not HT-greenfield capable. Determines when a non-AP STA should use HT-greenfield protection. Present in Beacon and Probe Response frames transmitted by an AP or mesh STA. Otherwise reserved. See 10.27.3.1.	Set to 0 if all HT STAs that are associated are HT-greenfield capable or all HT peer mesh STAs are HT-greenfield capable Set to 1 if one or more HT STAs that are not HT-greenfield capable are associated or one or more HT peer mesh STAs are not HT-greenfield capable	Y	N

Table 9-190—HT Operation element fields and subfields *(continued)*

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
OBSS Non-HT STAs Present	Indicates if the use of protection for non-HT STAs by overlapping BSSs is determined to be desirable. If the BSS is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior, this field indicates if there exist any non-HT OBSSs and whether HT-greenfield transmissions are allowed. Present in Beacon and Probe Response frames transmitted by an AP. Otherwise reserved. See 10.27.3.4 and 11.8.8.5.	If not operating in an operating class for which the behavior limits set listed in Annex E includes the value DFS_50_100_Behavior: Set to 1 if the use of protection for non-HT STAs by OBSSs is determined to be desirable. See NOTE 2. Set to 0 otherwise. If operating in an operating class for which the behavior limits set listed in Annex E includes the value DFS_50_100_Behavior: Set to 1 if there exists one or more non-HT OBSSs. Indicates that HT-greenfield transmissions are disallowed in the BSS. Set to 0 otherwise.	Y	Y
Channel Center Frequency Segment 2	Defines the channel center frequency for a 160 or 80+80 MHz BSS bandwidth with NSS support less than Max VHT NSS. See 21.3.14, 11.38 and 9.4.2.157.3.	For a STA with dot11VHTExtendedNSSBWCapable equal to true: See Table 9-272, otherwise this field is set to 0. NOTE—This subfield is not used in a non-VHT HT STA.	N	N
Dual Beacon	Indicates whether the AP transmits an STBC beacon. The use of the dual beacon mechanism is obsolete.	Set to 0 if no STBC beacon is transmitted Set to 1 if an STBC beacon is transmitted by the AP	Y	Y
Dual CTS Protection	Dual CTS protection is used by the AP to set a NAV at STAs that do not support STBC and at STAs that can associate solely through the STBC beacon. See 10.3.2.10. The use of the dual CTS mechanism is obsolete.	Set to 0 if dual CTS protection is not required Set to 1 if dual CTS protection is required	Y	Y
STBC Beacon	Indicates whether the beacon containing this element is a primary or an STBC beacon. The STBC beacon has half a beacon period shift relative to the primary beacon. Defined only in a Beacon frame transmitted by an AP. Otherwise reserved. See 11.1.3.2.	Set to 0 in a primary beacon Set to 1 in an STBC beacon	Y	Y

Table 9-190—HT Operation element fields and subfields *(continued)*

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
Basic HT-MCS Set	Indicates the HT-MCS values that are supported by all HT STAs in the BSS. Present in Beacon, Probe Response, Mesh Peering Open and Mesh Peering Confirm frames. Otherwise reserved.	A bitmap where a bit is set to 1 to indicate support for that MCS and 0 otherwise, where bit 0 corresponds to MCS 0. MCS values are defined in 9.4.2.55.4.	N	N
NOTE 1—Any change of STA Channel Width field does not impact the HT Protection field. NOTE 2—Examples of when this bit might be set to 1 include, but are not limited to, the following situations: a) One or more non-HT STAs are associated b) A non-HT BSS is overlapping (a non-HT BSS might be detected by the reception of a Beacon or Probe Response frame that does not include an HT Capabilities element)				

9.4.2.57 20/40 BSS Intolerant Channel Report element

The 20/40 BSS Intolerant Channel Report element contains a list of channels on which a STA has found conditions that disallow the use of a 20/40 MHz BSS. The format of the 20/40 BSS Intolerant Channel Report element is shown in Figure 9-383.

	Element ID	Length	Operating Class	Channel List
Octets:	1	1	1	variable

Figure 9-383—20/40 BSS Intolerant Channel Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Class field of the 20/40 MHz BSS Intolerant Channel Report element contains an enumerated value from Annex E, encoded as an unsigned integer, specifying the operating class in which the Channel List field is valid. If the operating class is "unknown" as described in 11.15.12, the Operating Class field is set to 0. A 20/40 BSS Intolerant Channel Report only reports channels for a single operating class. Multiple 20/40 BSS Intolerant Channel Report elements are used to report channels in more than one operating class.

The Channel List field of the 20/40 MHz BSS Intolerant Channel Report element contains a variable number of octets, where each octet describes a single channel number. Channel numbering is dependent on operating class according to Annex E.

A 20/40 BSS Intolerant Channel Report element includes only channels that are valid for the regulatory domain in which the STA transmitting the element is operating and that are consistent with the Country element transmitted by the AP of the BSS of which it is a member.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.58 Overlapping BSS Scan Parameters element

The Overlapping BSS Scan Parameters element is used by an AP to indicate the values to be used by BSS members when performing OBSS scan operations. The format of the Overlapping BSS Scan Parameters element is shown in Figure 9-384.

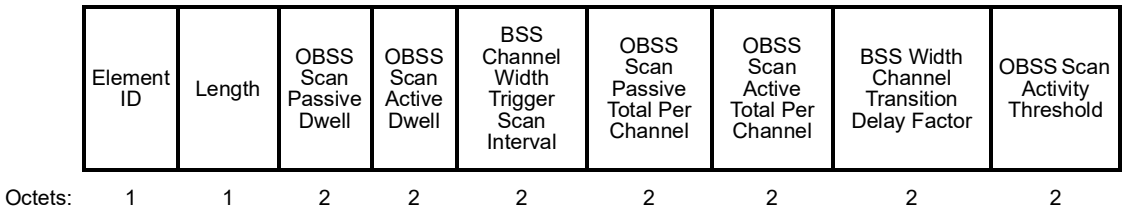

Figure 9-384—Overlapping BSS Scan Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

The OBSS Scan Passive Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveDwell as described in 11.15.5.

The OBSS Scan Active Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveDwell as described in 11.15.5.

The BSS Channel Width Trigger Scan Interval field contains a value in seconds, encoded as an unsigned integer, that a receiving STA uses to set dot11BSSWidthTriggerScanInterval as described in 11.15.5.

The OBSS Scan Passive Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveTotalPerChannel as described in 11.15.5.

The OBSS Scan Active Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveTotalPerChannel as described in 11.15.5.

The BSS Width Channel Transition Delay Factor field contains an integer value that a receiving STA uses to set dot11BSSWidthChannelTransitionDelayFactor as described in 11.15.5.

The OBSS Scan Activity Threshold field contains a value in hundredths of percent, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActivityThreshold as described in 11.15.5.

The use of each of these parameters is described in 11.15.5.

9.4.2.59 20/40 BSS Coexistence element

The 20/40 BSS Coexistence element is used by STAs to exchange information that affects 20/40 BSS coexistence.

The 20/40 BSS Coexistence element is formatted as shown in Figure 9-385.

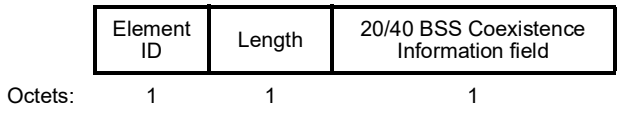

Figure 9-385—20/40 BSS Coexistence element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the 20/40 BSS Coexistence Information field is shown in Figure 9-386.

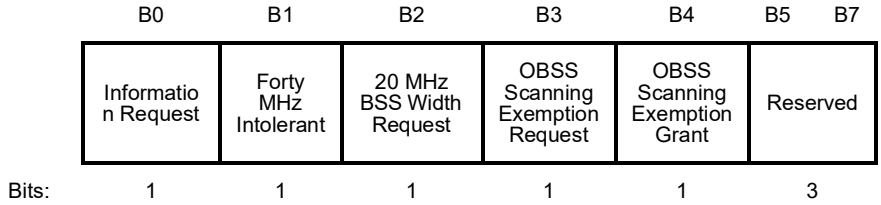

Figure 9-386—20/40 BSS Coexistence Information field format

The Information Request field is used to indicate that a transmitting STA is requesting the recipient to transmit a 20/40 BSS Coexistence Management frame with the transmitting STA as the recipient.

The Forty MHz Intolerant field is set to 1 to prohibit an AP that receives this information or reports of this information from operating a 20/40 MHz BSS. When equal to 0, it does not prohibit a receiving AP from operating a 20/40 MHz BSS. This field is used for inter-BSS communication. The definition of this field is the same as the definition of the Forty MHz Intolerant field in the HT Capabilities element (see 9.4.2.55), and its operation is described in 11.15.11.

The 20 MHz BSS Width Request field is set to 1 to prohibit a receiving AP from operating its BSS as a 20/40 MHz BSS. Otherwise, it is set to 0. This field is used for intra-BSS communication. The operation of this field is described in 11.15.12.

The OBSS Scanning Exemption Request field is set to 1 to indicate that the transmitting non-AP STA is requesting the BSS to allow the STA to be exempt from OBSS scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Request field is reserved when transmitted by an AP. The OBSS Scanning Exemption Request field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

The OBSS Scanning Exemption Grant field is set to 1 by an AP to indicate that the receiving STA is exempted from performing OBSS Scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Grant field is reserved when transmitted by a non-AP STA. The OBSS Scanning Exemption Grant field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

9.4.2.60 Time Advertisement element

The Time Advertisement element, shown in Figure 9-387, specifies fields describing the source of time corresponding to a time standard, an external clock (external time source), an estimate of the offset between that time standard and the TSF timer, and an estimate of the standard deviation of the error in the offset estimate. This information is used by a receiving STA to align its own estimate of the time standard based on that of another STA.

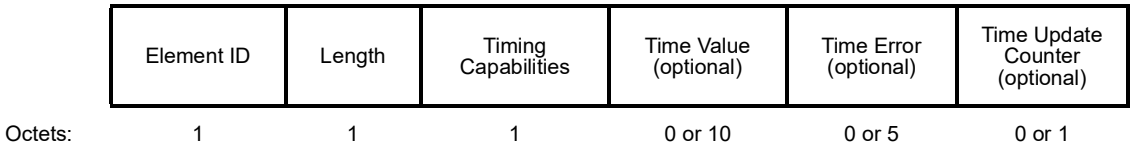

Figure 9-387—Time Advertisement element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Timing Capabilities field specifies the STA's source and encoding of the Time Value field. The encoding of the Timing Capabilities field is specified in Table 9-191.

Table 9-191—Encoding of the Timing Capabilities field

Value	Usage
0	No standardized external time source
1	Timestamp offset based on UTC (see ITU-R Recommendation TF.460-6 (2002) [B53]). The Timestamp offset value in nanoseconds is defined to be 0 at the beginning of the first nanosecond of the first day of the year 1958.
2	UTC time at which the TSF timer is 0.
3–255	Reserved

When the Timing Capabilities field is 0, only the Element ID, Length, and Timing Capabilities fields are included in the Time Advertisement element.

When the Timing Capabilities is 1, the following additional fields are included in the Time Advertisement element:

— Time Value field, a 2s complement integer in nanoseconds that, when added to the Timestamp present in the same transmitted frame, gives the receiving STA an estimate of the time standard at the time the frame was transmitted. The Timestamp is derived from the TSF Timer as defined in 11.19.

— Time Error field, which is set to an unsigned integer in nanoseconds that defines the standard deviation of the error in the Time Value estimate. The Time Error field is set to all 1s to indicate that the error is unknown.

When the Timing Capabilities field is 2, the following fields are included in the Time Advertisement element:

— The Time Value field is the UTC time at which the TSF Timer is 0, given that the TSF Timer units are 1 microsecond units as defined in 11.1.3. The format, including all subfields is shown in Table 9-192. For any subfield not known in the Time Value field, the subfield value is 0.

— The Time Error field is an unsigned integer in milliseconds that defines the standard deviation of the error in the Time Value estimate.

— The Time Update Counter field is a modulo 256 counter that increments each time the AP updates the Time Value UTC at which the TSF Timer is 0.

Table 9-192—Time Value field format when Timing Capabilities is 2

Octet	Description
0–1	Year (0–65 534)
2	Month (0–12)
3	Day of month (0–31)
4	Hours (0–23)
5	Minutes (0–59)
6	Seconds (0–59)
7–8	Milliseconds (0–999)
9	Reserved

9.4.2.61 Link Identifier element

The Link Identifier element contains information that identifies a TDLS direct link. The element information format is defined in Figure 9-388.

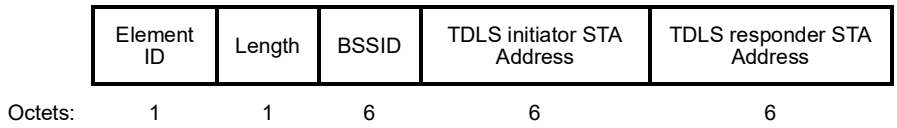

Figure 9-388—Link Identifier element format

The Element ID and Length fields are defined in 9.4.2.1.

The BSSID field is set to the BSSID of the BSS of which the TDLS initiator STA is a member.

The TDLS initiator STA Address field is set to the TDLS initiator STA's MAC address.

The TDLS responder STA Address field is set to the TDLS responder STA's MAC address.

9.4.2.62 Wakeup Schedule element

The Wakeup Schedule element contains information regarding the periodic wakeup schedule for TDLS peer PSM. The element format is defined in Figure 9-389.

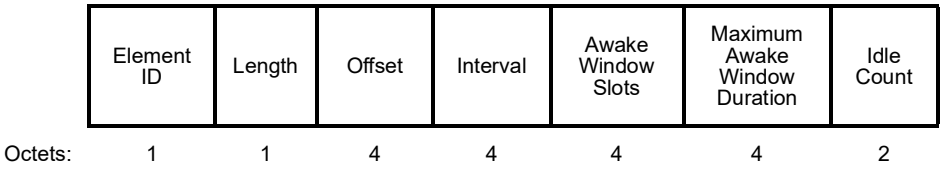

Figure 9-389—Wakeup Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The Offset field is the time in microseconds between TSF 0 and the start of a first Awake Window. See 11.2.3.12.

The Interval field is set to the time in microseconds between the start of two successive Awake Windows. See 11.2.3.12.

The Awake Window Slots field is set to the duration of the Awake Window in units of backoff slots (see 10.23.2.4). See 11.2.3.12.

The Maximum Awake Window Duration field is set to the maximum duration of the Awake Window, in units of microseconds. See 11.2.3.12.

The Idle Count field is set to the number of consecutive Awake Windows during which no individually addressed frame is received from the TDLS peer STA before a TDLS peer STA deletes the wakeup schedule. See 11.2.3.12.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.63 Channel Switch Timing element

The Channel Switch Timing element contains information regarding the channel switch timing. The element is defined in Figure 9-390.

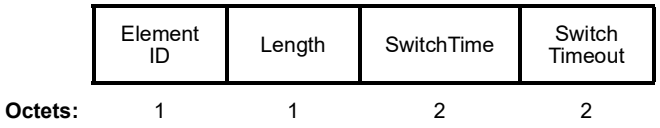

Figure 9-390—Channel Switch Timing element format

The Element ID and Length fields are defined in 9.4.2.1.

The Switch Time field is set to the time it takes for a STA sending the Channel Switch Timing element to switch channels, in units of microseconds.

The Switch Timeout field is set to a time in units of microseconds. The STA sending the Channel Switch Timing element waits for the first Data frame exchange on the off-channel for Switch Timeout microseconds before switching back to base channel. The time is measured from the end of the last symbol of the Ack frame that is transmitted in response to TDLS Channel Switch Response frame, as seen on the WM.

9.4.2.64 PTI Control element

The PTI Control element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is optionally included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 9-391.

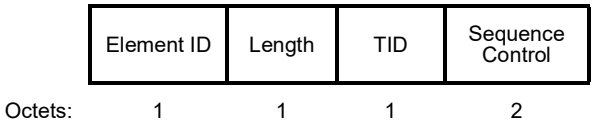

Figure 9-391—PTI Control element format

The Element ID and Length fields are defined in 9.4.2.1.

The TID field contained in the PTI Control element is set to the TID of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 11.2.3.13.

The Sequence Control field is defined in 9.2.4.4. The Sequence Control field contained in the PTI Control element is set to the sequence number of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 11.2.3.13.

9.4.2.65 TPU Buffer Status element

The TPU Buffer Status element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 9-392.

Copyright © 2021 IEEE. All rights reserved.

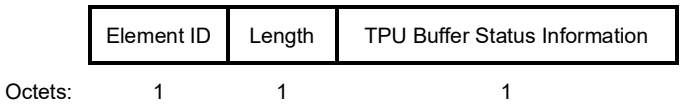

Figure 9-392—TPU Buffer Status element format

The Element ID and Length fields are defined in 9.4.2.1.

The TPU Buffer Status Information field is defined in Figure 9-393

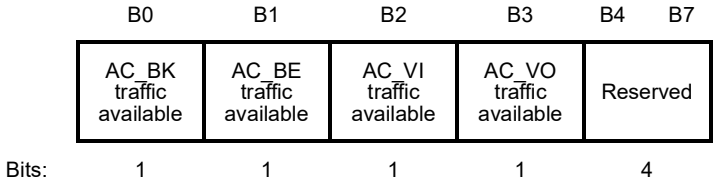

Figure 9-393—TPU Buffer Status Information field format

The AC_BK traffic available field is one bit in size and is set to 1 if AC_BK contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_BE traffic available field is one bit in size and is set to 1 if AC_BE contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_VI traffic available field is one bit in size and is set to 1 if AC_VI contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_VO traffic available field is one bit in size and is set to 1 if AC_VO contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

9.4.2.66 Event Request element

9.4.2.66.1 Event Request definition

The Event Request element contains a request to the receiving STA to perform the specified event action. The format of the Event Request element is shown in Figure 9-394.

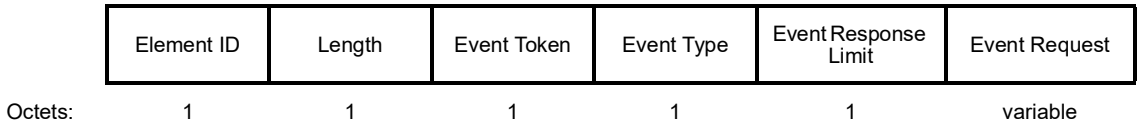

Figure 9-394—Event Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Event Token field is a nonzero number that is unique among the Event Request elements sent to each destination MAC address for which a corresponding Event Report element has not been received.

The Event Type field is a number that identifies the type of event request. The values of the Event Type field are defined in Table 9-193.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-193—Event Type field definitions for event requests and reports

Name	Event Type
Transition	0
RSNA	1
Peer-to-peer link	2
WNM log	3
Reserved	4–220
Vendor Specific	221
Reserved	222–255

The Event Response Limit field contains the maximum number of requested Event Reports to be included in the Event Report element. The field is set to 0 to indicate that no limit is set on the number of Event Reports to be included in the Event Report element.

The Event Request field contains the event request corresponding to the event type, as described in 9.4.2.66.2 to 9.4.2.66.4. The Event Request field is not present when requesting a WNM log report.

The Event Request element is included in an Event Request frame, as described in 9.6.13.2. The use of the Event Request element and Event Request frame is described in 11.21.2.

9.4.2.66.2 Transition event request

The Event Request field corresponding to the Transition event request contains zero or more Transition Event Request subelements. A transition event is a STA movement or attempted movement from one BSS (the source BSS) in one ESS to another BSS (the target BSS) within the same ESS.

The Transition Event subelements specify the conditions in which a Transition Event Report is sent by a STA. The set of valid Transition Event Request subelements is defined in Table 9-194.

Table 9-194—Transition Event Request subelement

Transition Event Request subelement	Subelement ID
Transition Target BSSID	0
Transition Source BSSID	1
Transition Time Threshold	2
Transition Result	3
Frequent Transition	4
Reserved	5–255

The Transition Target BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the target BSSID is equal to the specific BSSID in the Target BSSID field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Excluding this subelement from the Event Request element indicates a request for transition events for all target BSSIDs. The format of the Transition Target BSSID subelement is shown in Figure 9-395.

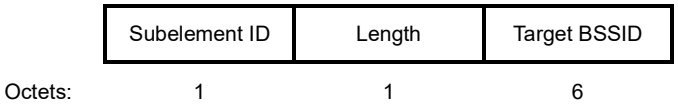

Figure 9-395—Transition Target BSSID subelement format

The Subelement ID field is equal to the Transition Target BSSID value in Table 9-194.

The Length field is defined in 9.4.3.

The Target BSSID field contains a 6-octet BSSID.

The Transition Source BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the source BSSID is equal to the BSSID specified in the Source BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the Transition Source BSSID subelement is shown in Figure 9-396.

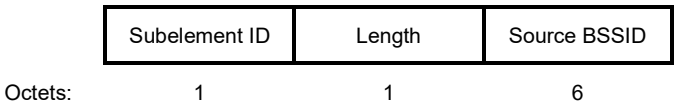

Figure 9-396—Transition Source BSSID subelement format

The Subelement ID field is equal to the Transition Source BSSID value in Table 9-194.

The Length field is defined in 9.4.3.

The Source BSSID field contains a 6-octet BSSID.

The Transition Time Threshold subelement is used to request that a Transition Event Report includes the transition event entry when the transition time is greater than or equal to the Transition Time Threshold value. The format of the Transition Time Threshold subelement is shown in Figure 9-397.

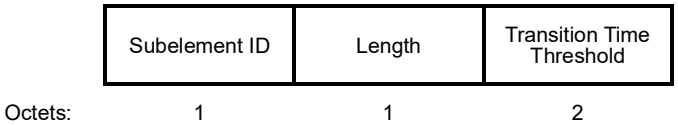

Figure 9-397—Transition Time Threshold subelement format

The Subelement ID field is equal to the Transition Time Threshold value in Table 9-194.

The Length field is defined in 9.4.3.

The Transition Time Threshold field contains a value representing the Transition Time to be used as the threshold value for the Transition Time condition in TUs. The Transition Time is defined in 11.21.2.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Transition Result subelement is used to request that a Transition Event Report includes the transition event entry that matches the transition result defined by this subelement. The format of Transition Result subelement is shown in Figure 9-398.

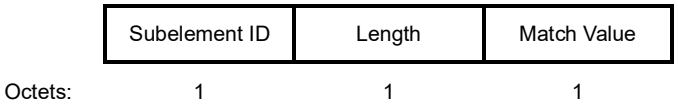

Figure 9-398—Transition Result subelement format

The Subelement ID field is equal to the Transition Result value in Table 9-194.

The Length field is defined in 9.4.3.

The Match Value field is set with each bit as defined in Figure 9-399 to request that the specified transition results that match the bit descriptions are included in the Transition Event report.

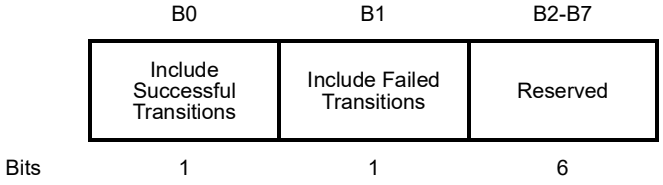

Figure 9-399—Match Value field definitions

The Frequent Transition subelement is used to request that an alerting Transition Event report be generated when the total transition count during the specified time period is greater than or equal to the value given in Frequent Transition Count Threshold field. The format of the Frequent Transition subelement is shown in Figure 9-400.

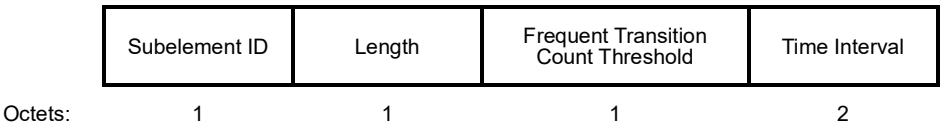

Figure 9-400—Frequent Transition subelement format

The Subelement ID field is equal to the Frequent Transition value in Table 9-194.

The Length field is defined in 9.4.3.

The Frequent Transition Count Threshold field containing the number of transitions in the measurement duration after which a Transition Event Report is generated.

The Time Interval field is the time interval in TUs during which the STA determines if the Frequent Transition Count Threshold is exceeded.

9.4.2.66.3 RSNA event request

The Event Request field corresponding to an RSNA event request contains zero or more RSNA Event Request subelements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The subelement format and ordering of subelements are defined in 9.4.3. The set of valid RSNA Event Request subelements is defined in Table 9-195.

Table 9-195—RSNA Event Request subelement

RSNA Event Request subelement	Subelement ID
RSNA Target BSSID	0
Authentication Type	1
EAP Method	2
RSNA Result	3
Reserved	4–255

The RSNA subelements specify reporting conditions for RSNA Event Reports.

The RSNA Target BSSID subelement identifies the BSS at which an RSNA Event establishment was attempted. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the RSNA Target BSSID subelement is shown in Figure 9-401.

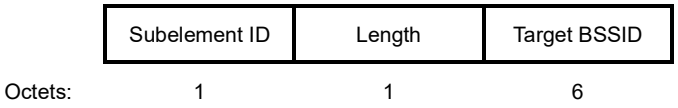

Figure 9-401—RSNA Target BSSID subelement format

The Subelement ID field is equal to the RSNA Target BSSID value in Table 9-195.

The Length field is defined in 9.4.3.

The Target BSSID field contains a 6-octet BSSID.

The Authentication Type subelement is used to request that an RSNA Event Report includes the RSNA event entry when the Authentication Type is equal to the authentication type specified in the Authentication Type field. The format of the Authentication Type subelement is shown in Figure 9-402.

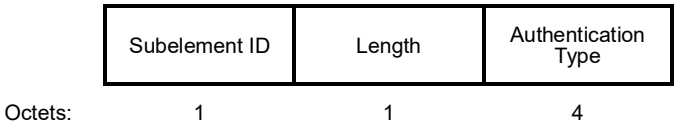

Figure 9-402—Authentication Type subelement format

The Subelement ID field is equal to the Authentication Type value in Table 9-195.

The Length field is defined in 9.4.3.

The Authentication Type field contains one of the AKM suite selectors defined in Table 9-151 in 9.4.2.24.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The EAP Method subelement is used to request that an RSNA Event Report includes the RSNA event entry when the EAP Method is equal to the EAP method specified in the EAP Method field. The format of the EAP Method subelement is shown in Figure 9-403.

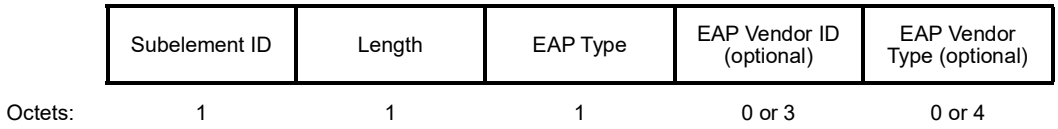

Figure 9-403—EAP Method subelement format

The Subelement ID field is equal to the EAP Method value in Table 9-195.

The Length field is defined in 9.4.3.

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254 and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254 and is excluded otherwise.

The RSNA Result subelement is used to request that an RSNA Event Report includes the RSNA event entry that matches the transition result defined by this subelement. The format of RSNA Result subelement is shown in Figure 9-404.

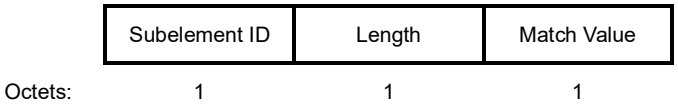

Figure 9-404—RSNA Result subelement format

The Subelement ID field is equal to the RSNA Result value in Table 9-195.

The Length field is defined in 9.4.3.

The Match Value field bits are set as defined in Figure 9-405 to request that the specified RSNA results that match that bit descriptions are included in the RSNA Event report.

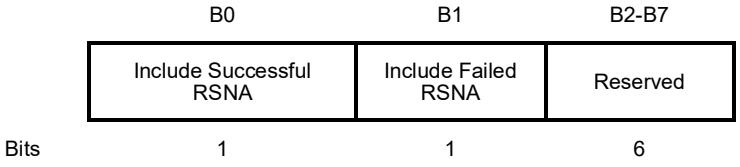

Figure 9-405—Match Value field definitions

9.4.2.66.4 Peer-to-peer link event request

The Event Request field corresponding to peer-to-peer link event request contains zero or more Peer-to-Peer Link Event Request subelements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Peer-to-Peer Link Event Request subelements are defined to have a common format consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable length subelement specific information field. The set of valid Peer-to-Peer Link Event Request subelements is defined in Table 9-196.

Table 9-196—Peer-to-Peer Link Event Request subelement

Peer-to-Peer Link Event Request subelement	Subelement ID
Peer Address	0
Channel Number	1
Reserved	2–255

The Peer-to-Peer Link Event Request subelements specify reporting conditions for peer-to-peer link event reporting.

The Peer Address subelement identifies the peer STA, BSS, or IBSS of the peer-to-peer links to be reported. Excluding this subelement from the Event Request element indicates a request for peer-to-peer link events for any peer STA, any BSS, and any IBSS. The format of the Peer Address subelement is shown in Figure 9-406.

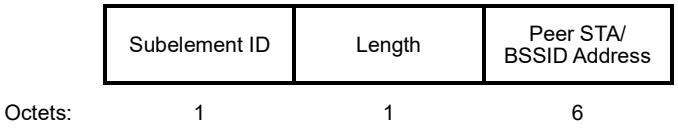

Figure 9-406—Peer Address subelement format

The Subelement ID field is equal to the Peer Address value in Table 9-196.

The Length field is defined in 9.4.3.

The Peer STA/BSSID Address field contains a 6-octet MAC address of a peer STA or a BSSID for peer-to-peer links in an IBSS. If the indicated address matches the Address 1 field of the MAC header contents (see Table 9-30), then the address is a peer STA address for a TDLS or IBSS. If the indicated address matches the Address 3 field of the MAC header contents, then the address is a BSSID for the Direct Link in an infrastructure BSS or for the IBSS.

The Channel Number subelement(s) identify the channel for the peer-to-peer links to be reported. Excluding this subelement from the Event Request element indicates a request for peer-to-peer link events for any channel. The format of the Channel Number subelement is shown in Figure 9-407. The identified channel is indicated by N+1 Channel Number subelements where the first N subelements contain an Operating Class octet with an 80+ behavior limit and the last subelement contains an Operating Class octet without an 80+ behavior limit (as defined in Annex E).

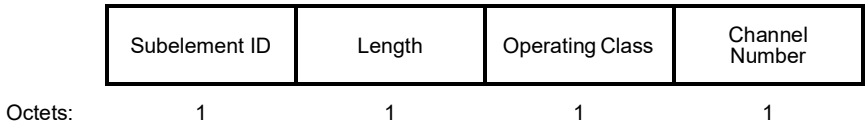

Figure 9-407—Channel Number subelement format

The Subelement ID field is equal to the Channel Number value in Table 9-196.

The Length field is defined in 9.4.3.

The Operating Class field indicates the channel set of the peer-to-peer link to be used for the peer-to-peer link event report. Operating Classes are defined in Annex E.

The Channel Number field indicates the channel number or (if the corresponding operating class in Annex E has "—" in the channel set column) the center frequency index of the frequency segment containing the primary channel of the peer-to-peer link events requested and included in the peer-to-peer link event report. A Channel Number of 0 in all *N*+1 Channel Number subelements indicates a request to report any peer-to-peer link event for any supported channel in the specified filtering Operating Class.

9.4.2.66.5 Vendor specific event request

The Event Request field corresponding to a vendor specific event request contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25).

9.4.2.67 Event Report element

9.4.2.67.1 Event Report definition

The Event Report element is used by a STA to report an event. The format of the Event Report element is shown in Figure 9-408.

	Element ID	Length	Event Token	Event Type	Event Report Status
Octets:	1	1	1	1	1

	Event TSF (optional)	UTC Offset (optional)	Event Time Error (optional)	Event Report (optional)
Octets:	0 or 8	0 or 10	0 or 5	variable

Figure 9-408—Event Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Event Token field is the Event Token in the corresponding Event Request element. If the Event Report element is being sent autonomously then the Event Token is 0.

The Event Type field is a number that identifies the type of event report. The values of the Event Type field are defined in Table 9-193.

The Event Report Status field is a value in Table 9-197, indicating the STA's response to the Event Request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-197—Event Report Status

Event Report Status	Description
0	Successful
1	Request failed
2	Request refused
3	Request incapable
4	Detected frequent transition
5–255	Reserved

The Event TSF, UTC Offset, Event Time Error, and Event Report fields are present only when the Event Report Status field is 0.

The Event TSF field is TSF value when the STA logged the event.

The UTC Offset field is the UTC value that corresponds to the UTC time when the TSF timer is equal to 0. If the UTC Offset is unknown, the field is 0.

The Event Time Error field is the UTC standard deviation, as described in 9.4.2.60, that corresponds to the TSF value logged for the event. If the Event Time Error is unknown, the field is 0.

The Event Report field contains the specification of a single event report, as described in 9.4.2.67.2 to 9.4.2.67.5.

The Event Report element is included in an Event Report frame, as described in 9.6.13.3. The use of the Event Report element and frame is described in 11.21.2.

9.4.2.67.2 Transition event report

The format of the Event Report field corresponding to a Transition event report is shown in Figure 9-409.

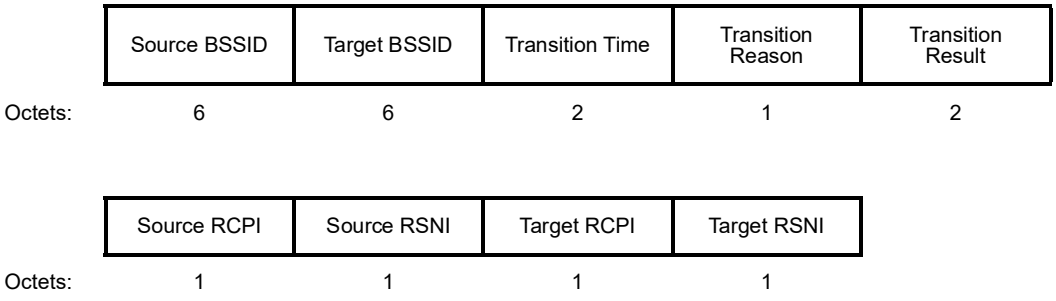

Figure 9-409—Event Report format for Transition event

The Source BSSID field contains the 6-octet BSSID address of the associated AP prior to the attempted transition.

The Target BSSID field contains the 6-octet BSSID address of the AP that is the target of the attempted transition.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Transition Time field contains the transition time in TUs. The transition time is defined in 11.21.2.2.

The Transition Reason field indicates the reason why a transition attempt occurred and contains one of the values in Table 9-198.

Table 9-198—Transition and Transition Query reasons

Transition Reason value	Description
0	Unspecified
1	Excessive frame loss rates and/or poor conditions
2	Excessive delay for current traffic streams
3	Insufficient QoS capacity for current traffic streams (TSPEC rejected)
4	First association to ESS (the association initiated by an Association Request frame instead of a Reassociation Request frame)
5	Load balancing
6	Better AP found
7	Deauthenticated or Disassociated from the previous AP
8	AP failed IEEE 802.1X EAP Authentication
9	AP failed 4-way handshake
10	Received too many replay counter failures
11	Received too many data MIC failures
12	Exceeded maximum number of retransmissions
13	Received too many broadcast disassociations
14	Received too many broadcast deauthentications
15	Previous transition failed
16	Low RSSI
17	Roam from a non-IEEE-802.11 system
18	Transition due to received BSS Transition Request frame
19	Preferred BSS transition candidate list included
20	Leaving ESS
21–255	Reserved

The Transition Result field contains the result of the attempted transition and is one of the status codes specified in Table 9-50 in 9.4.1.9.

The Source RCPI field indicates the received channel power of the most recently measured frame from the Source BSSID before the STA reassociates to the Target BSSID. The Source RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.37.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Source RSNI field indicates the received signal-to-noise indication of the most recently measured frame from the Source BSSID before the STA reassociates to the Target BSSID. The Source RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 9.4.2.40.

The Source BSSID, Source RCPI, and Source RSNI fields are set to 0 if the transition is initiated by an Association Request frame.

The Target RCPI field indicates the received channel power of the first measured frame just after the STA reassociates to the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received channel power of the most recently measured frame from the Target BSSID. The Target RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.37.

The Target RSNI field indicates the received signal-to-noise indication of the first measured frame just after the STA reassociates to the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received signal-to-noise indication of the most recently measured frame from the Target BSSID. The Target RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 9.4.2.40.

9.4.2.67.3 RSNA event report

The format of the Event Report field corresponding to an RSNA event report is shown in Figure 9-410.

	Target BSSID	Authentication Type	EAP Method	RSNA Result	RSNE
Octets:	6	4	1 or 8	2	variable

Figure 9-410—Event Report format for RSNA event

The Target BSSID field contains the 6-octet BSSID address of the AP accepting the authentication attempt.

The Authentication Type field contains the Authentication type in use at the time of the authentication attempt and is one of the AKM suite selectors defined in Table 9-151 in 9.4.2.24.3.

When the Authentication Type field is either 00-0F-AC:1 (Authentication negotiated over IEEE Std 802.1X or using PMKSA caching as defined in 12.6.10.3) or 00-0F-AC:3 (AKM suite selector for fast BSS transition as defined in 12.6.3), the EAP Method field contains the IANA assigned EAP type. The EAP type contains either the legacy type (1 octet) or the expanded type (1 octet type = 254, 3-octet Vendor ID, 4-octet Vendor-Type). The EAP Method field is 0 otherwise. The EAP Method field is a single octet set to 0 otherwise.

The RSNA Result field contains the result of the RSNA establishment attempt and is one of the status codes specified in Table 9-50 in 9.4.1.9.

The RSNE field contains the entire contents of the negotiated RSNE at the time of the authentication attempt. The maximum length of the RSNE field is less than the maximum length of an RSNE, as defined in 9.4.2.24. If the length of the RSNE included here exceeds the maximum length of the RSNE field, the RSNE is truncated to the maximum length allowed for the RSNE field.

9.4.2.67.4 Peer-to-peer link event report

The format of the Event Report field corresponding to a peer-to-peer link event report is shown in Figure 9-411.

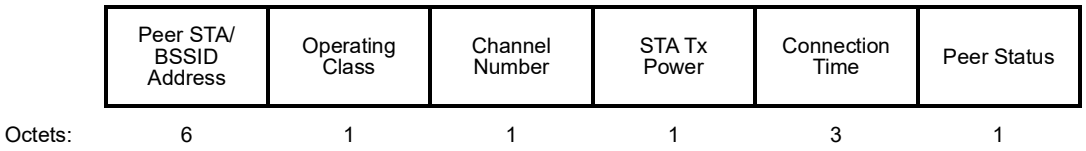

Figure 9-411—Event Report format for peer-to-peer link event

A peer-to-peer link is defined to be either a Direct Link within a QoS BSS, a TDLS, or a STA-to-STA communication in an IBSS.

The Peer STA/BSSID Address field contains a 6-octet MAC address. If this event is for a peer-to-peer link in an infrastructure BSS, this field contains the MAC address of the peer STA. If this event is for a peer-to-peer link in an IBSS, this field contains the BSSID.

The Operating Class field indicates the channel set of the peer-to-peer link. Valid values of the Operating Class are shown in Annex E.

The Channel Number field indicates the peer-to-peer channel number of the peer-to-peer link. The Channel Number is defined within an Operating Class as shown in Annex E.

The STA Tx Power field indicates the target transmit power at the antenna (i.e., EIRP) in dBm with a tolerance of ± 5 dB of the lowest basic rate of the reporting STA.

The Connection Time field contains the connection time in seconds. If the Peer Status is 0, this field indicates the duration of the Direct Link. If the Peer Status field is 1, this field indicates the time difference from the time the Direct Link was established to the time at which the reporting STA generated the event report. If the Peer Status field is 2, this field indicates the duration of the IBSS membership. If the Peer Status is 3, this field indicates the time difference from the time the STA joined the IBSS to the time at which the reporting STA generated the event report. See 11.21.2.4.

The Peer Status field indicates the Peer link connection status as indicated in Table 9-199.

Table 9-199—Peer Status definitions

Peer Status	Description
0	Direct Link terminated
1	Direct Link active
2	IBSS membership terminated
3	IBSS membership active
4–255	Reserved

9.4.2.67.5 WNM log event report

The format of the Event Report field corresponding to a WNM log event report is shown in Figure 9-412.

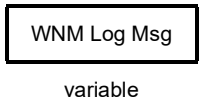

Figure 9-412—Event Report format for WNM log event

The WNM Log Msg field contains the entire syslog message, consisting of the PRI, HEADER, and MSG portion of a WNM log message as described in IETF RFC 5424. The TAG field of the MSG portion of the message is a 17-octet string containing the ASCII representation of the STA MAC address using hexadecimal notation with colons between octets. The octet containing the Individual/Group bit occurs last, and that bit is in the least significant position within that octet. See 11.21.2.5.

NOTE—For example, the TAG field for a STA with MAC address AC-DE-48-12-7B-80 is "80:7B:12:48:DE:AC" or "80:7b:12:48:de:ac".

9.4.2.67.6 Vendor Specific event report

The Event Report field corresponding to Vendor Specific event report contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.25).

9.4.2.68 Diagnostic Request element

9.4.2.68.1 Diagnostic Request definition

The Diagnostic Request element contains a request that the receiving STA undertake the specified diagnostic action. The format of the Diagnostic Request element is shown in Figure 9-413.

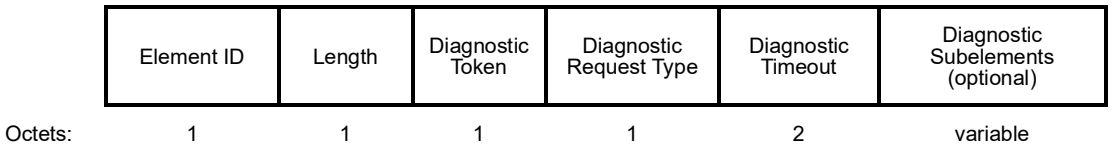

Figure 9-413—Diagnostic Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Diagnostic Token field is a number that is unique among the Diagnostic Request elements sent to each destination MAC address for which a corresponding Diagnostic Report element has not been received.

The Diagnostic Request Type field is a number that identifies a type of diagnostic request. The values of Diagnostic Request Types are shown in Table 9-200.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-200—Diagnostic Request/Report Type definitions

Name	Diagnostic Type values
Cancel Diagnostic Request	0
Manufacturer Information STA Report	1
Configuration Profile	2
Association Diagnostic	3
IEEE 802.1X Authentication Diagnostic	4
Reserved	5–220
Vendor Specific	221
Reserved	222–255

The Diagnostic Timeout field contains the time, in seconds, after which no response is returned.

The Diagnostic Subelements field contains zero or more diagnostic subelements depending on the specific Diagnostic Request Type, as defined in 9.4.2.68.2 to 9.4.2.68.4.

The Cancel Diagnostic Request, Manufacturer Information STA Report, and Configuration Profile Diagnostic Request elements carry no Diagnostic subelements.

The Diagnostic Request element is included in a Diagnostic Request frame, as described in 9.6.13.4. The use of Diagnostic Request element and frames is described in 11.21.3.

9.4.2.68.2 Association Diagnostic request

The Diagnostic Subelements field corresponding to an Association Diagnostic request type is shown in Table 9-201. The corresponding Diagnostic subelements are defined in 9.4.2.68.5.

Table 9-201—Association Diagnostic request contents

Order	Subelement
1	AP Descriptor
2	Profile ID

9.4.2.68.3 IEEE 802.1X Authentication Diagnostic request

The Diagnostic Subelements field corresponding to an IEEE 802.1X Authentication Diagnostic request type is shown in Table 9-202. The corresponding Diagnostic subelements are defined in 9.4.2.68.5.

4	Profile ID

9.4.2.68.4 Vendor Specific diagnostic request

The Diagnostic Subelements field corresponding to a Diagnostic Request element of type Vendor Specific diagnostic request contains zero or more Vendor Specific subelements. The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25).

9.4.2.68.5 Diagnostic subelement descriptions

The following text describes the various subelements that are optionally included in Diagnostic Subelements field of a Diagnostic Request element (9.4.2.68) or a Diagnostic Report element (9.4.2.69). The format of a Diagnostic subelement is shown in Figure 9-414.

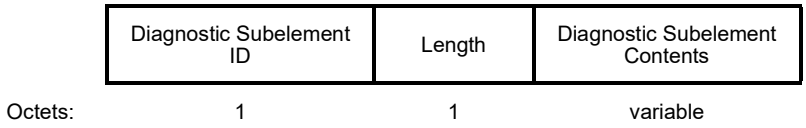

Figure 9-414—Diagnostic subelement format

The Diagnostic Subelement ID field indicates the Diagnostic subelement ID and is any allocated value in Figure 9-203.

Table 9-203—Diagnostic subelement ID values

Subelement ID	Subelement name
0	Credential Type
1	AKM Suite
2	AP Descriptor
3	Antenna Type
4	Cipher Suite
5	Collocated Radio Type
6	Device Type
7	EAP Method
8	Firmware Version
9	MAC Address

Table 9-203—Diagnostic subelement ID values *(continued)*

Subelement ID	Subelement name
12	Manufacturer OI
13	Manufacturer Serial Number String
14	Power Save Mode
15	Profile ID
16	Supported Operating Classes
17	Status Code
18	SSID
19	Tx Power Capability
20	Certificate ID
21–220	Reserved
221	Vendor Specific
221–255	Reserved

The Length field is the length in octets of the Diagnostic Subelement Contents field.

The values of the Diagnostic Subelement Contents field are described in the following paragraphs.

The format for the Credential Type subelement is shown in Figure 9-415.

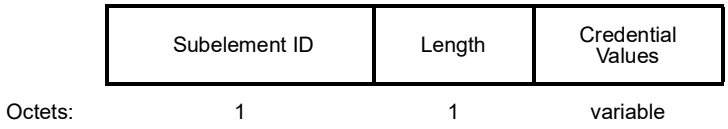

Figure 9-415—Credential Type subelement format

The Credentials Values field indicates one or more types of credential. Each value is chosen from those shown in Table 9-204.

Table 9-204—Credentials values

Value	Description
0	None
1	Preshared key
2	Username and password
3	X.509 certificate
4	Other certificate
5	One time password
6	Token
7–255	Reserved

The format for the AKM Suite subelement is shown in Figure 9-416.

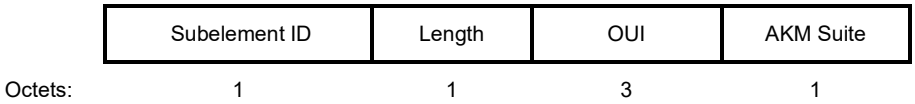

Figure 9-416—AKM Suite subelement format

The OUI and AKM Suite fields identify the authentication method, and the AKM suite selector is one of the values in Table 9-151 in 9.4.2.24.3.

The format of the AP descriptor subelement is shown in Figure 9-417.

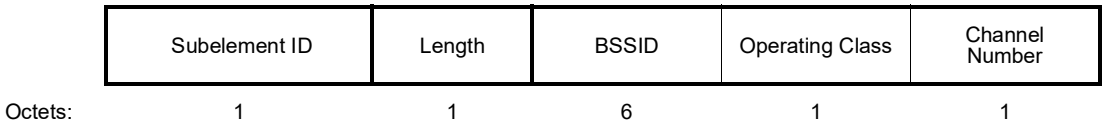

Figure 9-417—AP Descriptor subelement format

The set of current operating classes and channel widths of the AP is indicated by *N*+1 AP descriptor subelements where the first *N* subelements contain an Operating Class octet with an 80+ behavior limit and the last subelement contains an Operating Class octet without an 80+ behavior limit (as defined in Annex E).

NOTE 1—An 80+80 MHz AP sends four AP descriptor subelements for 20/40 MHz, 80 MHz, 80+ MHz (for the secondary 80 MHz frequency segment), and 80 MHz (for the primary 80 MHz frequency segment).

The BSSID field identifies the BSS indicated in the AP Descriptor subelement, as described in 9.2.4.3.4.

The Operating Class field contains an enumerated value from Annex E that identifies the mapping from Channel Number to frequency.

The Channel Number field indicates a current operating channel or (if the corresponding operating class in Annex E has "—" in the channel set column) the center frequency index of the frequency segment containing the primary channel, of the AP identified by the BSSID in the AP Descriptor subelement.

The format for the Antenna Type subelement is shown in Figure 9-418.

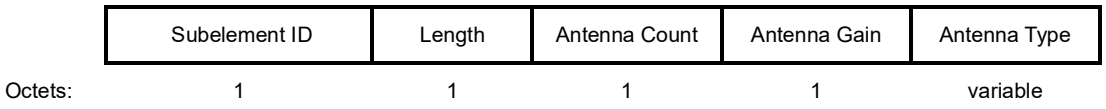

Figure 9-418—Antenna Type subelement format

The Antenna Count field contains the number of antennas of the indicated antenna type and antenna gain pair. The Antenna Count field value 0 is reserved.

The Antenna Gain field contains the peak gain, in dBi, of the antenna.

The Antenna Type field contains an ASCII string (truncated to 251 octets if required) describing the manufacturer's type information (i.e., a series of letters/numbers) of the antenna(s) or DMG antenna connected to the wireless adapter.

NOTE 2—Beamforming antennas for a non-DMG STA might have several antenna IDs, depending on antenna bearing.

The format for the Cipher Suite subelement is shown in Figure 9-419.

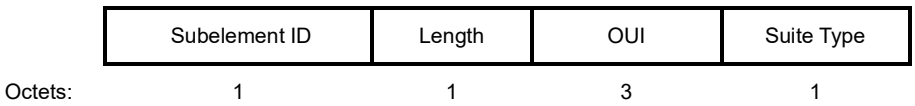

Figure 9-419—Cipher Suite subelement format

The OUI and Suite Type fields identify the cipher suite, and the cipher suite selector is one of the values in Table 9-149.

The format for the Collocated Radio Type subelement is shown in Figure 9-420.

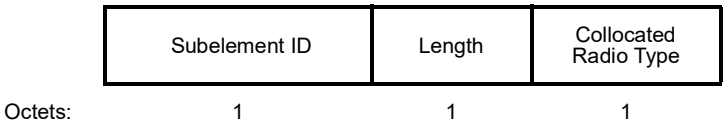

Figure 9-420—Collocated Radio Type subelement format

The Collocated Radio Type subelement indicates the type of collocated radio and is one of the values in Table 9-205. The method that a STA uses to obtain the information on the collocated radio is out of the scope of this standard.

Table 9-205—Collocated Radio Type

Collocated Radio Type	Value

The format for the EAP Method subelement is shown in Figure 9-422.

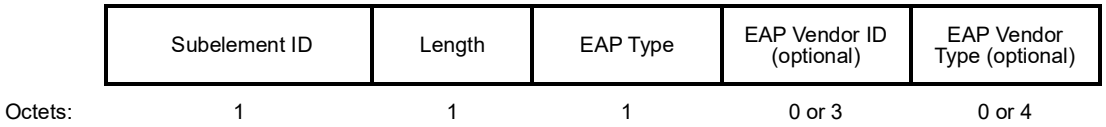

Figure 9-422—EAP Method subelement format

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254 and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254 and is excluded otherwise.

The format for the Firmware Version subelement is shown in Figure 9-423.

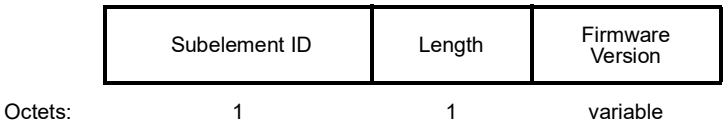

Figure 9-423—Firmware Version subelement format

This Firmware Version field contains an ASCII string identifying the version of firmware currently installed on the wireless network adaptor.

The format for the MAC Address subelement is shown in Figure 9-424.

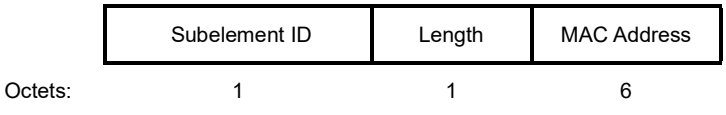

Figure 9-424—MAC Address subelement format

Copyright © 2021 IEEE. All rights reserved.

This MAC Address field contains the 6-octet IEEE 802 MAC address of the STA.

The format for the Manufacturer ID String subelement is shown in Figure 9-425.

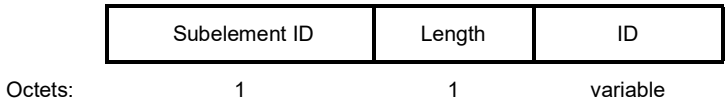

Figure 9-425—Manufacturer ID String subelement format

The ID field contains an ASCII string indicating the manufacturer identifier of the wireless network adaptor.

The format for the Manufacturer Model String subelement is shown in Figure 9-426.

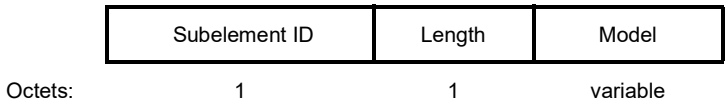

Figure 9-426—Manufacturer Model String subelement format

The Model field contains an ASCII string indicating the model of the wireless network adaptor.

The format for the Manufacturer OI subelement is shown in Figure 9-427.

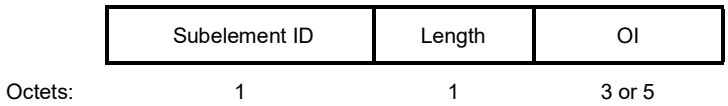

Figure 9-427—Manufacturer OI subelement format

The OI field contains an organization identifier, as defined in 9.4.1.31.

The format for the Manufacturer Serial Number String subelement is shown in Figure 9-428.

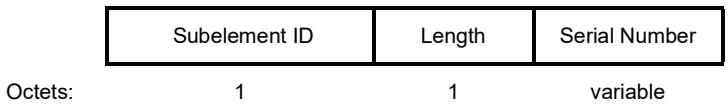

Figure 9-428—Manufacturer Serial Number String subelement format

The Serial Number field contains an ASCII string indicating the serial number of the wireless network adaptor.

The format for the Power Save Mode subelement is shown in Figure 9-429.

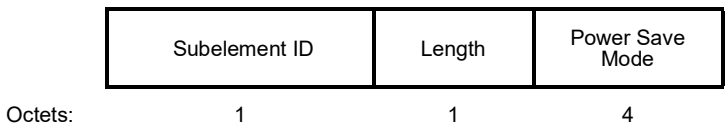

Figure 9-429—Power Save Mode subelement format

The format for the Profile ID subelement is shown in Figure 9-430.

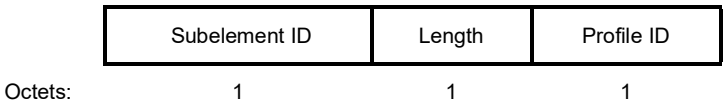

Figure 9-430—Profile ID subelement format

The Profile ID field contains a unique identifier for referencing a configuration profile available on a device. The identifier is uniquely associated to a single configuration profile on the device sending the identifier.

The format for the Supported Operating Classes subelement is shown in Figure 9-431.

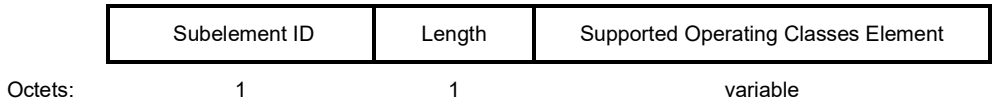

Figure 9-431—Supported Operating Classes subelement format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Supported Operating Classes Element field contains the Supported Operating Classes element, as defined in 9.4.2.53.

The format for the Status Code subelement is shown in Figure 9-432.

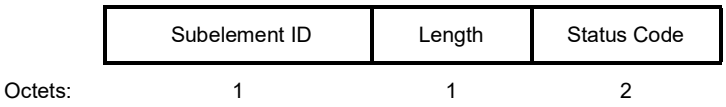

Figure 9-432—Status Code subelement format

The Status Code field contains the final IEEE 802.11 Status code, as defined in Table 9-50 in 9.4.1.9, received at the end of the applicable operation.

The format for the SSID subelement is shown in Figure 9-433.

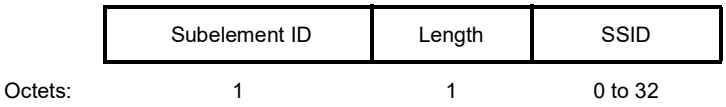

Figure 9-433—SSID subelement format

The SSID field contains a service set identifier with a maximum length of 32 octets, as defined in 9.4.2.2.

The format for the Tx Power Capability subelement is shown in Figure 9-434.

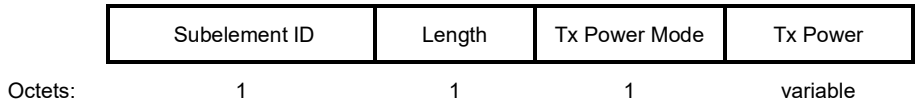

Figure 9-434—Tx Power Capability subelement format

The Tx Power Mode field identifies the transmit power mode of the non-AP STA and is one of the values in Table 9-208.

Table 9-208—Tx Power Modes

Tx Power Mode	Value
Discrete	0
Range	1
Reserved	2–255

The Tx Power field indicates the target transmit power level(s) at the antenna(s) or DMG antenna(s) (i.e., EIRP), where the actual power is within ± 5 dB to the target. Each transmit power level is encoded in a single octet as a 2s complement value in dBm, rounded to the nearest integer. If the Tx Power Mode field is 0, then the Tx Power field contains one or more transmit power levels in increasing numerical order. If the Tx Power Mode field is 1, the Tx Power field contains the STA's minimum and nonzero maximum transmit power levels, in that order.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format for the Certificate ID subelement is shown in Figure 9-435.

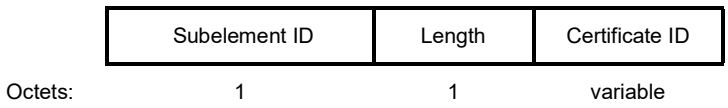

Figure 9-435—Certificate ID subelement format

The Certificate ID field contains a UTF-8 string indicating an identifier assigned to the STA in a manner outside the scope of the standard. The Certificate ID typically takes the form of "WFA3991" and might be used by a receiving STA to look up the certificate assigned to that ID.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25).

9.4.2.69 Diagnostic Report element

9.4.2.69.1 Diagnostic report definition

The Diagnostic Report element contains a Diagnostic report. The format of the Diagnostic Report element is shown in Figure 9-436.

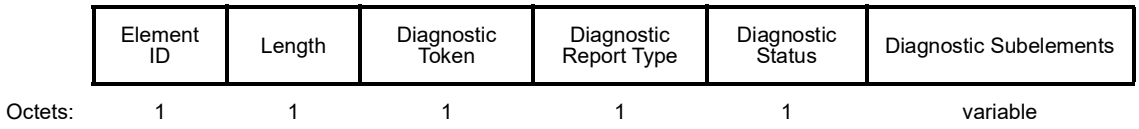

Figure 9-436—Diagnostic Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Diagnostic Token field is the Diagnostic Token in the corresponding Diagnostic Request element.

The Diagnostic Report Type field is a number that identifies the Diagnostic report. The Diagnostic Report Types are defined in Table 9-200.

The Diagnostic Status field is a value in Table 9-197 (see 9.4.2.67), indicating the STA's response to the diagnostic request indicated by the diagnostic token.

The Diagnostic Subelements field contains the results of the diagnostic request.

The Diagnostic Subelements field contains the diagnostic subelement values, defined in 9.4.2.68.5 corresponding to the Diagnostic Report Type field value.

The Diagnostic Report element is included in a Diagnostic Report frame, as described in 9.6.13.5. The use of Diagnostic Report element and frames is described in 11.21.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.69.2 Manufacturer Information STA Report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Manufacturer Information STA Report is shown in Table 9-209. The corresponding Diagnostic subelements are defined in 9.4.2.68.5.

Table 9-209—Manufacturer Information STA report contents

Order	Subelement
1	Manufacturer OI
2	Manufacturer ID string
3	Manufacturer model string
4	Manufacturer serial number string
6	Firmware Version
7	Antenna Type
8	Collocated Radio Type
9	Device Type
10	Certificate ID

9.4.2.69.3 Configuration Profile report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Configuration Profile is shown in Table 9-210. The corresponding Diagnostic subelements are defined in 9.4.2.68.5.

Table 9-210—Configuration Profile report contents

Order	Subelement
1	Profile ID
2	Supported Operating Classes
3	Tx Power
4	Cipher Suite
5	AKM Suite
6	EAP Method
7	Credential Type
8	SSID
9	Power Save Mode

9.4.2.69.4 Association Diagnostic report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Association Diagnostic is shown in Table 9-211. The corresponding Diagnostic subelements are defined in 9.4.2.68.5.

Table 9-211—Association Diagnostic report contents

Order	Subelement
1	AP Descriptor
2	Status Code

9.4.2.69.5 IEEE 802.1X Authentication Diagnostic report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type IEEE 802.1X Authentication Diagnostic is shown in Table 9-212. The corresponding Diagnostic subelements are defined in 9.4.2.68.5.

Table 9-212—IEEE 802.1X Authentication Diagnostic report contents

Order	Subelement
1	AP Descriptor
2	EAP Method
3	Credential Type
4	Status Code

9.4.2.69.6 Vendor Specific diagnostic report

The contents of the Diagnostic subelements field of a Diagnostic Report element of type Vendor Specific contains zero or more Vendor Specific subelements that have the same formats as Vendor Specific elements in 9.4.2.25.

9.4.2.70 Location Parameters element

9.4.2.70.1 Location Parameters definition

The Location Parameters element is used for location services. The format of this element is shown in Figure 9-437.

	Element ID	Length	Location Subelements
Octets:	1	1	variable

Figure 9-437—Location Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Location Subelements field contains one or more Location subelements described in Table 9-213.

Table 9-213—Optional subelement IDs for Location Parameters

Subelement ID	Subelement name
1	Location Indication Parameters (see 9.4.2.70.2)
2	Location Indication Channels (see 9.4.2.70.3)
3	Location Status (see 9.4.2.70.4)
4	Radio (see 9.4.2.70.5)
5	Motion (see 9.4.2.70.6)
6	Location Indication Broadcast Data Rate (see 9.4.2.70.7)
7	Time of Departure (see 9.4.2.70.8)
8	Location Indication Options (see 9.4.2.70.9)
9–220	Reserved
221	Vendor Specific (see 9.4.2.25)
222–255	Reserved

The Location Parameters element is included in Location Configuration Request frames, as described in 9.6.13.6; Location Configuration Response frames, as described in 9.6.13.7; and Location Track Notification frames, as described in 9.6.7.17. The use of the Location Parameters element is described in 11.21.4.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.4.2.70.2 Location Indication Parameters subelement

The Location Indication Parameters subelement contains STA location reporting characteristics. The format of the Location Indication Parameters subelement is shown in Figure 9-438.

	Subelement ID	Length	Indication Multicast Address	Report Interval Units	Normal Report Interval	Normal Number of Frames per Channel
Octets:	1	1	6	1	2	1

	In-Motion Report Interval	In-Motion Number of Frames per Channel	Burst Inter-frame Interval	Tracking Duration	ESS Detection Interval
Octets:	2	1	1	1	1

Figure 9-438—Location Indication Parameters subelement format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field is defined in Table 9-213.

The Length field is defined in 9.4.3.

Except in Location Track Notification frames sent in an IBSS, the Indication Multicast Address field specifies the destination address to which the Location Track Notification frames are sent. This field is a locally administered group address formed according to the procedure defined in 11.21.4.1. The field is reserved when Location Track Notification frames are transmitted in an IBSS.

The Report Interval Units field contains the units used for the Normal Report Interval field and In-Motion Report Interval field, as indicated in Table 9-214.

Table 9-214—Report Interval Units field

Report Interval Units	Description
0	Hours
1	Minutes
2	Seconds
3	Milliseconds
4–255	Reserved

The Normal Report Interval field is the time interval, expressed in the units indicated in the Report Interval Units field, at which the reporting STA is expected to transmit one or more Location Track Notification frames if either dot11MotionDetectionActivated is false or the STA is stationary. The STA does not transmit Location Track Notification frames when the value of the Normal Report Interval field is 0.

The Normal Number of Frames per Channel field is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each Normal Report Interval.

Motion is the act or process of moving, or a particular action or movement relative to the point at which the STA is configured to send Location Track Notification frames. Motion might be detected using one of the following criteria:

— Detection of speed that is greater or equal to 0.5 m/s.
— Detection of movement or vibration, for example by a ball-in-tube sensor or accelerometer or other means.

The exact criteria and mechanism to detect motion is out of scope for this standard.

The In-Motion Report Interval field is the time interval, expressed in the units indicated in the Report Interval Units field, at which the STA reports its location by sending a Location Track Notification frame when the reporting STA is in motion. If dot11MotionDetectionActivated is false, this field is 0.

The In-Motion Number of Frames per Channel field is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each In-Motion Report Interval. If dot11MotionDetectionActivated is false, this field is 0.

The Burst Inter-frame Interval field is the target time interval, expressed in milliseconds, between the transmissions of each of the Normal or In-Motion frames on the same channel. The Burst Inter-frame interval value is 0 to indicate that frames are transmitted with no target inter-frame delay.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Tracking Duration field is the amount of time, in minutes, that a STA sends the Location Track Notification frames. The duration starts as soon as the STA sends a Location Configuration Response frame with a Location Status value of Success. If the Tracking Duration value is a nonzero value the STA sends Location Track Notification frames, based on the Normal and In-Motion Report Interval field values, until the duration ends. If the Tracking Duration is 0 the STA continuously sends Location Track Notification frames as defined by Normal and In-Motion Report Interval field values until transmission is terminated based on the procedures detailed in 11.21.4.2.

The ESS Detection Interval field is the periodicity, in minutes, that a STA checks for beacons transmitted by one or more APs belonging to the same ESS that configured the STA. If no beacons from the ESS are received for this period, the STA terminates transmission of Location Track Notification frames, as described in the procedures detailed in 11.21.4.2. The ESS Detection Interval field is not used when the ESS Detection Interval field value is 0.

9.4.2.70.3 Location Indication Channels subelement

The Location Indication Channels subelement contains location reporting channel information. The format of the Location Indication Channels subelement format is shown in Figure 9-439.

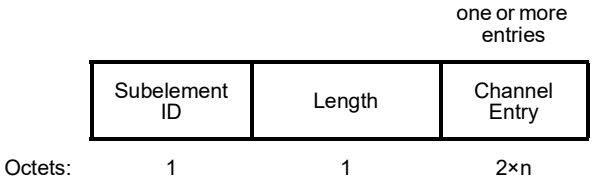

Figure 9-439—Location Indication Channels subelement format

The Subelement ID field is defined in Table 9-213.

The Length field is defined in 9.4.3.

The Channel Entry field includes one or more Operating Class and Channel fields (see Figure 9-106).

The Operating Class subfield of the Operating Class and Channel field indicates the frequency band on which a STA transmits Location Track Notification frames.

The Channel subfield of the Operating Class and Channel field indicates a channel number on which a STA sends or an ESS expects to receive Location Track Notification frames.

The Operating Class and Channel fields can be grouped together to identify a noncontiguous channel. A noncontiguous channel is indicated by a group of N+1 Operating Class and Channel fields where the first N Operating Class and Channel fields contain an Operating Class subfield with an 80+ behavior limit and the last Operating Class and Channel field in the group contains an Operating Class subfield without an 80+ behavior limit (as defined in Annex E).

9.4.2.70.4 Location Status subelement

The Location Status subelement provides the result of a Location Request or Location Configuration Request frame. The format of the Location Status subelement is shown in Figure 9-440.

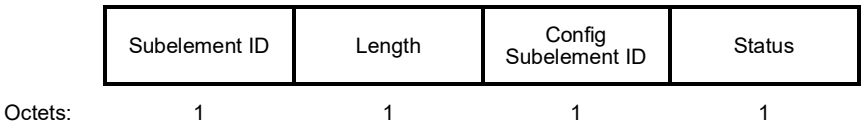

Figure 9-440—Location Status subelement format

The Subelement ID field is defined in Table 9-213.

The Length field is defined in 9.4.3.

The Config Subelement ID field is a specific Location Parameters subelement ID transmitted in a Location Configuration Request frame as defined in Table 9-213.

A Location Status subelement is included for each configuration subelement in the Location Configuration Request frame, except when all status values are the same. When all status values are the same, one Location Status subelement is included with the Config subelement ID set to 0 in the Location Configuration Response frame.

The Status field identifies the result of the Location Request frame and is one of the values in Table 9-197.

9.4.2.70.5 Radio subelement

The Radio subelement contains radio information. The format of the Radio subelement is shown in Figure 9-441.

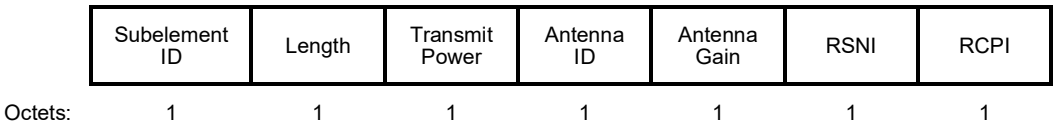

Figure 9-441—Radio subelement format

The Subelement ID field is defined in Table 9-213.

The Length field is defined in 9.4.3.

The Transmit Power field is the transmit power used to transmit the current Location Track Notification frame containing the Location Parameters element with the Radio subelement and is a 2s complement signed integer, reported as an EIRP in dBm. A Transmit Power field set to –128 indicates that the transmit power is unknown. The tolerance for the transmit power value reported in the Radio subelement is ± 5 dB. This tolerance is defined as the maximum possible difference, in decibels, between the reported power value and the total transmitted power across all antennas of the STA, which are measured when transmitting Location Request frames.

The Antenna ID field is the identifying number for the antenna or DMG antenna used to transmit the Location Request frame. The antenna ID or DMG antenna ID is defined in 9.4.2.39.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Antenna Gain field is the antenna gain of the antenna (or group of antennas) over which the Location Track Notification frame is transmitted and is a 2s complement signed integer, reported in dB. An Antenna Gain field set to –128 indicates that the antenna gain is unknown.

The RSNI field contains the RSNI value measured against the most recently received Location Configuration Request frame requesting that a Radio subelement be included in the Location Track Notification frame. The RSNI value is defined in 9.4.2.40. A RSNI field set to 255 indicates that the RSNI value is unknown or is not used.

The RCPI field contains the RCPI value measured against the most recently received Location Configuration Request frame requesting that a Radio subelement be included in the Location Track Notification frame. The RCPI value is defined in 9.4.2.37. A RCPI field set to 255 indicates that the RCPI value is unknown or is not used.

9.4.2.70.6 Motion subelement

The Motion subelement contains motion information. The format of the Motion subelement is shown in Figure 9-442.

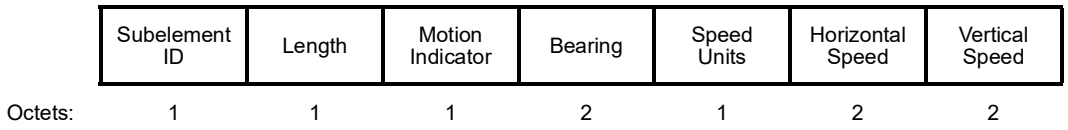

Figure 9-442—Motion subelement format

The Subelement ID field is defined in Table 9-213.

The Length field is defined in 9.4.3.

The Motion Indicator field is defined in Table 9-215. The mechanism that a STA uses to determine the value or transitions from one value to another of the Motion Indicator field is beyond the scope of the standard.

Table 9-215—Motion Indicator field

Motion Indicator value	Description
0	Stationary: the device is stationary and not in motion.
1	Start of motion: the device was stationary and is now in motion.
2	In motion: the device is and has been in motion.
3	End of motion: the device was in motion and is now stationary.
4	Unknown: information related to motion is unknown.
5–255	Reserved

The Bearing field, defined by a 2-octet unsigned integer, specifies the direction that the STA is traveling with relation to true north, increasing clockwise, measured in degrees from 0° to 359°. If the Bearing value is unknown, the field is 65 535.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Speed Units field contains the units for both Horizontal and Vertical Speed field, as defined in Table 9-216.

Table 9-216—Speed Units

Speed Units value	Description
0	Centimeters per second
1	Meters per second
2–255	Reserved

The Horizontal Speed field contains the horizontal speed of the STA expressed in the units indicated in the Speed Units field. If the Horizontal Speed value is unknown, the field is 65 535.

The Vertical Speed field is a 2s complement signed integer indicating the vertical speed of the STA expressed in the units indicated in the Speed Units field. If the Vertical Speed value is unknown or greater than 32 766, the field is 32 767. If the Vertical Speed value is less than –32 767, the field is –32 768.

The Motion subelement field values are valid at the time of transmission of the Location Track Notification frame containing the subelement.

9.4.2.70.7 Location Indication Broadcast Data Rate subelement

The Location Indication Broadcast Data Rate subelement contains location reporting transmission rate information. The format of the Location Indication Broadcast Data Rate subelement format is shown in Figure 9-443.

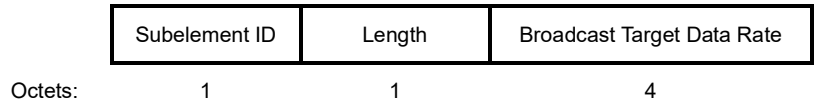

Figure 9-443—Location Indication Broadcast Data Rate subelement format

The Subelement ID field is defined in Table 9-213.

The Length field is defined in 9.4.3.

The Broadcast Target Data Rate field specifies the target data rate at which the STA transmits Location Track Notification frames. The Broadcast Target Data Rate field format is specified by the Rate Identification field defined in 9.4.1.32. A Broadcast Target Data Rate field set to 0 indicates the STA transmits Location Track Notification frames at a rate chosen by the STA transmitting the Location Track Notification frames.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.70.8 Time of Departure subelement

The Time of Departure subelement contains time of departure information for the Location Track Notification frame including the subelement. The format of the Time of Departure subelement is shown in Figure 9-444.

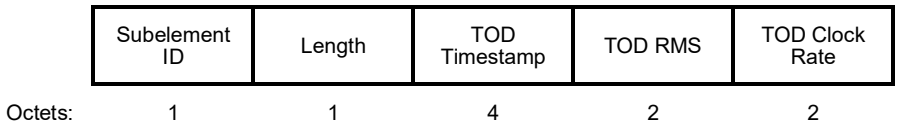

Figure 9-444—Time of Departure subelement format

The Subelement ID field is defined in Table 9-213.

The Length field is defined in 9.4.3.

The TOD Timestamp field specifies when the first frame energy is sent by the transmitting port in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field. The reported TOD timestamp value is determined from the TIME_OF_DEPARTURE parameter within the PHY-TXSTART.confirm primitive.

The TOD RMS field specifies the RMS time of departure error in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field, where the time of departure error equals the difference between the TOD Timestamp field and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock. The TOD RMS field is determined from aTxPHYTxStartRMS in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field.

The TOD Clock Rate field contains the clock rate used to generate the TOD timestamp value reported in the TOD Timestamp field, and it is specified in units of MHz.

9.4.2.70.9 Location Indication Options subelement

The Location Indication Options subelement contains the options for the STA when transmitting the Location Track Notification frame. The format of the Location Indication Options subelement is shown in Figure 9-445.

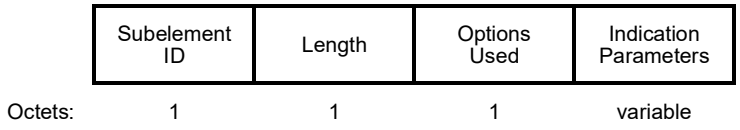

Figure 9-445—Location Indication Options subelement format

The Subelement ID field is defined in Table 9-213.

The Length field is defined in 9.4.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Options Used field specifies the Indication Parameter fields in the Location Indication Options subelement that are used. The format of the Options Used field is shown in Figure 9-446.

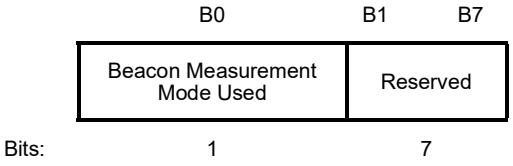

Figure 9-446—Options Used field format

The Indication Parameters field defines a sequence of optional fields that are included in the Location Indication Options subelement based on the Options Used field value. The value of the Indication Parameters field is defined in Table 9-217.

Table 9-217—Indication Parameter values

Order	Field length	Field	Description
1	1	Beacon Measurement Mode	The Beacon Measurement Mode field is the mode of beacon measurement, as defined in Table 9-103. The results of the beacon measurement are included in the Location Track Notification frame, as described in 9.6.7.17 and 11.21.4.2.
2–8		Reserved	

9.4.2.71 Nontransmitted BSSID Capability element

The format of the Nontransmitted BSSID Capability element when transmitted by a non-DMG STA is shown in Figure 9-447.

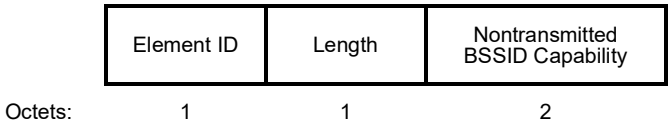

Figure 9-447—Nontransmitted BSSID Capability element format (non-DMG STA)

The format of the Nontransmitted BSSID Capability element when transmitted by a DMG STA is shown in Figure 9-448.

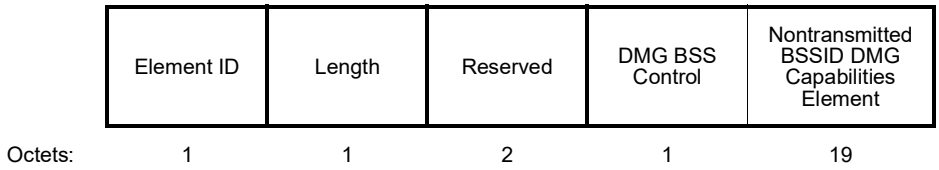

Figure 9-448—Nontransmitted BSSID Capability element format (DMG STA)

When transmitted by a DMG STA, the Nontransmitted BSSID Capability element includes the DMG BSS Control and the Nontransmitted BSSID DMG Capabilities Element fields.

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Nontransmitted BSSID Capability field contains the contents of the Capability Information field (defined in 9.4.1.4) in beacons for the BSS.

The Nontransmitted BSSID Capability element is included in the Nontransmitted BSSID Profile subelement of the Multiple BSSID element defined in 9.4.2.45. The use of the Multiple BSSID element is described in 11.10.14 and Nontransmitted BSSID advertisement procedures are described in 11.1.3.8.

The DMG BSS Control field is defined in Figure 9-449.

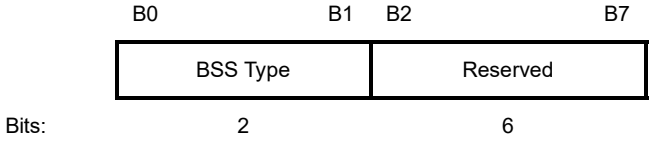

Figure 9-449—DMG BSS Control field format

The BSS Type field is defined in 9.4.1.46.

The Nontransmitted BSSID DMG Capabilities Element field contains the DMG Capabilities element of the DMG STA.

9.4.2.72 SSID List element

The format of the SSID List element is shown in Figure 9-450.

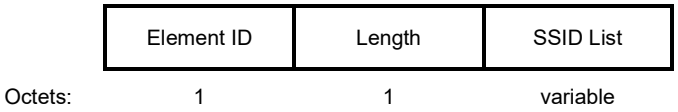

Figure 9-450—SSID List element format

The Element ID and Length fields are defined in 9.4.2.1.

The SSID List field is a list of SSID elements for which the STA is requesting information.

The SSID List element is included in Probe Request frames, as described in 9.3.3.9. The use of the SSID List element and frames is described in 11.1.4.

9.4.2.73 Multiple BSSID-Index element

The format of the Multiple BSSID-Index element is shown in Figure 9-451.

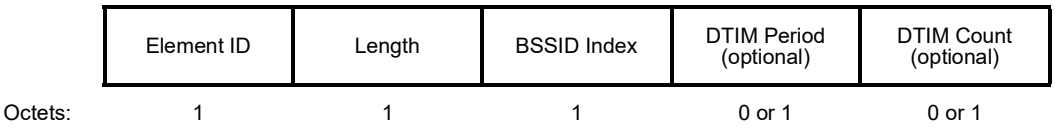

Figure 9-451—Multiple BSSID-Index element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The BSSID Index field is a value between 1 and $2^n - 1$ that identifies the nontransmitted BSSID, where n is a nonzero, positive integer value.

The DTIM Period field indicates the DTIM period for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The DTIM Count field indicates the DTIM count for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The Multiple BSSID-Index element is included in the nontransmitted BSSID profile element, as described in 11.1.3.8. The use of the Multiple BSSID element and frames is described in 11.10.14.

9.4.2.74 FMS Descriptor element

The FMS Descriptor element defines information about group addressed BUs buffered at the AP. It is present in the Beacon frames when dot11FMSActivated is true. The format of the FMS Descriptor element is shown in Figure 9-452.

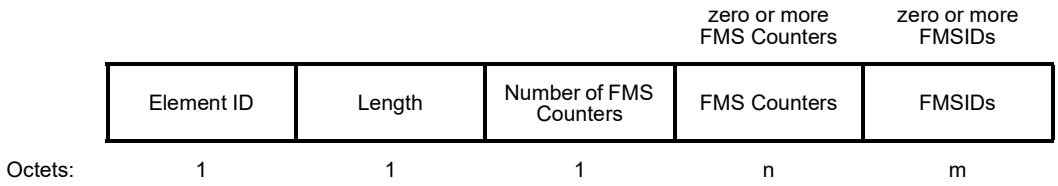

Figure 9-452—FMS Descriptor element format

The Element ID and Length fields are defined in 9.4.2.1.

The Number of FMS Counters field defines the number of FMS Counter fields that are contained in the FMS Counters field in the FMS Descriptor element.

The FMS Counters field contains zero or more FMS Counter fields. The format of the FMS Counter field is shown in Figure 9-453. When one or more FMS streams are accepted at the AP, at least one FMS counter is present in the FMS Descriptor element. A maximum of eight FMS counters are permitted. The FMS counters are used by the non-AP STA to identify the DTIM beacon after which group addressed BUs assigned to a particular delivery interval are transmitted. A single FMS counter is shared by all FMS streams that use the same delivery interval.

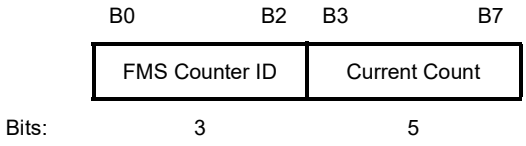

Figure 9-453—FMS Counter field format

The FMS Counter ID field is a 3- bit value that represents the counter ID assigned by the AP for a particular FMS stream.

The Current Count field indicates how many DTIM Beacon frames (including the current one) appear before the next DTIM Beacon frame after which the group addressed BUs assigned to a particular delivery interval are scheduled to be transmitted.

The FMSIDs field contains zero or more FMSIDs. Each FMSID is a 1-octet identifier assigned by the AP.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Inclusion of an FMSID indicates the AP has buffered BUs for the corresponding group addressed stream that is scheduled for transmission immediately after the DTIM Beacon frame.

The FMS Descriptor element is included in Beacon frames, as described in 9.3.3.2. The use of the FMS Descriptor element and frames is described in 11.2.3.14.

9.4.2.75 FMS Request element

The FMS Request element defines information about the group addressed frames being requested by the non-AP STA. The format of FMS Request element is shown in Figure 9-454.

	Element ID	Length	FMS Token	FMS Request Subelements
Octets:	1	1	1	variable

Figure 9-454—FMS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The FMS Token field contains a unique identifier for the FMS Stream Set that is the set of FMS subelements specified in the request. If this is a new request, then the FMS Token field is set to 0. Otherwise, the FMS Token field is set to the value assigned by the AP in the FMS Response element.

The FMS Request Subelements field contains one or more FMS Request subelements described in Table 9-218.

Table 9-218—Optional subelement IDs for FMS Request subelements

Subelement ID	Subelement name
0	Reserved
1	FMS subelement
2–220	Reserved
221	Vendor Specific subelement
222–255	Reserved

The format of the FMS subelement is shown in Figure 9-455.

								one or more TCLAS Elements
	Subelement ID	Length	Delivery Interval	Max Delivery Interval	Rate Identification	FMSID	TCLAS Elements	TCLAS Processing Element (optional)
Octets:	1	1	1	1	4	1	variable	0 or 3

Figure 9-455—FMS subelement format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field is 1 to uniquely identify this subelement as the FMS subelement.

The Length field is defined in 9.4.3.

The Delivery Interval field defines the periodicity of stream transmission in units of DTIMs. The default value is 1. The value set to 0 indicates that requesting non-AP STA does not use the FMS stream identified by the TCLAS elements anymore.

The Max Delivery Interval field defines the maximum delivery interval the non-AP STA supports for the requested stream in units of DTIMs. The value set to 0 indicates that the non-AP STA is willing to accept any maximum delivery interval supported by the AP.

The Rate Identification field specifies the data rate as described in 9.4.1.32, at which the STA requests to receive group addressed frames. If the STA does not request a particular multicast rate, the Rate Identification field is 0.

The FMSID field contains a unique identifier for this stream. If this is a new request, the FMSID field is reserved. Otherwise, the FMSID is set to the value assigned by the AP in the FMS Response element.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 9.4.2.30. The number of TCLAS elements is limited and the total size of the FMS Request element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.32.

The FMS Request element is included in FMS Request frames, as described in 9.6.13.11. The use of the FMS Request element and frames is described in 11.2.3.14.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25).

9.4.2.76 FMS Response element

The FMS Response element provides information about the delivery of group addressed frames. The format of the FMS Response element is shown in Figure 9-456.

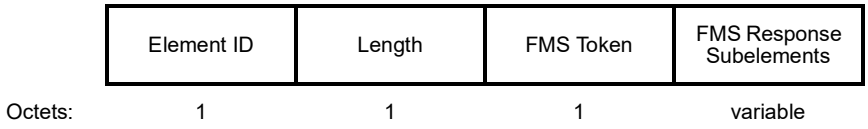

Figure 9-456—FMS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The FMS Token field is assigned by the AP for the set of FMS streams that share the counter identified by the FMS Counter ID maintained in the AP.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The FMS Response Subelements field contains one or more FMS Response subelements described in Table 9-219.

Table 9-219—Optional subelement IDs for FMS Response subelements

Subelement ID	Subelement name
0	Reserved
1	FMS Status subelement
2	TCLAS Status subelement
3–220	Reserved
221	Vendor Specific subelement
222–255	Reserved

The format of the FMS Status subelement is shown in Figure 9-457.

	Subelement ID	Length	Element Status	Delivery Interval	Max Delivery Interval	FMSID	FMS Counter	Rate Identification	Multicast Address
Octets:	1	1	1	1	1	1	1	4	6

Figure 9-457—FMS Status subelement format

The Subelement ID field is 1 to uniquely identify this subelement as the FMS Status subelement.

The Length field is defined in 9.4.3.

The Element Status field indicates the status of STA's requested delivery interval, as indicated in Table 9-220, provided by the AP.

Table 9-220—FMS Element Status and TFS Response Status definition

Value	Description
0	Accept
1	Deny, due to request format error or ambiguous classifier.
2	Deny, due to lack of resources on the AP.
3	Deny, due to requested classifier(s) matching 2 or more existing streams on different intervals.
4	Deny, by policy, requested stream or filter is not permitted to participate in the service.
5	Deny, reason unspecified.
6	Alternate proposed, due to existing stream with different delivery interval.
7	Alternate proposed, due to policy limits on the AP.
8	Alternate proposed, because the AP changed the delivery interval.
9	Multicast rate changes not allowed.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-220—FMS Element Status and TFS Response Status definition *(continued)*

Value	Description
10	Terminate, due to an AP policy change.
11	Terminate, due to lack of resources of the AP.
12	Terminate, due to other FMS stream with higher priority.
13	Alternate proposed, because the AP changed the maximum delivery interval.
14	Alternate proposed, because the AP is unable to provide requested TCLAS-based classifiers.
15–255	Reserved

The Delivery Interval field defines the minimum integer of DTIM periods between successive transmissions of frames for the stream corresponding to that FMSID.

The Max Delivery Interval field defines the maximum delivery interval the AP uses for the stream corresponding to FMSID. The value set to 0 indicates that the AP has no maximum delivery interval for the stream identified by FMSID.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The format of the FMS Counter field is shown in Figure 9-453. The FMS Counter ID field of the FMS Counter field is defined in 9.4.2.74. The Current Count field of the FMS Counter field is reserved in the FMS Status subelement.

The Rate Identification field specifies the data rate as described in 9.4.1.32 to be used for the multicast service. If the Rate Identification field is set to 0 then the data rate is undefined.

The Multicast MAC Address field contains the MAC address of the multicast traffic to which this FMS response relates.

The format of the TCLAS Status subelement is shown in Figure 9-458.

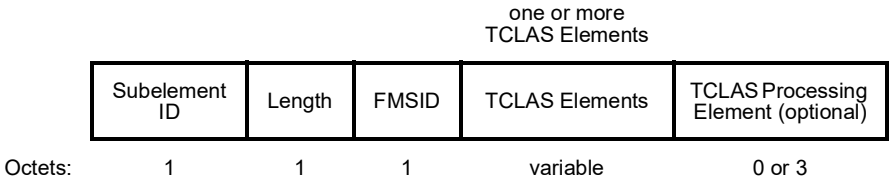

Figure 9-458—TCLAS Status subelement format

The Subelement ID field is 2 to uniquely identify this subelement as the TCLAS Status subelement.

The Length field is defined in 9.4.3.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 9.4.2.30. The number of TCLAS elements is limited and the total size of the FMS Response element is less than or equal to 255 octets.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.32.

The FMS Response element is included in FMS Response frames, as described in 9.6.13.12. The use of the FMS Response element and frames is described in 11.2.3.14.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.25).

9.4.2.77 QoS Traffic Capability element

The QoS Traffic Capability element provides information about types of traffic generated by a non-AP QoS STA and is used by a QoS AP to indicate the access categories of associated non-AP QoS STAs. The format of the QoS Traffic Capability element is shown in Figure 9-459.

	Element ID	Length	QoS Traffic Capability Bitmask/Flags	AC STA Count List (optional)
Octets:	1	1	1	Total number of nonzero bits in Bits 0–1 of QoS Traffic Capability Bitmask/Flags field

Figure 9-459—QoS Traffic Capability element format

The Element ID and Length fields are defined in 9.4.2.1. The Length field is set to 1 + *n*, where *n* equals the total number of nonzero bits in Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field.

The format of QoS Traffic Capability Bitmask/Flags field is defined in Table 9-221.

Table 9-221—QoS Traffic Capability Bitmask/Flags definition

Bit	Description
0	AC_VO
1	AC_VI
2	Reserved
3	Reserved
4	UP 4 Traffic
5	UP 5 Traffic
6	UP 6 Traffic
7	Reserved

Bits 0–1 serve as QoS Traffic Capability Bitmask. The bitmask indicates the AC values that have the station count specified in the following AC STA Count List. An AP sets the bit to 1 to indicate that the station count for the corresponding AC is present in the AC STA Count List field. An AP sets the bit to 0 to indicate that the station count for the corresponding AC is not present in the AC STA Count List field. Bits 0–1 are reserved in a transmission to an AP.

Bits 4–6 serve as QoS Traffic Capability Flags. Each of Bits 4–6 serves as a flag for a non-AP STA to indicate application requirements about the user priorities of the traffic it generates. A non-AP STA sets the

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

bit to 1 to indicate the existence of an application that requires generation of traffic belonging to the corresponding user priority (UP). A non-AP STA sets the bit to 0 to indicate that such application does not exist. Bits 4–6 are reserved in a transmission from an AP.

Bits 2–3 and Bit 7 are reserved.

The AC STA Count List field comprises a sequence of STA Count fields corresponding to the nonzero bits in the Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field. Each STA Count field is 1 octet long and contains an unsigned integer. The STA Count field specifies the number of associated QoS STAs that have indicated QoS traffic capability of the corresponding AC. If the number of STAs is greater than 255, the STA Count field is 255. The AC STA Count List field is present only when the QoS AP transmits the QoS Traffic Capability element.

The QoS Traffic Capability element is included in Beacon frames, as described in 9.3.3.2; Probe Response frames, as described in 9.3.3.10; Association Request frames, as described in 9.3.3.5; and Reassociation Request frames, as described in 9.3.3.7.

9.4.2.78 BSS Max Idle Period element

The BSS Max Idle Period element contains the time period a non-AP STA can refrain from transmitting frames to the AP before the AP disassociates the STA due to inactivity. The format of the BSS Max Idle Period element is shown in Figure 9-460.

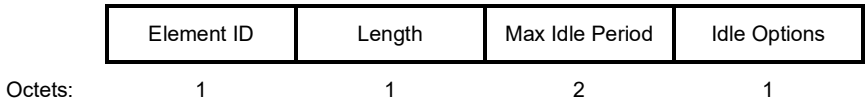

Figure 9-460—BSS Max Idle Period element format

The Element ID and Length fields are defined in 9.4.2.1.

The BSSMaxIdlePeriod parameter indicates the idle timeout limit, as described in 11.21.13. The time period is specified in units of 1000 TUs. The value of 0 is reserved. In a non-S1G STA, the Max Idle Period field is an unsigned integer that contains the value of the parameter BSSMaxIdlePeriod. In an S1G STA, the two MSBs of the Max Idle Period field contain the Unified Scaling Factor subfield and the remaining 14 bits contain the Unscaled Interval subfield (see Figure 9-89). In an S1G STA, the BSSMaxIdlePeriod parameter used by the MLME primitives is in units of 1000 TUs and is equal to the value of the Unscaled Interval subfield, multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield. The Unified Scaling Factor subfield encoding is defined in Table 9-48.

The Idle Options field indicates the options associated with the BSS Idle capability. The Idle Options field is shown in Figure 9-461.

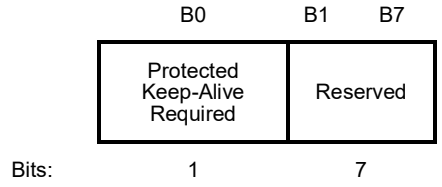

Figure 9-461—Idle Options field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Protected Keep-Alive Required subfield is set to 1 to indicate that only a protected frame indicates activity. The Protected Keep-Alive Required subfield is set to 0 to indicate that either an unprotected or a protected frame indicates activity.

The BSS Max Idle Period element is included in Association Request and Response frames, as described in 9.3.3.5 and 9.3.3.6, and Reassociation Request and Response frames, as described in 9.3.3.7 and 9.3.3.8. The use of the BSS Max Idle Period element and frames is described in 11.21.13.

9.4.2.79 TFS Request element

The TFS Request element defines information about the traffic filters that are enabled at the AP for the requesting non-AP STA. The format of the TFS Request element is defined in Figure 9-462.

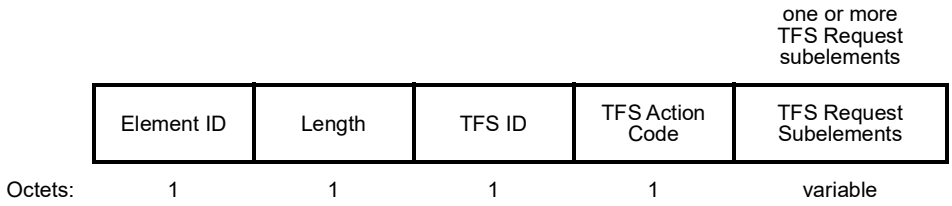

Figure 9-462—TFS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The TFS ID field is assigned by the STA and provides a unique identifier for the traffic filter set specified by the TFS Request Subelements field.

The TFS Action Code field defines the actions taken at the AP when a frame matches a traffic filter set. The functions of the bits in this field are shown in Table 9-222.

Table 9-222—TFS Action Code field values

Bit(s)	Name	Notes
0	Delete After Match	Setting this field to 1 for any traffic filter set indicates all traffic filter sets established at the AP for the non-AP STA are deleted when a frame matches any of the traffic filter sets established for the non-AP STA. Setting this field to 0 indicates no deletion of the traffic filter set upon a match.
1	Notify	Setting this field to 1 indicates the STA requests to be sent a TFS Notify frame upon the first frame matching to the traffic filter set or the first frame match after the AP receives a Notify Response frame containing the corresponding TFS ID. Setting this field to 0 indicates the AP does not send a TFS Notify frame to the requesting STA.
2–7	Reserved	All other bits are reserved.

The TFS Request Subelements field contains one or more TFS Request subelements described in Table 9-223. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-223. Each TFS Request subelement specifies one traffic filter. Using multiple TFS Request subelements in a TFS Request element is the equivalent to a logical AND operation on the match conditions of each TFS Request subelement.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-223—Optional subelement IDs for TFS Request parameters

Subelement ID	Subelement name
1	TFS subelement
221	Vendor Specific subelement
0, 2 to 220, 222 to 255	Reserved

In a TFS Response element, the number of the response subelements is the same as the number of the TFS Request subelements in the corresponding TFS Request element, where the TFS Response subelements appear in the same order as the corresponding TFS Request subelements in the corresponding TFS Request frame.

The format of the TFS subelement is shown in Figure 9-463.

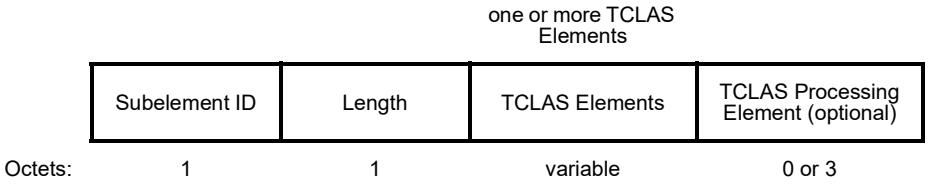

Figure 9-463—TFS subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS subelement.

The Length field is defined in 9.4.3.

The TCLAS Elements field contains one or more TCLAS elements, each specifying a set of filtering parameters as defined in 9.4.2.30. The number of TCLAS elements is limited and the total size of the TFS Request element is less than 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.32.

The format of the Vendor Specific subelement for a TFS Request element is shown in Figure 9-464.

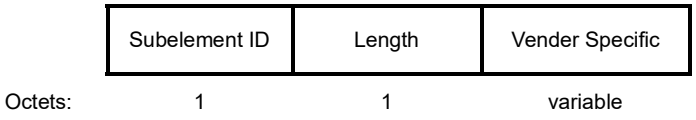

Figure 9-464—TFS Request Vendor Specific subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS Request subelement.

The Length field is defined in 9.4.3.

The Vendor Specific field contains the vendor specific information.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TFS Request element is included in TFS Request frames, as described in 9.6.13.15, and WNM Sleep Mode Request frames, as described in 9.6.13.19. The use of the TFS Request element and frames is described in 11.21.12.

9.4.2.80 TFS Response element

The TFS Response element defines information about the status of the requested filtering parameters. The format of the TFS Response element is defined in Figure 9-465.

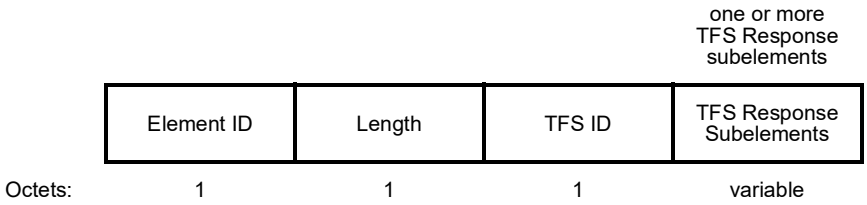

Figure 9-465—TFS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The TFS ID field indicates the unique ID for the TFS traffic filter set.

The TFS Response Subelements field contains one or more TFS Response subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-224.

In a TFS Response element, the number of the response subelements is the same as the number of the TFS Request subelements in the corresponding TFS Request element, where the TFS Response subelements appear in the same order as the corresponding TFS Request subelements in the corresponding TFS Request frame.

Table 9-224—Optional subelement IDs for TFS Response parameters

Subelement ID	Subelement name
1	TFS Status subelement
221	Vendor Specific subelement
0, 2–220, 222–255	Reserved

A TFS Status subelement contains the information as defined in Figure 9-466.

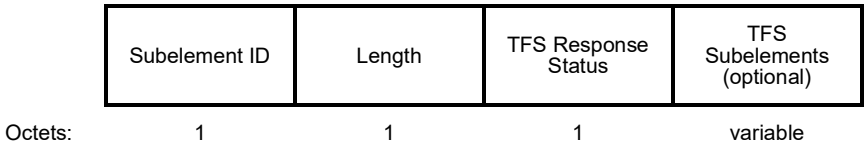

Figure 9-466—TFS Status subelement format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Length field is defined in 9.4.3.

The TFS Response Status field indicates the status returned by the AP responding to the STA's requested traffic filter, as indicated in Table 9-220.

If present, the TFS Subelements field contains one or more TFS Request subelements containing the alternative filtering parameters preferred by the AP.

The format of the Vendor Specific subelement for a TFS Response element is shown in Figure 9-467.

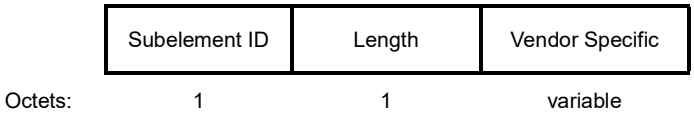

Figure 9-467—TFS Response Vendor Specific subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS Response subelement.

The Length field is defined in 9.4.3.

The Vendor Specific field contains the vendor specific information.

The TFS Response element is included in TFS Response frames, as described in 9.6.13.16, and WNM Sleep Mode Response frames, as described in 9.6.13.20. The use of the TFS Response element and frames is described in 11.21.12.

9.4.2.81 WNM Sleep Mode element

The WNM Sleep Mode element is used to enter and exit the WNM sleep mode. The format of the WNM Sleep Mode element is shown in Figure 9-468.

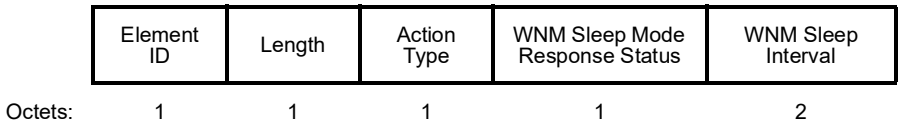

Figure 9-468—WNM Sleep Mode element format

The Element ID and Length fields are defined in 9.4.2.1.

The Action Type field is a number that identifies the type of WNM sleep mode request and response. The Action Types are shown in Table 9-225.

Table 9-225—Action Type definitions

Name	Action Type value
Enter WNM sleep mode	0
Exit WNM sleep mode	1
Reserved	2–255

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The WNM Sleep Mode Response Status field indicates the status returned by the AP responding to the non-AP STA's WNM sleep mode request as defined in Table 9-226. This field is valid only in the WNM Sleep Mode element in a WNM Sleep Mode Response frame and is reserved otherwise.

Table 9-226—WNM Sleep Mode Response Status definition

Value	Description
0	Enter/Exit WNM sleep mode Accept.
1	Exit WNM sleep mode Accept, GTK/IGTK/BIGTK update required.
2	Denied. The AP is unable to perform the requested action.
3	Denied temporarily. The AP is unable to perform the requested action at the current time. The request can be submitted again at a later time.
4	Denied. Due to the pending key expiration.
5	Denied. The requested action was not granted due to other WNM services in use by the requesting STA.
6–255	Reserved

The WNM Sleep Interval field is reserved if the Action Type field is 1.

The WNM Sleep Interval field indicates to the AP how often a STA in WNM sleep mode wakes to receive Beacon frames, defined as the number of DTIM intervals. The value set to 0 indicates that the requesting non-AP STA does not wake up at any specific interval. In a non-S1G STA, the WNM Sleep Interval field is an unsigned integer. In an S1G STA, the two MSBs of the WNM Sleep Interval field contain the Unified Scaling Factor subfield and the remaining 14 bits contain the Unscaled Interval subfield (see Figure 9-89). In an S1G STA, the WNM sleep interval is equal to the value of the Unscaled Interval subfield, multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield. The Unified Scaling Factor subfield encoding is defined in Table 9-48.

The WNM Sleep Mode element is included in WNM Sleep Mode Request frames, as described in 9.6.13.19, and WNM Sleep Mode Response frames, as described in 9.6.13.20. The use of the WNM Sleep Mode element and frames is described in 11.2.3.16.

9.4.2.82 TIM Broadcast Request element

The TIM Broadcast Request element contains information about the periodic TIM broadcast being requested by the non-AP STA. The format of the TIM Broadcast Request element is shown in Figure 9-469.

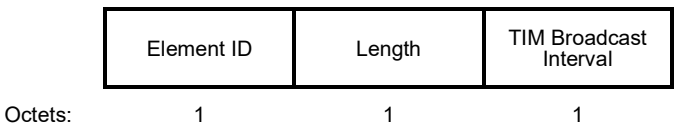

Figure 9-469—TIM Broadcast Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The TIM Broadcast Interval field is the number of beacon periods between TIM frame transmissions. A TIM Broadcast Interval field set to 0 terminates the use of TIM Broadcast for the requesting station.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TIM Broadcast Request element is included in TIM Broadcast Request frames, as described in 9.6.13.21; Association Request frames, as described in 9.3.3.5; and Reassociation Request frames, as described in 9.3.3.7. The use of the TIM Broadcast Request element and frames is described in 11.2.3.15.

9.4.2.83 TIM Broadcast Response element

The TIM Broadcast Response element contains information about the periodic TIM broadcast by the AP. The format of the TIM Broadcast Response element is shown in Figure 9-470.

	Element ID	Length	Status	TIM Broadcast Interval (optional)	TIM Broadcast Offset (optional)	High Rate TIM Rate (optional)	Low Rate TIM Rate (optional)
Octets:	1	1	1	0 or 1	0 or 4	0 or 2	0 or 2

Figure 9-470—TIM Broadcast Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The Status field indicates the status of the AP responding to the STA's requested delivery interval, as indicated in Table 9-227.

Table 9-227—Status field values

Field value	Description
0	Accept
1	Accept, timestamp present in TIM frames
2	Denied
3	Overridden
4	Overridden, timestamp present in TIM frames
5–255	Reserved

When the Status field is 0, 1, 3 or 4, the TIM Broadcast Interval field, TIM Broadcast Offset field, High Rate TIM Rate field, and Low Rate TIM Rate field are included in the TIM Broadcast Response element.

The TIM Broadcast Interval field contains the number of beacon periods between scheduled TIM frame transmissions.

The TIM Broadcast Offset field contains the offset in microseconds with a tolerance of ± 4 μs relative to the TBTT for which a TIM frame is scheduled for transmission. The field contains a 2s complement signed integer.

The High Rate TIM Rate field provides an indication of the rate that is used to transmit the high data rate TIM frame, in units of 0.5 Mb/s. Setting this field to 0 indicates that the high data rate TIM frame is not transmitted.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Low Rate TIM Rate field provides an indication of the rate that is used to transmit the low data rate TIM frame, in units of 0.5 Mb/s. The value 0 is reserved.

The TIM Broadcast Response element is included in TIM Broadcast Response frames, as described in 9.6.13.22; Association Response frames, as described in 9.3.3.6; and Reassociation Response frames, as described in 9.3.3.8. The use of the TIM Broadcast Response element and frames is described in 11.2.3.15.

9.4.2.84 Collocated Interference Report element

The Collocated Interference Report element contains some characteristics of the reported collocated interference. The Collocated Interference Report element is defined in Figure 9-471.

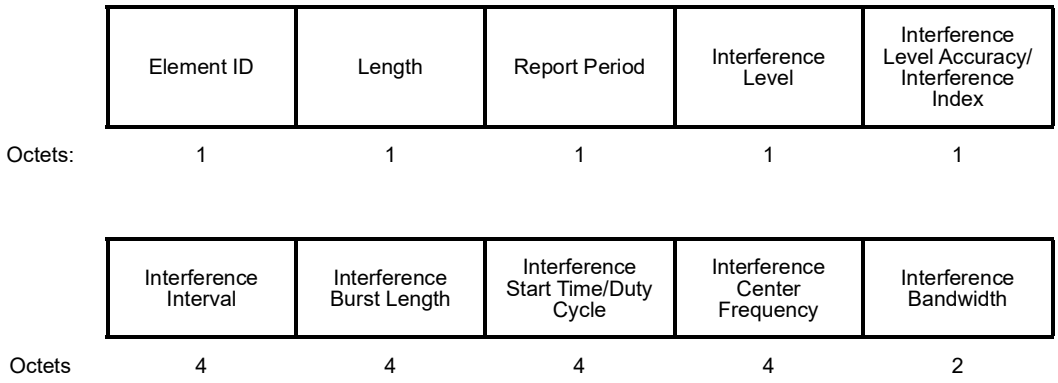

Figure 9-471—Collocated Interference Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Report Period field contains an unsigned integer value in units of 200 TUs. If the Report Period field is a value that is greater than 0, then the reporting is periodic, and the field contains the period of sending the report. If the Report Period field is 0, then the reporting is not periodic, and a report is generated when the STA knows of a change in the collocated interference. See 11.21.9 for further details.

The Interference Level field is a 2s complement signed integer indicating the maximum level of the collocated interference power in units of dBm over all receive chains averaged over a 4 μs period during an interference period and across interference bandwidth. When the interference level is unknown, the field is +127 dBm. When the interference level is equal or greater than 126 dBm, the field is +126 dBm. If no collocated interference is present the field is –128 dBm. When the interference level is equal or lower than –127 dBm, the field is –127 dBm. The interference level is referenced to the antenna connector (see "antenna connector" in 3.1) used for reception, like RCPI.

The Interference Level Accuracy/Interference Index field is shown in Figure 9-472.

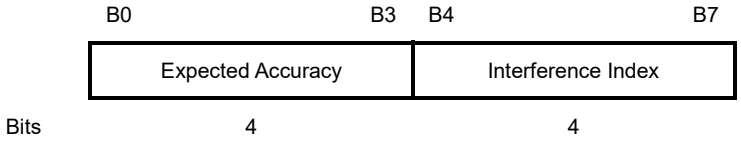

Figure 9-472—Interference Level Accuracy/Interference Index field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Expected Accuracy field represents an unsigned integer indicating the expected accuracy of the estimate of interference in dB with 95% confidence interval. If the Interference Level field is X (dBm) and the expected accuracy field is Y (dB), the actual interference level is in the range X – Y to X + Y with the probability of 95%. The range of expected accuracy is from 0 dB to 14 dB. If accuracy is unknown or greater than 14 dB, then the Expected Accuracy field is 15.

The Interference Index field indicates the interference index that is unique for each type of interference source. The field set to 0 indicates that no collocated interference is present. See 11.21.9 for further details.

The Interference Interval field indicates the interval between two successive periods of interference in microseconds. When the interval between two successive periods of interference is variable the field is 2^{32}–1. When the interval between two successive periods of interference is equal or greater than 2^{32}– 2, the field is 2^{32}– 2. If no collocated interference is present, the field is 0.

The Interference Burst Length field indicates the duration of each period of interference in microseconds. When the duration of each period of interference is variable the field is 2^{32}– 1. When the duration of each period of interference is equal or greater than 2^{32}– 2, the field is 2^{32}– 2. If no collocated interference is present, the field is 0.

The Interference Start Time/Duty Cycle field contains the least significant 4 octets (i.e., B0–B31) of the TSF timer at the start of the interference burst. When either the Interference Interval or the Interference Burst Length fields are set to 2^{32}– 1, this field indicates the average duty cycle. The average duty cycle value is defined as follows:

$$\text{Average duty cycle} = \left\lfloor (2^{32} - 2) \times \frac{T_B}{T_I} + 0.5 \right\rfloor$$

where

T_B is the average interference burst length
T_I is the average interference interval

When the interference is nonperiodic or no collocated interference is present, the Interference Start Time field is 0.

The Interference Center Frequency field indicates the center frequency of interference in units of 5 kHz. When center frequency is unknown, the center frequency of the STA's operating channel is reported. If no collocated interference is present the field is 0.

The Interference Bandwidth field indicates the bandwidth in units of 5 kHz at the –3 dB roll-off point of the interference signal. When bandwidth of the interference signal is unknown, the field is 65 535. When bandwidth of the interference signal is equal or greater than 65 534 the field is 65 534. If no collocated interference is present, the field is 0.

9.4.2.85 Channel Usage element

The Channel Usage element defines the channel usage information for BSSs that are not infrastructure BSSs or an off channel TDLS direct link. The format of the Channel Usage element is shown in Figure 9-473.

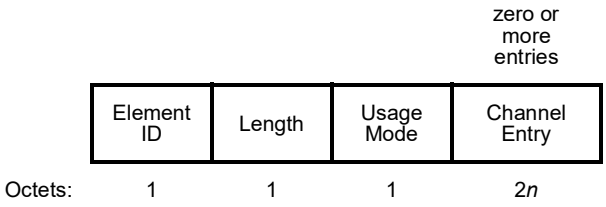

Figure 9-473—Channel Usage element format

The Element ID and Length fields are defined in 9.4.2.1.

The Usage Mode field is a number that identifies the usage of the recommended channels listed in the Operating Class/Channel Number pair fields. The Usage Mode definitions are shown in Table 9-228.

Table 9-228—Usage Mode definitions

Value	Usage Mode
0	Noninfrastructure IEEE 802.11 network
1	Off-channel TDLS direct link
2–255	Reserved

The Channel Entry field includes zero or more Operating Class and Channel fields. The format of the Operating Class and Channel fields is defined in 9.4.1.22. Operating Class and Channel fields can be grouped together to identify a noncontiguous channel as described in 9.4.2.70.3.

The Channel Usage element can be included in Probe Request frames, as described in 9.3.3.9; Probe Response frames, as described in 9.3.3.10; Channel Usage Request frames, as described in 9.6.13.24; and Channel Usage Response frames, as described in 9.6.13.25. The use of the Channel Usage element and frames is described in 11.21.15.

9.4.2.86 Time Zone element

The Time Zone element contains the local time zone of the AP. The format of the Time Zone element is shown in Figure 9-474.

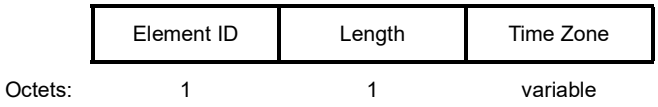

Figure 9-474—Time Zone element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Time Zone field is as specified in 8.3 of IEEE Std 1003.1-2004:

stdoffset[dst[offset][,start[/time],end[/time]]]

The length of the field is no less than 4 octets and no more than TZNAME_MAX, as defined in IEEE Std 1003.1-2004. The Time Zone field represents the time zone at the AP's location. The encoding of the field is in ASCII characters as shown in the following Example-1.

Example-1: EST5

Example-2: EST5EDT4,M3.2.0/02:00,M11.1.0/02:00

In the Example-2, the string is interpreted as a time zone that is normally five hours behind UTC, and four hours behind UTC during daylight saving time (DST), which runs from the second Sunday in March at 02:00 local time to the first Sunday in November at 02:00 local time. Normally, the time zone is abbreviated "EST" but during DST it is abbreviated "EDT."

9.4.2.87 DMS Request element

The DMS Request element defines information about the group addressed frames to be transmitted as individual addressed frames. The format of the DMS Request element is shown in Figure 9-475.

	Element ID	Length	DMS Descriptor List
Octets:	1	1	variable

Figure 9-475—DMS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMS Descriptor List field contains one or more DMS Descriptors. The format of the DMS Descriptor is defined in Figure 9-476.

	DMSID	DMS Length	Request Type	TCLAS Elements (zero or more TCLAS Elements)	TCLAS Processing Element (optional)	TSPEC Element (optional)	Optional Subelements
Octets:	1	1	1	variable	0 or 3	0 or 57	variable

Figure 9-476—DMS Descriptor format

The DMSID field is set to 0 when the Request Type field is "Add" as defined in Table 9-229; otherwise, the DMSID field is set to the nonzero value assigned by the AP to identify the DMS traffic flow.

The DMS Length field is set to 1 + *n*, where *n* indicates the total length in octets of all of the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Descriptor field. The maximum value of the DMS Length field is 253.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Request Type field identifies the type of DMS request. The encoding of the Request Type field is shown in Table 9-229.

Table 9-229—DMS Request Type field

Description	Request Type field value
Add	0
Remove	1
Change	2
Reserved	3–255

When the Request Type field contains "Add," the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 9.4.2.30. When a GCR Request subelement is included in the DMS Descriptor and the Request Type field is equal to "Add," the TCLAS Elements field contains at least a TCLAS element with frame classifier type set to 0 (Ethernet parameters) to specify a destination group address as defined in 9.4.2.30. When the Request Type field contains any value other than "Add," the TCLAS Elements field contains zero TCLAS elements.

When the Request Type field contains "Add" and when there are two or more TCLAS elements present, the TCLAS Processing Element field contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 9.4.2.32. Otherwise, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Request Type field contains "Add" or "Change," the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 9.4.2.29. When a GCR Request subelement is included in the DMS Descriptor and the Request Type field is equal to "Add" or "Change," the TSPEC Element field contains one TSPEC element. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-230.

Table 9-230—Optional subelement IDs for DMS Descriptor

Subelement ID	Name	Extensible
0	Reserved	
1	GCR Request	Yes
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Each DMS Descriptor contains zero or one GCR Request subelements. If present and the Request Type field is equal to "Add" or "Change," the GCR Request subelement indicates a request by a STA to respectively add or change the GCR service for a group addressed stream identified by the TCLAS element or by the DMSID in the DMS Descriptor. The format of the GCR Request subelement is shown in Figure 9-477.

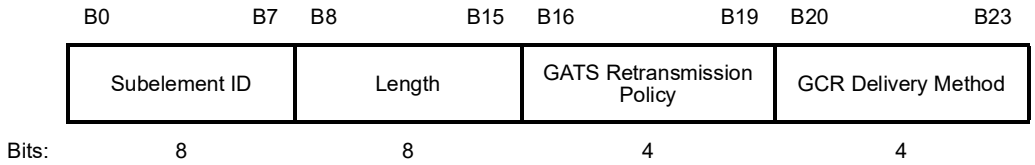

Figure 9-477—GCR Request subelement format

The Length field is defined in 9.4.3.

The GATS Retransmission Policy field is set to indicate the STA's preferred retransmission policy for the group address for which the GCR service is requested. The values are shown in Table 9-231.

Table 9-231—GATS Retransmission Policy field values

Value	GATS retransmission policy	Notes
0	No preference	
1	DMS	See 11.21.16.2.
2	GCR unsolicited retry	See 11.21.16.3.6.
3	GCR Block Ack	See 11.21.16.3.7.
4–15	Reserved	

The GCR Delivery Method field is set to indicate the STA's preferred delivery method for the group address for which the GCR service is requested. The values are shown in Table 9-232.

Table 9-232—GCR Delivery Method field values

Value	GCR delivery method	Notes
0	No preference	
1	Non-GCR-SP	See 11.21.16.3.1.
2	GCR-SP	See 11.21.16.3.8.
3–15	Reserved	

The DMS Request element is included in DMS Request frames, as described in 9.6.13.26, and Reassociation Request frames, as described in 9.3.3.7. The use of the DMS Request element and frames is described in 11.21.16.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.88 DMS Response element

The DMS Response element provides the status information about the requested group addressed frames. The format of the DMS Response element is shown in Figure 9-478.

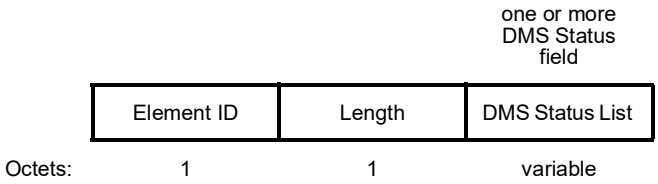

Figure 9-478—DMS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMS Status List field contains one or more DMS Status field. The format of the DMS Status field is defined in Figure 9-479.

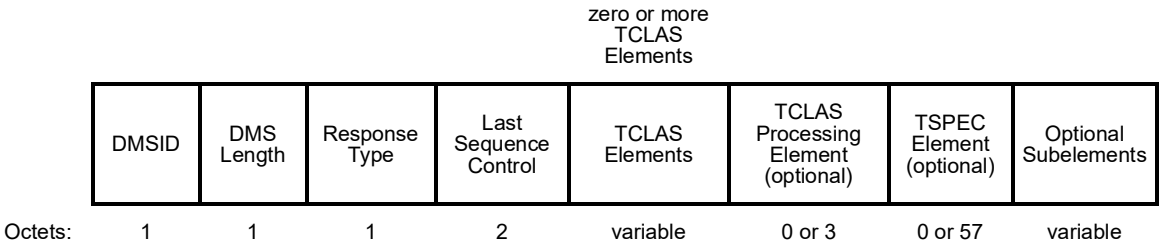

Figure 9-479—DMS Status field format

The DMSID is assigned by the AP and provides a unique identifier within the BSS for the DMS traffic flow identified by the TCLAS Elements, TCLAS Processing Element, and TSPEC Element fields. The uniqueness of the identifier is independent of the ordering of the TCLAS elements. In a mesh BSS, the DMSID is assigned by a mesh STA that responds to a GCR request and is unique among all existing DMSIDs used by the mesh STA for its current GCR agreements.

The DMS Length field is set to $3 + n$, where n indicates the total length in octets of all of the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Status field. When the Response Type field is equal to "Terminate," the DMS Length field is set to 3. The maximum value of the DMS Length field is 253.

The Response Type field indicates the response type returned by the AP responding to the non-AP STA's request or by a mesh STA responding to its peer mesh STA's request or indicates the DMS status is an advertisement of an existing GCR service, as indicated in Table 9-233.

Table 9-233—Response Type field values

Field value	Description	Notes
0	Accept	STA accepts the DMS or GCR request
1	Denied	STA rejects the DMS or GCR request
2	Terminate	STA terminates DMS previously accepted DMS or GCR request
3	GCR Advertise	STA advertises a group addressed stream subject to an existing GCR agreement.
4–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When the Last Sequence Control field is not supported the Last Sequence Control field is set to 65 535. When the Last Sequence Control field is supported and the Response Type field does not contain "Terminate" or "GCR Advertise," the Last Sequence Control field is reserved.

When the Response Type field is "Terminate" and the Last Sequence Control field is supported, Bit 0 to Bit 3 of the Last Sequence Control field is 0, and Bit 4 to Bit 15 of the Last Sequence Control field contains the sequence number of the last group addressed frame that the AP delivered to the non-AP STA that is the recipient of the DMS Response frame. If the Response Type field is "Terminate" and the last frame received by the non-AP STA prior to DMS termination has not also been sent using a group addressed frame, the Last Sequence Control field is set to 65 534.

When the Response Type field contains "Accept" or "Denied" and a GCR Response subelement is not included in the DMS Status field, the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 9.4.2.30. When the Response Type field is equal to "Accept," "Denied," or "GCR Advertise" and a GCR Response subelement is included in the DMS Status field, the TCLAS Elements field contains at least one TCLAS element with frame classifier type set to 0 (Ethernet parameters) to specify a destination group address as defined in 9.4.2.30. Otherwise, the TCLAS Elements field contains zero TCLAS elements.

When the Response Type field contains "Accept" or "Denied," the TCLAS Processing Element field optionally contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 9.4.2.32. When the Response Type field contains "Terminate" or when there is only one TCLAS element, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Response Type field contains "Accept" or "Denied," the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 9.4.2.29. When a GCR Response subelement is included in the DMS Status field and the Response Type field is equal to "Accept," "Denied," or "GCR Advertise," the TSPEC Element field contains one TSPEC element. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-234.

Table 9-234—Optional subelement IDs for DMS Status

Subelement ID	Name	Extensible
0	Reserved	
1	GCR Response	Subelements
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The GCR Response subelement contains one of the following:

— A response by an AP to a GCR request by a non-AP STA for GCR service for a group address
— A response by a mesh STA to a GCR request by a peer mesh STA for GCR service for a group address
— An unsolicited advertisement for the parameters of a group addressed stream subject to the GCR service

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the GCR Response subelement is shown in Figure 9-476.

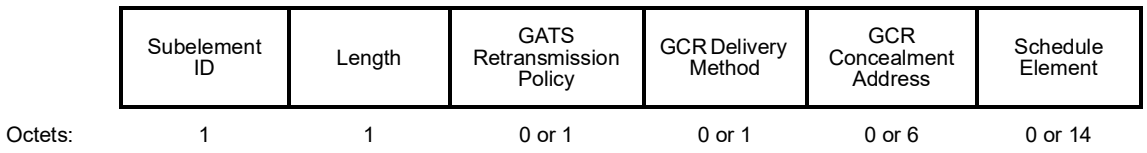

Figure 9-480—GCR Response subelement format

The GATS Retransmission Policy, GCR Delivery Method, and GCR Concealment Address fields are present when the Response Type field is not equal to "Denied"; otherwise, they are omitted. The Schedule Element field is optionally present when the Response Type field is not equal to "Denied."

The GATS Retransmission Policy field is set to indicate the current GCR retransmission policy for the group address for which the GCR service is requested. The values are shown in Table 9-231.

The GCR Delivery method field is set to indicate the current GCR Delivery method for the group address for which the GCR service is requested. The values are shown in Table 9-232.

The GCR Concealment Address field, when present, indicates the GCR concealment address, as described in 11.21.16.3.5.

The Schedule Element field is present if the GCR delivery method is equal to GCR-SP. It indicates the current SP schedule for the group addressed stream (see 9.4.2.33).

The DMS Response element is included in DMS Response frames, as described in 9.6.13.27, and Reassociation Response frames, as described in 9.3.3.8. The use of the DMS Response element and frames is described in 11.21.16.

9.4.2.89 Destination URI element

The Destination URI element contains URI and ESS Detection Interval values from the requesting STA that the responding STA can be used to deliver Event or Diagnostic Report frames. The format of the Destination URI element is shown in Figure 9-481.

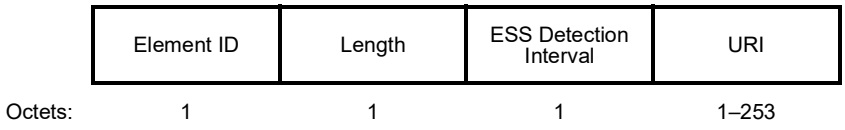

Figure 9-481—Destination URI element format

The Element ID and Length fields are defined in 9.4.2.1.

The ESS Detection Interval field is defined in 9.4.2.70.2 and its use for Event and Diagnostic requests is described in 11.21.2 and 11.21.3.

The URI field specifies the destination URI for Event and Diagnostic reports using the format defined in IETF RFC 3986. The URI field value is limited to 253 octets.

The Destination URI element is included as the last element in an Event or Diagnostic Request frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Destination URI element is included in Event Request frames, as described in 9.6.13.2, or Diagnostic Request frames, as described in 9.6.13.4.

Use of the Destination URI element in an Event Request frame is described in 11.21.2.1. Use of the Destination URI element in a Diagnostic Request frame is described in 11.21.3.1.

9.4.2.90 U-APSD Coexistence element

The U-APSD coexistence element provides the duration of requested transmission during a U-APSD service period. The format of the U-APSD Coexistence element is shown in Figure 9-482.

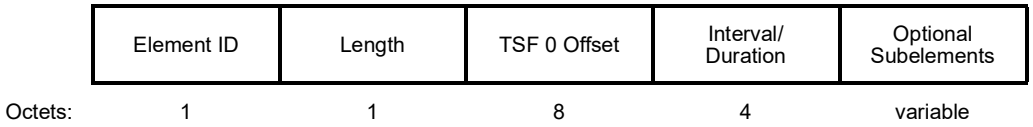

Figure 9-482—U-APSD Coexistence element format

The Element ID and Length fields are defined in 9.4.2.1.

The TSF 0 Offset field is set to the number of microseconds since TSF time 0 when the non-AP STA knew the start of interference. The AP uses the TSF 0 Offset field together with the Interval/Duration field to enqueue frames for transmission to the non-AP STA using the procedures as described in 11.2.3.5.2.

Setting the TSF 0 Offset field to 0 indicates the non-AP STA requests the AP transmit frames to the non-AP STA using the procedure described in 11.2.3.5.2 for the case where TSF 0 Offset is equal to 0.

The Interval/Duration field is defined as follows:

— When the TSF 0 Offset is 0, the Interval/Duration field is the number of microseconds during the U-APSD service period when the AP transmits frames to the non-AP STA as described in 11.2.3.5.2.
— When the TSF 0 Offset is nonzero, the Interval/Duration field is the number of microseconds between the start of consecutive interference bursts.

The Interval/Duration field value of 0 is reserved.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-235.

Table 9-235—Optional subelement IDs for U-APSD coexistence

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.91 Interworking element

The Interworking element contains information about the interworking service capabilities of a STA as shown in Figure 9-483.

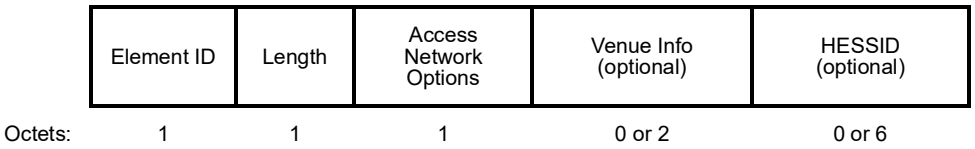

Figure 9-483—Interworking element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of Access Network Options field is shown in Figure 9-484.

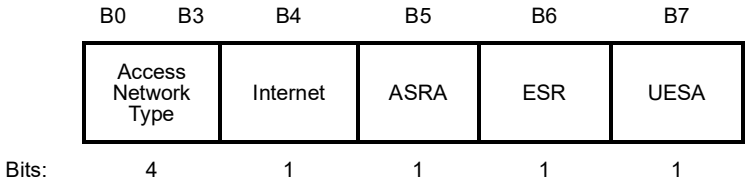

Figure 9-484—Access Network Options field format

A non-AP STA sets Internet, ASRA, ESR, and UESA fields to 0 when including the Interworking element in the Probe Request frame. A non-AP STA sets the Internet, ASRA and ESR bits to 0 when including the Interworking element in (Re)Association Request frames. A mesh STA sets the Internet bit to 0 when including the Interworking element in Mesh Peering Open frames. In (Re)Association Request frames, a non-AP STA sets the UESA bit according to the procedures in 11.3.5. The access network types are shown in Table 9-236. The Access Network Type field is set by the AP or the mesh STA to advertise its access network type to non-AP STAs. A non-AP STA uses this field to indicate the desired access network type in an active scan. See R.2 for the usage of fields contained within the Interworking element.

Table 9-236—Access network type

Access network type	Meaning	Description
0	Private network	Nonauthorized users are not permitted on this network. Examples of this access network type are home networks and enterprise networks, which might employ user accounts. Private networks do not necessarily employ encryption.
1	Private network with guest access	Private network but guest accounts are available. Example of this access network type is enterprise network offering access to guest users.
2	Chargeable public network	The network is accessible to anyone, however, access to the network requires payment. Further information on types of charges might be available through other methods (e.g., IEEE Std 802.21-2017, http/https redirect, or DNS redirection). Examples of this access network type is a hotspot in a coffee shop offering internet access on a subscription basis or a hotel offering in-room internet access service for a fee.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-236—Access network type *(continued)*

Access network type	Meaning	Description
3	Free public network	The network is accessible to anyone and no charges apply for the network use. An example of this access network type is an airport hotspot or municipal network providing free service.
4	Personal device network	A network of personal devices. An example of this type of network is a camera attaching to a printer, thereby forming a network for the purpose of printing pictures.
5	Emergency services only network	A network dedicated and limited to accessing emergency services.
6 to 13	Reserved	Reserved
14	Test or experimental	The network is used for test or experimental purposes only.
15	Wildcard	Wildcard access network type

Bit 4 is the Internet field. The AP or mesh STA sets this field to 1 if the network provides connectivity to the Internet; otherwise it is set to 0 indicating that it is unspecified whether the network provides connectivity to the Internet.

Bit 5 is the Additional Step Required for Access (ASRA) field. It is set to 1 by the AP to indicate that the network requires a further step for access. For more information, refer to Network Authentication Type Information in 9.4.5.6. A mesh STA uses the ASRA field as an emergency indicator. If a mesh STA requires emergency services, the ASRA field is set to 1; otherwise it is set to 0. See 11.22.6.

Bit 6 is the ESR (emergency services reachable) field. It is set to 1 by the AP or mesh STA to indicate that emergency services are reachable through the AP or mesh STA; otherwise it is set to 0 indicating that it is unable to reach the emergency services. See 11.22.6.

Bit 7 is the UESA (unauthenticated emergency service accessible) field. When set to 0, this field indicates that no unauthenticated emergency services are reachable through this AP or mesh STA. When set to 1, this field indicates that higher layer unauthenticated emergency services are reachable through this AP or mesh STA. A STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to a BSS to access emergency services. A mesh STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to another mesh STA to access emergency services. See 11.3.5.

The Venue Info field is defined in 9.4.1.34.

The HESSID field, which is the identifier for a homogeneous ESS, specifies the value of HESSID; see 11.22.2. A STA may use this field to indicate the target HESSID in an active scan per 11.1.4. The HESSID field for an AP is set to dot11HESSID. This optional field is not used by mesh STAs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.92 Advertisement Protocol element

The Advertisement Protocol element contains information that identifies a particular advertisement protocol and its corresponding Advertisement Control. The Advertisement Protocol element format is shown in Figure 9-485.

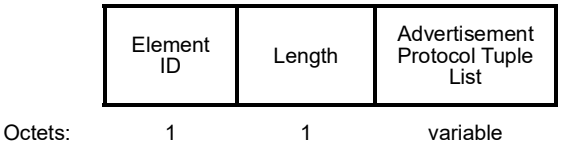

Figure 9-485—Advertisement Protocol element format

The Element ID and Length fields are defined in 9.4.2.1.

The Advertisement Protocol Tuple List field contains one or more Advertisement Protocol Tuple fields.

The format of an Advertisement Protocol Tuple field is shown in Figure 9-486.

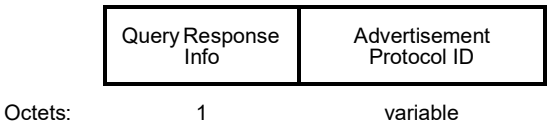

Figure 9-486—Advertisement Protocol Tuple field format

The format of Query Response Info field is shown in Figure 9-487.

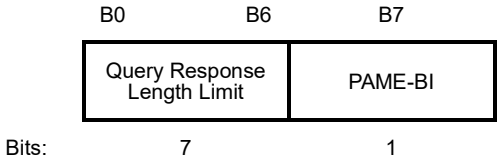

Figure 9-487—Query Response Info field format

The Query Response Info field is defined as follows:

— The Query Response Length Limit field indicates the maximum number of octets a STA will transmit in the Query Response field contained within one or more GAS Comeback Response frames. If the Query Response Length Limit field is larger than the maximum MMPDU size, the Query Response will span multiple MMPDUs. The Query Response Length Limit field is encoded as an integer number of 256 octet units. The value of 0 is reserved. The Query Response Length Limit field is set to 0x7F to indicate the maximum limit enforced is determined by the maximum allowable number of fragments in the GAS Query Response Fragment ID (see 9.4.1.33). The Query Response Length Limit field is reserved in a transmission from the requesting STA to the responding STA.

— Bit 7, the Preassociation Message Exchange BSSID Independent (PAME-BI) bit, is used by an AP to indicate whether the Advertisement Server, which is the non-AP STA's peer for this advertisement protocol, returns a Query Response that is independent of the BSSID used for the GAS frame exchange. This bit is set to 1 to indicate the Query Response is independent of the BSSID; it is set to 0 to indicate that the Query Response may be dependent on the BSSID. See 11.22.3.2 for further information. Bit 7 is reserved for non-AP STAs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Advertisement Protocol ID field is a variable length field. When this field contains a vendor-specific advertisement protocol ID, then this field will be structured per the Vendor Specific element defined in 9.4.2.25, where the Element ID of the Vendor Specific element of 9.4.2.25 is the first octet of the field and contains the vendor-specific value for advertisement protocol ID defined in Table 9-237; otherwise its length is 1 octet and its value is one of the values in Table 9-237. When one or more vendor-specific tuples are included in the Advertisement Protocol element, their total length needs to be constrained such that the total length of all of the Advertisement Protocol Tuple fields (both vendor specific and otherwise) is less than or equal to 255 octets.

— The ANQP supports information retrieval from an Advertisement Server. ANQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA might respond to queries with or without proxying the query to a server in an external network). See 11.22.3.3 for information on ANQP procedures.

— The MIS Information Service is a service defined in IEEE Std 802.21-2017 to support information retrieval from an information repository.

— The MIS Command and Event Services capability discovery is a mechanism defined in IEEE Std 802.21-2017 to support discovering capabilities of command service and event service entities in a STA or an external network.

— The EAS allows a network to disseminate emergency alert notifications from an external network to non-AP STAs. EAS uses the message format as defined in OASIS EDXL (see OASIS Standard EDXL-DE).

— The RLQP supports information retrieval from a RLSS. RLQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA can respond to queries with and without proxying the query to a server in an external network). 11.22 for information on RLQP procedures.

— The Advertisement protocol ID value 221 is reserved for vendor specific advertisement protocols. When the Advertisement Protocol ID field is equal to 221, the format of the Advertisement Protocol ID subfield follows the format of the Vendor Specific element in 9.4.2.25.

Table 9-237—Advertisement protocol ID definitions

Name	Value
Access network query protocol (ANQP)	0
MIS Information Service	1
MIS Command and Event Services Capability Discovery	2
Emergency Alert System (EAS)	3
Registered location query protocol (RLQP)	4
Reserved	5–220
Vendor Specific	221
Reserved	222–255

9.4.2.93 Expedited Bandwidth Request element

The Expedited Bandwidth Request element is transmitted from a non-AP STA to an AP in an ADDTS Request frame containing a TSPEC element and provides usage information for the bandwidth request. The Expedited Bandwidth Request element format is shown in Figure 9-488.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

	Element ID	Length	Precedence Level
Octets:	1	1	1

Figure 9-488—Expedited Bandwidth Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Precedence Level field is provided in Table 9-238.

Table 9-238—Precedence Level field description

Precedence level value	Description
0–15	Reserved
16	Emergency call, defined in NENA 08-002 [B57]
17	First responder (public)
18	First responder (private)
19	MLPP Level A
20	MLPP Level B
21	MLPP Level 0
22	MLPP Level 1
23	MLPP Level 2
24	MLPP Level 3
25	MLPP Level 4
26–255	Reserved

The precedence levels are derived from the 3rd Generation Partnership Project (3GPP) document 3GPP TS 22.067 [B2].

The first responders (public) in Table 9-238 are government agencies or entities acting on behalf of the government, and the first responders (private) are private entities, such as individuals or companies.

9.4.2.94 QoS Map element

The QoS Map element is transmitted from an AP to a non-AP STA in a (Re)Association Response frame or a QoS Map Configure frame and provides the mapping of higher layer quality-of-service constructs to User Priorities defined by transmission of Data frames in this standard. This element maps the higher layer priority from the DSCP field used with the Internet Protocol to User Priority as defined by this standard. The QoS Map element is shown in Figure 9-489.

	Element ID	Length	DSCP Exception List	UP 0 DSCP Range	UP 1 DSCP Range	UP 2 DSCP Range	...	UP 7 DSCP Range
Octets:	1	1	$n \times 2$	2	2	2		2

Figure 9-489—QoS Map element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The DSCP Exception List field contains zero or more (*n*) DSCP Exception fields. The maximum value of *n* is 21. The format of each DSCP Exception field is shown in Figure 9-490.

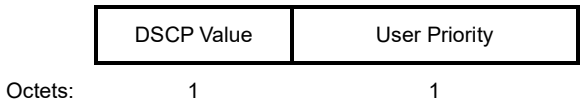

Figure 9-490—DSCP Exception format

The DSCP value in the DSCP Exception field is in the range 0 to 63, or 255; the User Priority value is in the range 0 to 7.

— When a non-AP STA begins transmission of a Data frame containing the Internet Protocol, it matches the DSCP field in the IP header to the corresponding DSCP value contained in this element. The non-AP STA first attempts to match the DSCP value to a DSCP exception field and uses the UP from the corresponding UP in the same DSCP exception field if successful; if no match is found then the non-AP STA attempts to match the DSCP field to a UP n DSCP Range field, and uses the n as the UP if successful; and otherwise uses a UP of 0.

— Each DSCP Exception field has a unique DSCP Value.

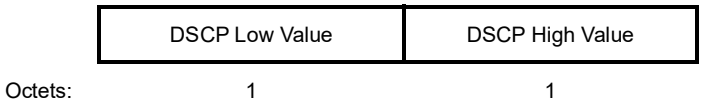

Figure 9-491—DSCP Range description

The QoS Map element has a DSCP Range field corresponding to each of the 8 user priorities. The format of the range field is shown in Figure 9-491. The DSCP Range value is between 0 and 63, or 255.

— The DSCP range for each user priority is nonoverlapping.

— The DSCP High Value is greater than or equal to the DSCP Low Value.

— If the DSCP Range high value and low value are both equal to 255, then the corresponding UP is not used.

9.4.2.95 Roaming Consortium element

The Roaming Consortium element contains information identifying the roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP transmitting this element; see 11.22.8. The element's format is shown in Figure 9-492.

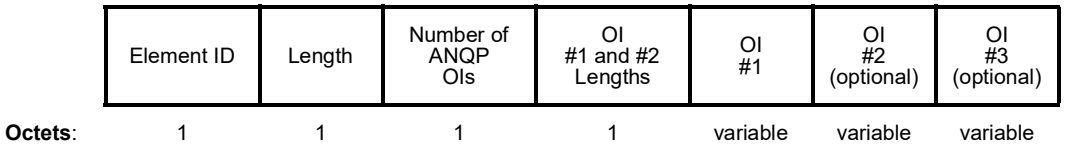

Figure 9-492—Roaming Consortium element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Number of ANQP OIs field is an unsigned integer whose value is the number of additional roaming consortium organization identifiers (OIs) obtainable via ANQP. The Number of ANQP OIs field is set to 0 to indicate that no additional OIs are returned in response to an ANQP request for the Roaming Consortium list. The Number of ANQP OIs field is set to 255 to indicate that 255 or more additional OIs are obtainable via ANQP.

The OI #1 and #2 Lengths field format is shown in Figure 9-493.

— The OI #1 Length subfield is set to the length in octets of the OI #1 field.
— The OI #2 Length subfield is set to the length in octets of the OI #2 field. If the OI #2 field is not present, the OI #2 Length subfield is set to 0.

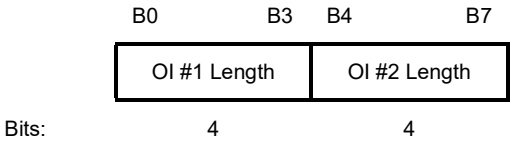

Figure 9-493—OI #1 and #2 Lengths field format

NOTE—When there are three OIs, the OI #3 Length is calculated by subtracting sum of 2 plus the value of the OI #1 Length subfield plus the value of the OI #2 Length subfield from the value of the Length field.

The OI field is defined in 9.4.1.31. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP. The OI(s) in this table are equal to the first 3 OIs in the dot11RoamingConsortiumTable. If fewer than 3 values are defined in the dot11RoamingConsortiumTable, then only as many OIs as defined in the table are populated in this element. The values of the OIs in this element are equal to the values of the first OIs, up to 3, from the table.

9.4.2.96 Emergency Alert Identifier element

The Emergency Alert Identifier element provides a hash to identify instances of the active EAS messages that are currently available from the network. The hash allows the non-AP STA to assess whether an EAS message advertised by an AP has been previously received and therefore whether it is necessary to download from the network. The format of the Emergency Alert Identifier element is shown in Figure 9-494.

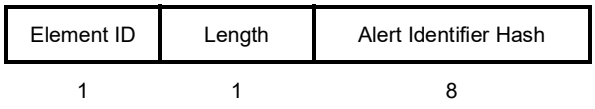

Figure 9-494—Emergency Alert Identifier element format

The Element ID and Length fields are defined in 9.4.2.1.

The Alert Identifier Hash (AIH) contains a unique value used to indicate an instance of an EAS message. This field is set to the hash produced by the HMAC-SHA-1-64 hash algorithm operating on the EAS message.

AIH =HMAC-SHA-1-64(“ES_ALERT”, Emergency_Alert_Message)

where

“ES_ALERT” is an ASCII string.
Emergency_Alert_Message is the EAS message itself.

9.4.2.97 Mesh Configuration element

9.4.2.97.1 General

The Mesh Configuration element shown in Figure 9-495 is used to advertise mesh services. It is contained in Beacon frames and Probe Response frames transmitted by mesh STAs and is also contained in Mesh Peering Open and Mesh Peering Confirm frames.

	Element ID	Length	Active Path Selection Protocol Identifier	Active Path Selection Metric Identifier	Congestion Control Mode Identifier	Synchronization Method Identifier	Authentication Protocol Identifier	Mesh Formation Info	Mesh Capability
Octets	1	1	1	1	1	1	1	1	1

Figure 9-495—Mesh Configuration element format

The Element ID and Length fields are defined in 9.4.2.1.

The remainder of the fields are described in the following subclauses.

9.4.2.97.2 Active Path Selection Protocol Identifier

The Active Path Selection Protocol Identifier field indicates the path selection protocol that is currently activated in the MBSS. Table 9-239 provides path selection protocol identifier values defined by this standard.

Table 9-239—Active Path Selection Protocol Identifier field values

Value	Meaning
0	Reserved
1	Hybrid wireless mesh protocol (default path selection protocol) defined in 14.10 (default path selection protocol)
2–254	Reserved
255	Vendor specific (The active path selection protocol is specified in a Vendor Specific element)

When the Active Path Selection Protocol Identifier field is 255, the active path selection protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.25.)

9.4.2.97.3 Active Path Selection Metric Identifier

The Active Path Selection Metric Identifier field indicates the path metric that is currently used by the active path selection protocol in the MBSS. Table 9-240 provides the path selection metric identifier values defined by this standard.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-240—Active Path Selection Metric Identifier field values

Value	Meaning
0	Reserved
1	Airtime link metric defined in 14.9.2 (default path selection metric)
2	High PHY rate airtime link metric defined in 14.9.2
3–254	Reserved
255	Vendor specific (The active metric is specified in a Vendor Specific element)

When the Active Path Selection Metric Identifier field is 255, the active path metric is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.25.)

9.4.2.97.4 Congestion Control Mode Identifier

The Congestion Control Mode Identifier field indicates the congestion control protocol that is currently activated in the MBSS. Table 9-241 provides the congestion control mode identifier values defined by this standard.

Table 9-241—Congestion Control Mode Identifier field values

Value	Meaning
0	Congestion control is not activated (default congestion control mode)
1	Congestion control signaling protocol defined in 14.12.2
2–254	Reserved
255	Vendor specific (The active congestion control protocol is specified in a Vendor Specific element)

The Congestion Mode Identifier field set to 0 indicates the mesh STA has no active congestion control protocol and is set as the default value for the congestion control mode identifier in the MBSS.

When the Congestion Control Mode Identifier field is 255, the active congestion control protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.25.)

9.4.2.97.5 Synchronization Method Identifier

The Synchronization Method Identifier field indicates the synchronization method that is currently activated in the MBSS. Table 9-242 provides the synchronization method identifier values defined by this standard.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-242—Synchronization Method Identifier field values

Value	Meaning
0	Reserved
1	Neighbor offset synchronization method defined in 14.13.2.2 (default synchronization method)
2–254	Reserved
255	Vendor specific (The active synchronization method is specified in a Vendor Specific element)

The neighbor offset synchronization method is defined as the default synchronization method among mesh STAs. The details of the neighbor offset synchronization method are described in 14.13.2.2.

When the Synchronization Method Identifier field is 255, the active synchronization method is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.25.)

9.4.2.97.6 Authentication Protocol Identifier

The Authentication Protocol Identifier field indicates the type of authentication protocol that is currently used to secure the MBSS. Table 9-243 provides the authentication protocol identifier values defined by this standard.

Table 9-243—Authentication Protocol Identifier field values

Value	Meaning
0	No authentication method is required to establish mesh peerings within the MBSS
1	SAE defined in 12.4
2	IEEE 802.1X authentication
3–254	Reserved
255	Vendor specific (The active authentication protocol is specified in a Vendor Specific element)

When the Authentication Protocol Identifier field is 255, the active authentication protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.25.)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.97.7 Mesh Formation Info

The format of the Mesh Formation Info field is shown in Figure 9-496.

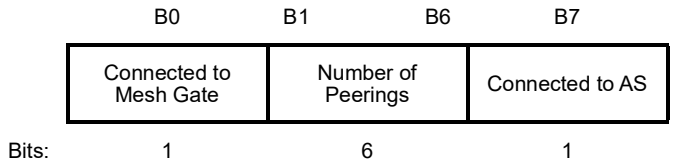

Figure 9-496—Mesh Formation Info field format

The Connected to Mesh Gate subfield is set to 1, if the mesh STA has a mesh path to a mesh gate that announces its presence using GANN elements, RANN elements, or PREQ elements, and set to 0 otherwise.

The Number of Peerings subfield contains an unsigned integer that indicates the number of mesh peerings currently maintained by the mesh STA or 63, whichever is smaller.

The Connected to AS subfield is set to 1 if the Authentication Protocol Identifier field in the Mesh Configuration element is equal to 2 (indicating IEEE 802.1X authentication) and the mesh STA has an active connection to an AS.

NOTE—When an AS is collocated with an IEEE 802.1X Authenticator an active connection is implicitly true.

9.4.2.97.8 Mesh Capability

The Mesh Capability field comprises a set of values indicating whether a mesh STA is a possible candidate for mesh peering establishment. The details of the Mesh Capability field are shown in Figure 9-497.

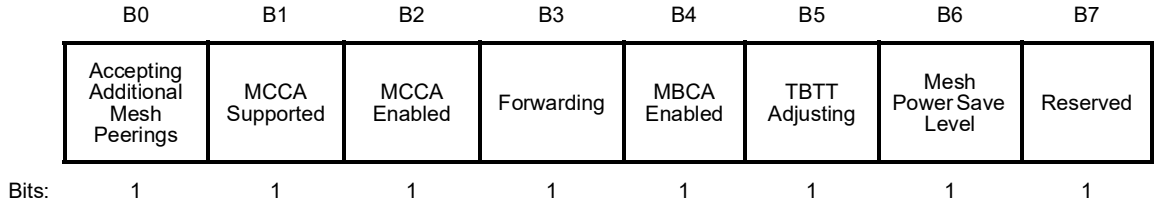

Figure 9-497—Mesh Capability field format

The Accepting Additional Mesh Peerings subfield is set to 1 if the mesh STA is willing to establish additional mesh peerings with other mesh STAs and set to 0 otherwise (i.e., the Accepting Additional Mesh Peerings subfield is set in accordance with dot11MeshAcceptingAdditionalPeerings). When the Mesh Configuration element is included in the Mesh Peering Open frame and in the Mesh Peering Confirm frame, the Accepting Additional Mesh Peerings subfield is set to 1.

The MCCA Supported subfield is set to 1 if the mesh STA implements MCCA and set to 0 otherwise (i.e., the MCCA Supported subfield is set in accordance with dot11MCCAImplemented).

The MCCA Enabled subfield is set to 1 if the mesh STA is using the MCCA and set to 0 otherwise (i.e., the MCCA Enabled subfield is set in accordance with dot11MCCAActivated).

The Forwarding subfield is set to 1 if the mesh STA forwards MSDUs and set to 0 otherwise (i.e., the Forwarding subfield is set in accordance with dot11MeshForwarding).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MBCA Enabled subfield is set to 1 if the mesh STA is using MBCA and is set to 0 otherwise (i.e., the MBCA Enabled subfield is set in accordance with dot11MBCAActivated). (See 14.13.4.)

The TBTT Adjusting subfield is set to 1 while the TBTT adjustment procedure is ongoing and is set to 0 otherwise. (See 14.13.4.4.3.)

The Mesh Power Save Level subfield is set to 1 if at least one of the peer-specific mesh power management modes is deep sleep mode and set to 0 otherwise. The Mesh Power Save Level subfield is reserved when the Power Management subfield in the Frame Control field is set to 0. See 9.2.4.5.11.

9.4.2.98 Mesh ID element

The Mesh ID element is used to advertise the identification of an MBSS and is described in 14.2.2. The format of the Mesh ID element is shown in Figure 9-498. The Mesh ID element is transmitted in Mesh Peering Open frames, Mesh Peering Confirm frames, Mesh Peering Close frames, Beacon frames, and Probe Request and Response frames.

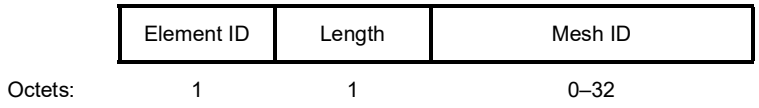

Figure 9-498—Mesh ID element format

The Element ID and Length fields are defined in 9.4.2.1.

A Mesh ID field of length 0 indicates the wildcard Mesh ID, which is used within Probe Request frame.

Detailed usage of the Mesh ID element is described in 14.2.2.

9.4.2.99 Mesh Link Metric Report element

The Mesh Link Metric Report element is transmitted by a mesh STA to a neighbor peer mesh STA to indicate the quality of the link between the transmitting mesh STA and the neighbor peer mesh STA. The format of the Mesh Link Metric Report element is shown in Figure 9-499.

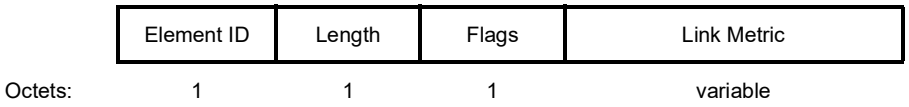

Figure 9-499—Mesh Link Metric Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-500.

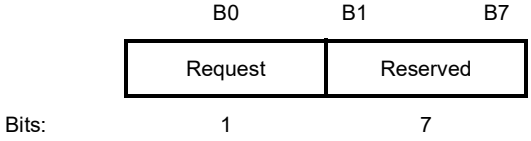

Figure 9-500—Flags field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Flags field is set as follows:

— Bit 0: Request subfield (0 = not a request, 1 = link metric report request). A Request subfield equal to 1 indicates that the recipient of Mesh Link Metric Report element is requested to send a link metric report to the transmitter of the Mesh Link Metric Report element.

— Bit 1–7: Reserved.

The Link Metric field indicates the link metric associated with the mesh link between the peer mesh STA transmitting the Mesh Link Metric Report and the neighbor mesh STA receiving the Mesh Link Metric report. The length and the data type of the Link Metric field are determined by the active path selection metric identifier (see 9.4.2.97.3). The length and the data type for the airtime link metric are given in Table 14-5 in 14.9.2. The length and the data type for the airtime link metric and the high PHY rate airtime link metric are given in Table 14-5 in 14.9.2.

9.4.2.100 Congestion Notification element

The Congestion Notification element is used to indicate the congestion status of the mesh STA per mesh destination and AC, and the duration for which the STA expects the congestion to last. The format of the Congestion Notification element is shown in Figure 9-501. The Congestion Notification element is included in Congestion Control Notification frames, as described in 9.6.16.5.

	Element ID	Length	Destination Mesh STA Address	Congestion Notification Duration (AC_BK)	Congestion Notification Duration (AC_BE)	Congestion Notification Duration (AC_VI)	Congestion Notification Duration (AC_VO)
Octets:	1	1	6	2	2	2	2

Figure 9-501—Congestion Notification element format

The Element ID and Length fields are defined in 9.4.2.1.

The Destination Mesh STA Address field is represented as a 48-bit MAC address and is set to the address of the mesh destination for which the intra-mesh congestion control is applied. It is set to the broadcast address if the intra-mesh congestion control is applied to all destinations.

The element contains four Congestion Notification Duration fields for the four EDCA access categories to indicate the estimated congestion duration per AC at the mesh STA transmitting the congestion notification. The congestion notification duration values are encoded as unsigned integers in units of 100 μs.

9.4.2.101 Mesh Peering Management element

The Mesh Peering Management element is used to manage a mesh peering with a neighbor mesh STA. The format of the Mesh Peering Management element is shown in Figure 9-502.

	Element ID	Length	Mesh Peering Protocol Identifier	Local Link ID	Peer Link ID (optional)	Reason Code (optional)	Chosen PMK (optional)
Octets:	1	1	2	2	0 or 2	0 or 2	0 or 16

Figure 9-502—Mesh Peering Management element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Mesh Peering Protocol Identifier field indicates the type of mesh peering protocol that is currently used to establish mesh peerings. Table 9-244 provides the mesh peering protocol identifier values defined by this standard.

Table 9-244—Mesh Peering Protocol Identifier field values

Value	Meaning
0	Mesh peering management protocol
1	Authenticated mesh peering exchange protocol
2–254	Reserved
255	Vendor specific (The active mesh peering protocol is specified in a Vendor Specific element)
256–65 535	Reserved

When the Mesh Peering Protocol Identifier field is 255, the active mesh peering protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.25.)

The Local Link ID field is the unsigned integer value generated by the local mesh STA to identify the mesh peering instance.

The conditional components of the Mesh Peering Management element are present depending on the Action field of the frame in which the Mesh Peering Management element is conveyed.

The Peer Link ID field is the unsigned integer value generated by the peer mesh STA to identify the mesh peering instance. This field is not present for the Mesh Peering Open frame, is present for the Mesh Peering Confirm frame, and is optionally present for the Mesh Peering Close frame. The presence or absence of the Peer Link ID in a Mesh Peering Close is inferred by the Length field.

The Reason Code field enumerates reasons for sending a Mesh Peering Close. It is present for the Mesh Peering Close frame and is not present for Mesh Peering Open or Mesh Peering Confirm frames. The reason code is defined in 9.4.1.7.

The Chosen PMK field is present when dot11MeshSecurityActivated is true and a PMK is shared between the transmitter and receiver of the frame containing the element. It contains the PMKID that identifies the PMK used to protect the mesh peering Management frame.

Detailed usage of the Mesh Peering Management element is described in 14.3.6, 14.3.7, 14.3.8, and 14.5.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.102 Mesh Channel Switch Parameters element

The Mesh Channel Switch Parameters element is used together with Channel Switch Announcement element and Extended Channel Switch Announcement element by a mesh STA to advertise to other mesh STAs when it is changing to a new operating channel and/or operating class. The format of the Mesh Channel Switch Parameters element is shown in Figure 9-503.

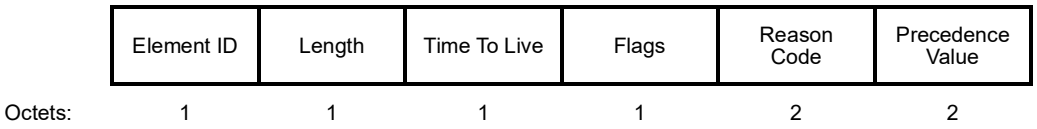

Figure 9-503—Mesh Channel Switch Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

The Time To Live field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Flags field indicates the attribute of this channel switch attempt. The format of the Flags field is shown in Figure 9-504.

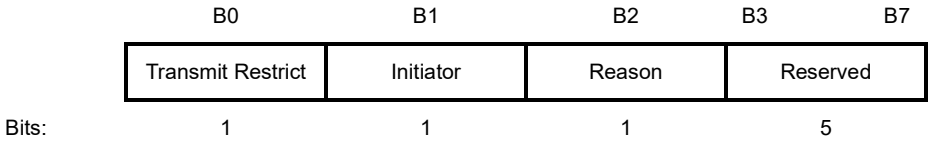

Figure 9-504—Flags field format

The Transmit Restrict subfield is set to 1 when the mesh STA asks neighboring peer mesh STAs not to transmit further frames except frames containing Mesh Channel Switch Parameters element on the current channel until the scheduled channel switch. The Transmit Restrict subfield is set to 0 otherwise.

The Initiator subfield is set to 1 when the mesh STA initiates this channel switch attempt. The Initiator subfield is set to 0 when this channel switch attempt is initiated by another mesh STA and propagated by the current mesh STA.

The Reason subfield indicates the validity of the Reason Code field. It is set to 1 if the Reason Code field is valid and is set to 0 otherwise. When the Reason subfield is 0, the content of the Reason Code field is reserved.

The Reason Code field specifies the reason for the mesh channel switch. The Reason Code is defined in 9.4.1.7. The content of the Reason Code field is valid only when Reason subfield of Flags field is set to 1 and is reserved otherwise.

The Precedence Value field is coded as unsigned integer and is set to a random value drawn from a uniform distribution in the range 0 to 65 535 determined by the initiator of this channel switch attempt.

The Mesh Channel Switch Parameters element is included in Channel Switch Announcement frames, as described in 9.6.2.6, and Extended Channel Switch Announcement frames, as described in 9.6.7.7. During MBSS channel switching, the Mesh Channel Switch Parameters element is included in Beacon frames, as described in 9.3.3.2, and Probe Response frames, as described in 9.3.3.10, until the scheduled channel switch.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.103 Mesh Awake Window element

The Mesh Awake Window element is present in DTIM Beacon frames and is optionally present in Beacon and Probe Response frames. The format of the Mesh Awake Window element is shown in Figure 9-505.

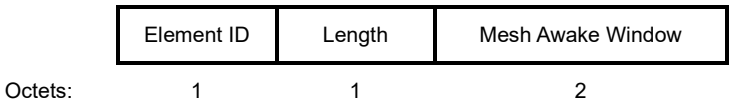

Figure 9-505—Mesh Awake Window element format

The Element ID and Length fields are defined in 9.4.2.1.

The Mesh Awake Window field contains an unsigned integer that indicates the duration of the mesh awake window in TUs.

9.4.2.104 Beacon Timing element

The Beacon Timing element is used to advertise the beacon timing information of neighbor STAs (mesh STAs, IBSS APs, or IBSS STAs). The format of the Beacon Timing element is shown in Figure 9-506.

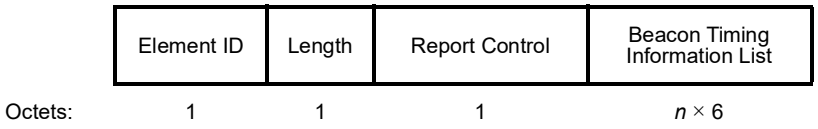

Figure 9-506—Beacon Timing element format

The Element ID and Length fields are defined in 9.4.2.1.

The Report Control field is used to signal information about the beacon timing information tuple contained in the Beacon Timing element. The structure of the Report Control field is defined in Figure 9-507.

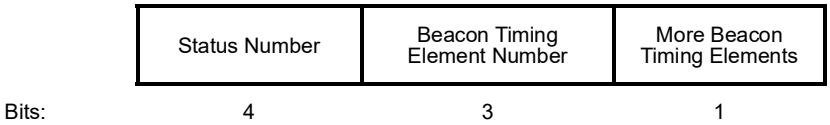

Figure 9-507—Report Control field format

The Status Number subfield is set to the status number of the beacon timing information set. The status number is managed as described in 14.13.4.2.4.

The Beacon Timing Element Number subfield is an unsigned integer that indicates the index of the beacon timing information tuple contained in this Beacon Timing element. The Beacon Timing Element Number is set to 0 in the Beacon Timing element for the first or only tuple of the beacon timing information and is incremented by one for each successive tuple of the beacon timing information. The beacon timing information tuples are managed as described in 14.13.4.2.5.

The More Beacon Timing Element subfield is set to 1 if a successive tuple of beacon timing information exists, and set to 0 otherwise.

The Beacon Timing Information List field contains one or more (n) Beacon Timing Information fields.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Each Beacon Timing Information field contains the beacon timing information of a neighbor STA. When the mesh STA reports multiple beacon timing information, multiple Beacon Timing Information fields are included in the Beacon Timing element. The structure of the Beacon Timing Information field is defined in Figure 9-508.

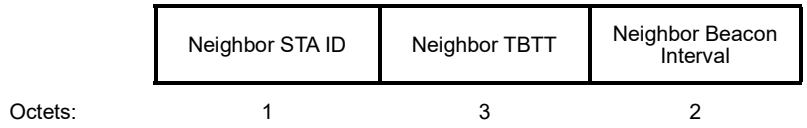

Figure 9-508—Beacon Timing Information field format

The Neighbor STA ID subfield is an unsigned integer that indicates the identification of the neighbor STA corresponding to this beacon timing information. When a mesh peering is established with this neighbor STA, the MSB of this field is set to 0, and the rest of this field is set to the last 7 digits (7 LSBs) of the AID value assigned to this neighbor mesh STA. When a mesh peering is not established with this neighbor STA, the MSB of this field is set to 1, and the rest of this field is set to MAC_ADDR[42:47] of the 48-bit MAC address of this neighbor STA.

NOTE—Since the Neighbor STA ID subfield is provided in abbreviated form, it is possible that the same Neighbor STA ID value appears in multiple Beacon Timing Information fields.

The Neighbor TBTT subfield is an unsigned integer that indicates a TBTT of the corresponding neighbor STA, measured in the local TSF timer of the mesh STA. The value is indicated in multiples of 32 μs. When the active synchronization method is the neighbor offset synchronization method, the TBTT is calculated as described in 14.13.4.2.2. The B5 to the B28 (taking the B0 as the LSB) of the calculated TBTT are contained in this subfield.

The Neighbor Beacon Interval subfield is an unsigned integer that indicates the beacon interval being used by the corresponding neighbor STA. The unit of the Neighbor Beacon Interval subfield is TU.

Detailed usage of the Beacon Timing element is described in 14.13.4.2.

9.4.2.105 MCCAOP Setup Request element

9.4.2.105.1 General

The MCCAOP Setup Request element is used to make an MCCAOP reservation. This element is transmitted in individually addressed MCCA Setup Request frames or in group addressed MCCA Setup Request frames. The mesh STA transmitting the MCCA Setup Request element is the MCCAOP owner of the MCCAOPs that will be scheduled with this reservation setup request. The receivers of the MCCAOP Setup Request frame are the MCCAOP responders. The format of the element is shown in Figure 9-509.

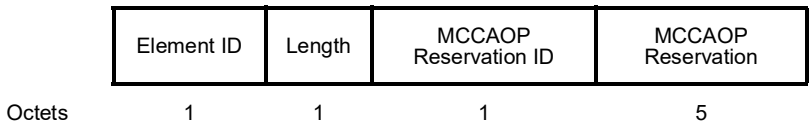

Figure 9-509—MCCAOP Setup Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The MCCAOP Reservation ID field is an unsigned integer that represents the ID for the MCCAOP reservation. It is determined by the MCCAOP owner. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation. If this

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

MCCAOP Setup Request element is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127 and the MCCAOP Setup Request element is transmitted in an individually addressed frame to the intended responder. If this MCCAOP Setup Request element is for a group addressed transmission, the MCCAOP Reservation ID is between 128 and 254 and the MCCAOP Setup Request element is transmitted in a group addressed frame. The value 255 is not used to identify a single MCCAOP reservation.

The MCCAOP Reservation field is described in 9.4.2.105.2.

9.4.2.105.2 MCCAOP Reservation field

The MCCAOP Reservation field is a 5-octet field specifying a schedule for frame transmissions called *MCCAOPs*. The MCCAOP Reservation field consists of three subfields and its format is shown in Figure 9-510.

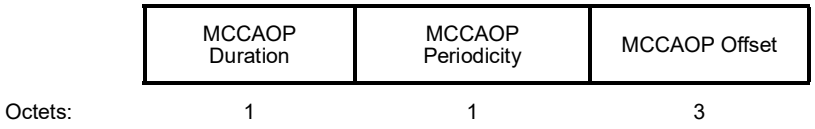

Figure 9-510—MCCAOP Reservation field format

The MCCAOP Duration subfield contains an unsigned integer. It specifies the duration of the MCCAOPs in multiples of 32 μs.

The MCCAOP Periodicity subfield contains a positive integer. It specifies the number of MCCAOPs scheduled in each DTIM interval.

The MCCAOP Offset subfield is 3 octets in length and contains an unsigned integer. It specifies the beginning of the first MCCAOP in each DTIM interval. The value is specified in multiples of 32 μs. The sum of MCCAOP Offset plus MCCAOP Duration is constrained to be smaller than the duration of the DTIM interval divided by MCCAOP Periodicity.

9.4.2.106 MCCAOP Setup Reply element

The MCCAOP Setup Reply element is used to reply to an MCCAOP Setup Request. This element is transmitted in individually addressed MCCA Setup Reply frames. The mesh STA transmitting the MCCA Setup Reply element is the MCCAOP responder of the MCCAOPs scheduled in this reservation setup. The receiver of the MCCAOP Setup Reply is the MCCAOP owner. The format of the element is shown in Figure 9-511.

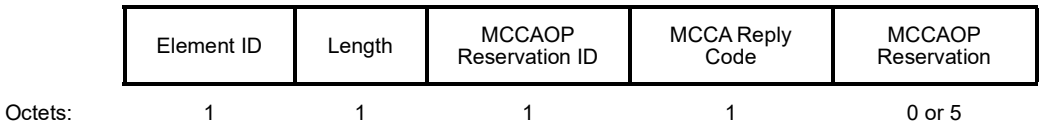

Figure 9-511—MCCAOP Setup Reply element format

The Element ID and Length fields are defined in 9.4.2.1.

The MCCAOP Reservation ID field is an unsigned integer that represents the ID for the requested series of MCCAOPs. It is determined by the MCCAOP owner and copied from the MCCAOP Setup Request element. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MCCA Reply Code field is a 1-octet field that contains the reply code used in an MCCAOP Setup Reply element. The reply codes are defined in Table 9-245.

Table 9-245—MCCA Reply Code field values

MCCA reply code	Meaning
0	Accept
1	Reject: MCCAOP reservation conflict
2	Reject: MAF limit exceeded
3	Reject: MCCA track limit (dot11MCCATrackStatesActive) exceeded
4–255	Reserved

The MCCAOP Reservation field includes an alternative to the MCCAOP reservation specified in the MCCAOP Setup Request frame. Its format is described in 9.4.2.105.2. When the MCCA Reply Code is 1, the MCCAOP Reservation field might be present. When the MCCA Reply Code is set to other values, the MCCAOP Reservation field is not present.

9.4.2.107 MCCAOP Advertisement Overview element

The MCCAOP Advertisement Overview element is used by a mesh STA to advertise its MCCA Information and information about its MCCAOP Advertisement elements, representing its MCCAOP advertisement set, to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the MCCAOP Advertisement Overview element is shown in Figure 9-512.

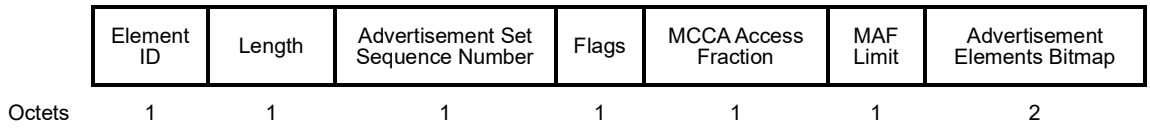

Figure 9-512—MCCAOP Advertisement Overview element format

The Element ID and Length fields are defined in 9.4.2.1.

The Advertisement Set Sequence Number field is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement Overview element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.

The format of the Flags field is shown in Figure 9-513.

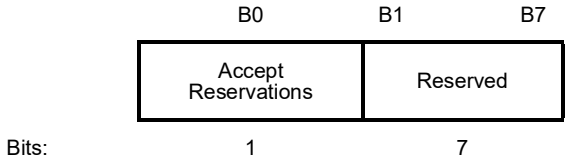

Figure 9-513—Flags field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Flags field is set as follows:

— Bit 0: Accept Reservations subfield. The Accept Reservations subfield is set to 1 if the mesh STA accepts additional reservations. It is set to 0 otherwise.

— Bit 1–7: Reserved

The MCCA Access Fraction field is an unsigned integer. The MCCA Access Fraction field is set to the current value of the MCCA access fraction at the mesh STA rounded down to the nearest multiple of (1/255) of the DTIM interval length.

The MAF Limit field is an unsigned integer. The MAF Limit field is set to the maximum MCCA access fraction allowed at the mesh STA rounded down to the nearest multiple of (1/255) of the DTIM interval length.

The Advertisement Elements Bitmap field indicates the MCCAOP Advertisement elements that are part of this MCCAOP advertisement set. The Advertisement Elements Bitmap field is a bitmap. Bit *i* in this bitmap equals 1 if the MCCAOP Advertisement element with MCCAOP Advertisement Element Index equal to *i* is part of this MCCAOP advertisement set, and it equals 0 otherwise.

9.4.2.108 MCCAOP Advertisement element

9.4.2.108.1 General

The MCCAOP Advertisement element is used by a mesh STA to advertise MCCAOP reservations to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the element is shown in Figure 9-514.

	Element ID	Length	Advertisement Set Sequence Number	MCCAOP Advertisement Element Information	TX-RX Periods Report	Broadcast Periods Report	Interference Periods Report
Octets:	1	1	1	1	variable	variable	variable

Figure 9-514—MCCAOP Advertisement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Advertisement Set Sequence Number field is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.

The MCCAOP Advertisement Element Information field is described in 9.4.2.108.2.

The TX-RX Periods Report field is a variable length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.108.3. This field is present when the TX-RX Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The TX-RX Periods Report field is described in 10.24.3.7.2.

The Broadcast Periods Report field is a variable length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.108.3. This field is present when the Broadcast Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The Broadcast Periods Report field is described in 10.24.3.7.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Interference Periods Report field is a variable length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.108.3. This field is present when the Interference Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The Interference Periods Report field is described in 10.24.3.7.2.

9.4.2.108.2 MCCAOP Advertisement Element Information field

The MCCA Information field is 1 octet in length and provides information on the MCCAOP reservations. The field consists of four subfields and its format is shown in Figure 9-515.

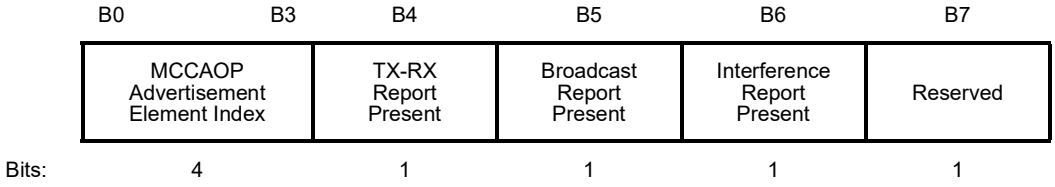

Figure 9-515—MCCAOP Advertisement Element Information field format

The MCCAOP Advertisement Element Index subfield is an unsigned integer. It identifies the MCCAOP Advertisement element.

The TX-RX Report Present subfield is set to 1 if the TX-RX Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no TX-RX Periods Report field is present.

The Broadcast Report Present subfield is set to 1 if the Broadcast Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Broadcast Periods Report field is present.

The Interference Report Present subfield is set to 1 if the Interference Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Interference Periods Report field is present.

9.4.2.108.3 MCCAOP Reservation Report field

The MCCAOP Reservation Report field is of variable length and is used to report a number of MCCAOP reservations. The field consists of a variable number of subfields and its format is shown in Figure 9-516.

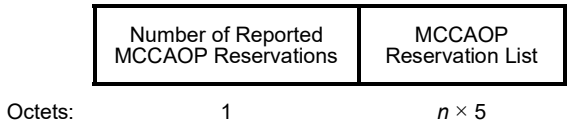

Figure 9-516—MCCAOP Reservation Report field format

The Number of Reported MCCAOP Reservations field is an unsigned integer that indicates the number, *n*, of MCCAOP Reservation fields reported in the MCCAOP Reservation List field.

The MCCAOP Reservation List field contains one or more (*n*) MCCAOP Reservation fields.

The MCCAOP Reservation fields specify the MCCAOP reservations reported. The format of each MCCAOP Reservation field is shown in Figure 9-510 in 9.4.2.105.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.109 MCCAOP Teardown element

The MCCAOP Teardown element is used to announce the teardown of an MCCAOP reservation. The MCCAOP Teardown element is transmitted in individually addressed MCCA Teardown frames or in group addressed MCCA Teardown frames. Its format is shown in Figure 9-517.

Figure 9-517—MCCAOP Teardown element format

The Element ID and Length fields are defined in 9.4.2.1.

An MCCAOP Teardown element is transmitted by either the MCCAOP owner or the MCCAOP responder of an MCCAOP reservation to tear down the MCCAOP reservation.

The MCCAOP Reservation ID field is an unsigned integer that represents the ID for the MCCAOP reservation.

The MCCAOP Owner field, if present, indicates the 48-bit MAC address of the MCCAOP owner. This field is included if the element is transmitted by the MCCAOP responder; it is not included otherwise.

9.4.2.110 GANN element

The GANN (gate announcement) element is used for announcing the presence of a mesh gate in the MBSS. The GANN element is transmitted in a Gate Announcement frame (see 9.6.16.4). The format of the GANN element is shown in Figure 9-518.

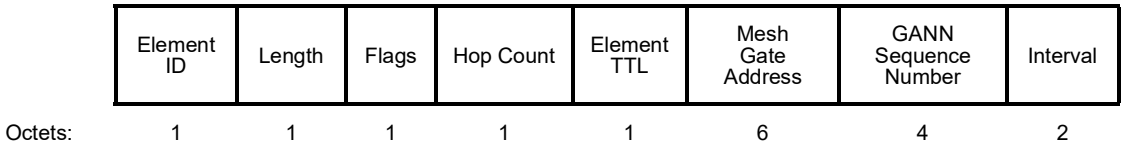

Figure 9-518—GANN element format

The Element ID and Length fields are defined in 9.4.2.1.

The Flags field is reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating mesh gate to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Mesh Gate Address field is represented as a 48-bit MAC address and is set to the MAC address of the mesh gate.

The GANN Sequence Number field is coded as an unsigned integer and is set to a GANN Sequence Number specific for the originating mesh gate.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Interval field is coded as an unsigned integer and is set to the number of seconds between the periodic transmissions of Gate Announcements by the mesh gate.

Detailed usage of the GANN element is described in 14.11.2.

9.4.2.111 RANN element

The RANN (root announcement) element is used for announcing the presence of a mesh STA configured as root mesh STA with dot11MeshHWMProotMode set to rann (4). RANN elements are sent out periodically by such a root mesh STA. The RANN element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.16.3). The format of the RANN element is shown in Figure 9-519.

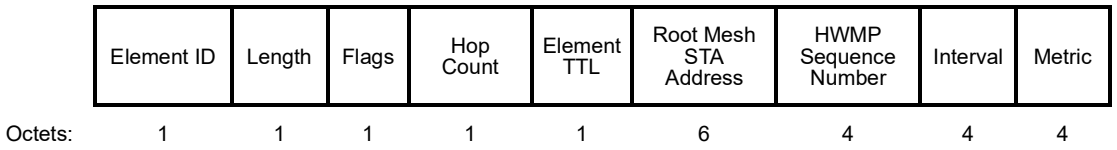

Figure 9-519—RANN element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-520.

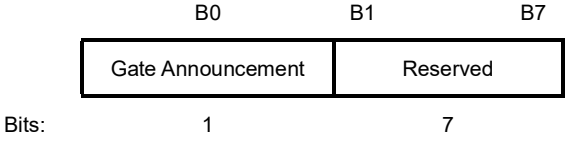

Figure 9-520—Flags field format

The Flags field is set as follows:

— Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the Root Mesh STA Address is a mesh gate with dot11MeshGateAnnouncements equal to true.

— Bit 1–7: Reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating root mesh STA to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Root Mesh STA Address field is represented as a 48-bit MAC address and is set to the MAC address of the root mesh STA.

The HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP sequence number (SN) specific to the root mesh STA.

The Interval field is coded as an unsigned integer and is set to the number of TUs between the periodic transmissions of Root Announcements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Metric field is set to the cumulative metric from the originating root mesh STA to the mesh STA transmitting the announcement.

Detailed usage of the RANN element is described in 14.10.12.

9.4.2.112 PREQ element

The PREQ (path request) element is used for discovering a path to one or more target mesh STAs, maintaining a path (optional), building a proactive (reverse) path selection tree to the root mesh STA, and confirming a path to a target mesh STA (optional). The PREQ element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.16.3). The format of the PREQ element is shown in Figure 9-521.

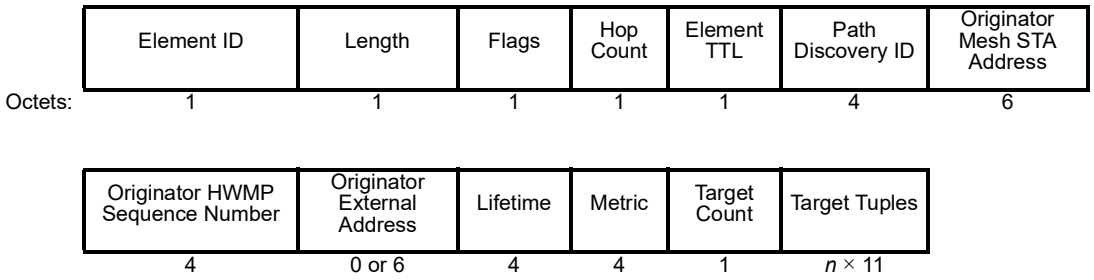

Figure 9-521—PREQ element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-522.

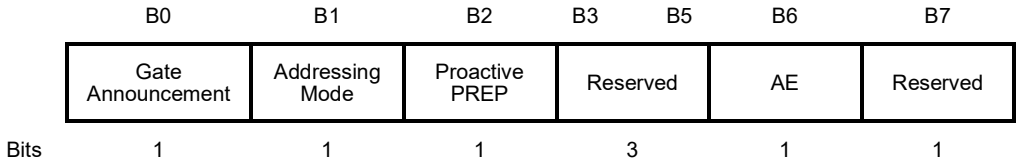

Figure 9-522—Flags field format

The Flags field is set as follows:

— Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the originator mesh STA address is a mesh gate with dot11MeshGateAnnouncements equal to true.

— Bit 1: Addressing Mode subfield (0 = group addressed, 1 = individually addressed). When the Addressing Mode subfield is 0, the PREQ element is sent in an HWMP Mesh Path Selection frame that is group addressed to all neighbor peer mesh STAs. When the Addressing Mode subfield is 1, the PREQ element is sent in an HWMP Mesh Path Selection frame that is individually addressed to a neighbor peer mesh STA. Detailed addressing information is provided in 14.10.7.

— Bit 2: Proactive PREP subfield (0 = off, 1 = on). The Proactive PREP subfield is of relevance only if the Target Address is the broadcast address (all 1s). If equal to 1, every recipient of a PREQ element with Target Address equal to the broadcast address replies with a PREP element. If equal to 0, a recipient replies only under certain conditions (see 14.10.4.2) and does not reply otherwise.

— Bit 3–5: Reserved.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— Bit 6: AE (Address Extension) subfield (1= external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Originator External Address is present, and that the originator mesh STA is a proxy for this external address.
— Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the originator to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Path Discovery ID field is coded as an unsigned integer and is set to some unique ID for this PathDiscovery.

The Originator Mesh STA Address field is represented as a 48-bit MAC address and is set to the originator MAC address.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN specific to the originator.

The Originator External Address field is the MAC address of an external STA proxied by the originator. This field is present only if the AE subfield in the Flags field is set to 1 and is represented as a 48-bit MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREQ element consider the forwarding information to be valid. The lifetime is measured in TUs.

The Metric field is set to the cumulative metric from the originator to the mesh STA transmitting the PREQ element.

The Target Count field is an unsigned integer and gives the number of targets (*n*) contained in this PREQ element. The maximum value of *n* is 20.

The Target Tuples field contains one or more Target Tuple fields. The format of a Target Tuple field is shown in Figure 9-523.

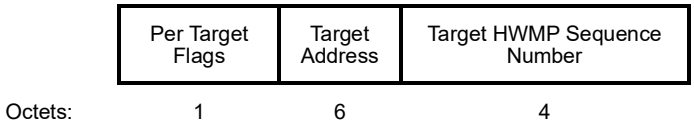

Figure 9-523—Target Tuple field format

The format of the Per Target Flags field is shown in Figure 9-524.

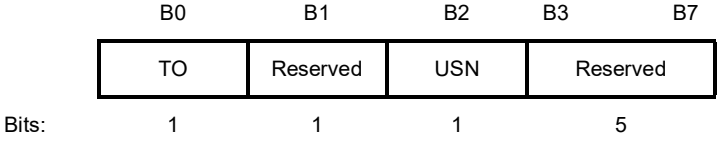

Figure 9-524—Per Target Flags field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Per Target Flags field is set as follows:

— Bit 0: TO (Target Only) subfield: The TO subfield defines the mesh STA to respond with a PREP element to the PREQ element containing an individual target address. If TO = 1, only the target mesh STA responds. If TO = 0, intermediate mesh STAs with active forwarding information to the target mesh STA also respond. See 14.10.10.3.

— Bit 1: Reserved.

— Bit 2: USN (Unknown Target HWMP Sequence Number) subfield: The USN subfield indicates whether the Target HWMP Sequence Number field of the corresponding target is interpreted as HWMP SN (USN = 0) or not (USN = 1), the latter meaning that a target HWMP SN is unknown at the originator mesh STA.

— Bit 3–7: Reserved.

The Target Address field is represented as a 48-bit MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is the latest known HWMP SN received in the past by the originator mesh STA for any path toward the target. If such a target HWMP SN is not known, the USN subfield is set to 1 and Target HWMP Sequence Number field is reserved.

Detailed usage of the PREQ element is described in 14.10.9.

9.4.2.113 PREP element

The PREP (path reply) element is used to establish a forward path to a target and to confirm that a target is reachable. The PREP element is issued in response to a PREQ element. The PREP element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.16.3). The format of the PREP element is shown in Figure 9-525.

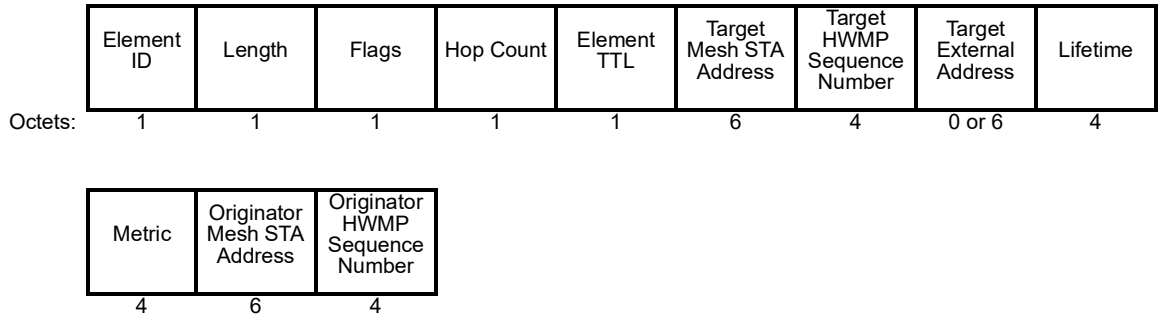

Figure 9-525—PREP element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-526.

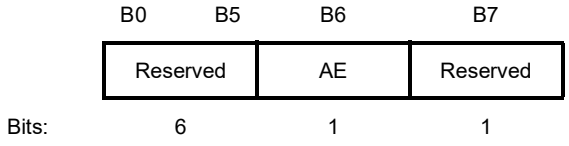

Figure 9-526—Flags field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Flags field is set as follows:

— Bit 0–5: Reserved.

— Bit 6: AE (Address Extension) subfield (1 = external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Target External Address is present, and that the target mesh STA is a proxy for this external address.

— Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the path target to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Target Mesh STA Address is the MAC address of the target mesh STA or target proxy mesh gate and is represented as a 48-bit MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the target mesh STA (if the AE subfield in the Flags field is equal to 0) or target proxy mesh gate (if the AE subfield in the Flags field is equal to 1).

The Target External Address field is set to the external address on behalf of which the PREP element is sent. This field is present only if Bit 6 (AE subfield) in Flags field equals 1 and is represented as a 48-bit MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREP element consider the forwarding information to be valid. The lifetime is measured in TUs.

The Metric field indicates the cumulative metric from the path target to the mesh STA transmitting this element.

The Originator Mesh STA Address field is represented as a 48-bit MAC address and is set to the MAC address of the originator, which is contained in the PREQ element.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the originator mesh STA contained in the PREQ element.

The detailed usage of the PREP element is described in 14.10.10.

9.4.2.114 PERR element

The PERR (path error) element is used for announcing an unreachable destination. The PERR element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.16.3). The format of the PERR element is shown in Figure 9-527.

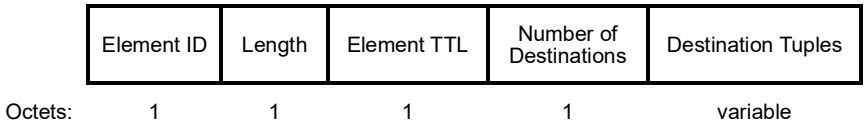

Figure 9-527—PERR element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element TTL field is an unsigned integer that indicates the remaining number of hops allowed for this element.

The Number of Destinations field is an unsigned integer and indicates the number of announced destinations in PERR, *n*. The maximum value of *n* is 19.

The Destination Tuples field contains one or more Destination Tuple fields. The format of a Destination Tuple field is shown in Figure 9-528.

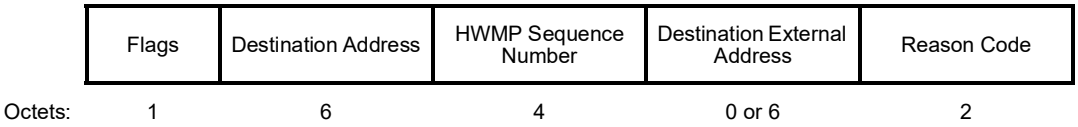

Figure 9-528—Destination Tuples field format

The format of the Flags field is shown in Figure 9-529.

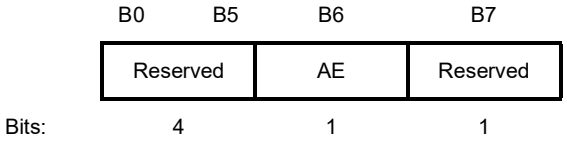

Figure 9-529—Flags field format

The Flags field is set as follows:

— Bit 0–5: Reserved.
— Bit 6: AE (Address Extension) subfield (1 = destination external address is present, 0 = otherwise).
— Bit 7: Reserved.

The Destination Address field is represented as a 48-bit MAC address and indicates the detected unreachable destination MAC address.

The HWMP Sequence Number field is coded as an unsigned integer and indicates the HWMP SN for the invalidated destination, if applicable. Otherwise, the HWMP Sequence Number field is reserved depending on the reason code.

The Destination External Address field is set to the external address, on behalf of which the PERR is sent. This field is present only if Bit 6 (AE subfield) in the Flags field equals 1 and is represented as a 48-bit MAC address.

The Reason Code field specifies the reason for sending a PERR element. The Reason Code is defined in 9.4.1.7.

The detailed usage of the PERR element is described in 14.10.11.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.115 PXU element

The PXU (proxy update) element is used to inform the destination mesh STA of the proxy information at the originator mesh STA. The PXU element is transmitted in a Proxy Update frame (see 9.6.17.2). The format of the PXU element is shown in Figure 9-530.

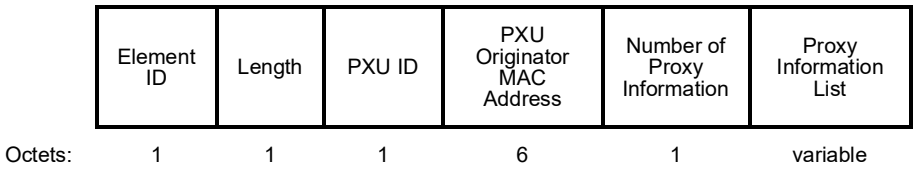

Figure 9-530—PXU element format

The Element ID and Length fields are defined in 9.4.2.1.

The PXU ID field is an unsigned integer and is set to the sequence number of the PXU. The source mesh STA sets the PXU ID field in the PXU element to a value from a single modulo 256 counter that is incremented by 1 for each new PXU element.

The PXU Originator MAC Address field is represented as a 48-bit MAC address and is the MAC address of the mesh STA that originates this PXU element.

The Number of Proxy Information field is set to the number *n* of Proxy Information fields in the Proxy Information List field and that are reported to the destination mesh STA. The maximum value of *n* is 22.

The Proxy Information List field contains one or more (*n*) Proxy Information fields.

A Proxy Information field contains a single proxy information (see 14.11.4.2). The length of the Proxy Information field depends on the settings of the subfields in the Flags subfield and is 11, 15, 17, or 21 octets.

The format of the Proxy Information field is defined in Figure 9-531.

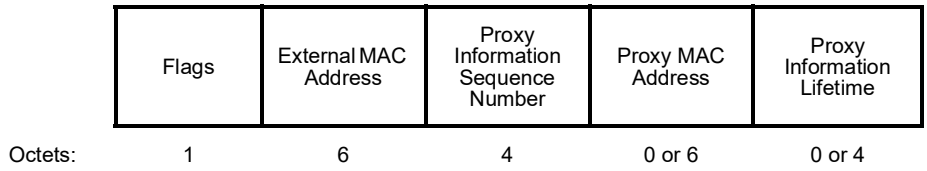

Figure 9-531—Proxy Information field format

The format of the Flags subfield is shown in Figure 9-532.

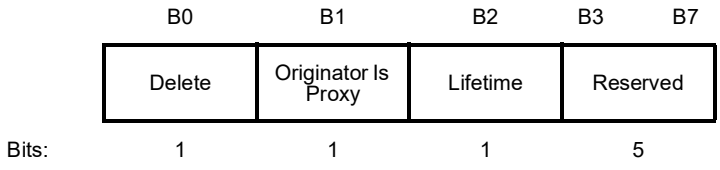

Figure 9-532—Flags subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Flags subfield is set as follows:

— Bit 0: The Delete subfield indicates whether this proxy information is to be deleted. It is set to 1 if the proxy information is to be deleted, and set to 0 otherwise.

— Bit 1: The Originator Is Proxy subfield indicates that the originator mesh STA of the PXU element is the proxy mesh gate of this proxy information when set to 1. In this case, there is no Proxy MAC Address subfield present in this Proxy Information field. When the Originator Is Proxy subfield is 0, the Proxy MAC Address subfield is present in this Proxy Information field.

— Bit 2: The Lifetime subfield indicates that the Proxy Information Lifetime subfield is present in this Proxy Information field when set to 1.

— Bit 3–7: Reserved.

The External MAC Address subfield is represented as a 48-bit MAC address and is the MAC address of the external STA proxied by the proxy mesh gate.

The Proxy Information Sequence Number field is coded as an unsigned integer and is set to the sequence number of the proxy information. The sequence number of the proxy information defines a chronological order of the proxy information for the external STA at this proxy mesh gate.

The Proxy MAC Address subfield is represented as a 48-bit MAC address and is set to the MAC address of proxy mesh gate. It is present if the Originator Is Proxy subfield of the Flags subfield is 0; it is not present otherwise.

The Proxy Information Lifetime subfield is coded as an unsigned integer and is set to the time for which the mesh STA receiving this PXU considers this proxy information to be valid. The proxy information lifetime is measured in TUs. It is present if the Lifetime subfield of the Flags subfield is 1; it is not present otherwise.

9.4.2.116 PXUC element

The PXUC (proxy update confirmation) element is used to confirm the previously received PXU. The PXUC element is transmitted in a Proxy Update Confirmation frame (see 9.6.17.3). The format of PXUC element is shown in Figure 9-533.

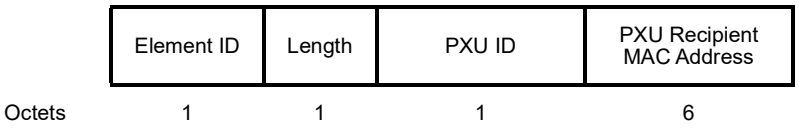

Figure 9-533—PXUC element format

The Element ID and Length fields are defined in 9.4.2.1.

The PXU ID field is coded as an unsigned integer and is the PXU ID of the received PXU that is being confirmed.

The PXU Recipient MAC Address is represented as a 48-bit MAC address and is set to the MAC address of the recipient of the PXU, i.e., the originator of the PXUC element.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.117 Authenticated Mesh Peering Exchange element

The Authenticated Mesh Peering Exchange element includes information needed to perform the authentication sequence during an authenticated mesh peering exchange. This element is shown in Figure 9-534.

	Element ID	Length	Selected Pairwise Cipher Suite	Local Nonce	Peer Nonce	Key Replay Counter (optional)	GTKdata (optional)	IGTKdata (optional)
Octets	1	1	4	32	32	8	variable	variable

Figure 9-534—Authenticated Mesh Peering Exchange element format

The Element ID and Length fields are defined in 9.4.2.1.

The Selected Pairwise Cipher Suite field contains a pairwise cipher suite selector, as defined in 9.4.2.24.2, indicating a cipher suite to be used to secure the link.

The Local Nonce field contains a nonce value chosen by the mesh STA that is transmitting the element. It is encoded following the conventions from 9.2.2.

The Peer Nonce field contains a nonce value that was chosen by the peer mesh STA or candidate peer mesh STA to which the element is being sent. It is encoded following the conventions from 9.2.2.

The Key Replay Counter field is optional. It is used only for the Mesh Group Key Inform frame (see 14.6.3) and the Mesh Group Key Acknowledge frame (see 14.6.4). It is represented as an unsigned integer.

The GTKdata field is optional. When present, it contains the bit string of {GTK || Key RSC || GTKExpirationTime} as the GTK data material. When present, the GTKdata field is protected by the exchange in which it is contained (see 14.5). The Key RSC denotes the last TSC or PN sent using the GTK and is specified in Table 12-8 of 12.7.2. GTKExpirationTime denotes the key lifetime of the GTK in seconds and the format is specified in Figure 12-40 of 12.7.2.

The IGTKdata field is present when dot11RSNAProtectedManagementFramesActivated equals true. When present, it contains the Key ID, IPN and IGTK used with BIP for management frame protection. The format of the IGTKdata field is specified in Figure 12-42 of 12.7.2.

Detailed usage of the Authenticated Mesh Peering Exchange element is described in 14.5.5 and in 14.6.

9.4.2.118 MIC element

The MIC element provides message integrity to mesh peering Management frames. The format of the MIC element is shown in Figure 9-535.

	Element ID	Length	MIC
Octets:	1	1	16

Figure 9-535—MIC element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The MIC field contains a message integrity code calculated over the mesh peering Management frame (as specified in 14.5) and the mesh group key handshake frame (as specified in 14.6).

9.4.2.119 Quality-of-Service Management Frame Policy element

The Quality-of-Service Management Frame (QMF) Policy element defines a QMF access category mapping (QACM) of Management frames and is used to advertise and exchange QMF policy between STAs. The use of the QMF Policy element is given in 11.24. See Figure 9-536.

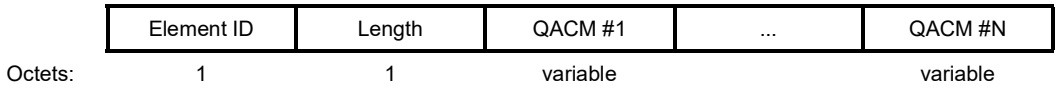

Figure 9-536—QMF Policy element format

The Element ID and Length fields are defined in 9.4.2.1.

The QACM field specifies a group of Management frames and their associated access categories. See Figure 9-537 and see 11.24.3.

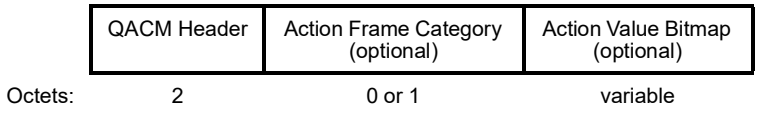

Figure 9-537—QACM field format

The format of the QACM Header subfield of the QACM field is defined in Figure 9-538.

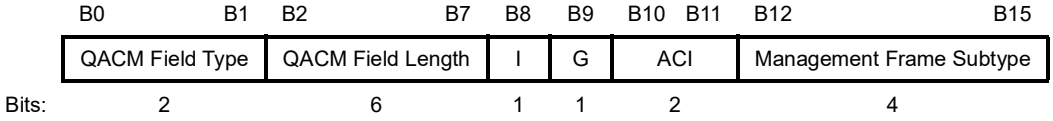

Figure 9-538—QACM Header subfield format

The QACM Field Type subfield defines the structure of the QACM field. Its value is 0. Values 1, 2, and 3 are reserved.

The QACM Field Length subfield defines the length in octets of the QACM field excluding the QACM Header subfield.

When the QACM applies to individually addressed Management frames, the Individually Addressed (I) subfield is set to 1. Otherwise, it is 0.

When the QACM applies to group addressed Management frames, the Group Addressed (G) subfield is set to 1. Otherwise, it is 0.

The combination of I = 0 and G = 0 is not allowed.

Each Management frame that is listed in the QACM Header subfield is transmitted using the access category identified by the accompanying ACI subfield.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Management Frame Subtype subfield indicates the subtype of Management frames that are sent using the access category indicated in the ACI subfield. The valid values for this subfield are the subtypes in Table 9-1 that correspond to Management frames.

The Action Frame Category subfield indicates the category of the Action frame, as defined in 9.4.1.1, of Action frames that are sent using the access category indicated in the ACI subfield. The Action Frame Category subfield is included only when the Management Frame Subtype subfield indicates Action or Action No Ack subtype as specified in 11.24.3.

The Action Value Bitmap subfield is included when the QACM Policy is specified for a subset of Action frame types in a Action Frame Category. The Action Value Bitmap subfield is of variable length and indicates the action values, as defined in 9.6, for the corresponding Action frame category that are sent using the access category indicated in the ACI subfield. The Action Value Bitmap subfield is included only when the Management Frame Subtype subfield indicates Action or Action No Ack subtype and the QACM Field Length subfield is greater than or equal to 2. Each bit in the Action Value Bitmap subfield is mapped to the corresponding action value. The Action Value Bitmap subfield is zero padded to complete any incomplete octet. When included, the size in octets of the Action Value Bitmap field is found by subtracting 1 from the value of the QACM Field Length subfield.

9.4.2.120 Intra-Access Category Priority element

The Intra-Access Category Priority element provides information from a non-AP STA to an AP on the relative priorities of streams within an AC, as described in 10.2.3.2 and 11.25.2. This element is optionally present in ADDTS Request, QoS Map Configure, or SCS Request frames. The Intra-Access Category Priority element is defined in Figure 9-539.

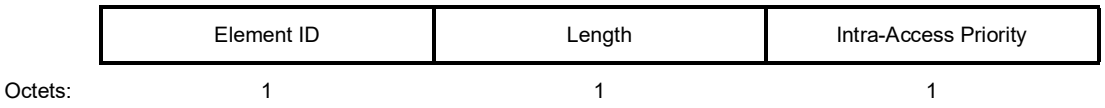

Figure 9-539—Intra-Access Category Priority element format

The Element ID and Length fields are defined in 9.4.2.1.

The Intra-Access Priority field is defined in Figure 9-540.

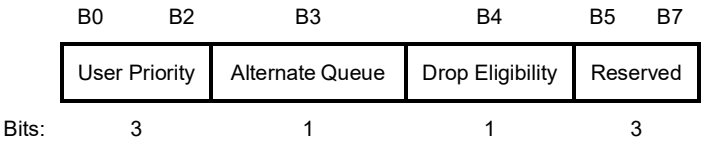

Figure 9-540—Intra-Access Priority field format

The User Priority subfield indicates the UP of MSDUs or A-MSDUs of the stream to which this Intra-Access Category Priority element relates.

The Alternate Queue subfield indicates the intended primary or alternate EDCA queue that is used for this stream. When dot11AlternateEDCAActivated is false, this subfield is reserved. When the Alternate Queue subfield is equal to 0, the primary EDCA queue for this AC is used. When the Alternate Queue subfield is equal to 1, the Alternate EDCA queue for this AC (see 10.2.3.2) is used.

The Drop Eligibility subfield is used to indicate the suitability of this TS to be discarded if there are insufficient resources. If there are insufficient resources, a STA should discard the MSDUs or A-MSDUs of

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

a TS with a Drop Eligibility subfield equal to 1, in preference to MSDUs or A-MSDUs of a TS whose Drop Eligibility subfield is equal to 0. See 11.24.2. The mechanisms for determining whether the resources are insufficient or when to discard MSDUs or A-MSDUs are beyond the scope of this standard.

9.4.2.121 SCS Descriptor element

The SCS Descriptor element defines information about the stream that is being classified using the procedures defined in 11.25.2. The format of the SCS Descriptor element is shown in Figure 9-541.

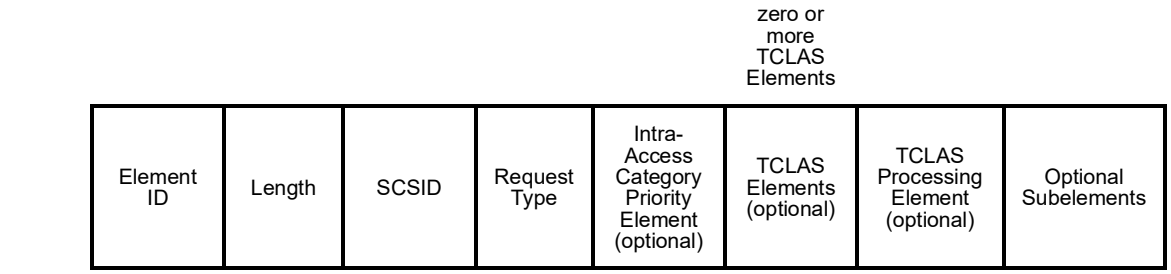

Figure 9-541—SCS Descriptor element format

The Element ID and Length fields are defined in 9.4.2.1.

The SCSID field is set to a nonzero value chosen by the non-AP STA identifying the SCS stream specified in this SCS Descriptor element.

The Request Type field is set to a number to identify the type of SCS request. The Request Types are shown in Table 9-246.

Table 9-246—SCS Request Type definitions

Name	Value
Add	0
Remove	1
Change	2
Reserved	3–255

The Intra-Access Category Priority Element field is present when Request Type field is equal to “Add” or “Change” and is defined in 9.4.2.120.

The TCLAS Elements field contains zero or more TCLAS elements to specify how incoming MSDUs are classified as part of this SCS stream, as defined in 9.4.2.30. One or more TCLAS elements are present when Request Type field is equal to “Add” or “Change,” and no TCLAS elements are present when Request Type field is equal to “Remove.”

The TCLAS Processing Element field is present when more than one TCLAS element is present in the TCLAS Elements field and contains a TCLAS Processing element that defines how the multiple TCLAS elements are to be processed, as defined in 9.4.2.32.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Optional Subelement ID field values for the defined subelements are shown in Table 9-247.

Table 9-247—Optional subelement IDs for SCS Descriptor element

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The SCS Descriptor element is included in SCS Request frames, as described in 9.6.18.2. The use of the SCS Descriptor element and SCS Request frames is described in 11.25.2.

9.4.2.122 QLoad Report element

9.4.2.122.1 QLoad Report element format

The QLoad Report element contains the set of parameters necessary to support OBSS management. The format of the QLoad Report element is shown in Figure 9-542.

	Element ID	Length	Potential Traffic Self	Allocated Traffic Self	Allocated Traffic Shared	EDCA Access Factor	HCCA Peak	HCCA Access Factor	Overlap	Sharing Policy	Optional Subelements
Octets:	1	1	5	5	5	1	2	1	1	1	variable

Figure 9-542—QLoad Report element format

The Element ID and Length fields are defined in 9.4.2.1.

Potential Traffic Self, Allocated Traffic Self, and Allocated Traffic Shared fields use the QLoad field format as described in 9.4.2.122.2.

The Potential Traffic Self field represents the peak composite QoS traffic for this BSS if all of the potential admission control and HCCA TSPECs from the non-AP STAs are active. The methods for gathering the total potential TSPEC information are described in 11.26.2.

The Allocated Traffic Self field represents the composite QoS traffic for this BSS based upon all of the admission control and HCCA TSPECs admitted within the same BSS, as described in 11.26.2.

The Allocated Traffic Shared field represents the sum of the Allocated Traffic Self field values that have been received or obtained from other APs whose beacons have been detected or obtained within the last 100 beacon periods, plus the Allocated Traffic Self field value of the AP itself. Computation of the values represented in the Allocated Traffic Shared field is described in 11.26.2.

As described in 11.26.2, the EDCA Access Factor field value is the sum of the Potential Traffic Self field values that have been received or obtained from other APs, plus the Potential Traffic Self field value of the AP itself, minus the sum of the HCCA Peak field values that have been received or obtained from

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

overlapping APs, minus the HCCA Peak field value of the AP itself. The EDCA Access Factor is expressed as a fraction rounded down to a multiple of 1/64. When the EDCA Access Factor is greater than 254/64, the EDCA Access Factor field is set to 255.

The HCCA Peak field is the total peak HCCA TXOP requirement, over a period of 1 s, for the AP and BSS, for all of the HCCA TSPECs that are included in the QLoad. HCCA Peak is expressed in multiples of 32 μs over a period of 1 s. The HCCA Peak field is reserved if HCCA is not supported.

NOTE—Because the HCCA peak is calculated over 1 s periods, its value might be an underestimate of the instantaneous peak of interactive variable bit rate (VBR) flows.

The HCCA Access Factor field value is the sum of the HCCA Peak field values in the QLoad Report elements that have been received from the APs of OBSSs, plus the HCCA Peak field value of the AP itself, as described in 11.26.2. It is expressed as a fraction rounded down to a multiple of 1/64. When the HCCA Access Factor is greater than 254/64, the HCCA Access Factor field is set to 255.

The Overlap field indicates the number of other APs that are sharing the same channel and whose beacons have been detected or obtained within the last 100 beacon periods by the AP issuing this beacon.

The Sharing Policy field contains the currently active sharing policy. The values for the Sharing Policy field are described in Table 9-248.

Table 9-248—Sharing Policy definitions

Sharing Policy field value	Current sharing policy
0	Not specified
1	Static
2	Dynamic
3–220	Reserved
221	Vendor Specific
222–255	Reserved

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-249.

Table 9-249—Optional subelement IDs for QLoad Report element

Subelement ID	Name	Extensible
0–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.122.2 QLoad field format

The QLoad field format is shown in Figure 9-543.

Figure 9-543—QLoad field format

The Mean subfield represents the amount of time admitted, or the amount of time scheduled traffic requires to access the medium, in units of 32 μs per second. In the case of EDCA admission control, this value is the sum of the admitted medium times, and for HCCA it is the total TXOP time required per second (see T.2.2). If the mean medium time is larger than 2 097 088 μs (65 534 × 32), the Mean subfield is set to 0xFFFE. The Mean subfield is set to 0xFFFF to indicate that the mean medium time is unknown.

The Standard Deviation subfield indicates the standard deviation from the mean medium time, in units of 32 μs per second. If the standard deviation is larger than 8128 μs (254 × 32), the Standard Deviation subfield is set to 0x3FFE. The Standard Deviation subfield is set to 0x3FFF to indicate that the standard deviation from the mean is unknown.

The AC_VO Streams subfield indicates the number of TSs using explicit admission control for AC_VO in the QoS traffic load report. Bidirectional streams are counted as two streams. If the number of admitted AC_VO streams is larger than 14, the AC_VO Streams subfield is set to 0xE. The AC_VO Streams subfield is set to 0xF to indicate that the number of TSs using explicit admission control for AC_VO is unknown.

The AC_VI Streams subfield indicates the number of TSs using explicit admission control for AC_VI in the QoS traffic load report. Bidirectional streams are counted as two streams. If the number of TSs using explicit admission control for AC_VO is larger than 14, the AC_VI Streams subfield is set to 0xE. The AC_VI Streams subfield is set to 0xF to indicate that the number of TSs using explicit admission control for AC_VI is unknown.

See 11.26.2 and Annex T.

9.4.2.123 HCCA TXOP Update Count element

The HCCA TXOP Update Count element is used by an AP to advertise its change in TXOP schedule. The format is shown in Figure 9-544.

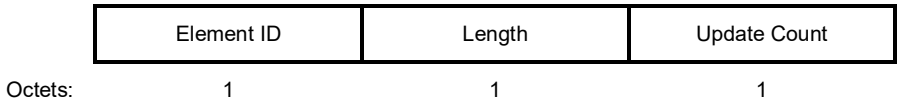

Figure 9-544—HCCA TXOP Update Count element format

The Element ID and Length fields are defined in 9.4.2.1.

The Update Count field is described in 11.26.3 and is used to indicate that a change has occurred in the number of active HCCA or HEMM TSs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.124 Higher Layer Stream ID element

The Higher Layer Stream ID element identifies a stream from a higher layer protocol. This element is used to bind messages that are exchanged in order to complete a procedure, e.g., messages exchanged in an AP-initiated TS setup procedure. See 11.4.4.3. The format is shown in Figure 9-545.

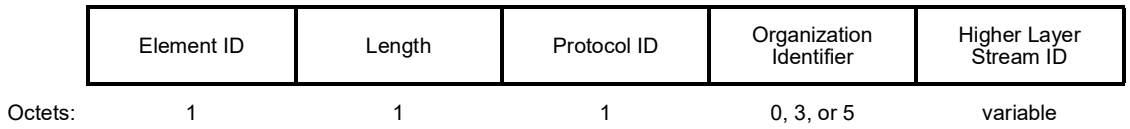

Figure 9-545—Higher Layer Stream ID element format

The Element ID and Length fields are defined in 9.4.2.1.

The Protocol ID field identifies the higher layer protocol to which the stream belongs. The values defined for the Protocol ID field are described in Table 9-250.

Table 9-250—Protocol ID definitions

Protocol ID	Protocol	Description
0	Reserved	
1	IEEE 802.1Q SRP	Protocol is IEEE 802.1Q SRP, and the corresponding Stream ID is 8 octets long.
2–220	Reserved	
221	Vendor Specific	Corresponding Organization Identifier field is included in the element.
222–255	Reserved	

The Organization Identifier field is present when the Protocol ID field is equal to 221 and contains a organization identifier assigned by IEEE. The identifier is specified in 9.4.1.31. The order of the Organization Identifier field is described in 9.2.2.

The Higher Layer Stream ID field is an octet string and is defined by the higher layer protocol specified in the Protocol ID field.

9.4.2.125 GCR Group Address element

The GCR Group Address element defines information about group addressed frames to be transmitted using the GCR service. The format of the GCR Group Address element is shown in Figure 9-546.

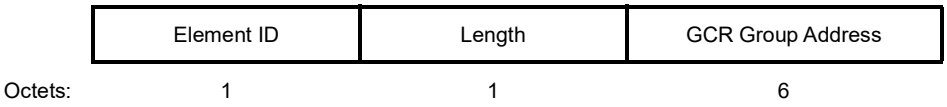

Figure 9-546—GCR Group Address element format

The Element ID and Length fields are defined in 9.4.2.1.

GCR Group Address field is the MAC address of the GCR group.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.126 DMG BSS Parameter Change element

The DMG BSS Parameter Change element is defined in Figure 9-547.

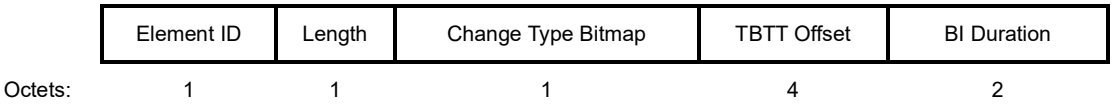

Figure 9-547—DMG BSS Parameter Change element format

The Element ID and Length fields are defined in 9.4.2.1.

The Change Type Bitmap field indicates the type of the parameter change to the BSS. This field is defined in Figure 9-548.

Figure 9-548—Change Type Bitmap field format

If the Move subfield is set to 1, it indicates a change in the TBTT of the BSS. The TBTT is not changed if the Move field is set to 0. If the Size subfield is set to 1, it indicates a change in the beacon interval duration. The beacon interval duration is not changed if the Size subfield is set to 0.

The TBTT Offset field contains a value expressed in microseconds. In any DMG BSS Parameter Change element included in the DMG Beacon and/or Announce frame, the TBTT Offset field represents the lower order 4 octets of the AP or PCP TSF timer of the first changed TBTT.

The BI Duration field value indicates the beacon interval, expressed in TUs, following the indicated DMG BSS parameter change. The BI Duration field is reserved if the Size bit of the Change Type Bitmap field is set to 0.

9.4.2.127 DMG Capabilities element

9.4.2.127.1 General

The DMG Capabilities element contains a STA identifier and several fields that are used to advertise the support of optional DMG capabilities of a DMG STA. The element is present in Association Request, Association Response, Reassociation Request, Reassociation Response, Probe Request and Probe Response frames and can be present in DMG Beacon, Information Request, and Information Response frames. The DMG Capabilities element is formatted as defined in Figure 9-549.

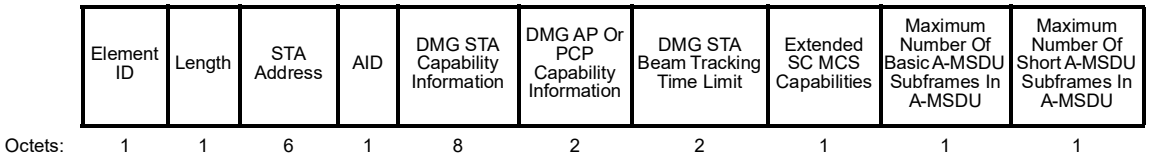

Figure 9-549—DMG Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The STA Address field contains the MAC address of the STA.

The AID field contains the AID assigned to the STA by the AP or PCP. The AID field is reserved in Association Request, Reassociation Request and Probe Request frames and when used in an IBSS.

9.4.2.127.2 DMG STA Capability Information field

The DMG STA Capability Information field, shown in Figure 9-550, represents the transmitting STA capabilities irrespective of the role of the STA.

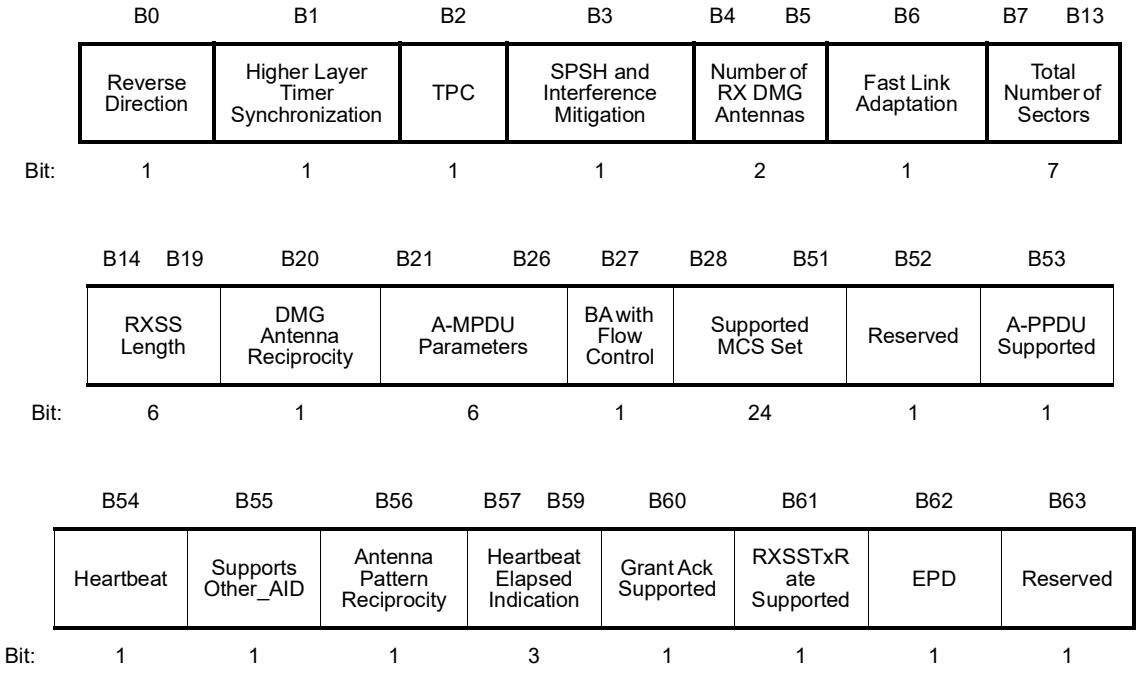

Figure 9-550—DMG STA Capability Information field format

The Reverse Direction subfield is set to 1 if the STA supports RD as defined in 10.29 and is set to 0 otherwise.

The Higher Layer Timer Synchronization subfield is set to 1 if the STA supports Higher Layer Timer Synchronization as defined in 11.6 and is set to 0 otherwise.

The TPC subfield is set to 1 if the STA supports the TPC as defined in 11.7 and is set to 0 otherwise.

The SPSH (spatial sharing) and Interference Mitigation subfield is set to 1 if the STA is capable of performing the function of SPSH and Interference Mitigation and if dot11RadioMeasurementActivated is true and is set to 0 otherwise (see 11.30).

The Number of RX DMG Antennas subfield indicates the total number of receive DMG antennas of the STA minus 1.

The Fast Link Adaptation subfield is set to 1 to indicate that the STA supports the fast link adaptation procedure described in 10.43.3. Otherwise, it is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Total Number of Sectors subfield indicates the total number of transmit sectors the STA uses in a transmit sector sweep combined over all DMG antennas, including any LBIFS required for DMG antenna switching (see 10.42), minus 1.

The value represented by the RXSS Length subfield specifies the total number of receive sectors combined over all receive DMG antennas of the STA, including any LBIFS required for DMG antenna switching (see 10.42). This subfield is set to (RXSS Length+1)×2, which ranges from 2 to 128.

The DMG Antenna Reciprocity subfield is set to 1 to indicate that the best transmit DMG antenna of the STA is the same as the best receive DMG antenna of the STA and vice versa. Otherwise, this subfield is set to 0.

The A-MPDU Parameters subfield is shown in Figure 9-551.

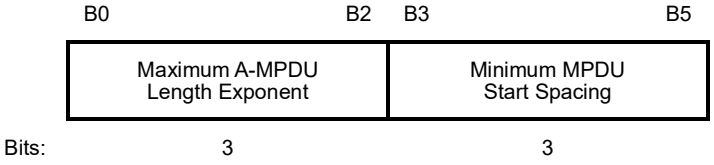

Figure 9-551—A-MPDU parameters subfield format

The subfields of the A-MPDU Parameters subfield are defined in Table 9-251.

Table 9-251—Subfields of the A-MPDU Parameters subfield

Subfield	Definition	Encoding
Maximum A-MPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive.	This subfield is an integer in the range 0 to 5. The length defined by this subfield is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets.
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP.	Set to 0 for no restriction Set to 1 for 16 ns Set to 2 for 32 ns Set to 3 for 64 ns Set to 4 for 128 ns Set to 5 for 256 ns Set to 6 for 512 ns Set to 7 for 1024 ns

The BA with Flow Control subfield is set to 1 if the STA supports BA with flow control as defined in 10.42.9 and is set to 0 otherwise.

The Supported MCS Set subfield indicates the MCSs a STA supports. An MCS is identified by an MCS index, which is represented by an integer in the range 0 to 12, or an integer in the range 25 to 31 or by one of the values 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the DMG PHY, see Clause 20. The structure of the Supported MCS Set subfield is defined in Figure 9-552.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

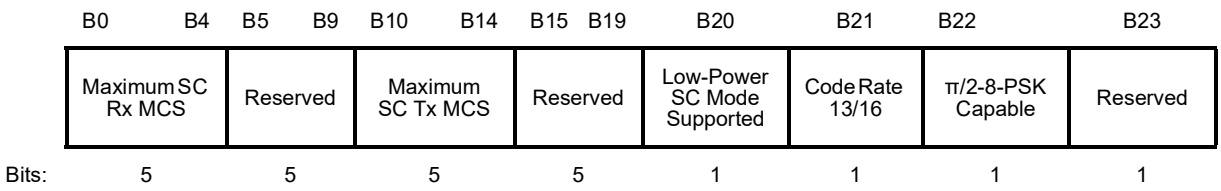

Figure 9-552—Supported MCS Set subfield format

The Maximum SC Rx MCS subfield contains the value of the maximum MCS index the STA supports for reception of single-carrier frames. Values 0-3 of this subfield are reserved. Possible values for this subfield are shown in Table 20-15. This subfield does not indicate support for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6. Support for these MCSs is indicated using the Extended SC MCS Capabilities field; see 9.4.2.127.5.

The Maximum SC Tx MCS subfield contains the value of the maximum MCS index the STA supports for transmission of single-carrier frames. Values 0-3 of this subfield are reserved. Possible values for this subfield are shown in Table 20-15. This subfield does not indicate support for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6. Support for these MCSs is indicated using the Extended SC MCS Capabilities field; see 9.4.2.127.5.

The Low-Power SC Mode Supported subfield is set to 1 to indicate that the STA supports the DMG low-power SC mode (20.6). Otherwise, it is set to 0. If the STA supports the low-power SC mode, it supports all low-power SC mode MCSs indicated in Table 20-21.

The Code Rate 13/16 subfield specifies whether the STA supports rate 13/16. It is set to 1 to indicate that the STA supports rate 13/16 and is set to 0 otherwise. If this subfield is 0, MCS with 13/16 code rate specified in Table 20-15 is not supported regardless of the value in Maximum SC Tx/Rx MCS subfields.

The π/2-8-PSK Capable subfield specifies whether the STA supports the use of π/2-8-PSK for MCS 10 and MCS 11. It is set to 1 to indicate the STA supports π/2-8-PSK for both transmission and reception and is set to 0 otherwise.

The A-PPDU Supported subfield is set to 1 to indicate that the STA supports A-PPDU aggregation as described in 10.14. Otherwise, it is set to 0.

The Supports Other_AID subfield is set to 1 to indicate that the STA sets its AWV configuration according to the Other_AID subfield in the BRP Request field during the BRP procedure as described in 10.42.6.4.4 and 20.9.2.2.6, if the value of the Other_AID subfield is different from zero. Otherwise, this subfield is set to 0.

The Heartbeat subfield is set to 1 to indicate that the STA expects to receive a frame from the AP or PCP during the ATI (10.39.3) and expects to receive a frame with the DMG Control modulation from a source DMG STA at the beginning of an SP (10.39.6.2) or TXOP (10.23.2). Otherwise, it is set to 0.

The Antenna Pattern Reciprocity subfield is set to 1 to indicate that the transmit antenna pattern associated with an AWV is the same as the receive antenna pattern for the same AWV. Otherwise, this subfield is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Heartbeat Elapsed Indication subfield is used to calculate the value of the Heartbeat Elapsed Time. The Heartbeat Elapsed Time is computed according to the following equation:

$$T_{HE} = \begin{cases} 0, & F_{HE} = 0 \\ \frac{2^{F_{HE}}}{4}, & F_{HE} > 0 \end{cases}$$

where

T_{HE} is the Heartbeat Elapsed Time (in milliseconds)
F_{HE} is the value of the Heartbeat Elapsed Indication subfield

The Grant Ack Supported subfield is set to 1 to indicate that the STA is capable of responding to a Grant frame with a Grant Ack frame. Otherwise, this subfield is set to 0.

The RXSSTxRate Supported subfield is set to 1 to indicate that the STA can perform an RXSS with SSW frames transmitted at MCS 1 of the DMG SC modulation class. Otherwise, it is set to 0.

A DMG STA sets the EPD subfield in the DMG STA Capability Information field to 1 when dot11EPDImplemented is true and sets it to 0 otherwise.

9.4.2.127.3 DMG AP Or PCP Capability Information field

The DMG AP Or PCP Capability Information field, shown in Figure 9-553, represents the capabilities when the transmitting STA performs in the role of AP or PCP and that are in addition to the capabilities in the DMG STA Capability Information field.

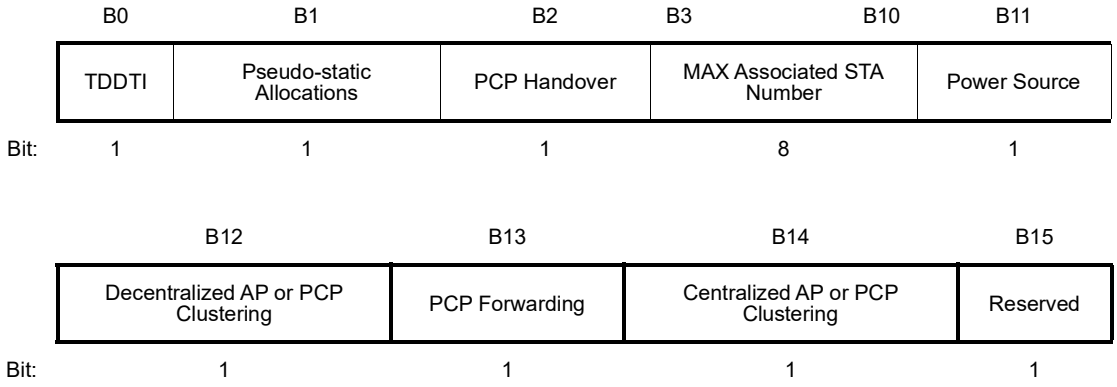

Figure 9-553—DMG AP Or PCP Capability Information field format

The TDDTI (time division data transfer interval) subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing channel access as defined in 10.39.6 and 11.4 and is set to 0 otherwise.

The Pseudo-static Allocations subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing pseudo-static allocations as defined in 10.39.6.4 and is set to 0 otherwise. The Pseudo-static Allocations subfield is set to 1 only if the TDDTI subfield in the DMG AP Or PCP Capability Information field is set to 1. The Pseudo-static Allocations subfield is reserved if the TDDTI subfield in the DMG AP Or PCP Capability Information field is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The PCP Handover subfield is set to 1 if the STA, while operating as a PCP, is capable of performing a PCP Handover as defined in 11.27.2 and is set to 0 if the STA does not support PCP Handover.

The MAX Associated STA Number subfield indicates the maximum number of STAs that the STA can perform association with if operating as an AP or PCP. This subfield includes the STAs, if any, that are co-located with the AP or PCP.

The Power Source subfield is set to 0 if the STA is battery powered and is set to 1 otherwise.

The Decentralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing decentralized AP or PCP clustering and is set to 0 otherwise.

The PCP Forwarding subfield is set to 1 if the STA, while operating as a PCP, is capable of forwarding frames it receives from a non-PCP STA and destined to another non-PCP STA in the PBSS. This subfield is set to 0 otherwise.

The Centralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing centralized AP or PCP clustering and is set to 0 otherwise. An AP or PCP that is incapable of performing centralized AP or PCP clustering is subject to requirements as described in 10.40.2.2.

9.4.2.127.4 DMG STA Beam Tracking Time Limit field

The DMG STA Beam Tracking Time Limit field contains the value of dot11BeamTrackingTimeLimit. This field indicates the maximum time between a request for beam tracking feedback and the feedback response, such that the response will be considered valid. This use of this field is discussed in 10.42.7.

9.4.2.127.5 Extended SC MCS Capabilities field

The Extended SC MCS Capabilities field (see Figure 9-554) advertises the support of the STA for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6.

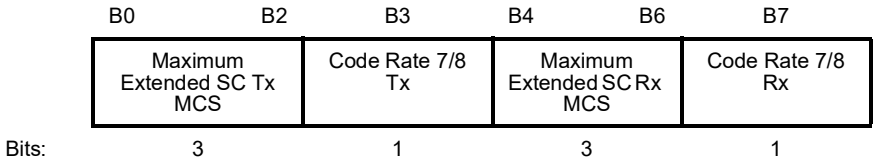

Figure 9-554—Extended SC MCS Capabilities field format

The Maximum Extended SC Tx MCS subfield indicates the maximum transmit extended SC MCS supported by the STA. The values in the subfield are ordered as shown in Table 9-252.

A STA that indicates support for transmission of an extended SC MCS by setting the value in the Maximum Extended SC Tx MCS subfield to *k* supports the subset of MCSs {9.1, 12.1, 12.2, 12.3, 12.4, 12.5 12.6} that have a data rate lower than or equal to the data rate of the MCS indicated by *k*. A STA that indicates support for MCSs with a data rate higher than the data rate of MCS 9.1 in the Maximum Extended SC Tx MCS subfield sets the Maximum SC Tx MCS subfield of the Supported MCS Set subfield to 12.

A STA that indicates support for transmission of an extended SC MCS by setting the value in the Maximum Extended SC Tx MCS subfield to *k* supports all extended SC MCSs with values lower than or equal to *k*.

The Maximum Extended SC Rx MCS subfield indicates the maximum receive extended SC MCS supported by the STA. The values in the subfield are ordered as shown in Table 9-252.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-252—Mapping of Extended SC MCS to Maximum Supported Rx/Tx MCS subfield values

Extended MCS name	Value in Maximum Extended SC Rx/Tx MCS subfield
None	0
MCS 9.1	1
MCS 12.1	2
MCS 12.2	3
MCS 12.3	4
MCS 12.4	5
MCS 12.5	6
MCS 12.6	7

A STA indicates support for transmission of code rate 7/8 by setting the Code Rate 7/8 Tx subfield to 1. If a STA indicates that it does not support code rate 7/8, then the STA does not support MCS 9.1 or 12.2 even if the value in the Maximum Extended SC Tx MCS subfield is greater than 1 or 3 respectively. A STA that indicates support for MCSs with a data rate higher than the data rate of MCS 9.1 in the Maximum Extended SC Rx MCS subfield sets the Maximum SC Rx MCS subfield of the Supported MCS Set subfield to 12.

A STA that indicates support for reception of an extended SC MCS by setting the Maximum Extended SC Rx MCS subfield to *k* supports the subset of MCSs {9.1, 12.1, 12.2, 12.3, 12.4, 12.5 12.6} that have a data rate lower than or equal to the data rate of the MCS indicated by *k*.

A STA indicates support for reception of code rate 7/8 by setting the Code Rate 7/8 Rx subfield to 1. If a STA indicates that it does not support code rate 7/8, the STA does not support MCS 9.1 or 12.2 even if the value in the Maximum Extended SC Rx MCS field is greater than 1 or 3 respectively.

9.4.2.127.6 Maximum number of A-MSDU subframes in an A-MSDU

The Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield is defined in Table 9-253 and indicates the maximum number of Basic A-MSDU subframes in an A-MSDU that the DMG STA is able to receive from another DMG STA.

Table 9-253—Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield

Value	Meaning
0	No limit on the maximum number of Basic A-MSDU subframes supported
1	A maximum of 4 Basic A-MSDU subframes are supported
2	A maximum of 8 Basic A-MSDU subframes are supported
3	A maximum of 16 Basic A-MSDU subframes are supported
4	A maximum of 32 Basic A-MSDU subframes are supported

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-253—Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield *(continued)*

Value	Meaning
5	A maximum of 64 Basic A-MSDU subframes are supported
6	A maximum of 128 Basic A-MSDU subframes are supported
7	A maximum of 256 Basic A-MSDU subframes are supported
8–255	Reserved

The Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield is defined in Table 9-254 and indicates the maximum number of Short A-MSDU subfields in an A-MSDU that the DMG STA is able to receive from another DMG STA.

Table 9-254—Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield

Value	Meaning
0	No limit on the maximum number of Short A-MSDU subframes supported
1	A maximum of 32 Short A-MSDU subframes are supported
2	A maximum of 64 Short A-MSDU subframes are supported
3	A maximum of 128 Short A-MSDU subframes are supported
4	A maximum of 256 Short A-MSDU subframes are supported
5	A maximum of 512 Short A-MSDU subframes are supported
6	A maximum of 1024 Short A-MSDU subframes are supported
7–255	Reserved

9.4.2.128 DMG Operation element

The operational parameters of a BSS provided by the AP or PCP are determined by the DMG Operation element defined in Figure 9-555.

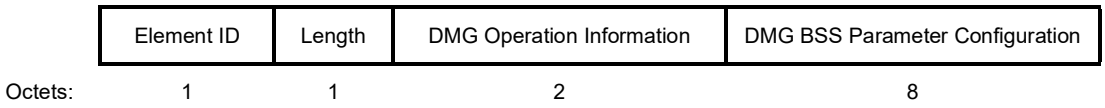

Figure 9-555—DMG Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Operation Information field is shown in Figure 9-556.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Figure 9-556—DMG Operation Information field format

The TDDTI subfield is set to 1 if the AP or PCP provides time division channel access as defined in 10.39.6 and is set to 0 otherwise.

The Pseudo-static allocations subfield is set to 1 if the AP or PCP provides pseudo-static allocations as defined in 10.39.6.4 and is set to 0 otherwise. The Pseudo-static allocations subfield is set to 1 only if the TDDTI subfield in the DMG Operation Information field is 1. The Pseudo-static allocations subfield is reserved if the TDDTI subfield in the DMG Operation Information field is 0.

The PCP Handover subfield is set to 1 if the PCP provides PCP Handover as defined in 11.27.2 and is set to 0 if the PCP does not provide PCP Handover.

The DMG BSS Parameter Configuration field is defined in Figure 9-557.

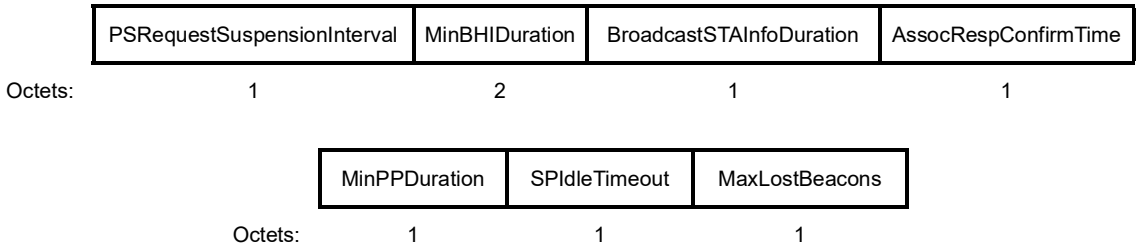

Figure 9-557—DMG BSS Parameter Configuration field format

The PSRequestSuspensionInterval subfield indicates the power save suspension interval and is specified in number of beacon intervals.

The MinBHIDuration subfield indicates the minimum duration of the BHI, which can include the BTI, A-BFT, and ATI and is specified in microseconds.

The BroadcastSTAInfoDuration subfield indicates the amount of time that the AP or PCP expects to take to transmit information about associated STAs and is specified in number of beacon intervals.

The AssocRespConfirmTime subfield indicates the amount of time that the AP or PCP expects to take to respond to association requests and is specified in units of 50 milliseconds. A non-PCP and non-AP STA that receives a DMG Operation element can use the value of this field to set dot11AssociationResponseTimeOut.

The MinPPDuration subfield indicates the minimum duration of the PP and GP as part of the dynamic allocation of service period mechanism and is specified in microseconds.

The SPIdleTimeout subfield indicates time during which a STA expects to receive a frame from its peer STA and is specified in microseconds.

The MaxLostBeacons subfield contains the value of dot11MaxLostBeacons.

Copyright © 2021 IEEE. All rights reserved.

9.4.2.129 DMG Beam Refinement element

The DMG Beam Refinement element is defined as shown in Figure 9-558.

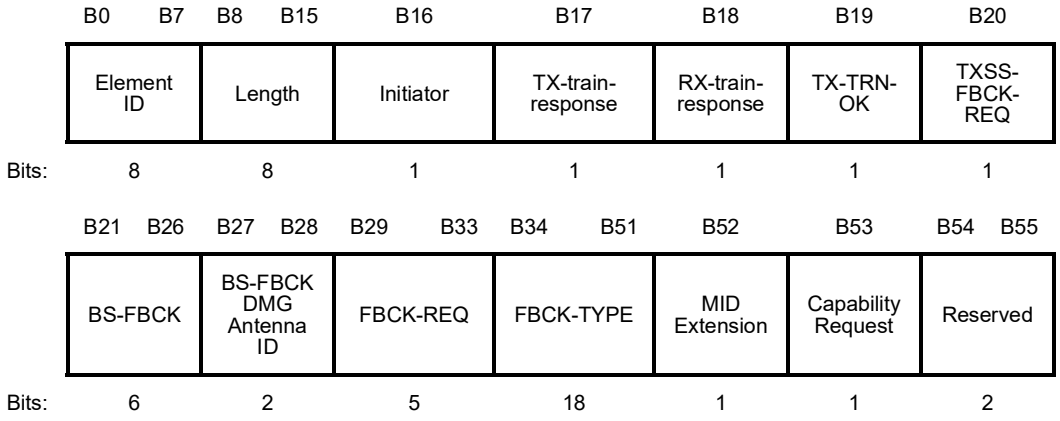

Figure 9-558—DMG Beam Refinement element format

The Element ID and Length fields are defined in 9.4.2.1.

An Initiator field set to 1 indicates that the sender is the beam refinement initiator. Otherwise, this field is set to 0.

A TX-train-response field set to 1 indicates that this element is the response to a TX training request. Otherwise, this field is set to 0.

A RX-train-response field set to 1 indicates that the element serves as an acknowledgment for a RX training request. Otherwise, this field is set to 0.

A TX-TRN-OK field set to 1 confirms a previous training request received by a STA. Otherwise, this field is set to 0.

A TXSS-FBCK-REQ field set to 1 indicates a request for transmit sector sweep feedback.

The BS-FBCK field indicates the index of the TRN-T subfield that was received with the best quality in the last received BRP-TX PPDU, where the first TRN-T subfield in the PPDU is defined as having an index equal to 1. If the last received PPDU was not a BRP-TX PPDU, this field is set to 0. The determination of best quality is implementation dependent.

The BS-FBCK DMG Antenna ID field specifies the DMG antenna ID corresponding to the sector indicated by the BF-FBCK field.

The FBCK-REQ field is defined in Figure 9-559 and is described in Table 9-255.

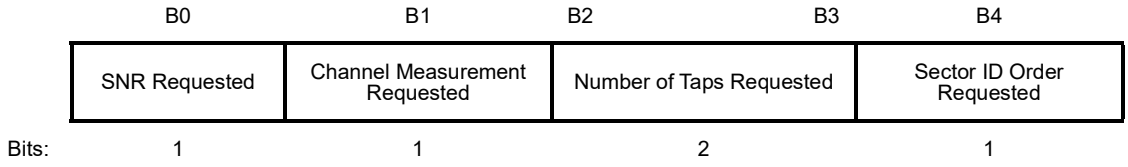

Figure 9-559—FBCK-REQ field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-255—FBCK-REQ field description

Subfield	Meaning
SNR Requested	If set to 1, the SNR subfield is requested as part of the returned Channel Measurement element(s). Otherwise, set to 0.
Channel Measurement Requested	If set to 1, the Channel Measurement subfield is requested as part of the returned Channel Measurement element(s). Otherwise, set to 0.
Number of Taps Requested	Number of taps in each channel measurement: 0 x 0 – 1 tap 0 x 1 – 5 taps 0 x 2 – 15 taps 0 x 3 – 63 taps
Sector ID Order Requested	If set to 1, the Sector ID Order subfield is requested as part of the returned Channel Measurement element(s). Otherwise, set to 0.

The FBCK-TYPE field is defined in Figure 9-560 and is described in Table 9-256. When both N_{meas} and N_{beam} in this field are equal to 0, the Channel Measurement Feedback element is not present.

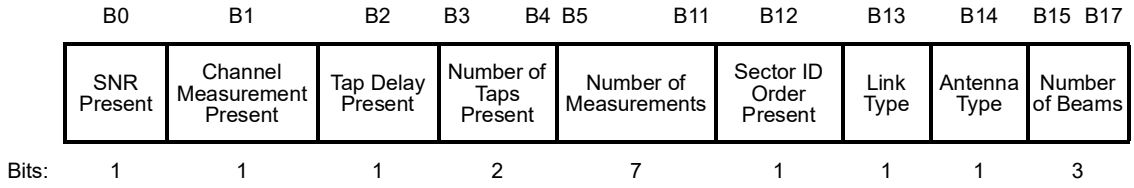

Figure 9-560—FBCK-TYPE field format

Table 9-256—FBCK-TYPE field description

Subfield	Meaning
SNR Present	Set to 1 to indicate that the SNR subfield is present as part of the channel measurement feedback. Set to 0 otherwise.
Channel Measurement Present	Set to 1 to indicate that the Channel Measurement subfield is present as part of the channel measurement feedback. Set to 0 otherwise.
Tap Delay Present	Set to 1 to indicate that the Tap Delay subfield is present as part of the channel measurement feedback. Set to 0 otherwise.
Number of Taps Present	Number of taps in each channel measurement: 0 x 0 – 1 tap 0 x 1 – 5 taps 0 x 2 – 15 taps 0 x 3 – 63 taps
Number of Measurements	Number of measurements in the SNR subfield and the Channel Measurement subfield. It is equal to the number of TRN-T subfields in the BRP-TX frame on which the measurement is based, or the number of received sectors if TXSS result is reported by setting the TXSS-FBCK-REQ subfield to 1.
Sector ID Order Present	Set to 1 to indicate that the Sector ID Order subfield is present as part of the channel measurement feedback. Set to 0 otherwise.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-256—FBCK-TYPE field description *(continued)*

Subfield	Meaning
Link Type	Set to 0 for the initiator link and to 1 for the responder link
Antenna Type	Set to 0 for the transmitter antenna and to 1 for the receiver antenna
Number of Beams	Indicates the number of beams in the Sector ID Order subfield for the MIDC subphase

A MID Extension field set to 1 indicates the intention to continue transmitting BRP-RX frames during the MID subphases. Otherwise, this field is set to 0.

A Capability Request field set to 1 indicates that the transmitter of the frame requests the intended receiver to respond with a BRP frame that includes the BRP Request field. Otherwise, this field is set to 0.

9.4.2.130 DMG Wakeup Schedule element

The DMG Wakeup Schedule element is defined in Figure 9-561.

	Element ID	Length	BI Start Time	Sleep Cycle	Number of Awake BIs
Octets:	1	1	4	2	2

Figure 9-561—DMG Wakeup Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Wakeup Schedule element is used to communicate the wakeup schedule (WS) of DMG STAs.

The BI Start Time field indicates the lower order 4 octets of the TSF timer at the start of the first A-BI in the WS defined by the DMG Wakeup Schedule element. A transmitted BI Start Time field points to a TBTT not more than 2^{31} μs minus aDMGDWSValidPeriod before, and not more than (2^{31} – 1) μs after the TBTT of the beacon interval during which the BI Start Time field is transmitted.

NOTE—The delay between the moment a STA receives a DMG Wakeup Schedule element over the air and the moment the STA interprets the value of the BI Start Time field in the element can be large, to the extent that the beacon interval during which the BI Start Time filed is interpreted is different from the beacon interval during which the DMG Wakeup Schedule element is received. Excluding an interval from the range of BI Start Time field values at transmission enables the receiving STA to be able to correctly interpret any received value for the BI Start Time field of the DMG Wakeup Schedule element belonging to a STA in PS mode without having to remember the beacon interval during which the DMG Wakeup Schedule element was received, as long as the beginning of the beacon interval at the time of interpretation has not advanced more than aDMGDWSValidPeriod relative to the beginning of the beacon interval at the time of reception.

The Sleep Cycle field indicates the sleep cycle duration in beacon intervals, i.e., the sum of A-BIs and D-BIs that make up the sleep cycle.

The Number of Awake BIs field indicates the number of A-BIs at the beginning of each sleep cycle. A Number of Awake BIs field set to 0 indicates that all beacon intervals in the WS are D-BIs.

9.4.2.131 Extended Schedule element

The Extended Schedule element is defined in Figure 9-562. Because the length parameter supports only 255 octets of information in an element, the AP or PCP can split the Allocation fields into more than

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

one Extended Schedule element entry in the same DMG Beacon or Announce frame. Despite this splitting, the set of Extended Schedule element entries conveyed within a DMG Beacon and Announce frame is considered to be a single schedule for the beacon interval, and in this standard referred to simply as Extended Schedule element unless otherwise noted. The Allocation fields are ordered by increasing allocation start time with allocations beginning at the same time arbitrarily ordered.

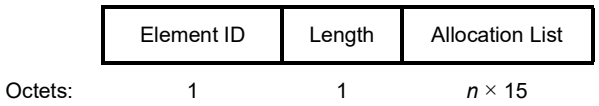

Figure 9-562—Extended Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The Allocation List field contains one or more (*n*) Allocation fields. The Allocation fields are ordered by increasing allocation start time with allocations beginning at the same time arbitrarily ordered.

An Allocation field is formatted as shown in Figure 9-563.

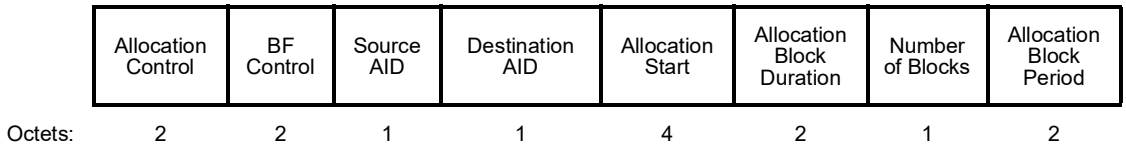

Figure 9-563—Allocation field format

The Allocation Control subfield is defined in Figure 9-564 for a DMG STA and in Figure 9-565 for a CDMG STA.

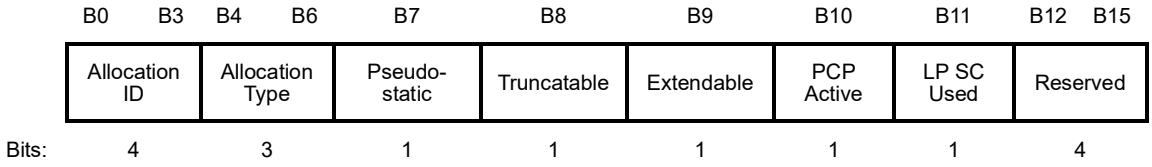

Figure 9-564—Allocation Control subfield format (DMG)

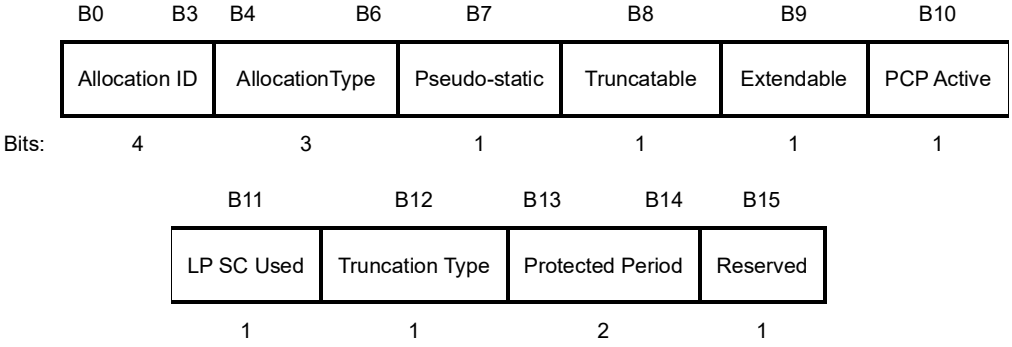

Figure 9-565—Allocation Control subfield format (CDMG)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Allocation ID subfield, when set to a nonzero value, identifies an airtime allocation from Source AID to Destination AID. Except for CBAP allocations with broadcast Source AID and broadcast Destination AID, the tuple (Source AID, Destination AID, Allocation ID) uniquely identifies the allocation. For CBAP allocations with broadcast Source AID and broadcast Destination AID, the Allocation ID subfield is set to 0.

The AllocationType subfield defines the channel access mechanism during the allocation, with possible values listed in Table 9-257.

Table 9-257—AllocationType subfield values

Bit 4	Bit 5	Bit 6	Meaning
0	0	0	SP allocation
1	0	0	CBAP allocation
0	1	0	SP allocation on a 1.08 GHz channel
1	1	0	CBAP allocation on a 1.08 GHz channel
All other combinations			Reserved

The Pseudo-static subfield is set to 1 to indicate that this allocation is pseudo-static (10.39.6.4) and set to 0 otherwise.

For an SP allocation, the Truncatable subfield is set to 1 to indicate that the source DMG STA and destination DMG STA can request SP truncation and set to 0 otherwise. For a CBAP allocation, the Truncatable subfield is reserved.

For an SP allocation, the Truncatable subfield is set to 1 to indicate that the source CDMG STA and destination CDMG STA can request SP truncation, and the SP truncation type is determined by the Truncation Type subfield. Otherwise, it is set to 0, and the Truncation Type subfield is reserved. For a CBAP allocation, the Truncatable subfield is reserved

For an SP allocation, the Extendable subfield is set to 1 to indicate that the source DMG STA and destination DMG STA can request SP extension and set to 0 otherwise. For a CBAP allocation, the Extendable subfield is reserved.

For a PCP in active mode (see 11.2.7), or when applied to a CBAP or SP in a PCP A-BI, a PCP Active subfield set to 1 indicates that the PCP is available to transmit or receive during the CBAP or SP, and a PCP Active subfield set to 0 indicates the PCP is unavailable to transmit or receive. For a DMG PCP, the PCP Active subfield is set to 1 at least in the following cases:

— The PCP transmitting the subfield is the source or destination of the CBAP or SP
— At least one of the Truncatable or Extendable subfields is set to 1
— The subfield is transmitted by an AP

For a CDMG PCP, the PCP Active subfield is set to 1 at least in the following cases:

— The PCP transmitting the field is the source or destination of the CBAP or SP
— The Truncatable subfield is equal to 1, and the Truncation Type subfield is equal to 0
— The Extendable subfield is equal to 1
— The subfield is transmitted by an AP

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The PCP Active subfield is ignored when it applies to a CBAP or SP that resides in a PCP D- BI.

The BF Control subfield is defined in 9.5.5.

The Source AID subfield is set to the AID of the STA that initiates channel access during the SP or CBAP allocation or, in the case of a CBAP allocation, can also be set to the broadcast AID if all STAs are allowed to transmit during the CBAP allocation.

The Destination AID subfield is set to the AID of the STA that the source STA targets during the allocation, or to the broadcast AID if the source STA targets more than one STA during the allocation. If both Source AID and Destination AID subfields for an SP allocation are set to the broadcast AID, then during the SP a non-AP and non-PCP STA does not transmit unless it receives a Poll or Grant frame from the AP or PCP.

The Allocation Start subfield contains the lower 4 octets of the TSF at the time the SP or CBAP starts. The Allocation Start subfield can be specified at a future beacon interval when the pseudo-static subfield is set to 1.

The Allocation Block Duration subfield indicates the duration, in microseconds, of a time block for which the SP or CBAP allocation is made and cannot cross beacon interval boundaries. Possible values range from 1 to 32 767 for an SP allocation and 1 to 65 535 for a CBAP allocation.

The Number of Blocks subfield contains the number of time blocks making up the allocation.

The Allocation Block Period subfield contains the time, in microseconds, between the start of two consecutive time blocks belonging to the same allocation. The Allocation Block Period subfield is reserved when the Number of Blocks subfield is set to 1.

The LP SC Used subfield is set to 1 to indicate that the low-power SC mode described in 20.6 is used in this SP. Otherwise, it is set to 0.

If the Truncatable subfield is equal to 0, the Truncation Type subfield is reserved. Otherwise, a CDMG AP or a CDMG PCP sets the Truncation Type subfield to 0 to indicate that the CDMG STA is to return the time left in the SP to the CDMG AP or PCP, and it sets the Truncation Type subfield to 1 to indicate that the CDMG STA allocates any portion of its SP as a CBAP.

For CDMG STAs, the Protected Period subfield is used to indicate whether the source and destination STAs of the allocated SP are required to establish a protected period and on which channels the protected period is established. The Protected Period subfield is set to 0 to indicate the source and destination STAs of the SP are allowed to create a protected period, and the STA determines whether to establish a protected period. The Protected Period subfield is set to a nonzero value to indicate the source and destination STAs of the SP are required to create a protected period on the indicated channel(s). The values of the Protected Period subfield for a CDMG STA operating on a 2.16 GHz channel or a 1.08 GHz are listed in Table 9-258 and Table 9-259, respectively. For a CBAP allocation, the Protected Period subfield is reserved.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-258—Protected Period subfield value for a CDMG STA operating on a 2.16 GHz channel

Value	Meaning
0	The STA determines whether to establish a protected period.
1	The current channel needs a protected period.
2	Both the current 2.16 GHz channel and the low frequency channel 35 or channel 37 need a protected period.
3	Both the current 2.16 GHz channel and the high frequency channel 36 or channel 38 need a protected period.

Table 9-259—Protected Period subfield value for a CDMG STA operating on a 1.08 GHz channel

Value	Meaning
0	The STA determines whether to establish a protected period.
1	The current channel needs a protected period.
2	The current 1.08 GHz channel and the overlapping 2.16 GHz channel need a protected period.
3	Reserved.

9.4.2.132 STA Availability element

The STA Availability element is used by a non-AP and non-PCP STA to inform an AP or PCP about the STA availability during the subsequent CBAPs (10.39.5) and to indicate participation in the dynamic allocation of service periods (10.39.7). The AP or PCP uses the STA Availability element to inform the non-AP and non-PCP STAs of other STAs availability during subsequent CBAPs and participation of other STAs in the Dynamic allocation of service periods.

The format of the STA Availability element is defined in Figure 9-566.

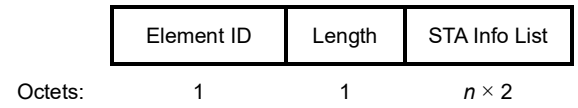

Figure 9-566—STA Availability element format

The Element ID and Length fields are defined in 9.4.2.1.

The STA Info List field contains one or more (*n*) STA Info fields.

The format of the STA Info field is shown in Figure 9-567.

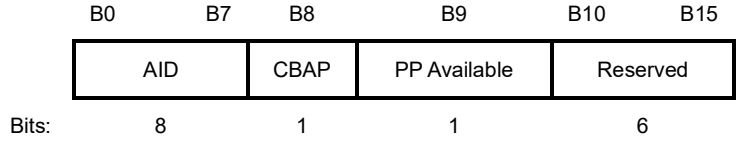

Figure 9-567—STA Info field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The AID subfield contains the AID of the STA for which availability is indicated.

The CBAP subfield is set to 1 to indicate that the STA is available to receive transmissions during CBAPs and set to 0 otherwise.

The PP Available subfield is set to 1 to indicate that the STA is available during PPs (10.39.7) and is set to 0 otherwise.

9.4.2.133 DMG TSPEC element

The DMG TSPEC element is present in the ADDTS Request frame sent by a non-AP and non-PCP DMG STA and contains the set of parameters needed to create or modify an airtime allocation. The DMG TSPEC element is also present in the ADDTS Response frame sent by a DMG AP or PCP and reflects the parameters, possibly modified, by which the allocation was created. The format of the DMG TSPEC element is shown in Figure 9-568.

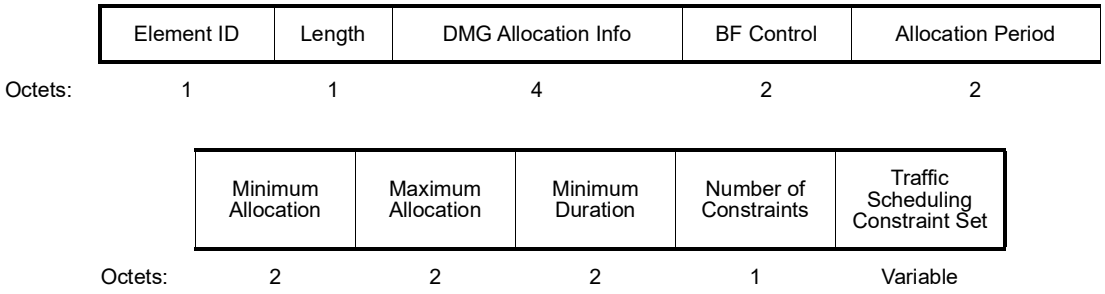

Figure 9-568—DMG TSPEC element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Allocation Info field is formatted as shown in Figure 9-569.

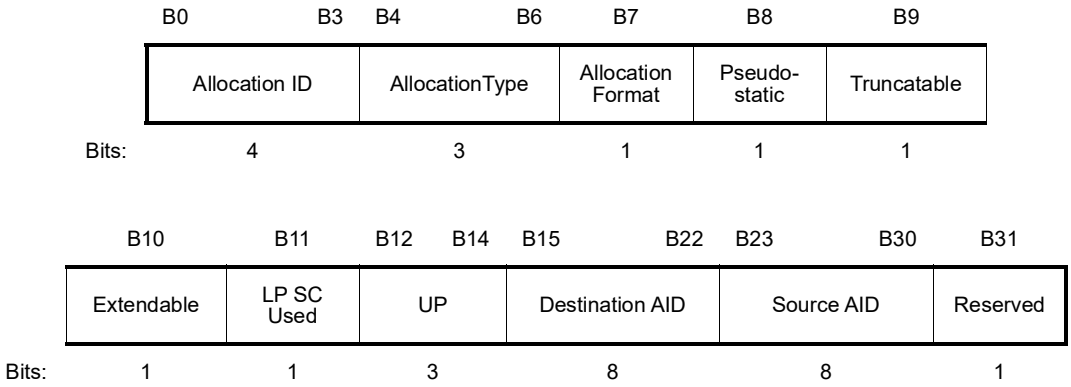

Figure 9-569—DMG Allocation Info field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Allocation ID subfield identifies an allocation if set to a nonzero value and is used as follows:

— The STA that transmits an ADDTS Request frame containing the DMG TSPEC element sets the Allocation ID subfield to a nonzero value to create a new allocation or modify an existing allocation.

— The STA that transmits an ADDTS Response frame containing the DMG TSPEC element sets the Allocation ID subfield to a nonzero value to identify a created or modified allocation or sets it to 0 if creating or modifying the allocation failed.

The AllocationType subfield defines the channel access mechanism used during the allocation, with values listed in Table 9-257.

The Allocation Format field values are listed in Table 9-260.

Table 9-260—Allocation Format subfield values

Allocation Format subfield value	Description
1	Isochronous allocation format
0	Asynchronous allocation format

The Pseudo-static subfield is set to 1 for a pseudo-static allocation and set to 0 otherwise.

For an SP allocation, the Truncatable subfield is set to 1 if the STA expects to truncate the SP, as described in 10.39.8. If the STA does not expect to truncate the SP, the Truncatable subfield is set to 0. The subfield is reserved for CBAP allocations.

For an SP allocation, the Extendable subfield is set to 1 if the STA expects to extend the SP, as described in 10.39.9. If the STA does not expect to extend the SP, the Extendable subfield is set to 0. The subfield is reserved for CBAP allocations.

The LP SC Used subfield is defined in 9.4.2.131.

The UP subfield indicates the lowest priority UP to be used for possible transport of MSDUs belonging to TCs with the same source and destination of the allocation.

The Destination AID subfield contains the AID of a STA that the requesting STA targets during the allocation.

The Source AID subfield contains the AID of the STA that initiates channel access during the allocation.

The BF Control subfield is defined in 9.5.5.

The Allocation Period is specified as a fraction or multiple of the beacon interval as defined in Table 9-261.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-261—Allocation Period field values

B0–B14	B15	Meaning
0	0	Reserved
0	1	Not periodic or periodicity unknown
1–32 767	0	The allocation period is a multiple of the beacon interval, i.e., allocation period = *n* x *bi* where *n* is the value represented by B0–B14 and *bi* is the beacon interval.
1–32 767	1	The allocation period is a fraction of the beacon interval, i.e., allocation period = *bi*/*n* where *n* is the value represented by B0–B14 and *bi* is the beacon interval.

For isochronous allocation format requests the Allocation Period, Minimum Allocation and Maximum Allocation fields are set as follows:

— The Allocation Period field indicates the period over which the allocation repeats.

— The Minimum Allocation field is set to the minimum acceptable allocation in microseconds in each allocation period.

— The Maximum Allocation field is set to the requested allocation in microseconds in each allocation period.

For asynchronous allocation format requests the Maximum Allocation field is reserved, and the Allocation Period and Minimum Allocation fields are set as follows:

— The Allocation Period field indicates the period over which the minimum allocation applies. The Allocation Period is an integer multiple of the beacon interval.

— The Minimum Allocation field specifies the minimum allocation in microseconds that the STA expects within the allocation period.

The Minimum Duration field specifies the minimum acceptable duration in microseconds. Possible values range from 1 to 32 767 for an SP allocation and 1 to 65 535 for a CBAP allocation. This field is set to 0 to indicate no minimum specified.

The Number of Constraints field indicates the number of Constraint subfields contained in the element. The field ranges from 0 to 15. Other values are reserved.

The Traffic Scheduling Constraint Set field contains one or more Constraint subfields (see Figure 9-570).

Figure 9-570—Traffic Scheduling Constraint Set field format

The Constraint subfield is defined as shown in Figure 9-571.

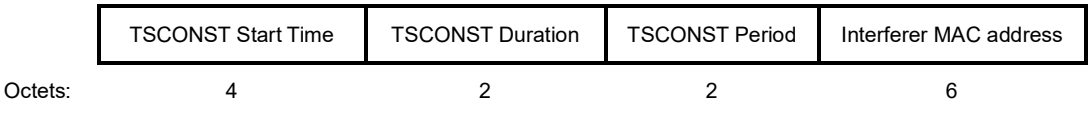

Figure 9-571—Constraint subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TSCONST Start Time subfield contains the lower 4 octets of the TSF at the time the scheduling constraint starts.

The TSCONST Duration subfield indicates the time, in microseconds, for which the scheduling constraint is specified.

The TSCONST Period subfield is specified as a fraction or multiple of the beacon interval as defined in Table 9-262. This subfield is used to indicate a periodic scheduling constraint by specifying the temporal gap between two consecutive scheduling constraints.

Table 9-262—TSCONST Period values

B0–B14	B15	Meaning
0	0	Reserved
0	1	Not periodic or periodicity unknown
1–32 767	0	The TSCONST period is a multiple of the beacon interval, i.e., TSCONST period = *n* x *bi* where *n* is the value represented by B0–B14 and *bi* is the beacon interval..
1–32 767	1	The TSCONST period is a fraction of the beacon interval, i.e., TSCONST period = *bi*/*n* where *n* is the value represented by B0–B14 and *bi* is the beacon interval..

The Interferer MAC Address subfield is set to the TA field within a frame received during the interval of time indicated by this Constraint subfield. If the value is unknown, the Interferer MAC Address subfield is set to the broadcast address.

9.4.2.134 CMMG TSPEC element

The definition of the CMMG TSPEC element is similar with the definition of the DMG TSPEC element except for the specific change defined by Figure 9-572 and Figure 9-573.

The Constraint subfield is defined in Figure 9-572 for CMMG STAs.

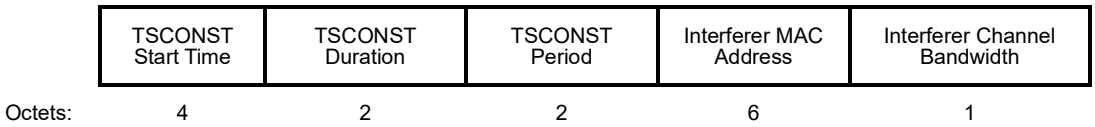

Figure 9-572—Constraint subfield format for CMMG STAs

The Interference Channel Bandwidth subfield is defined in Figure 9-573.

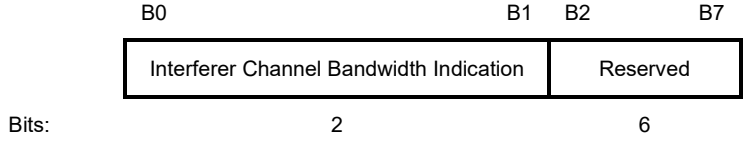

Figure 9-573—Interferer Channel Bandwidth subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Interferer Channel Bandwidth Indication subfield is present only when the operating channel bandwidth of the CMMG STA is 1080 MHz. The Interferer Channel Bandwidth Indication subfield indicates the part of the operating channel with interference during the time interval indicated by the TSCONST subfields. If the Interferer Channel Bandwidth Indication subfield is 0, interference occurred in the upper 540 MHz of the 1080 MHz operating channel. If the Interferer Channel Bandwidth Indication subfield is 1, interference occurred in the lower 540 MHz of the 1080 MHz operating channel. If the Interferer Channel Bandwidth Indication subfield is 2, interference occurred in over the total operating channel. A value of 3 for the Interferer Channel Bandwidth Indication subfield is reserved.

9.4.2.135 Next DMG ATI element

The Next DMG ATI element indicates the earliest start time for the next ATI in a subsequent beacon interval. See Figure 9-574.

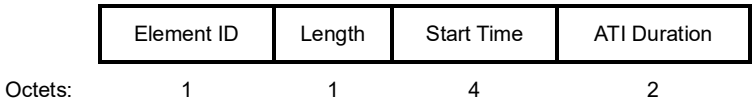

Figure 9-574—Next DMG ATI element format

The Element ID and Length fields are defined in 9.4.2.1.

The Start Time field contains the low order 4 octets of the TSF for the earliest time at which the next ATI in a subsequent beacon interval starts.

The ATI Duration field contains the duration, in microseconds, of the next ATI in a subsequent beacon interval.

9.4.2.136 Channel Measurement Feedback element

The Channel Measurement Feedback element is used to carry the channel measurement feedback in response to a request in the DMG Beam Refinement element of a BRP frame. It may contain data that the STA has measured on the TRN-T subfields of the BRP PPDU that contained the BRP frame, or a list of sectors identified during a sector sweep or during beam combination (10.42.6.3). The format and size of the Channel Measurement Feedback element are defined by the parameter values specified in the accompanying DMG Beam Refinement element.

The Channel Measurement Feedback element, as shown in Table 9-263, is composed of 4 subfields: the SNR subfield, the Channel Measurement subfield, the Tap Delay subfield, and the Sector ID Order subfield.

The Element ID and Length fields are defined in 9.4.2.1.

The number of channel/SNR measurements reported, N_{meas}, is equal to the number of TRN-T subfields that were appended to the PPDU on which the measurements were performed. If the measurement reports the result of an SLS or of an MID, it is equal to the number of frames received during the sector sweep, or the number of PPDUs used during the MID subphase.

The SNR subfield levels are unsigned integers referenced to a level of –8 dB. Each step is 0.25 dB. SNR values less than or equal to –8 dB are represented as 0. SNR values greater than or equal to 55.75 dB are represented as 0xFF.

Table 9-263—Channel Measurement Feedback element format

Field	Size		Meaning
Element ID	8 bits		
Length	8 bits		
SNR	SNR_1	8 bits	SNR as measured in the first TRN-T subfield or at the first sector from which SSW frame is received.
	SNR_2	8 bits	SNR as measured in the second TRN-T subfield or at the second sector from which SSW frame is received.
	…		
	$SNR_{N_{meas}}$	8 bits	SNR as measured in the N_{meas} TRN-T subfield or at sector N_{meas} from which SSW frame is received.
Channel Measurement	Channel Measurement 1	N_{taps}×16 bits	Channel measurement for the first TRN-T subfield
	Channel Measurement 2	N_{taps}×16 bits	Channel measurement for the second TRN-T subfield
	…		
	Channel Measurement N_{meas}	N_{taps}×16 bits	Channel measurement for the N_{meas} TRN-T subfield
Tap Delay	Relative Delay Tap #1	8 bits	The delay of Tap #1 in units of T_c relative to the path with the shortest delay detected.
	Relative Delay Tap #2	8 bits	The delay of Tap #2 in units of T_c relative to the path with the shortest delay detected.
	…		
	Relative Delay Tap #N_{taps}	8 bits	The delay of Tap #N_{taps} in units of T_c relative to the path with the shortest delay detected.
Sector ID Order	Sector ID_1	6 bits	Sector ID for SNR_1 being obtained, or sector ID of the first detected beam.
	DMG Antenna ID_1	2 bits	DMG Antenna ID corresponding to sector ID_1.
	Sector ID_2	6 bits	Sector ID for SNR_2 being obtained, or sector ID of the second detected beam.
	DMG Antenna ID_2	2 bits	DMG Antenna ID corresponding to sector ID_2.
	…		
	Sector ID_{Nmeas} or sector ID_{Nbeam}	6 bits	Sector ID for SNR_{Nmeas} being obtained, or sector ID of the detected beam N_{beam}.
	DMG Antenna ID_{Nmeas} or DMG Antenna ID_{Nbeam}	2 bits	DMG Antenna ID corresponding to sector ID_{Nmeas} or sector ID_{Nbeam}

The format of each channel measurement is specified in Table 9-264.

Table 9-264—Channel measurement

Field	Size	Meaning
Relative I Component Tap #1	8 bits	The in-phase component of impulse response for Tap #1, relative to the amplitude of the strongest tap measured.
Relative Q Component Tap #1	8 bits	The quadrature component of impulse response for Tap #1, relative to the amplitude of the strongest tap measured.
Relative I Component Tap #2	8 bits	The in-phase component of impulse response for Tap #2, relative to the amplitude of the strongest tap measured.
Relative Q Component Tap #2	8 bits	The quadrature component of impulse response for Tap #2, relative to the amplitude of the strongest tap measured.
…		
Relative I Component Tap #N_{taps}	8 bits	The in-phase component of impulse response for Tap #N_{taps}, relative to the amplitude of the strongest tap measured.
Relative Q Component Tap #N_{taps}	8 bits	The quadrature component of impulse response for Tap #N_{taps}, relative to the amplitude of the strongest tap measured.

Each channel measurement contains N_{taps} channel impulse taps. The channel impulse response reported for all N_{meas} measurements correspond to a common set of relative tap delays. If the Tap Delay subfield is not present, then the N_{taps} channel taps is interpreted as consecutive time samples, separated by T_c. Selection of which taps are sent is implementation dependent. The delay values in the Tap Delay subfield, when present, correspond to the strongest taps and are unsigned integers, in increments of T_c, starting from 0. Each channel tap is reported as an in-phase and quadrature component pair, with each component value represented as a 2s complement number between –128 and 127. Unless all in-phase and quadrature component values are reported as zero, they are scaled such that the two most significant bits for at least one of the component values equal 01 or 10 (binary). The same scale applies to all measurements over all TRN subfields.

The Sector ID Order subfield indicates the TX sector IDs corresponding to the SNRs in the SNR subfield when the SNR Present subfield is set to 1 and Sector ID Order Present subfield is set to 1, in response to a BRP PPDU with the SNR Requested subfield set to 1. The Sector ID Order subfield indicates the TX sector IDs ranked in the decreasing order of link quality, as measured on a preceding sector sweep, MID, or BC phase, determined in an implementation dependent manner, when the SNR Present subfield is set to 0 and the Sector ID Order Present subfield is set to 1 in response to setting the SNR Requested subfield to 0 and the Sector ID Order Requested subfield to 1. The FBCK-REQ field and the FBCK TYPE field in the DMG Beam Refinement element are used by the transmitter and receiver to, respectively, request for and indicate the sector IDs and their order.

9.4.2.137 Awake Window element

The Awake Window element is defined as shown in Figure 9-575.

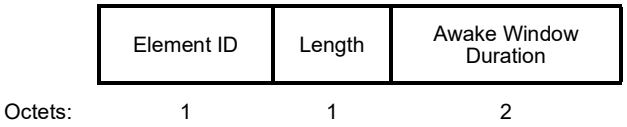

Figure 9-575—Awake Window element format

The Element ID and Length fields are defined in 9.4.2.1.

The Awake Window Duration field contains the duration of the Awake Window in microseconds.

9.4.2.138 Multi-band element

The Multi-band element indicates that the STA transmitting this element (the transmitting STA) is within a multi-band device capable of operating in a frequency band or operating class or channel other than the one in which this element is transmitted. In addition, if used as part of a fast session transfer, this element indicates that the transmitting STA is able to accomplish a fast session transfer from the current channel to a channel using another STA in the same device, in the other or same band. The format of the Multi-band element is shown in Figure 9-576.

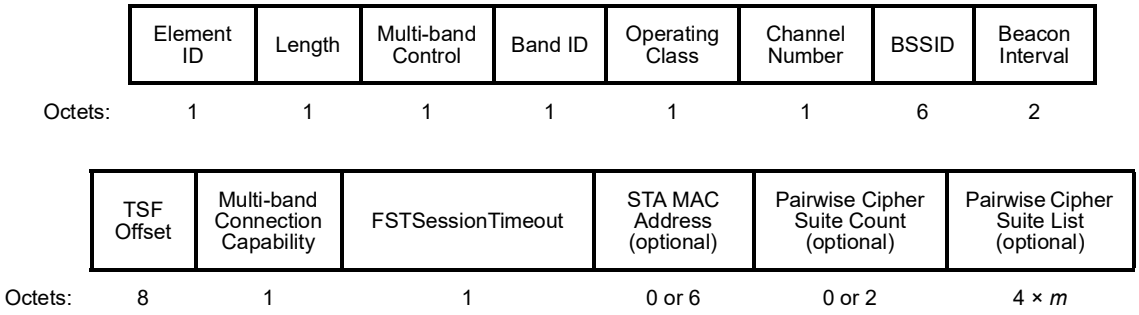

Figure 9-576—Multi-band element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Multi-band Control field is shown in Figure 9-577.

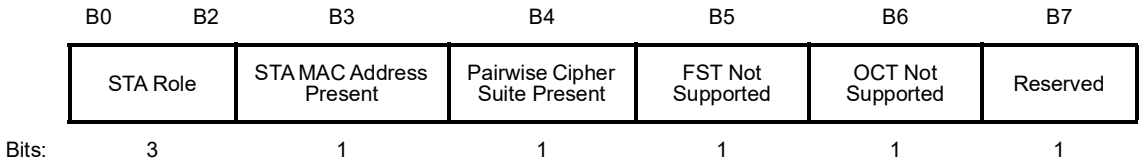

Figure 9-577—Multi-band Control field format

The STA Role subfield specifies the role the transmitting STA plays on the channel of the operating class indicated in this element. The possible values of the STA Role subfield are indicated in Table 9-265.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-265—STA Role subfield values

STA role	Value
AP	0
TDLS STA	1
IBSS STA	2
PCP	3
Non-PCP and Non-AP STA	4
Reserved	5–7

NOTE—A STA can perform in more than one role in a channel, and the STA Role subfield identifies the role that is most relevant for the STA for that channel.

The STA MAC Address Present subfield indicates whether the STA MAC Address subfield is present in the Multi-band element. If the present subfield is set to 1, the STA MAC Address subfield is present. If the STA MAC Address Present subfield is set to 0, the STA MAC Address subfield is not present.

The Pairwise Cipher Suite Present subfield indicates whether the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are present in the Multi-band element. If the Pairwise Cipher Suite Present subfield is set to 1, the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are present. If the Pairwise Cipher Suite Present subfield is set to 0, the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are not present.

The FST Not Supported subfield is set to 1 to indicate that FST protocol (see 11.31.3) is not supported. The FST protocol is supported otherwise.

The OCT Not Supported subfield is set to 1 to indicate that OCT (see 11.31.5) is not supported. OCT is supported otherwise.

The Band ID field provides the identification of the frequency band related to the Operating Class and Channel Number fields. The Band ID field is defined in 9.4.1.45.

The Operating Class field indicates the channel set for which the Multi-band element applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the Multi-band element applies. Valid values of the Operating Class field are shown in Annex E. This field is set to 0 to indicate all operating classes within the frequency band specified by the Band ID field.

The Channel Number field is set to the number of the channel the transmitting STA is operating on or intends to operate on. This field is set to 0 to indicate all channels within the frequency band specified by the Band ID field.

The BSSID field specifies the BSSID of the BSS operating on the channel and frequency band indicated by the Channel Number and Band ID fields. When used as part of the on-channel tunneling operation (see 11.31.5), this field can contain the wildcard BSSID.

The Beacon Interval field specifies the size of the beacon interval for the BSS operating on the channel and frequency band indicated by the Channel Number and Band ID fields. This field is set to 0 if no BSS is in operation in the indicated channel and frequency band.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the transmitting STA is a member of a PBSS or infrastructure BSS on both the channel indicated in this element and the channel on which the element is transmitted, then the TSF Offset field contains the time offset of the TSF of the PBSS or infrastructure BSS of which the transmitting STA is member on the channel indicated in this element relative to the TSF of the PBSS or infrastructure BSS corresponding to the BSSID indicated in the Address 3 field of the MPDU in which this element is transmitted. The TSF Offset field is specified as a 2s complement integer in microsecond units. If the transmitting STA is not a member of an infrastructure BSS or PBSS on both the channel indicated in this element and the channel on which the element is transmitted, then the TSF Offset field contains the value 0.

The Multi-band Connection Capability field is defined in Figure 9-578. The Multi-band Connection Capability field indicates the connection capabilities supported by the STA on the channel and band indicated in this element.

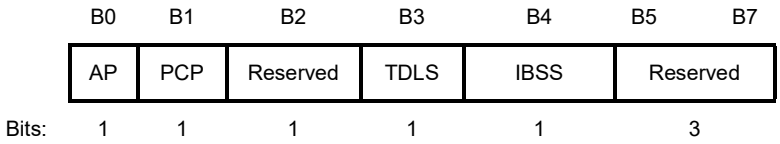

Figure 9-578—Multi-band Connection Capability field format

The AP subfield specifies whether the STA can function as an AP on the channel and band indicated in the element. It is set to 1 when the STA is capable to function as an AP, and it is set to 0 otherwise.

The PCP subfield specifies whether the STA can function as a PCP on the channel and band indicated in the element. It is set to 1 when the STA is capable to function as a PCP, and it is set to 0 otherwise.

The TDLS subfield is set to 1 to indicate that the STA can perform a TDLS on the channel and band indicated in the element. Otherwise, it is set to 0.

The IBSS subfield is set to 1 to indicate that the STA is able to support IBSS on the channel and band indicated in the element. Otherwise, it is set to 0.

The FSTSessionTimeout field is used in the FST Setup Request frame to indicate the timeout value for FST session setup protocol as defined in 11.31.1. The FSTSessionTimeout field contains the duration, in TUs, after which the FST setup is terminated. The FSTSessionTimeout field is reserved if the FST Not Supported subfield is 1.

The STA MAC Address field contains the MAC address that the transmitting STA uses while operating on the channel indicated in this element. The STA MAC Address field is not present in this element if the STA MAC Address Present field is set to 0.

The Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are defined in 9.4.2.24. These fields are not present in this element if the Pairwise Cipher Suite Present subfield is set to 0.

9.4.2.139 ADDBA Extension element

The ADDBA Extension element is shown in Figure 9-579.

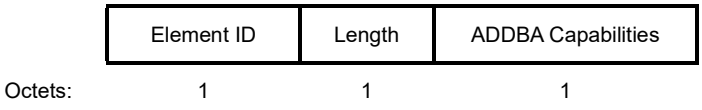

Figure 9-579—ADDBA Extension element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The ADDBA Capabilities field is shown in Figure 9-580.

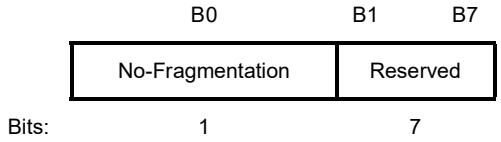

Figure 9-580—ADDBA Capabilities field format

The ADDBA Extension element can be included in the ADDBA Request and Response frames.

The No-Fragmentation subfield determines whether a fragmented MSDU can be carried in the MPDU sent under the block ack agreement. When this subfield set to 1 in the ADDBA Request frame, it indicates that the originator is not fragmenting sent MSDUs. When this subfield set to 1 in the ADDBA Response frame, it indicates that the recipient is not capable of receiving fragmented MSDUs.

9.4.2.140 Next PCP List element

The Next PCP List element contains one or more AID of NextPCP *i* fields as shown in Figure 9-581.

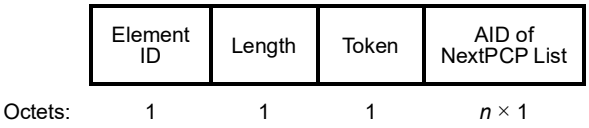

Figure 9-581—Next PCP List element format

The Element ID and Length fields are defined in 9.4.2.1.

The Token field is set to 0 when the PBSS is initialized and incremented each time the sequence of AID of NextPCP *i* fields is updated.

The AID of NextPCP List field contains one or more (*n*) AID of NextPCP fields.

Each AID of NextPCP field contains the AID value of a STA. The AID values are listed in the order described in 11.27.2.

9.4.2.141 PCP Handover element

The PCP Handover element is used to indicate the STA becoming the new PCP following an explicit or implicit handover procedure. The PCP Handover element is defined in Figure 9-582.

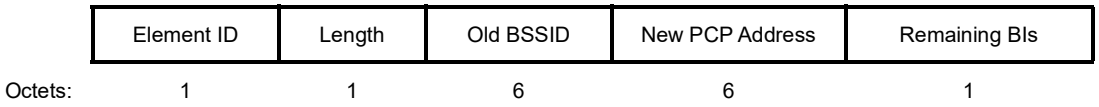

Figure 9-582—PCP Handover element format

The Element ID and Length fields are defined in 9.4.2.1.

The Old BSSID field contains the BSSID of the PBSS from which control is being handed over.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The New PCP Address field indicates the MAC address of the new PCP following a handover.

The Remaining BIs field indicates the number of beacon intervals, from the beacon interval in which this element is transmitted, remaining until the handover takes effect.

9.4.2.142 DMG Link Margin element

9.4.2.142.1 General

The format of the DMG Link Margin element is shown in Figure 9-583. The DMG Link Margin element is included in a Link Measurement Report frame.

	Element ID	Length	Activity	MCS	Link Margin	SNR	Reference Timestamp
Octets:	1	1	1	1	1	1	4

Figure 9-583—DMG Link Margin element format

The Element ID and Length fields are defined in 9.4.2.1.

The Activity field is set to a preferred action that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame execute. The method by which the sending STA determines a suitable action for the peer STA is implementation specific. The Activity field is defined in 9.4.2.142.2.

The MCS field is set to an integer representation of the MCS that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame use to transmit frames to this STA. The reference PER for selection of the MCS is 10^{-2} for an MPDU length of 4096 octets. The method by which the sending STA determines a suitable MCS for the peer STA is implementation specific. Values 0–12 and values 25–31 indicate MCS 0 to MCS 12 and MCS 25 to MCS 31, respectively. Values 133, 134, 135, 136, 137, 138, and 140 indicate MCSs 12.1, 9.1, 12.3, 12.4, 12.5, 12.2, and 12.6, respectively.

The Link Margin field contains the measured link margin of Data frames received from the peer STA indicated in the RA field of the Link Measurement Report frame and is coded as a 2s complement signed integer in units of decibels. This field is set to –128 to indicate that no link margin is provided. The method used to measure the link margin is beyond the scope of this standard.

The SNR field indicates the SNR measured during the reception of a PPDU. Values are from –13 dB to 50.75 dB in 0.25 dB steps.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.142.2 Activity field

The Activity field values are defined in Table 9-266.

Table 9-266—Activity field values

Preferred Action value	Meaning
0	No change preferred
1	Change(d) MCS
2	Decrease(d) transmit power
3	Increase(d) transmit power
4	Fast session transfer (FST)
5	Power conserve mode
6	Perform SLS
7–255	Reserved

9.4.2.143 DMG Link Adaptation Acknowledgment element

The format of the DMG Link Adaptation Acknowledgment element is shown in Figure 9-584. The DMG Link Adaptation Acknowledgment element is carried in the Optional Subelements field of the Link Measurement Report frame.

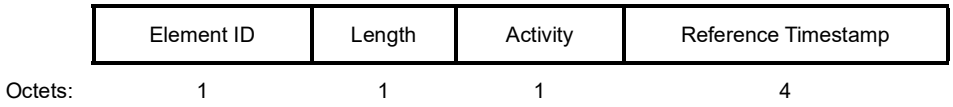

Figure 9-584—DMG Link Adaptation Acknowledgment element format

The Element ID and Length fields are defined in 9.4.2.1.

The Activity field is set to the action that the STA sending this element has executed following the reception of the recommended activity in a Link Measurement Report frame. The method by which the sending STA determines the action is described in 10.42.9 and the Activity field is defined in 9.4.2.142.2.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

9.4.2.144 Switching Stream element

The Switching Stream element indicates the streams that the transmitting STA requests to be switched to a new frequency band or operating class or channel. The format of the Stream Switching element is shown in Figure 9-585.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

	Element ID	Length	Old Band ID	New Band ID	Non-QoS Data Frames	Number of Streams Switching	Switching Parameters
Octets:	1	1	1	1	1	1	2 × Number of Streams Switching

Figure 9-585—Switching Stream element format

The Element ID and Length fields are defined in 9.4.2.1.

The Old Band ID field specifies the frequency band to which the information carried in this element is related. This field is defined in 9.4.1.45.

The New Band ID field specifies the frequency band to which the information contained in the Stream ID In New Band subfield of this element is related. This field is defined in 9.4.1.45.

The Non-QoS Data Frames field specifies whether non-QoS Data frames can be transmitted in the frequency band indicated in the New Band ID field. If the Non-QoS Data Frames field is equal to 0, non-QoS Data frames cannot be transmitted in the frequency band indicated in the New Band ID field. If the Non-QoS Data Frames field is equal to 1, non-QoS Data frames can be transmitted in the frequency band indicated in the New Band ID field.

The Number of Streams Switching field specifies the number of streams to be switched.

The format of Switching Parameters field is shown in Figure 9-586.

	B0 B3	B4	B5 B8	B9	B10	B11	B12 B15
	Stream ID In Old Band		Stream ID In New Band		Stream ID In New Band Valid	LLT Type	Reserved
	TID	Direction	TID	Direction			
Bits:	4	1	4	1	1	1	4

Figure 9-586—Switching Parameters field format

The Stream ID In Old Band and Stream ID In New Band subfields are comprised of the TID and Direction subfields. The subfields within the Stream ID In New Band subfield are reserved if the Stream ID In New Band Valid subfield is set to 0.

The TID subfield specifies the stream in the corresponding band.

The Direction subfield specifies whether the STA transmitting this element is the source or destination of the corresponding TID. It is set to 0 to indicate that the STA transmitting this element is the source of the TID, and it is set to 1 otherwise.

The Stream ID In New Band Valid subfield is set to 1 if the information contained in the Stream ID In New Band subfield is valid, that is, the TID specified within the Stream ID In New Band subfield has been established in the band identified in the New Band ID field. The Stream ID In New Band Valid subfield is set to 0 otherwise.

The LLT Type subfield is set to 1 to indicate that the streambased Link Loss Countdown is used for the stream identified by the Stream ID In Old Band subfield. The LLT Type subfield is set to 0 to indicate that the STA-based Link Loss Countdown is used for the stream identified by the Stream ID In Old Band subfield. This subfield is reserved when the LLT field within the FST Setup Request or FST Setup Response frame containing this element is set to 0.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.145 Session Transition element

The Session Transition element is defined in Figure 9-587.

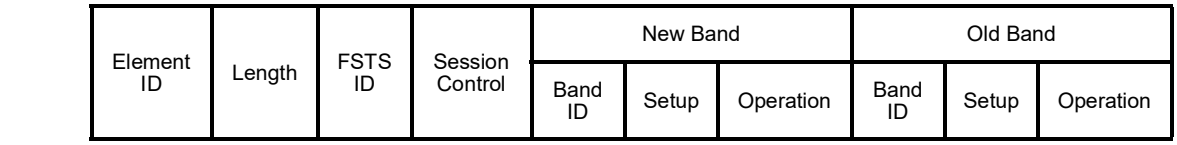

Figure 9-587—Session Transition element format

The Element ID and Length fields are defined in 9.4.2.1.

The FSTS ID (fast session transfer session identifier) field contains the identification of the FST session established between a pair of STAs as allocated by the initiator (11.31).

The Session Control field is defined in Figure 9-588.

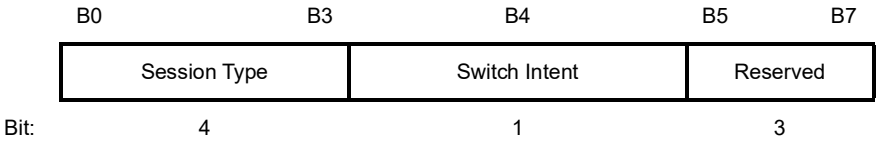

Figure 9-588—Session Control field format

The Session Type subfield is defined as shown in Table 9-267 and indicates the type of connection/session that is intended to be set up in the new band for this FST session.

Table 9-267—Session Type subfield values

Value	Session type
0	Infrastructure BSS
1	IBSS
2	Reserved
3	TDLS
4	PBSS
5–255	Reserved

When the Session Type subfield is set to IBSS and the STA Role subfield within the Multi-band element is set to IBSS STA, the BSSID field within the Multi-band element contains the BSSID. This indicates that the transmitting STA is not associated with an AP on the band and channel indicated in the Multi-band element.

The Switch Intent subfield is set to 1 to indicate that the FST initiator that transmitted the FST Setup Request frame intends to switch to the band/channel indicated within the Band ID subfield of the FST Setup Request frame and in the Multi-band element, even if the fast session transfer does not succeed. Otherwise, this subfield is set to 0. This subfield is reserved when transmitted within an FST Setup Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The New Band and Old Band subfields are used for the signaling described in 11.31.1. Both the New Band and Old Band subfields contain a Band ID subfield, a Setup subfield, and an Operation subfield.

The Band ID subfield is defined in 9.4.1.45. If a Multi-band element is present in the frame containing this Session Transition element, the Band ID subfield refers to the Operating Class and Channel Number fields within the Multi-band element provided both of these fields are nonzero.

The Setup subfield is set to 1 to indicate that the STA transmitting this element has an FST session established with the STA that the frame containing this element is addressed and in the band indicated within the Band ID subfield. Otherwise, it is set to 0. Other values are reserved.

The Operation subfield is set to 1 to indicate that the STA is operating in the band indicated within the Band ID subfield. Otherwise, it is set to 0. Other values are reserved.

9.4.2.146 Cluster Report element

The format of the Cluster Report element is shown in Figure 9-589. The Cluster Report element is included Action frames, such as Announce and Information Response frames, transmitted to the AP or PCP of the BSS. Because the Length field supports only 255 octets of information in an element, the STA can split the content of the Extended Schedule Element field, as described in 9.4.2.131, in different Cluster Report elements.

	Element ID	Length	Cluster Report Control	Reported BSSID	Reference Timestamp	Clustering Control
Octets:	1	1	1	0 or 6	0 or 4	0 or 8

	ECAPC Policy Element	Extended Schedule Element	Number of Constraints	Traffic Scheduling Constraint Set
Octets:	0, 13 or 17	0 or 17 – *n*	1	Variable

Figure 9-589—Cluster Report element format

The value of *n* in Figure 9-589 is given by the following equation:

$$n = 255 - (2 + S_{RB} + S_{RT} + S_{CC} + S_{EPE} + S_{TSCONST})$$

where

S_{RB} is the size of the Reported BSSID field in octets
S_{RT} is the size of the Reference Timestamp field in octets
S_{CC} is the size of the Clustering Control field in octets
S_{EPE} is the size of the ECAPC Policy Element field in octets
$S_{TSCONST}$ is the size of the Traffic Scheduling Constraint Set field in octets

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Cluster Report Control field is defined in Figure 9-590.

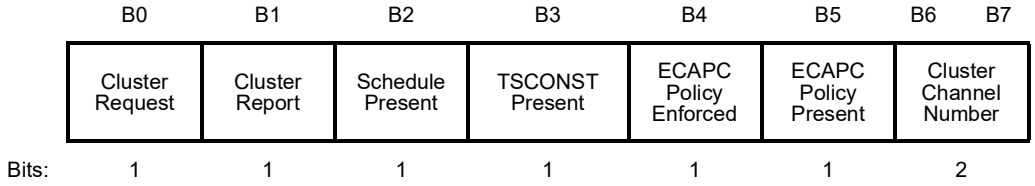

Figure 9-590—Cluster Report Control field format

The Cluster Request subfield is set to 1 to indicate that the STA is requesting the AP or PCP to start AP or PCP clustering (10.40). Otherwise, it is set to 0.

The Cluster Report subfield is set to 1 to indicate that this element contains a cluster report. If this subfield is set to 1, the Reported BSSID, Reference Timestamp and Clustering Control fields are present in this element. Otherwise, if the Cluster Report subfield is set to 0, none of the Reported BSSID, Reference Timestamp, Clustering Control, Extended Schedule Element, and Traffic Scheduling Constraint Set fields is present in this element.

The Schedule Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The Schedule present subfield is set to 1 to indicate that the Extended Schedule Element field is present in this element. Otherwise, the Extended Schedule Element field is not present in this element.

The TSCONST Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The TSCONST Present subfield is set to 1 to indicate that the Number of Constraints field and the Traffic Scheduling Constraint Set field are present in this element. Otherwise, these fields are not present in this element.

The ECAPC Policy Enforced subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The ECAPC Policy Enforced subfield is defined in 9.3.4.2 and contains the ECAPC Policy Enforced subfield received in the DMG Beacon frame that generated this report.

The Cluster Channel Number subfield is set to 0 to indicate that the operating channel of the reported cluster is the common 2.16 GHz channel; it is set to 1 to indicate that the operating channel of the reported AP or PCP cluster is the low frequency 1.08 GHz channel 35 or 37 (see Annex E); it is set to 2 to indicate the operating channel of the reported AP or PCP cluster is the high frequency 1.08 GHz channel 36 or 38; and the value 3 is reserved.

The ECAPC Policy Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The ECAPC Policy Present subfield is set to 1 to indicate that the ECAPC Policy Present Element field is present in this element. Otherwise, the ECAPC Policy Present Element field is not present in this element.

The Reported BSSID field contains the BSSID field of the DMG Beacon frame that triggered this report.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the STA's MAC received a DMG Beacon frame that triggered this report.

The Clustering Control field is defined in 9.3.4.2 and contains the Clustering Control received in the DMG Beacon frame that triggered this report.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The ECAPC Policy Element field is defined in 9.4.2.150 and contains the ECAPC Policy element obtained from the AP or PCP that sent the DMG Beacon frame that generated this report (see 10.40.4).

The Extended Schedule Element field is defined in 9.4.2.131 and contains a single Extended Schedule element received in the DMG Beacon frame that generated this report. If an Extended Schedule element is not present in the received DMG Beacon, this field is set to all 0s.

The Number of Constraints field indicates the number of Constraint subfields contained in the Traffic Scheduling Constraint Set field. This field ranges from 0 to 15. Other values are reserved.

The Traffic Scheduling Constraint Set field contains one or more Constraint subfields as defined in 9.4.2.133 and specifies periods of time with respect to the TBTT of the beacon interval of the BSS the STA participates where the STA experiences poor channel conditions, such as due to interference.

9.4.2.147 Relay Capabilities element

A STA that intends to participate in relay operation (11.34) advertises its capabilities through the Relay Capabilities element. The Relay Capabilities element is defined in Figure 9-591.

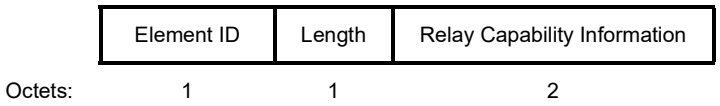

Figure 9-591—Relay Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The Relay Capability Information field is defined in Figure 9-592.

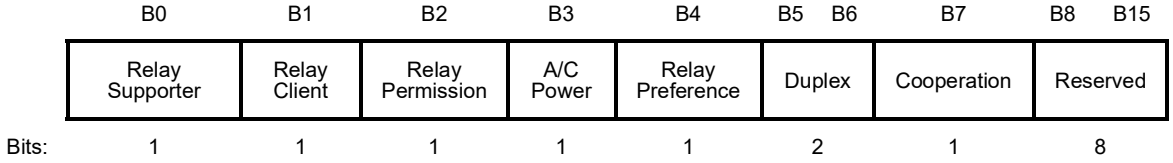

Figure 9-592—Relay Capability Information field format

The Relay Supporter subfield indicates whether the STA is capable of relaying by transmitting and receiving frames between a pair of other STAs. A STA capable of relaying is called a *relay* STA. This subfield is set to 1 if the STA supports relaying; otherwise, it is set to 0.

The Relay Client subfield indicates whether the STA is capable of using frame-relaying through a relay STA. It is set to 1 if the STA supports transmission and reception of frames through a relay STA; otherwise, it set to 0.

The Relay Permission subfield indicates whether the AP or PCP allows relay operation (11.34) to be used within the AP's or PCP's BSS. It is set to 0 if relay operation is not allowed in the BSS; otherwise, it is set to 1. This subfield is reserved when transmitted by a non-AP and non-PCP STA.

The A/C Power subfield indicates whether the STA is power constrained or not. It is set to 1 if the STA is not power constrained, i.e., supplied by external power, including PoE, wall plug, etc.; otherwise, it is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Relay Preference subfield indicates whether the STA prefers to become RDS rather than REDS. It is set to 1 if a STA prefers to be RDS; otherwise, it is set to 0.

The Duplex subfield indicates whether the STA is capable of full-duplex/amplify-and-forward (FD-AF) or half-duplex/decode-and-forward (HD-DF). It is set to 1 if the STA is not capable of HD-DF but is capable of only FD-AF. It is set to 2 if the STA is capable of HD-DF but is not capable of FD-AF. It is set to 3 if the STA is capable of both HD-DF and FD-AF. The value 0 is reserved.

The Cooperation subfield indicates whether a STA is capable of supporting link cooperation. It is set to 1 if the STA supports both link cooperation and link switching. It is set to 0 otherwise.

9.4.2.148 Relay Transfer Parameter Set element

A source REDS that intends to transfer frames via an RDS advertises the parameters for the relay operation with the transmission of a Relay Transfer Parameter Set element (11.34). The Relay Transfer Parameter Set element is defined in Figure 9-593.

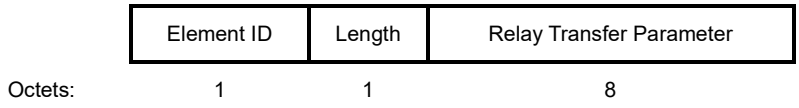

Figure 9-593—Relay Transfer Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

The Relay Transfer Parameter field is defined in Figure 9-594.

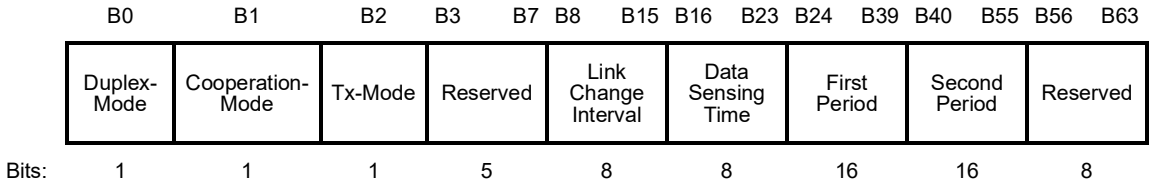

Figure 9-594—Relay Transfer Parameter field format

The Duplex-Mode subfield indicates that the source REDS set the duplex mode of the RDS involved in RLS. The Duplex-Mode subfield value is set to 0 if the RDS operates in HD-DF mode. It is set to 1 if the RDS operates in FD-AF mode.

The Cooperation-Mode subfield indicates whether the source REDS sets the link cooperation of the RDS involved in RLS. This subfield is valid only when the RDS is capable of link cooperation and Duplex-Mode subfield is set to 0. Otherwise, this subfield is reserved. The Cooperation-Mode subfield value is set to 0 if the RDS operates in link switching. It is set to 1 if the RDS operates in link cooperation.

The Tx-Mode subfield indicates that the source REDS sets the transmission mode of the RDS involved in RLS. This subfield is valid only when the RDS is capable of link switching and the Duplex-Mode subfield is set to 1. Otherwise, this subfield is reserved. The Tx-Mode subfield value is set to 0 if a group of three STAs involved in the RLS operates in Normal mode and is set to 1 if the group operates in Alternation mode.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Link Change Interval subfield indicates when the link of frame transmission between source REDS and destination REDS is changed. From the start position of one reserved continuous SP, every time instant of link change interval can have an opportunity to change the link. Within one link change interval, only one link is used for frame transfer. The unit of this subfield is microseconds. This subfield is used only when the group involved in the RLS operates in link switching.

The Data Sensing Time subfield indicates the defer time offset from the time instant of the next link change interval when the link switching occurs. By default, it is set to SIFS plus SBIFS. This subfield is used only when the STAs involved in the RLS operate in link switching with Tx-Mode that is 0.

The First Period subfield indicates the period of the source REDS-RDS link in which the source REDS and RDS exchange frames. This subfield is used only when HD-DF RDS operates in link switching.

The Second Period subfield indicates the period of the RDS-destination REDS link in which the RDS and destination REDS exchange frames and the following period of the RDS-source REDS link in which the RDS informs the source REDS of finishing one frame transfer. This subfield is used only when HD-DF RDS operates in link switching.

9.4.2.149 Quiet Period Request element

The Quiet Period Request element defines a periodic sequence of quiet intervals that the requester AP requests the responder AP to schedule. The format of the Quiet Period Request element is shown in Figure 9-595.

	Element ID	Length	Request Token	Quiet Period Offset	Quiet Period	Quiet Duration	Repetition Count	Target BSSID
Octets:	1	1	2	2	4	2	1	6

Figure 9-595—Quiet Period Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Request Token field is set to a nonzero value chosen by the requester AP.

The Quiet Period Offset field is set to the offset of the start of the first quiet interval from the QAB Request frame that contains this element, expressed in TUs. The reference time is the start of the preamble of the PPDU that contains this element.

The Quiet Period field is set to the spacing between the start of two consecutive quiet intervals, expressed in TUs.

The Quiet Duration field is set to duration of the quiet time, expressed in TUs.

The Repetition Count field is set to the number of requested quiet intervals.

NOTE—The periodic sequence of quiet intervals ends after the start of preamble of the PPDU containing the QAB IE + Quiet Period Offset + (Repetition Count-1)×Quiet Period + Quiet Duration (in TUs).

The Target BSSID field is set to the responder AP's MAC address.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.150 Quiet Period Response element

The Quiet Period Response element defines the feedback information from the AP that received the Quiet Period Request element. The format of the Quiet Period Response element is shown in Figure 9-596.

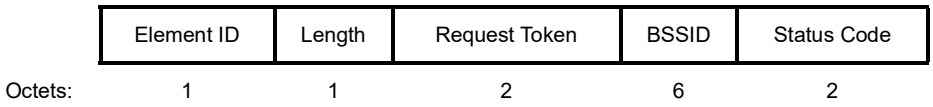

Figure 9-596—Quiet Period Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The Request Token field is set to the value of the Request Token field of the corresponding received Quiet Period Request element.

The BSSID field is set to the value of the Target BSSID field of the corresponding received Quiet Period Request element.

The Status Code field is defined in 9.4.1.9.

9.4.2.151 BeamLink Maintenance element

The format of the BeamLink Maintenance element is shown in Figure 9-597. The BeamLink Maintenance element is included in Action frames, such as Probe, Announce and the Information Request and Response frames, transmitted between a non-AP and non-PCP DMG STA and a DMG AP or PCP. The element is included in the Probe and Information Request and Response frames transmitted between non-AP and non-PCP DMG STAs.

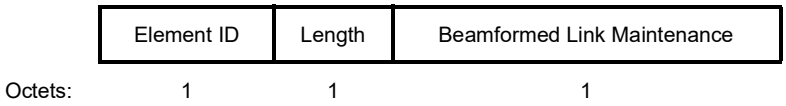

Figure 9-597—BeamLink Maintenance element format

The Element ID and Length fields are defined in 9.4.2.1.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.4.2.152 Multiple MAC Sublayers (MMS) element

The format of Multiple MAC Sublayers (MMS) element is shown in Figure 9-598. The MMS element is included in Action frames, such as Probe Request, Association Request, Information Request, Announce, and Information Response frames, transmitted to the peer STA and the AP or PCP of the BSS.

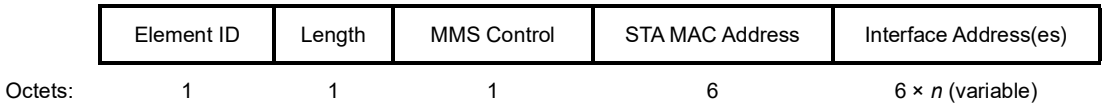

Figure 9-598—MMS element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MMS Control field is defined in Figure 9-599.

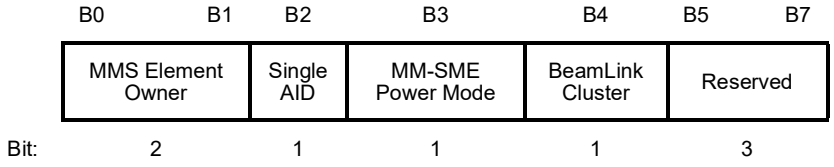

Figure 9-599—MMS Control field format

The MMS Element Owner subfield is encoded as shown in Table 9-268. If the MMS Element Owner field is set to No Owner, then the Interface address(es) field in the MMS element is reserved.

Table 9-268—MMS Element Owner subfield definition

MMS Element Owner subfield value		Meaning
B0	B1	
0	0	No Owner
1	0	Non-AP and Non-PCP MMS element
0	1	PCP MMS element
1	1	AP MMS element

The Single AID subfield is 1 bit in length and is encoded as defined in Table 9-269.

Table 9-269—Single AID subfield definition

MMS element sent from	MMS element sent to	MMS Element Owner		Single AID	Meaning
		B0	B1	B3	
Non-AP and non-PCP STA	AP or PCP	1	0	1	Request to allocate single AID for MAC addresses included in the MMS element
Non-AP and non-PCP STA	AP or PCP	1	0	0	Do not allocate single AID for MAC addresses included in the MMS element
AP or PCP	Non-PCP, non-AP STA	1	0	1	Single AID is allocated for all MAC addresses in the MMS element
AP or PCP	Non-PCP, non-AP STA	1	0	0	Single AID is not allocated for all MAC addresses in the MMS element
Non-AP and non-PCP STA	Non-PCP, non-AP STA	1	0	1	Single AID is allocated for all MAC addresses in the MMS element

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-269—Single AID subfield definition *(continued)*

MMS element sent from	MMS element sent to	MMS Element Owner		Single AID	Meaning
		B0	B1	B3	
Non-AP and non-PCP STA	Non-PCP, non-AP STA	1	0	0	Single AID is not allocated for all MAC addresses in the MMS element
AP or PCP	Non-PCP, non-AP STA	0	1	1	Single AID is allocated for all MAC addresses in the non-AP and non-PCP STA MMS element
AP or PCP	Non-PCP, non-AP STA	0	1	0	Single AID is not allocated for all MAC addresses in the non-AP and non-PCP STA MMS element

The MM-SME Power Mode subfield is 1 bit in length and is set to 1 to indicate that when a STA advertised in the MMS element sent by the STA coordinated by an MM-SME moves from the awake to the doze state, then all other STAs advertised in the MMS element sent by the STA move to the doze state. The STA coordinated by the MM-SME moves to the awake state only when all STAs advertised in the MMS element move to the awake state. The MM-SME Power Mode subfield is set to 0 to indicate that when a STA advertised in the MMS element sent by the STA moves from the doze to the awake state, then all other STAs advertised in the MMS element sent by the STA coordinated by the MM-SME move to the awake state. The STA coordinated by the MM-SME moves to the doze state only when all STAs advertised in the MMS element move to the doze state.

The BeamLink Cluster subfield is 1 bit in length and is set to 1 if the DMG STA intends to maintain the same beamformed link for all of the links within the MMSL cluster. Otherwise, this subfield is set to 0.

The STA MAC Address field contains the MAC address of the STA.

When present in the element, the Interface Address(es) field contains one or more MAC addresses that can be used to identify the STAs in addition to the STA MAC address, coordinated by the same MM-SME (see 11.32).

9.4.2.153 U-PID element

The format of the Upper Layer Protocol Identification (U-PID) element is shown in Figure 9-600.

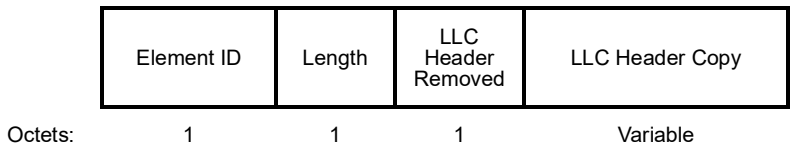

Figure 9-600—U-PID element format

The Element ID and Length fields are defined in 9.4.2.1.

The LLC Header Removed field is set to 1 to indicate that MSDUs do not contain the LLC (Logical Link Control) header over the WM. It is set to 0 otherwise.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The content and corresponding size of the LLC Header Copy field are specified in Table 9-270.

Table 9-270—LLC Header Copy field size

LLC Header Copy field contents	LLC Header Copy field size (octets)
LLC header with 8-bit control field without SNAP	3
LLC header with 8-bit control field with SNAP	8
LLC header with 16-bit control field without SNAP	4
LLC header with 16-bit content field with SNAP	9

NOTE—The structure of the LLC header is defined in IEEE Std 802.2-1998. The structure of the LLC with SNAP extension is defined in IEEE Std 802.2-1998.

9.4.2.154 ECAPC Policy element

The format of the ECAPC Policy element is shown in Figure 9-601.

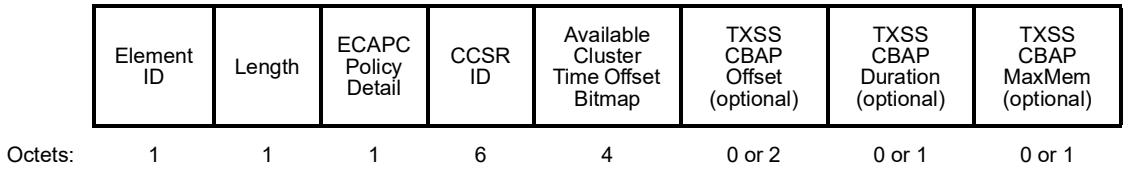

Figure 9-601—ECAPC Policy element format

The Element ID and Length fields are defined in 9.4.2.1.

The ECAPC Policy Detail field is defined in Figure 9-602.

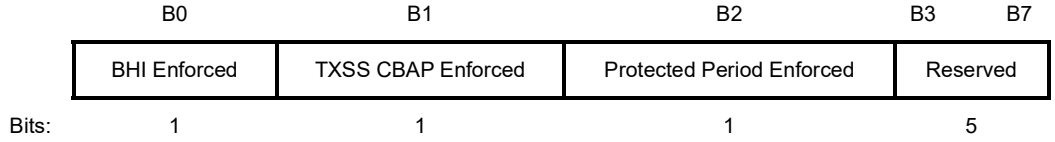

Figure 9-602—ECAPC Policy Detail field format

The BHI Enforced subfield set to 1 indicates that an AP or PCP in a centralized AP or PCP cluster completes the BHI for the current beacon interval before TBTT + (8×Beacon SP duration), as described in 10.40.3.4. The BHI Enforced subfield set to 0 indicates that an AP or PCP within a cluster does not have to complete the BHI for the current beacon interval before TBTT + (8×Beacon SP duration).

The TXSS CBAP Enforced subfield set to 1 indicates that a STA in a centralized AP or PCP cluster performs each of its TXSSs in the DTI within one or more TXSS CBAPs, as described in 10.40.3.4. The TXSS CBAP Enforced subfield set to 0 indicates that a STA within a centralized AP or PCP cluster does not have to perform each of its TXSSs in the DTI within one or more TXSS CBAPs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Protected Period Enforced subfield indicates that every scheduled SP in the BSS is a DMG protected period as specified in 10.39.6.6. The Protected Period Enforced subfield set to 0 indicates that a scheduled SP in the BSS does not have to be a DMG protected period.

The CCSR ID field is set to the MAC address of the CCSR within the ECAPC that the AP or PCP belongs to. The AP or PCP is the transmitter of the frame containing the ECAPC Policy element except when the ECAPC Policy element is transmitted in a Cluster Report element, where the AP or PCP is the transmitter that triggered the Cluster report.

The Available Time Cluster Offset Bitmap field is a bitmap where the bit n–1, n = 1 to 32, indicates the availability of the n^{th} Beacon SP. Values of n = 1 and greater than ClusterMaxMem are reserved (i.e., bit 0 and bits ClusterMaxMem+1 to 31). Bit n–1 set to 0 indicates that $ClusterTimeOffset_{n-1}$ is determined to be already in use by a neighboring AP or PCP, excluding the recipient if sent within an individually addressed frame, in the ECAPC. Bit n–1 set to 1 indicates that $ClusterTimeOffset_{n-1}$ is not determined to be already in use by a neighboring AP or PCP, excluding the recipient if sent within an individually addressed frame, in the ECAPC.

If TXSS CBAP Enforced field is set to 0, then the TXSS CBAP Offset field, the TXSS CBAP Duration field, and the TXSS CBAP MaxMem field are not present in the element; otherwise, they are present in the element.

The TXSS CBAP Offset field is the delay of the first TXSS CBAP in a beacon interval from the TBTT, in units of 8 μs.

The TXSS CBAP Duration field indicates the duration of each TXSS CBAP, in units of 8 μs.

The TXSS CBAP MaxMem field is the number of TXSS CBAPs per beacon interval.

9.4.2.155 Cluster Time Offset element

The format of the Cluster Time Offset element is shown in Figure 9-603.

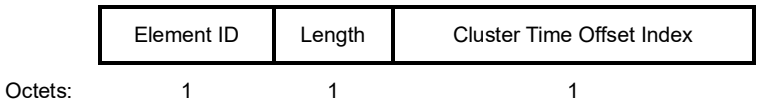

Figure 9-603—Cluster Time Offset element format

The Element ID and Length fields are defined in 9.4.2.1.

The Cluster Time Offset Index field is set to n–1 for a member AP or member PCP of a centralized AP or PCP cluster that adopted the n^{th} Beacon SP (see 10.40). Values equal to 0 and greater than ClusterMaxMem are reserved.

9.4.2.156 Antenna Sector ID Pattern element

The format of the Antenna Sector ID Pattern element is shown in Figure 9-604.

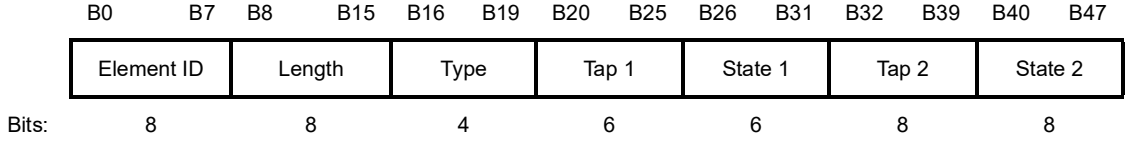

Figure 9-604—Antenna Sector ID Pattern element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID and Length fields are defined in 9.4.2.1.

The Type field is set to 0 for Random Sequence Generator. Values 1 to 3 are reserved.

The Tap 1 field indicates the taps for Sequence Generator 1.

The State 1 field indicates the state for Sequence Generator 1.

The Tap 2 field indicates the taps for Sequence Generator 2.

The State 2 field indicates the state for Sequence Generator 2.

Sequence Generator 1 is shown in Figure 9-605 and is defined as follows:

— Generate the sector IDs for subsequent DMG Beacons by advancing the Sequence Generator 1, which is initialized using the values of the Tap 1 and State 1 fields contained in the Antenna Sector ID Pattern element received from the AP or PCP.

— Advance the Sequence Generator 1 by one shift for each anticipated DMG Beacon frame transmission thereafter.

— After advancing the Sequence Generator 1, if the next state equals the initial state for the second time, overwrite the state with an all-zero state. The next state following the state following all zero-state uses the first 6 bits of the state of Sequence Generator 2 as the initial state.

— If the STA's total number of transmit sectors is not equal to the period of the Sequence Generator 1, ignore state(s) greater than or equal total number of transmit sectors and continue advancing Sequence Generator 1 until the state is less than the total number of transmit sectors.

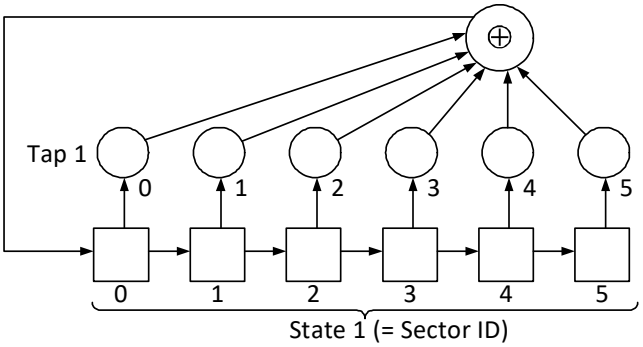

Figure 9-605—Sequence Generator 1

NOTE 1—The taps are selected from the set of sequences with maximal length property.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Sequence Generator 2 is shown in Figure 9-606 and is defined as follows:

— Sequence Generator 2 is initiated with the value of the Tap 2 and State 2 fields contained in the Antenna Sector ID Pattern element received from the AP or PCP.

— Sequence Generator 2 is advanced by one shift when a new initial state is needed from Sequence Generator 1.

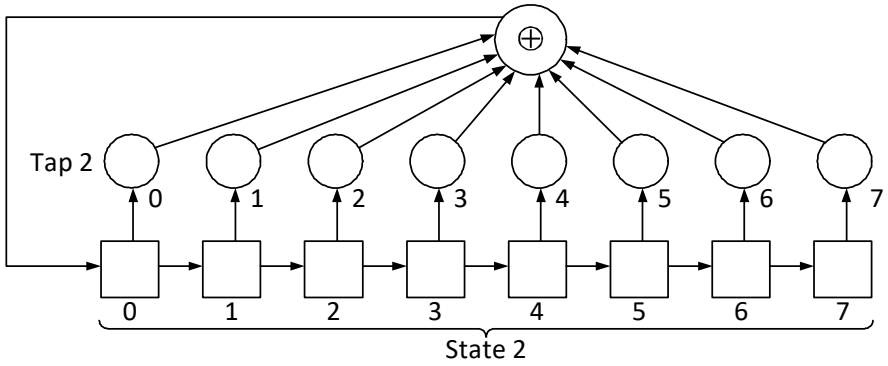

Figure 9-606—Sequence Generator 2

NOTE 2—The taps are selected from the set of the sequences with maximal length property.

9.4.2.157 VHT Capabilities element

9.4.2.157.1 VHT Capabilities element structure

A VHT STA declares that it is a VHT STA by transmitting the VHT Capabilities element.

The VHT Capabilities element contains a number of fields that are used to advertise the VHT capabilities of a VHT STA. The VHT Capabilities element is defined in Figure 9-607.

	Element ID	Length	VHT Capabilities Info	Supported VHT-MCS and NSS Set
Octets:	1	1	4	8

Figure 9-607—VHT Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

9.4.2.157.2 VHT Capabilities Information field

The structure of the VHT Capabilities Information field is defined in Figure 9-608.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

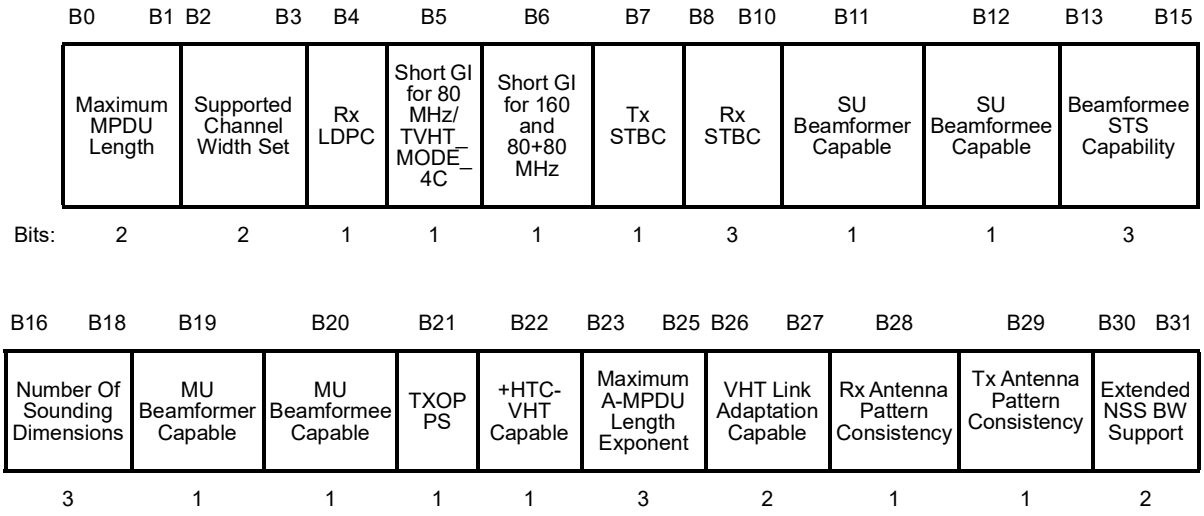

Figure 9-608—VHT Capabilities Information field format

The subfields of the VHT Capabilities Information field are defined in Table 9-271.

Table 9-271—Subfields of the VHT Capabilities Information field

Subfield	Definition	Encoding
Maximum MPDU Length	Indicates the maximum MPDU length that the STA is capable of receiving (see 10.11).	Set to 0 for 3895 octets. Set to 1 for 7991 octets. Set to 2 for 11 454 octets. The value 3 is reserved.
Supported Channel Width Set	Together with the Extended NSS BW Support subfield and Supported VHT-MCS and NSS Set field, indicates the channel widths and maximum NSS values per width supported by the STA. See 11.38.	In a non-TVHT STA, see Table 9-272. When the Channel Width subfield of the VHT Operation element is 2 or 3 (deprecated), the channel center frequency is defined in Table 11-24. In a TVHT STA, the field is structured into subfields as defined in Figure 9-609. In a TVHT STA, set the TVHT_MODE_2C Support subfield to 1 if it supports TVHT_MODE_2C; otherwise set the subfield to 0. In a TVHT STA, set the TVHT_MODE_2N Support subfield to 1 if it supports TVHT_MODE_2N; otherwise set the subfield to 0.
Rx LDPC	Indicates support for receiving LDPC encoded PPDUs.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 80 MHz/ TVHT_MODE_4C	In a non-TVHT STA, indicates short GI support for the reception of PPDUs transmitted with the TXVECTOR parameter FORMAT equal to VHT and CH_BANDWIDTH equal to CBW80. In a TVHT STA, indicates support for TVHT_MODE_4C.	In a non-TVHT STA, set to 1 if Short GI for 80 MHz is supported. In a TVHT STA, set to 1 if TVHT_MODE_4C is supported. Otherwise set to 0.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-271—Subfields of the VHT Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Short GI for 160 and 80+80 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to VHT and CH_BANDWIDTH equal to CBW160 or CBW80+80.	Set to 0 if not supported. Set to 1 if supported. In a TVHT STA, set to 1 if it supports TVHT_MODE_4N.
Tx STBC	Indicates support for the transmission of at least 2×1 STBC.	Set to 0 if not supported. Set to 1 if supported.
Rx STBC	Indicates support for the reception of PPDUs using STBC.	Set to 0 for no support. Set to 1 for support of one spatial stream. Set to 2 for support of one and two spatial streams. Set to 3 for support of one, two, and three spatial streams. Set to 4 for support of one, two, three, and four spatial streams. The values 5, 6, 7 are reserved. See NOTE 3.
SU Beamformer Capable	Indicates support for operation as an SU beamformer (see 10.36.5).	Set to 0 if not supported. Set to 1 if supported.
SU Beamformee Capable	Indicates support for operation as an SU beamformee (see 10.36.5).	Set to 0 if not supported. Set to 1 if supported.
Beamformee STS Capability	Indicates the maximum number of space-time streams that the STA can receive in a VHT NDP and the maximum value of *Nr* that the STA transmits in a VHT Compressed Beamforming frame.	If the SU Beamformee Capable field is set to 1, set to maximum number of space-time streams that the STA can receive in a VHT NDP minus 1. Otherwise, reserved.
Number of Sounding Dimensions	Beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for a VHT NDP.	If the SU Beamformer Capable field is set to 1, set to the maximum supported value of the TXVECTOR parameter NUM_STS minus 1. Otherwise, reserved.
MU Beamformer Capable	Indicates support for operation as an MU beamformer (see 10.36.5).	Set to 0 if not supported or if SU Beamformer Capable is set to 0 or if sent by a non-AP STA. Set to 1 if supported and SU Beamformer Capable is set to 1.
MU Beamformee Capable	Indicates support for operation as an MU beamformee (see 10.36.5).	Set to 0 if not supported or if SU Beamformee Capable is set to 0 or if sent by an AP. Set to 1 if supported, SU Beamformee Capable is set to 1 and not sent by an AP.
TXOP PS	Indicates whether the AP supports TXOP power save mode or whether the non-AP STA has enabled TXOP power save mode.	Set to 0 if the AP does not support TXOP power save mode. Set to 1 if the AP supports TXOP power save mode. Set to 0 if the non-AP STA does not enable TXOP power save mode. Set to 1 if the non-AP STA enables TXOP power save mode.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-271—Subfields of the VHT Capabilities Information field *(continued)*

Subfield	Definition	Encoding
+HTC-VHT Capable	Indicates whether the STA supports receiving a VHT variant HT Control field.	Set to 0 if not supported. Set to 1 if supported.
Maximum A-MPDU Length Exponent	Indicates the maximum length of an A-MPDU pre-EOF padding that the STA can receive.	The length defined by this field is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets.
VHT Link Adaptation Capable	Indicates whether the STA supports link adaptation using VHT variant HT Control field.	If +HTC-VHT Capable is 1: Set to 0 (No Feedback) if the STA does not provide VHT MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited VHT MFB. Set to 3 (Both) if the STA can provide VHT MFB in response to VHT MRQ and if the STA provides unsolicited VHT MFB. The value 1 is reserved. Reserved if +HTC-VHT Capable is 0.
Rx Antenna Pattern Consistency	Indicates the possibility of a receive antenna pattern change.	Set to 0 if the receive antenna pattern might change during the lifetime of the current association. Set to 1 if the receive antenna pattern does not change during the lifetime of the current association. See 11.38.6.
Tx Antenna Pattern Consistency	Indicates the possibility of a transmit antenna pattern change.	Set to 0 if the transmit antenna pattern might change during the lifetime of the current association. Set to 1 if the transmit antenna pattern does not change during the lifetime of the current association. See 11.38.6.
Extended NSS BW Support	Together with the Supported Channel Width Set subfield and Supported VHT-MCS and NSS Set field, indicates the channel widths and maximum NSS values per width supported by the STA (for non-TVHT VHT STAs). See 11.38.	In a non-TVHT STA, see Table 9-272. In a TVHT STA, the field is reserved. In a STA with dot11VHTExtendedNSSBWCapable equal to false or not present, this field is set to 0.

NOTE 1—An AP that sets MU Beamformer Capable to 1 can transmit a VHT MU PPDU with only one nonzero TXVECTOR parameter NUM_STS[p], for $0 \le p \le 3$. However, a STA that sets MU Beamformee Capable to 0 is not required to be able to demodulate a VHT MU PPDU with only one nonzero RXVECTOR parameter NUM_STS[p], for $0 \le p \le 3$.

NOTE 2—The Maximum MPDU Length subfield of the VHT Capabilities Information field imposes a constraint on the allowed value in the Maximum MPDU Length subfield of the HT Capabilities element carried in the same frame (see 10.11).

NOTE 3—Subject to any extended NSS BW support constraint.

In the context of Table 9-272:

— 1/2× or 3/4× Max VHT NSS support can be less than 1, indicating no support.
— A supported multiple of Max VHT NSS applies to both transmit and receive.
— 2× Max VHT NSS support can be used for 20 MHz or 40 MHz HT PPDUs.
— Any other combination than the ones listed in this table is reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-272—Setting of the Supported Channel Width Set subfield and Extended NSS BW Support subfield at a STA transmitting the VHT Capabilities Information field

Transmitted VHT Capabilities Information field		NSS support of STA transmitting the VHT Capabilities Information field as a function of the VHT PPDU (×Max VHT NSS) (see requirements R1 and R2)					Location of 160 MHz channel center frequency if BSS bandwidth is 160 MHz	Location of secondary 80 MHz channel center frequency if BSS bandwidth is 80+80 MHz
Supported Channel Width Set	Extended NSS BW Support	20 MHz	40 MHz	80 MHz	160 MHz	80+80 MHz		
0	0	1	1	1				
0	1	1	1	1	1/2		CCFS2	
0	2	1	1	1	1/2	1/2	CCFS2	CCFS2
0	3	1	1	1	3/4	3/4	CCFS2	CCFS2
1	0	1	1	1	1		CCFS1	
1	1	1	1	1	1	1/2	CCFS1	CCFS2
1	2	1	1	1	1	3/4	CCFS1	CCFS2
1	3	2	2	2	2	1	CCFS1	CCFS1
2	0	1	1	1	1	1	CCFS1	CCFS1
2	3	2	2	2	1	1	CCFS1	CCFS1

R1: NSS support is rounded down to the nearest integer.
R2: The maximum NSS supported is 8.

NOTE 1—Max VHT NSS is defined per MCS in 9.4.2.157.3.

NOTE 2—CCFS1 refers to the Channel Center Frequency Segment 1 field of the most recently transmitted VHT Operation element.

NOTE 3—CCFS2 refers to the Channel Center Frequency Segment 2 field of the most recently transmitted HT Operation element.

NOTE 4—CCFS1 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is at least Max VHT NSS. CCFS2 is zero in this case.See NOTE 7.

NOTE 5—CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is less than Max VHT NSS. CCFS1 is zero in this case. See NOTE 7.

NOTE 6—At most one of CCFS1 and CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz. See NOTE 7.

NOTE 7—See Table 11-24.

NOTE 8—A receiving STA in which dot11VHTExtendedNSSBWCapable is false will ignore the Extended NSS BW Support subfield and effectively evaluate this table only at the entries where Extended NSS BW Support is 0.

NOTE 9—See also 11.38.

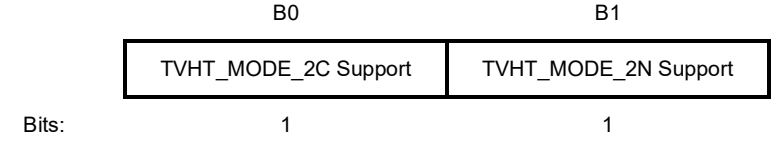

Figure 9-609—Supported Channel Width Set field format (TVHT)

Support for short GI for the reception of PPDUs with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20 or CBW40 is indicated in the HT Capabilities Info field of the HT Capabilities element.

9.4.2.157.3 Supported VHT-MCS and NSS Set field

The Supported VHT-MCS and NSS Set field is used to convey the combinations of VHT-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The structure of the field is shown in Figure 9-610.

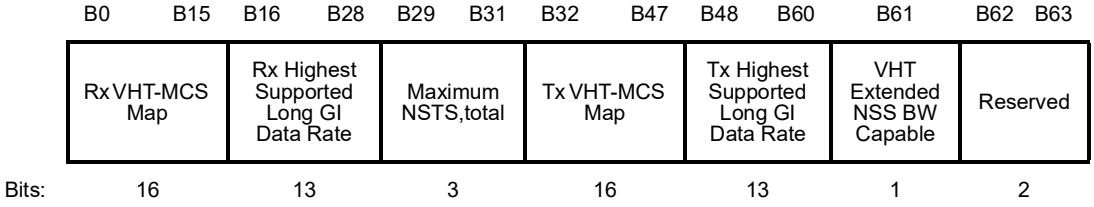

Figure 9-610—Supported VHT-MCS and NSS Set field format

The Supported VHT-MCS and NSS Set field's subfields are defined in Table 9-273.

Table 9-273—Supported VHT-MCS and NSS Set subfields

Subfield	Definition	Encoding
Rx VHT-MCS Map	If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is not true, it indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams. If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is true, this field combined with the Extended NSS BW Support subfield and the 160/80+80 BW subfield of the Operating Mode field determines the maximum value of the RXVECTOR parameter MCS of a PPDU as described in 9.4.2.157.2 and 9.4.1.53.	The format and encoding of this subfield are defined in Figure 9-611 and the associated description.
Rx Highest Supported Long GI Data Rate	Indicates the highest long GI VHT PPDU data rate that the STA is able to receive.	The largest integer value less than or equal to the highest long GI VHT PPDU data rate in Mb/s the STA is able to receive (see 10.6.13.1). The value 0 indicates that this subfield does not specify the highest long GI VHT PPDU data rate that the STA is able to receive.

Table 9-273—Supported VHT-MCS and NSS Set subfields *(continued)*

Subfield	Definition	Encoding
Maximum NSTS,total	Indicates the maximum value for $N_{STS,total}$ that can be sent to the STA in a VHT MU PPDU.	If MU beamformee capable and different from 0, indicates the maximum value for $N_{STS,total}$ minus 1 that can be sent to the STA in a VHT MU PPDU. NOTE—This value is greater than or equal to the value in the Beamformee STS Capability subfield of the VHT Capabilities Information field. If MU Beamformee capable and equal to 0, indicates that the maximum value for $N_{STS,total}$ is equal to the value in the Beamformee STS Capability subfield of the VHT Capabilities Information field. Otherwise reserved.
Tx VHT-MCS Map	If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is not true, indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be transmitted at all channel widths supported by this STA for each number of spatial streams. If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is true, this field combined with the Extended NSS BW Support subfield and the 160/80+80 BW subfield of an Operating Mode field determines the maximum value of the TXVECTOR parameter MCS of a PPDU as described in 9.4.2.157.2 and 9.4.1.53.	The format and encoding of this subfield are defined in Figure 9-611 and the associated description.
Tx Highest Supported Long GI Data Rate	Indicates the highest long GI VHT PPDU data rate at which the STA is able to transmit.	The largest integer value less than or equal to the highest long GI VHT PPDU data rate in Mb/s that the STA is able to transmit (see 10.6.13.2). The value 0 indicates that this subfield does not specify the highest long GI VHT PPDU data rate that the STA is able to transmit.
VHT Extended NSS BW Capable	Indicates whether the STA is capable of interpreting the Extended NSS BW Support subfield of the VHT Capabilities Information field.	If dot11VHTExtendedNSSBWCapable is true, then this field is set to 1 to indicate that the STA is capable of interpreting the Extended NSS BW Support subfield of the VHT Capabilities Information field. Set to 0 otherwise.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Rx VHT-MCS Map subfield and the Tx VHT-MCS Map subfield have the structure shown in Figure 9-611.

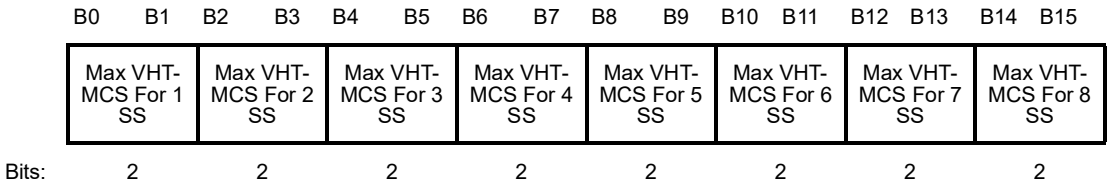

Figure 9-611—Rx VHT-MCS Map and Tx VHT-MCS Map subfields and Basic VHT-MCS And NSS Set field format

The Max VHT-MCS For *n* SS subfield (where *n* = 1, ..., 8) is encoded as follows:

— 0 indicates support for VHT-MCS 0-7 for *n* spatial streams
— 1 indicates support for VHT-MCS 0-8 for *n* spatial streams
— 2 indicates support for VHT-MCS 0-9 for *n* spatial streams
— 3 indicates that *n* spatial streams is not supported

The Max VHT NSS for a given MCS is equal to the smaller of the following:

— The maximum value of *n* for which the Max VHT-MCS for *n* SS has a value that indicates support for that VHT-MCS (0, 1 or 2 for VHT-MCS 0-7, 1 or 2 for VHT-MCS 8, 2 for VHT-MCS 9).
— The maximum supported NSS as indicated by the Rx NSS field of the Operating Mode Notification frame if the RX NSS Type is 0.

NOTE—A VHT-MCS indicated as supported in the VHT-MCS Map fields for a particular number of spatial streams might not be valid at all bandwidths (see 21.5), might be limited by the declaration of Tx Highest Supported Long GI Data Rates and Rx Highest Supported Long GI Data Rates, and might be affected by 10.6.13.3 and the Extended NSS BW Support field of the VHT Capabilities Information field in 9.4.2.157.2 and the 160/80+80 BW subfield of the Operating Mode field in 9.4.1.53.

9.4.2.158 VHT Operation element

The operation of VHT STAs in the BSS is controlled by the HT Operation element and the VHT Operation element. The format of the VHT Operation element is defined in Figure 9-612.

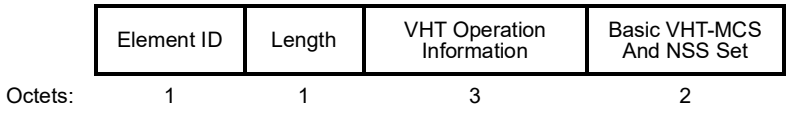

Figure 9-612—VHT Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the VHT Operation Information field is defined in Figure 9-613.

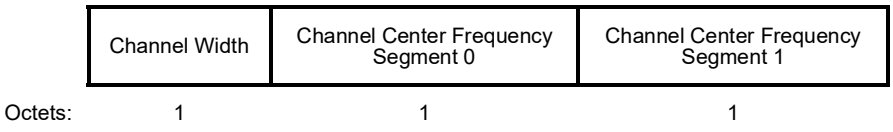

Figure 9-613—VHT Operation Information field format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The VHT STA gets the primary channel information from the HT Operation element. The subfields of the VHT Operation Information field are defined in Table 9-274.

The Basic VHT-MCS And NSS Set field indicates the VHT-MCSs for each number of spatial streams in VHT PPDUs that are supported by all VHT STAs in the BSS (including IBSS and MBSS). The Basic VHT-MCS And NSS Set field is a bitmap of size 16 bits; each 2 bits indicates the supported VHT-MCS set for N_{SS} from 1 to 8. The Basic VHT-MCS And NSS Set field is defined in Figure 9-611.

Table 9-274—VHT Operation Information subfields

Subfield	Definition	Encoding
Channel Width	This field, together with the HT Operation element STA Channel Width field, defines the BSS bandwidth (see 11.38.1).	Set to 0 for 20 MHz or 40 MHz BSS bandwidth. Set to 1 for 80 MHz, 160 MHz or 80+80 MHz BSS bandwidth. Set to 2 for 160 MHz BSS bandwidth (deprecated). Set to 3 for noncontiguous 80+80 MHz BSS bandwidth (deprecated). Values in the range 4 to 255 are reserved.
Channel Center Frequency Segment 0	Defines a channel center frequency for a 20, 40, 80, 160, or 80+80 MHz VHT BSS. See 21.3.14.	For 20, 40, or 80 MHz BSS bandwidth, indicates the channel center frequency index for the 20, 40, or 80 MHz channel on which the VHT BSS operates. For 160 MHz BSS bandwidth and the Channel Width subfield equal to 1, indicates the channel center frequency index of the 80 MHz channel segment that contains the primary channel. For 160 MHz BSS bandwidth and the Channel Width subfield equal to 2, indicates the channel center frequency index of the 160 MHz channel on which the VHT BSS operates. For 80+80 MHz BSS bandwidth and the Channel Width subfield equal to 1 or 3, indicates the channel center frequency index for the primary 80 MHz channel of the VHT BSS. Reserved otherwise.
Channel Center Frequency Segment 1	Defines a channel center frequency for a 160 or 80+80 MHz VHT BSS. See 21.3.14.	For a 20, 40, or 80 MHz BSS bandwidth, this subfield is set to 0. For a 160 MHz BSS bandwidth and the Channel Width subfield equal to 1, indicates the channel center frequency index of the 160 MHz channel on which the VHT BSS operates. For a 160 MHz BSS bandwidth and the Channel Width subfield equal to 2, this field is set to 0. For an 80+80 MHz BSS bandwidth and the Channel Width subfield equal to 1 or 3, indicates the channel center frequency index of the secondary 80 MHz channel of the VHT BSS. See Table 9-275. Reserved otherwise.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-275—BSS bandwidth when the VHT Operation Information field Channel Width subfield is 1

Channel Center Frequency Segment 1 subfield value	BSS bandwidth
CCFS1 = 0	80 MHz or less
CCFS1 > 0 and | CCFS1 – CCFS0 | = 8 (40 MHz apart)	160 MHz (CCFS0: center frequency of the 80 MHz channel segment that contains the primary channel) (CCFS1: center frequency of the 160 MHz channel)
CCFS1 > 0 and | CCFS1 – CCFS0 | > 16 (> 80 MHz apart)	80+80 MHz (CCFS0: center frequency of the primary 80 MHz channel) (CCFS1: center frequency of the secondary 80 MHz channel)
CCFS1 > 0 and | CCFS1 – CCFS0 | < 8 (< 40 MHz apart)	Reserved
CCFS1 > 0 and 8 < | CCFS1 – CCFS0 | ≤ 16 (> 40 MHz and ≤ 80 MHz apart)	Reserved
NOTE 1—CCFS0 represents the Channel Center Frequency Segment 0 subfield. NOTE 2—CCFS1 represents the Channel Center Frequency Segment 1 subfield.	

9.4.2.159 Extended BSS Load element

The Extended BSS Load element reported by the AP contains information on MIMO spatial stream underutilization and bandwidth utilization. The element format is defined in Figure 9-614. A STA receiving the element might use the information it conveys in an implementation-specific AP selection algorithm.

	Element ID	Length	MU-MIMO Capable STA Count	Spatial Stream Underutilization	Observable Secondary 20 MHz Utilization	Observable Secondary 40 MHz Utilization	Observable Secondary 80 MHz Utilization
Octets:	1	1	2	1	1	1	1

Figure 9-614—Extended BSS Load element format

The Element ID and Length fields are defined in 9.4.2.1.

The MU-MIMO Capable STA Count field indicates the total number of STAs currently associated with this BSS that have a 1 in the MU Beamformee Capable field of their VHT Capabilities element.

The Spatial Stream Underutilization field is defined as the percentage of time, linearly scaled with 255 representing 100%, that the AP has underutilized spatial domain resources for given busy time of the medium. The spatial stream underutilization is calculated only for the primary channel. This percentage is computed using the formula,

$$\text{Spatial Stream Underutilization} = \left\lfloor \frac{N_{\text{max_SS}} \times T_{\text{busy}} - T_{\text{utilized}}}{N_{\text{max_SS}} \times T_{\text{busy}}} \times 255 \right\rfloor$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where

N_{max_SS} is the maximum number of spatial streams supported by the AP

T_{busy} is the number of microseconds during which CCA indicated the channel was busy during the measurement duration. The resolution of the CCA busy measurement is in microseconds

$T_{utilized}$ is $\sum_{i=1}^{N} N_{SS,i} T_i$, where T_i is the time interval, in units of microseconds, during which the primary 20 MHz channel is busy due to the transmission of one or more spatial streams by the AP to MU beamformee capable STAs; $N_{SS,i}$ is the number of spatial streams transmitted during the time interval T_i; and N is the number of busy events that occurred during the total measurement time, which is less than or equal to dot11ChannelUtilizationBeaconIntervals consecutive beacon intervals

If T_{busy} is 0, the Spatial Stream Underutilization field is reserved.

The measurement of the observable loading on each of the secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel in conjunction with the measurement on the primary 20 MHz channel provides a STA with the loading on the 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channels.

The Observable Secondary 20 MHz Utilization, Observable Secondary 40 MHz Utilization, and Observable Secondary 80 MHz Utilization fields are defined using Equation (9-3).

$$\text{Observable Secondary } W1 \text{ Utilization} = \left\lfloor \frac{T_{busy,W1}}{\text{dot11ChannelUtilizationBeaconIntervals} \times \text{dot11BeaconPeriod} \times 1024} \times 255 \right\rfloor \quad (9\text{-}3)$$

where

dot11ChannelUtilizationBeaconIntervals represents the number of consecutive beacon intervals during which the secondary channel busy time is measured

$T_{busy,W1}$ is computed as the sum of the times from PHY-CCA.indication(BUSY,{W2}) to the next issue of a PHY-CCA.indication primitive and that overlap the measurement interval, for W1 = 20, 40, or 80, and where W2 equals secondary, secondary40, or secondary80 for W1 = 20, 40, or 80, respectively

If the AP indicates a channel width of 20 MHz, 40 MHz, or 80 MHz in the STA Channel Width field in the HT Operation element and in the Channel Width field in the VHT Operation element, then the Observable Secondary 80 MHz Utilization field is reserved. If the AP indicates a channel width of 20 MHz or 40 MHz in the STA Channel Width field in the HT Operation element, then the Observable Secondary 40 MHz Utilization field is reserved. If the AP indicates a channel width of 20 MHz in the STA Channel Width field in the HT Operation element, then the Observable Secondary 20 MHz Utilization field is reserved.

9.4.2.160 Wide Bandwidth Channel Switch element

The Wide Bandwidth Channel Switch element is included in Channel Switch Announcement frames, as described in 9.6.2.6, Extended Channel Switch Announcement frames, as described in 9.6.7.7, and TDLS Channel Switch Request frames, as described in 9.6.12.7. The format of the Wide Bandwidth Channel Switch element is shown in Figure 9-615.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

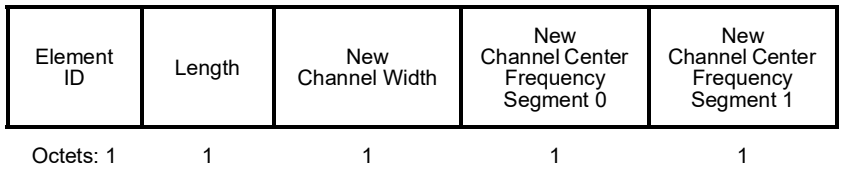

Figure 9-615—Wide Bandwidth Channel Switch element format

The Element ID and Length fields are defined in 9.4.2.1.

If the New Operating Class field in the frame that contains this element does not indicate an S1G band, the subfields New Channel Width, New Channel Center Frequency Segment 0, and New Channel Center Frequency Segment 1 have the same definition, respectively, as Channel Width, Channel Center Frequency Segment 0, and Channel Center Frequency Segment 1 in the VHT Operation Information field, described in Table 9-274. Otherwise, the subfields New Channel Width and New Channel Center Frequency Segment 0 have the same definition, respectively, as the Channel Width and the Channel Center Frequency in the S1G Operation Information field, described in Table 9-311. The New Channel Center Frequency Segment 1 subfield is reserved.

9.4.2.161 Transmit Power Envelope element

The Transmit Power Envelope element conveys the local maximum transmit power for various transmission bandwidths. The format of the Transmit Power Envelope element is shown in Figure 9-616.

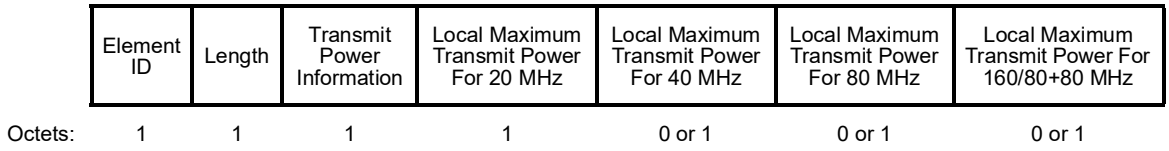

Figure 9-616—Transmit Power Envelope element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Transmit Power Information field is defined in Figure 9-617.

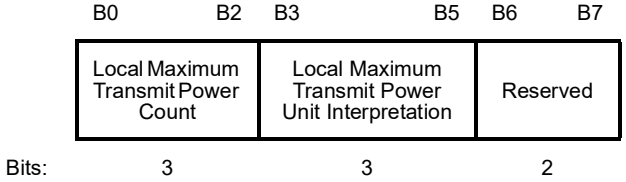

Figure 9-617—Transmit Power Information field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Local Maximum Transmit Power Count subfield indicates the number of Local Maximum Transmit Power For *X* MHz fields (where *X* = 20, 40, 80, or 160/80+80) minus 1 in the Transmit Power Envelope element, as shown in Table 9-276.

Table 9-276—Meaning of Local Maximum Transmit Power Count subfield

Value	Field(s) present
0	Local Maximum Transmit Power For 20 MHz.
1	Local Maximum Transmit Power For 20 MHz and Local Maximum Transmit Power For 40 MHz.
2	Local Maximum Transmit Power For 20 MHz, Local Maximum Transmit Power For 40 MHz, and Local Maximum Transmit Power For 80 MHz.
3	Local Maximum Transmit Power For 20 MHz, Local Maximum Transmit Power For 40 MHz, Local Maximum Transmit Power For 80 MHz, and Local Maximum Transmit Power For 160/80+80 MHz. For TVHT STAs, reserved.
4–7	Reserved

The Local Maximum Transmit Power Unit Interpretation subfield provides additional interpretation for the units of the Local Maximum Transmit Power For *X* MHz fields (where *X* = 20, 40, 80, or 160/80+80) and is defined in Table 9-277. Allowed values are further constrained as defined in Annex E.

Table 9-277—Definition of Local Maximum Transmit Power Unit Interpretation subfield

Value	Unit interpretation of the Local Maximum Transmit Power For *X* MHz fields
0	EIRP
1–7	Reserved
NOTE—This table is expected to be updated only if regulatory domains mandate the use of transmit power control with limits that cannot be converted into an EIRP value per transmission bandwidth.	

Local Maximum Transmit Power For *X* MHz fields (where *X* = 20, 40, 80, or 160/80+80) define the local maximum transmit power limit of *X* MHz PPDUs. Each Local Maximum Transmit Power For *X* MHz field is encoded as an 8-bit 2s complement signed integer in the range –64 dBm to 63 dBm with a 0.5 dB step. Setting this field to 63.5 dBm indicates 63.5 dBm or higher (i.e., no local maximum transmit power constraint).

In frames transmitted by a TVHT STA the Local Maximum Transmit Power for 20 MHz field indicates the Local Maximum Transmit Power for TVHT_W bandwidth; the Local Maximum Transmit Power for 40 MHz field indicates the Local Maximum Transmit Power for TVHT_2W or TVHT_W+W bandwidth; the Local Maximum Transmit Power for 80 MHz field indicates the Local Maximum Transmit Power for TVHT_4W or TVHT_2W+2W bandwidth; the Local Maximum Transmit Power for 160/80+80 MHz field is not included in the Transmit Power Envelope element.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.162 Channel Switch Wrapper element

The Channel Switch Wrapper element contains subelements that indicate characteristics of the BSS after a channel switch. The format of the Channel Switch Wrapper element is defined in Figure 9-618. Procedures related to the inclusion of subelements in the Channel Switch Wrapper element are defined in 11.38.4.

	Element ID	Length	New Country subelement (optional)	Wide Bandwidth Channel Switch subelement (optional)	New Transmit Power Envelope subelement (optional)
Octets:	1	1	variable	variable	variable

Figure 9-618—Channel Switch Wrapper element format

The Element ID and Length fields are defined in 9.4.2.1.

The New Country subelement is present when an AP or mesh STA performs extended channel switching to a new Country, new Operating Class Table, or a changed set of operating classes relative to the contents of the Country element sent in the Beacon; otherwise, this subelement is not present. The format of the New Country subelement is defined to be the same as the format of the Country element (see 9.4.2.8), except that no Subband Triplet fields are present in the New Country subelement. The Country String field in the New Country subelement indicates the Country and Operating Class Table of the BSS after extended channel switching, and Operating Triplet fields within the New Country subelement indicate the operating classes of the BSS after extended channel switching (see 11.38.1).

The Wide Bandwidth Channel Switch subelement is present under the following conditions:

— Channel switching to a BSS bandwidth of 40 MHz or wider
— Extended channel switching to a BSS bandwidth of 80 MHz or wider

The Wide Bandwidth Channel Switch subelement is optionally present if extended channel switching to a BSS bandwidth of 40 MHz. The Wide Bandwidth Channel Switch subelement is not present if channel switching to a 20 MHz BSS bandwidth.

The format of the Wide Bandwidth Channel Switch subelement is the same as the Wide Bandwidth Channel Switch element (see 9.4.2.160) except for the following:

— A value 0 in the New Channel Width field signifies only a 40 MHz BSS bandwidth.
— When switching to a 40 MHz BSS bandwidth, the New Channel Center Frequency Segment 0 field indicates the channel center frequency index for the 40 MHz channel after the channel switch.

If present, the Wide Bandwidth Channel Switch subelement indicates the BSS bandwidth after channel switching (see 11.38.1). For example, when switching to a 40 MHz BSS bandwidth on channel indices 36 and 40, the New Channel Width field is set to 0, and the New Channel Center Frequency Segment 0 field is set to 38.

Each New Transmit Power Envelope subelement that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.161) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. Each New Transmit Power Envelope subelement indicates the local maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.38.1).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If transmitted by a TVHT STA, the Wide Bandwidth Channel Switch subelement is present when the STA is switching channels to a BSS bandwidth of TVHT_2W or TVHT_W+W bandwidth or wider; if switching to a TVHT_W bandwidth BSS bandwidth then this subelement is not present.

9.4.2.163 AID element

The AID element includes the AID assigned by an AP during association that represents the 16-bit ID of a STA. The format of the AID element is shown in Figure 9-619.

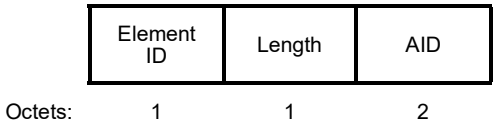

Figure 9-619—AID element format

The Element ID and Length fields are defined in 9.4.2.1.

The AID field is defined in 9.4.1.8.

9.4.2.164 Quiet Channel element

The Quiet Channel element is used to indicate that the secondary 80 MHz channel of a VHT BSS is to be quieted during a quiet interval, and, in an infrastructure BSS, to indicate if the primary 80 MHz channel of a VHT BSS can be used during the quiet interval. A quiet interval is established using either a Quiet element (see 9.4.2.22) or, in an infrastructure BSS, the Quiet Channel element if its AP Quiet Mode field is equal to 1.

The Quiet Channel element is optionally present in Beacon frames, as described in 9.3.3.2, and Probe Response frames, as described in 9.3.3.10. The use of Quiet Channel elements is described in 11.8.3.

The format of the Quiet Channel element is shown in Figure 9-620.

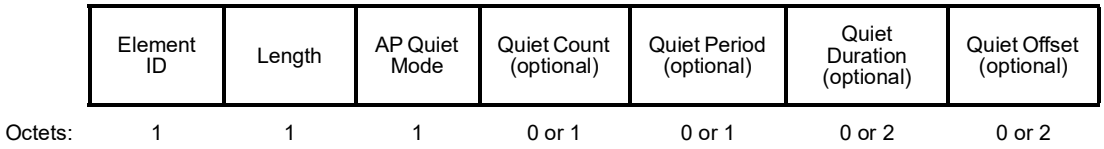

Figure 9-620—Quiet Channel element format

The Element ID and Length fields are defined in 9.4.2.1.

The AP Quiet Mode field specifies STA behavior in an infrastructure BSS during the quiet intervals. When communications to the AP are allowed within the primary 80 MHz channel, then the AP Quiet Mode field is set to 1. Otherwise, the AP Quiet Mode field is set to 0.

If the AP Quiet Mode field is 1, then the Quiet Count field, Quiet Period field, Quiet Duration field, and Quiet Offset field are present in the Quiet Channel element; otherwise, these fields are not present in the Quiet Channel element.

The Quiet Count field, Quiet Period field, Quiet Duration field, and Quiet Offset field have the same definition as described in 9.4.2.22.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.165 Operating Mode Notification element

The Operating Mode Notification element is used to notify STAs that the transmitting STA is changing one or more of its operating channel width, the maximum number of spatial streams it can receive, and its LDPC receive preference. The format of the Operating Mode Notification element is defined in Figure 9-621.

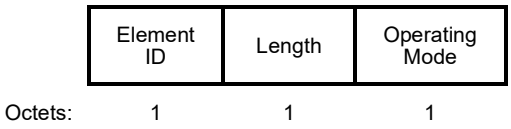

Figure 9-621—Operating Mode Notification element format

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Mode field is defined in 9.4.1.53.

9.4.2.166 UPSIM element

The UPSIM element is defined as shown in Figure 9-622.

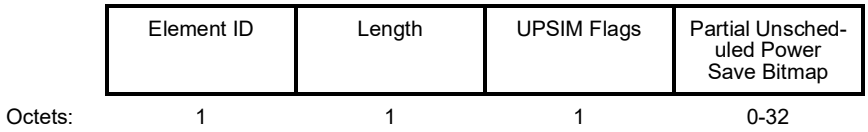

Figure 9-622—UPSIM element format

The Element ID and Length fields are defined in 9.4.2.1.

The Length field for this element is constrained as described below.

The UPSIM Flags field is defined in Figure 9-623.

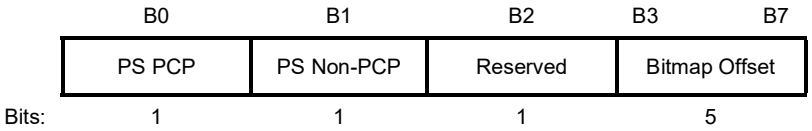

Figure 9-623—UPSIM Flags field format

The PS PCP field is set to 1 if the PCP is in unscheduled PS mode at the time of UPSIM element transmission and is set to 0 otherwise. The PS PCP field is set to 0 in infrastructure BSS. The PS Non-PCP field is set to 1 if all non-AP and non-PCP STAs are in unscheduled PS mode at the time of UPSIM element transmission and is set to 0 otherwise. The Bitmap Offset field defines the octet offset into a virtual bitmap maintained by the AP or PCP, as described below.

The AP or PCP maintains an unscheduled power save indication virtual bitmap that is 256 bits in length and is organized into 32 octets such that bit number N ($0 \le N \le 255$) in the bitmap corresponds to bit number (N mod 8) in octet number $\lfloor N / 8 \rfloor$, where the low order bit of each octet is bit number 0, and the high order bit is bit number 7. Bit N in the bitmap is set to 1 if there is an associated DMG STA with AID equal to N and the STA is in unscheduled PS mode and is set to 0 if there is no associated DMG STA with AID equal to N or the STA is not in unscheduled PS mode. Bit 0 is set to 0 in the infrastructure BSS. Bit 255 is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Partial Unscheduled Power Save Bitmap field is not present when bits numbered 1 to 254 of the unscheduled power save indication virtual bitmap all have the same value at the time of UPSIM element transmission. In this case, the Length field is set to 1 and the Bitmap Offset field is set to 0.

When there are two bits in the unscheduled power save indication virtual bitmap with numbers between 1 and 254 and different values, the Partial Unscheduled Power Save Bitmap field consists of octets numbered $N1$ to $N2$ of the unscheduled power save indication virtual bitmap, where $N1$ is the largest integer such that bits numbered 1 to ($N1$× 8) - 1 in the unscheduled power save indication virtual bitmap are all 0, and $N2$ is the smallest number such that bits numbered ($N2$ + 1) × 8 to 255 in the unscheduled power save indication virtual bitmap are all 0. In this case, the Length field is set to ($N2$ - $N1$) + 2 and the Bitmap Offset subfield is set to $N1$.

NOTE—The Partial Unscheduled Power Save Bitmap field does not need to include bit 0 of the unscheduled power save indication virtual bitmap even if that bit is set.

9.4.2.167 Fine Timing Measurement Parameters element

The Fine Timing Measurement Parameters element contains a number of subfields that are used to advertise the requested or allocated FTM configuration from one STA to another. The Fine Timing Measurement Parameters element is included in the initial Fine Timing Measurement Request frame, as described in 9.6.7.32, and the initial Fine Timing Measurement frame, as described in 9.6.7.33. The use of the Fine Timing Measurement Parameters element is described in 11.21.6.

The format of the Fine Timing Measurement Parameters element is shown in 9-624.

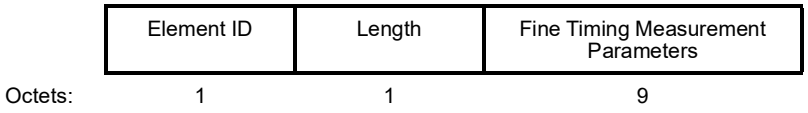

Figure 9-624—Fine Timing Measurement Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Fine Timing Measurement Parameters field is shown in 9-625.

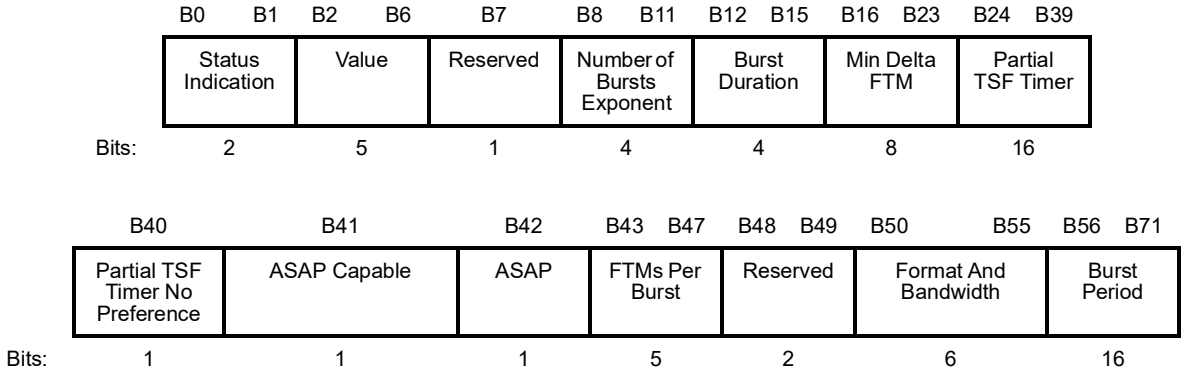

Figure 9-625—Fine Timing Measurement Parameters field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Status Indication subfield indicates the responding STA's response to the initial Fine Timing Measurement Request frame. The encoding of the Status Indication subfield is shown in Table 9-278.

Table 9-278—Status Indication subfield values

Value	Description
0	Reserved
1	Successful (some requested parameters might have been overridden). Measurement exchanges are about to begin.
2	Request incapable. Do not send same request again. FTM session ends.
3	Request failed. Do not send new request for Value seconds. FTM session ends.

The Status Indication subfield and Value subfield are reserved in the initial Fine Timing Measurement Request frame. When the Status Indication subfield is set to 3 by the responding STA, the Value subfield contains a duration in units of seconds; otherwise the Value subfield is reserved.

The Number of Bursts Exponent subfield indicates how many burst instances, defined in 11.21.6.4, are requested for the FTM session if included in an initial Fine Timing Measurement Request frame, or allocated for the FTM session if included in an initial Fine Timing Measurement frame respectively, where the number of burst instances is $2^{\text{Number of Bursts Exponent}}$. The value 15 in an initial Fine Timing Measurement Request frame indicates no preference by the initiating STA and is valid (indicating 2^{15} burst instances) when set by the responding STA.

The Burst Duration subfield indicates the duration of a burst instance. The value 15 in the initial Fine Timing Measurement Request indicates no preference by the initiating STA and is not used by the responding STA. Table 9-279 shows the encoding of this subfield.

Table 9-279—Burst Duration subfield encoding

Value	Represents
0-1	Reserved
2	250 μs
3	500 μs
4	1 ms
5	2 ms
6	4 ms
7	8 ms
8	16 ms
9	32 ms
10	64 ms
11	128 ms
12–14	Reserved
15	No preference

The Min Delta FTM subfield indicates the minimum time between consecutive Fine Timing Measurement frames. It is measured from the start of a Fine Timing Measurement frame to the start of following Fine Timing Measurement frame, in units of 100 μs. The value 0 indicates no preference by the initiating STA and is not used by the responding STA.

The value in the Partial TSF Timer subfield is the partial value of the responding STA's TSF at the start of the first burst instance. The Partial TSF Timer subfield value is derived as follows, so as to have units of TUs: from the 64 TSF timer bits at the start of the first burst instance of an FTM session, remove the most significant 38 bits and the least significant 10 bits.

The initiating STA indicates a preferred time for the start of the first burst instance by setting the Partial TSF Timer No Preference subfield to 0 and by setting the Partial TSF Timer subfield to indicate the preferred start of the first burst instance, in the Fine Timing Measurement Request frame. Otherwise the Partial TSF Timer No Preference subfield is set to 1 and the Partial TSF Timer subfield is reserved. The Partial TSF Timer No Preference subfield is reserved when the Fine Timing Measurement Parameters element is included in an initial Fine Timing Measurement frame.

The value of the Partial TSF Timer subfield in an initial Fine Timing Measurement frame is the partial value of the responding STA's TSF timer at the start of the first burst instance of an FTM session.

NOTE 1—1024 TUs out of the full range of the Partial TSF Timer subfield are not used in order to allow the recipient to resolve ambiguity arising from 1) imperfect synchronization between the initiating and responding STAs, and 2) retries of the initial Fine Timing Measurement Request frame or retransmissions of the initial Fine Timing Measurement frame.

The ASAP Capable subfield indicates that the responding STA is capable of capturing timestamps associated with an initial Fine Timing Measurement frame and its acknowledgment and sending them in the following Fine Timing Measurement frame. This subfield is reserved in the initial Fine Timing Measurement Request frame.

The ASAP subfield indicates the initiating STA's request to start the first burst instance of the FTM session with the initial Fine Timing Measurement frame and capture timestamps corresponding to the transmission of the initial Fine Timing Measurement frame and the receipt of its acknowledgment. The responding STA sets the ASAP subfield to 1 to indicate the STA's intent to send a Fine Timing Measurement frame as soon as possible and capture timestamps corresponding to the transmission of the initial Fine Timing Measurement frame and the receipt of its acknowledgment.

When the ASAP subfield is set to 0 and the Partial TSF Timer No Preference subfield is set to 0 by an initiating STA, the initiating STA requests the start of the first burst instance specified by the Partial TSF Timer subfield in the initial Fine Timing Measurement Request frame. When the ASAP subfield is set to 1 and the Partial TSF Timer No Preference subfield is set to 0 by an initiating STA, the Partial TSF Timer subfield in the Fine Timing Measurement Request frame indicates the requested start of the first burst instance if the ASAP subfield is set to 0 in the corresponding initial Fine Timing Measurement frame. The Partial TSF Timer subfield in both these frames is set to a value between 0 and 62/64 of 65 535 TUs.

Figure 9-626 describes how the value of the Partial TSF Timer subfield is determined based on the ASAP subfield and the Partial TSF Timer No Preference subfield at an initiating STA and on the ASAP subfield at the responding STA.

The ASAP subfield is also used by the responding STA to signal whether that request has been honored or not. When the ASAP subfield is set to 0 by the responding STA, the Partial TSF Timer subfield in the initial Fine Timing Measurement frame indicates the start time of the first burst instance and the earliest time the Fine Timing Measurement Request frame (see 11.21.6.4) should be sent by the initiating STA. The Partial TSF Timer subfield in both these frames is set to a value between 0 and 62/64 of 65 535 TUs.

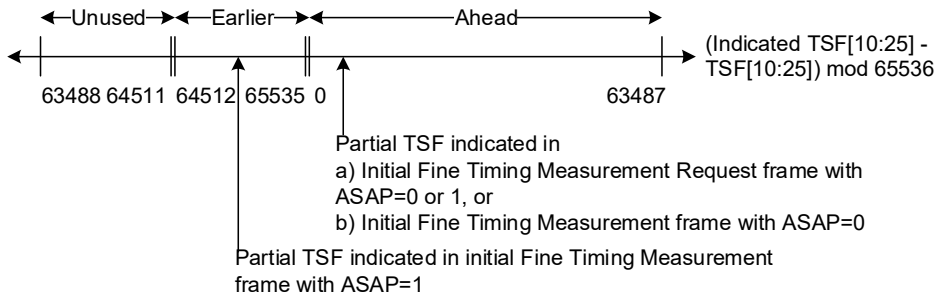

Figure 9-626—Calculation of the value of the Partial TSF Timer subfield

When the ASAP subfield is set to 1 by the responding STA, the Partial TSF Timer subfield in the initial Fine Timing Measurement frame indicates the start time of the first burst instance and the earliest time the initial Fine Timing Measurement frame will be sent. The value in the Partial TSF Timer subfield in this case is set to a value less than 1/64 of 65 536 TUs (≥1024 TUs) from the responding STA's TSF timer.

The FTMs Per Burst subfield indicates how many successfully transmitted Fine Timing Measurement frames are requested per burst instance by the initial Fine Timing Measurement Request frame, or allocated by the initial Fine Timing Measurement frame, respectively. The value 0 indicates no preference by the initiating STA and is not used by the responding STA.

The Format And Bandwidth subfield indicates the requested or allocated PPDU format and bandwidth that can be used by Fine Timing Measurement frames in an FTM session and is shown in Table 9-280. The value 0 indicates no preference by the initiating STA in the associated state and is not used by the responding STA.The value 0 is not used by the initiating STA in the unassociated state.

Table 9-280—Format And Bandwidth subfield

Field value	Format	Bandwidth (MHz)
0	No preference	No preference
1–3	Reserved	Reserved

Table 9-280—Format And Bandwidth subfield *(continued)*

Field value	Format	Bandwidth (MHz)
16	VHT (single RF LO)	160
17–30	Reserved	Reserved
31	DMG	2160
32–63	Reserved	Reserved

NOTE 2—See 21.3.17.3 regarding the usage of two separate RF LOs.

The Burst Period subfield indicates the interval between two consecutive burst instances, in units of 100 ms. The value 0 indicates no preference by the initiating STA. This subfield is reserved when the Number of Bursts Exponent subfield is set to 0.

9.4.2.168 Device Location element

A Device Location element includes the location configuration information (LCI), which contains latitude, longitude, and altitude information. The Device Location element format is shown in Figure 9-627.

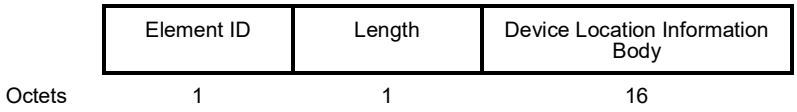

Figure 9-627—Device Location element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Device Location Information Body field is defined in 9.4.1.56.

9.4.2.169 White Space Map element

The White Space Map element includes available radio frequency information obtained from a GDB. The format of the WSM Information field is determined by the WSM Type field. The format of the White Space Map Announcement element is shown in Figure 9-628.

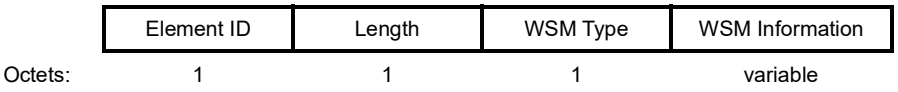

Figure 9-628—WSM element format

The Element ID and Length fields are defined in 9.4.2.1.

The format and values of WSM Type and WSM Information fields are defined in 9.4.1.57.

9.4.2.170 Reduced Neighbor Report element

9.4.2.170.1 General

The Reduced Neighbor Report element contains channel and other information related to neighbor APs. The format of the Reduced Neighbor Report element is shown in Figure 9-629.

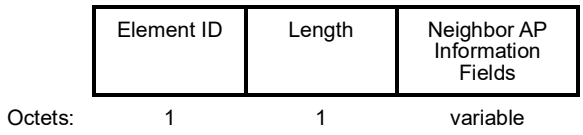

Figure 9-629—Reduced Neighbor Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Neighbor AP Information Fields field contains one or more of the Neighbor AP Information field described in 9.4.2.170.2.

9.4.2.170.2 Neighbor AP Information field

The Neighbor AP Information field specifies TBTT and other information related to a group of neighbor APs on one channel. See Figure 9-630.

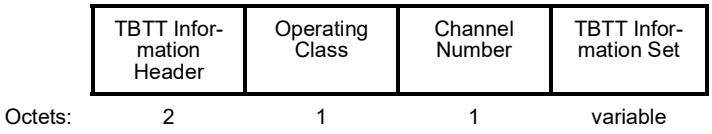

Figure 9-630—Neighbor AP Information field format

The format of TBTT Information Header subfield is defined in Figure 9-631.

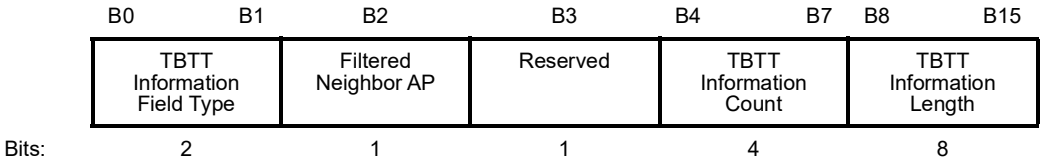

Figure 9-631—TBTT Information Header subfield format

The TBTT Information Field Type subfield identifies, together with the TBTT Information Length subfield, the format of the TBTT Information field. It is set to 0.. Values 1, 2, and 3 are reserved.

The Filtered Neighbor AP subfield is reserved except when the Reduced Neighbor Report element is carried in a Probe Response frame transmitted by a TVHT AP.

In a Probe Response frame transmitted by a TVHT AP, the Filtered Neighbor AP subfield is set to 1 if the specific SSID corresponding to every BSS of the APs in this Neighbor AP Information field matches the SSID in the corresponding Probe Request frame; otherwise it is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TBTT Information Count subfield contains the number of TBTT Information fields included in the TBTT Information Set field of the Neighbor AP Information field, minus one.

The TBTT Information Length subfield indicates the length of each TBTT Information field included in the TBTT Information Set field of the Neighbor AP Information field. When the TBTT Information Field Type subfield is set to 0, the TBTT Information Length subfield

— Contains the length in octets of each TBTT Information field that is included in the TBTT Information Set field of the Neighbor AP Information field.
— Is set to 1, 5, 7, or 11; other values are reserved.
— Indicates the TBTT Information field contents as shown in Table 9-281.

A TVHT AP sets the TBTT Information Length subfield to 1.

The TBTT Information Length subfield is interpreted as shown in Table 9-281.

Table 9-281—TBTT Information field contents

TBTT Information Length subfield value	TBTT Information field contents
1	The Neighbor AP TBTT Offset subfield
5	The Neighbor AP TBTT Offset subfield and the Short SSID subfield
7	The Neighbor AP TBTT Offset subfield and the BSSID subfield
11	The Neighbor AP TBTT Offset subfield, the BSSID subfield and the Short SSID subfield
0, 2–4, 6, 8–10, 12–255	Reserved

The Operating Class field indicates a channel starting frequency that, together with the Channel Number field, indicates the primary channel of the BSSs of the APs in this Neighbor AP Information field.

NOTE—The Operating Class field and Channel Number tuple indicate the primary channel in order to assist with passive scanning.

The Channel Number field indicates the last known primary channel of the APs in this Neighbor AP Information field. Channel Number is defined within an Operating Class as shown in Table E-4.

The TBTT Information Set field contains one or more TBTT Information fields. The TBTT Information field is defined in Figure 9-632.

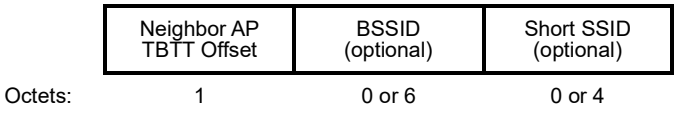

Figure 9-632—TBTT Information field (format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Neighbor AP TBTT Offset subfield indicates the offset in TUs, rounded down to nearest TU, to the next TBTT of an AP's BSS from the immediately prior TBTT of the AP that transmits this element. The value 254 indicates an offset of 254 TUs or higher. The value 255 indicates an unknown offset value.

The BSSID field is defined in 9.2.4.3.4.

The Short SSID subfield is calculated as given in 9.4.2.170.3.

9.4.2.170.3 Calculating the short SSID

A short SSID is a 32-bit value calculated over an SSID. The SSID is referred to as the calculation fields.

The value of the Short SSID field is calculated using the following standard generator polynomial of degree 32:

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

The value of the Short SSID field is the 1s complement of the sum (modulo 2) of the following:

a) The remainder of $x^k \times (x^{31} + x^{30} + x^{29} + \ldots + x^2 + x + 1)$ divided (modulo 2) by $G(x)$, where k is the number of bits in the calculation fields, and

b) The remainder after multiplication of the contents (treated as a polynomial) of the calculation fields by x^{32} and then division by $G(x)$.

The Short SSID field is transmitted commencing with the coefficient of the highest-order term.

9.4.2.171 TVHT Operation element

The operation of TVHT STAs in the BSS is controlled by the TVHT Operation element. The format of the TVHT Operation element is defined in Figure 9-633.

	Element ID	Length	TVHT Operation Information	Basic VHT-MCS And NSS Set
Octets:	1	1	4	2

Figure 9-633—TVHT Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the TVHT Operation Information field is defined in Figure 9-634.

	Primary Channel Number	Channel Width	Channel Center Frequency Segment 0	Channel Center Frequency Segment 1
Octets:	1	1	1	1

Figure 9-634—TVHT Operation Information field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The subfields of the TVHT Operation Information field are defined in Table 9-282.

Table 9-282—TVHT Operation Information subfields

Field	Definition	Encoding
Primary Channel Number	Indicates the channel number of the primary channel (see 11.41).	Channel number of the primary channel.
Channel Width	This field defines the BSS bandwidth (see 11.41).	Set to 0 for TVHT_W BSS bandwidth. Set to 1 for TVHT_2W BSS bandwidth. Set to 2 for TVHT_W+W BSS bandwidth. Set to 3 for TVHT_4W BSS bandwidth. Set to 4 for noncontiguous TVHT_2W+2W BSS bandwidth. Values in the range 5 to 255 are reserved.
Channel Center Frequency Segment 0	Defines the channel center frequency for a TVHT_W, TVHT_2W, and TVHT_4W TVHT BSS and the segment 0 channel center frequency for a TVHT_W+W and TVHT_2W+2W TVHT BSS. See 22.3.14.	For TVHT_W or TVHT_2W or TVHT_4W BSS bandwidth, indicates the center frequency of the lowest TV channel index for the TVHT_W or TVHT_2W or TVHT_4W channel on which the TVHT BSS operates. For TVHT_W+W or TVHT_2W+2W BSS bandwidth, indicates the lowest TV channel index for the TVHT_W or TVHT_2W channel of frequency segment 0 on which the TVHT BSS operates. Reserved otherwise.
Channel Center Frequency Segment 1	Defines the segment 1 channel center frequency for a TVHT_W+W and TVHT_2W+2W TVHT BSS. See 22.3.14.	For TVHT_W+W or TVHT_2W+2W BSS bandwidth, indicates the lowest TV channel index in the segment for the TVHT_W or TVHT_2W channel of frequency segment 1 on which the TVHT BSS operates. Reserved otherwise.

The Basic VHT-MCS And NSS Set field indicates the MCSs for each spatial stream in VHT PPDU in TVWS bands that are supported by all TVHT STAs in the BSS (including IBSS). The Basic VHT-MCS And NSS Set field is a bitmap of size 16 bits; B8-B9, B10-B11, B12-B13, and B14-B15 are set to 3. For B0-B7, each 2 bits indicates the supported MCS set for N_{SS} from 1 to 4. The Basic VHT-MCS And NSS Set field is defined as B0-B7 of Rx VHT-MCS Map subfield in 9.4.2.157.3.

9.4.2.172 FTM Synchronization Information element

The format of the FTM Synchronization Information element is defined in Figure 9-635.

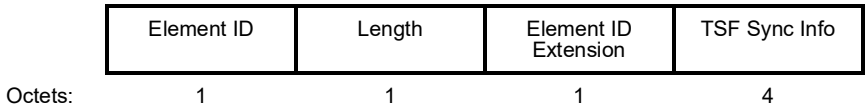

Figure 9-635—FTM Synchronization Information element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The TSF Sync Info field is set to the 4 least significant octets of the TSF.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.173 Estimated Service Parameters Inbound element

The Estimated Service Parameters Inbound element is used by a STA to provide information to another STA that can then use the information as input to an algorithm to generate an estimate of inbound throughput between the two STAs.

The format of the Estimated Service Parameters Inbound element is shown in Figure 9-636.

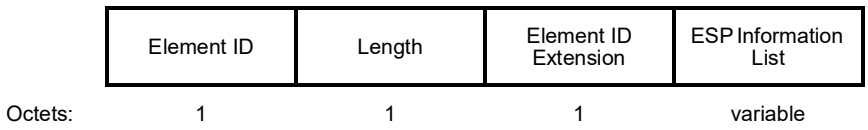

Figure 9-636—Estimated Service Parameters Inbound element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The ESP Information List field contains from 1 to 4 ESP Information fields, each corresponding to an access category for which estimated service parameters information is provided.

The format of the ESP Information field is shown in Figure 9-637.

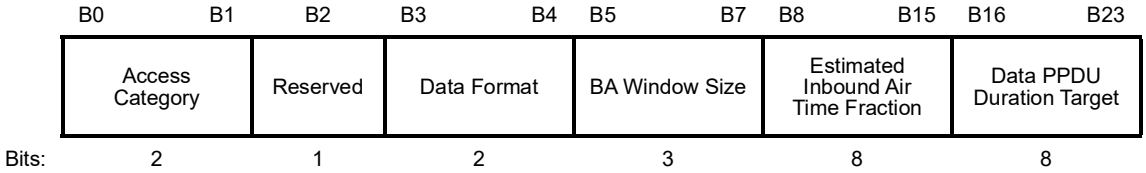

Figure 9-637—ESP Information field format

The Access Category subfield indicates the access category to which the remaining parameters of the ESP Information field apply. The encoding of the Access Category subfield is given in Table 9-283. When parameters for more than one access category are present in an Estimated Service Parameters Inbound element the ESP Information fields for the access categories appear in order of Access Category subfield value, with the ESP Information field with the lowest Access Category subfield value appearing first.

Table 9-283—Access Category subfield encoding

Value	Access Category
0	AC_BK
1	AC_BE
2	AC_VI
3	AC_VO

Copyright © 2021 IEEE. All rights reserved.

The Data format subfield has the meaning indicated in Table 9-284.

Table 9-284—Data Format subfield encoding

Value	Description
0	No aggregation is expected to be performed for MSDUs or MPDUs with the Type subfield equal to Data for the corresponding AC
1	A-MSDU aggregation is expected to be performed for MSDUs for the corresponding AC, but A-MPDU aggregation is not expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC
2	A-MPDU aggregation is expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC, but A-MSDU aggregation is not expected to be performed for MSDUs for the corresponding AC
3	A-MSDU aggregation is expected to be performed for MSDUs for the corresponding AC, and A-MPDU aggregation is expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC

The BA Window Size subfield is indicates the size of the Block Ack window that is expected for the corresponding access category as defined in Table 9-285. When the Block Ack window size expected to be used by the transmitter of the element does not match any of the values shown in the table, the transmitter uses the next lower value in the table.

Table 9-285—BA Window Size subfield encoding

Value	Expected block ack window size
0	Block Ack not expected to be used
1	2
2	4
3	6
4	8
5	16
6	32
7	64

The Estimated Inbound Air Time Fraction subfield contains an unsigned integer that represents the predicted percentage of time, linearly scaled with 255 representing 100% and 0 representing 0%, that a new STA joining the BSS can expect to be available for the transmission of PPDUs to that STA, including overhead, where such PPDUs contain MPDUs with the Type subfield equal to Data that belong to the access category indicated in the Access Category subfield of the corresponding ESP Information field and any other MPDUs in the PPDU are considered to be overhead.

The Data PPDU Duration Target field is an unsigned integer that indicates the expected target duration of PPDUs transmitted to the STA that contain MPDUs with the Type subfield equal to Data that belong to the access category indicated in the Access Category subfield of the corresponding ESP Information field for

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

the corresponding access category in units of 50 μs. This value is determined using a method that is beyond the scope of this standard.

9.4.2.174 Future Channel Guidance element

The Future Channel Guidance element is used by an AP, IBSS STA, mesh STA, or PCP to guide STAs about the likely future channel if the sending STA changes channels of operation. The format of the Future Channel Guidance element is shown in Figure 9-638.

	Element ID	Length	Element ID Extension	New Channel Number	Secondary Channel Offset element	Mesh Channel Switch Parameters element	Wide Bandwidth Channel Switch element	New Transmit Power Envelope element
Octets:	1	1	1	4	0 or 3	0 or 6	0 or 5	variable

Figure 9-638—Future Channel Guidance element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The New Channel Number field is set to the number of the channel to which the STA will be moving in the event of a channel switch (as defined in 17.3.8.4.3).

The Secondary Channel Offset element is defined in 9.4.2.19. This element is present when switching to a 40 MHz or wider channel. It is optionally present when switching to a 20 MHz channel (in which case the Secondary Channel Offset field is set to SCN). See 11.38.4.

The Mesh Channel Switch Parameters element is defined in 9.4.2.102. This element is present when a mesh STA performs MBSS channel switch. Otherwise, the Mesh Channel Switch Parameters element is not present.

The Wide Bandwidth Channel Switch element is defined in 9.4.2.160. This element is present when switching to a channel width wider than 40 MHz.

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.161 and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the local maximum transmit powers for the BSS for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.38.1).

The Future Channel Guidance procedure is defined in 11.8.10.

9.4.2.175 Association Delay Info element

The Association Delay Info element is used to identify the minimum (re)association response timeout to the non-AP STA. The format of the Association Delay Info element is shown in Figure 9-639.

	Element ID	Length	Element ID Extension	Association Delay Info
Octets:	1	1	1	1

Figure 9-639—Association Delay Info element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Association Delay Info field contains an unsigned integer indicating the minimum association response delay in number of TUs.

9.4.2.176 CAG Number element

The Common Advertisement Group (CAG) is a group of elements that are defined by the same advertisement protocol and that do not change on a rapid basis within an AP. The CAG Number element provides one or more current version numbers of the CAG (CAG Version) associated with the AP, where each version number is associated with a specific advertisement protocol and server. The CAG Number element is optionally present in the Beacon or Probe Response frame to reduce GAS frame exchanges when dot11InterworkingServiceActivated is true. The CAG Number element is optionally present in the GAS Initial Request frame to indicate the CAG Version and the associated CAG Information Type cached by the non-AP STA when dot11SolicitedPADActivated is true.

The format of the CAG Number element is shown in Figure 9-640.

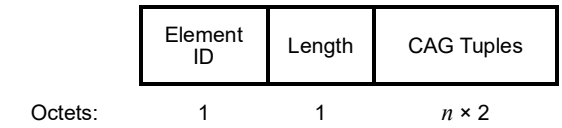

Figure 9-640—CAG Number element format

The Element ID and Length fields are defined in 9.4.2.1.

The CAG Tuples field contains one or more 2-octet CAG Tuple fields. The format of a CAG Tuple field is shown in Figure 9-641.

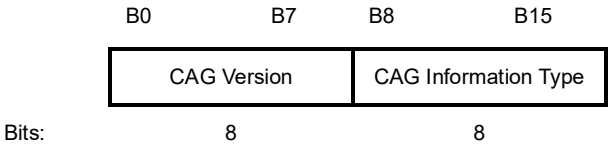

Figure 9-641—CAG Tuple field

The CAG Version subfield is an unsigned integer indicating the current version of the CAG of the associated advertisement protocol and server indicated by the CAG Information Type subfield in the same CAG Tuple field. The use of CAG Version is explained in 11.22.3.3.

The CAG Information Type subfield is indicates the type of information associated with the CAG Version in the same CAG Tuple field. The CAG Information Type is defined in Table 9-286.

Table 9-286—CAG Information Type definitions

9.4.2.177 FILS Request Parameters element(

The contents of the FILS Request Parameters element in Probe Request frame are used in determining whether to transmit a Probe Response frame as described in 11.1.4.3.4. The FILS Request Parameters element is defined in Figure 9-642.

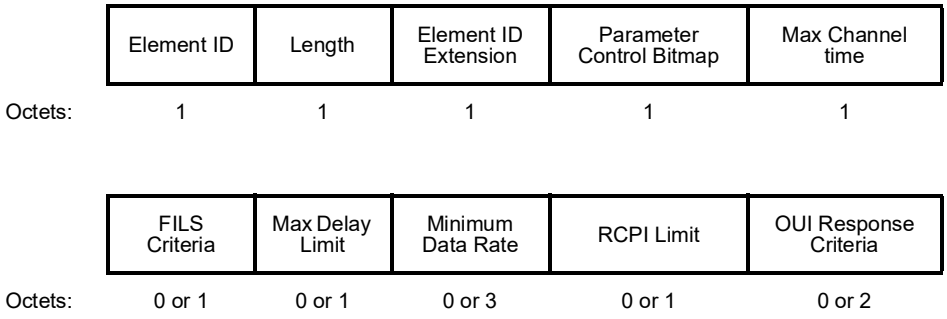

Figure 9-642—FILS Request Parameters element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Parameter Control Bitmap field is shown in Figure 9-643.

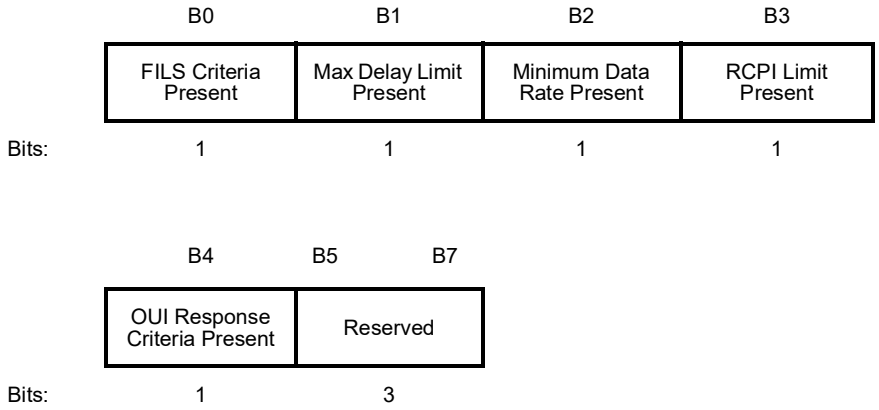

Figure 9-643—Parameter Control Bitmap field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Bits 0 to 4 of the Parameter Control Bitmap field correspond to the Parameter fields that are conditionally present in the element. A 1 in a bit indicates the corresponding parameter is present, and 0 indicates the corresponding parameter is not present.

The FILS Criteria field is shown in Figure 9-644.

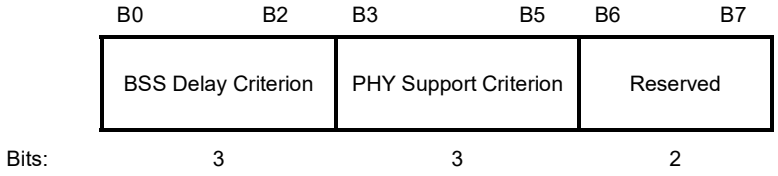

Figure 9-644—FILS Criteria field format

The BSS Delay Criterion subfield indicates the delay type that is applied in the decision to respond to the Probe Request frame as described in 11.1.4.3.4. The delay type is selected as indicated in Table 9-287.

Table 9-287—BSS Delay Criterion subfield

Value	Explanation
0	Delay criterion is not in use.
1	Access delay is indicated as Average Access Delay for Background (AC_BK) subfield of the BSS AC Access Delay element as described in 9.4.2.43.
2	Access delay is indicated as Average Access Delay for Best Effort (AC_BE) subfield of the BSS AC Access Delay element as described in 9.4.2.43.
3	Access delay is indicated as Average Access Delay for Video (AC_VI) subfield of the BSS AC Access Delay element as described in 9.4.2.43.
4	Access delay is indicated as Average Access Delay for Voice (AC_VO) subfield of the BSS AC Access Delay element as described in 9.4.2.43.
5	Access Delay is indicated as Average Access Delay as described in 9.4.2.43.
6, 7	Reserved

The PHY Support Criterion subfield indicates the required PHY type of the responding STA.

The indicated PHY type is used in the decision to respond to the Probe Request frame as described in 11.1.4.3.4. The meaning of the values for the PHY Support Criterion is shown in Table 9-288.

Table 9-288—PHY Support Criterion subfield

Value	Explanation
0	Indicates that PHY Support Criterion is not in use.
1	Indicates that a responding FILS STA is HT capable.
2	Indicates that a responding FILS STA is VHT capable.
3–7	Reserved

The Max Delay Limit field (see 11.1.4.3.4) is an unsigned integer in units of 400 μs to indicate the maximum access delay as indicated by the BSS Delay Criterion subfield of the FILS Criteria of the FILS Request Parameters element. Value 0 is reserved. The use of the maximum access delay and the delay criterion are explained in 11.1.4.3.4. Max Delay Limit is not present if FILS Criteria is not present or BSS Delay Criterion is not in use.

The Minimum Data Rate field (see 11.1.4.3.4), if present, contains an unsigned integer in units of kilobits per second that specifies the lowest total data rate specified at the MAC SAP for transport of MSDUs or A-MSDUs that the STA is going to transmit. The minimum MAC SAP data rate does not include the MAC and PHY overheads incurred in transferring the MSDUs or A-MSDUs.

The RCPI Limit field is an unsigned integer in units of 1 dB. The use of the RCPI Limit field is explained in 11.1.4.3.4.

OUI Response Criteria field (see 11.1.4.3.9) is a bitmap whose bits correspond to the Vendor Specific elements of the Probe Request frame in order of presence. Bit 0 corresponds to the first Vendor Specific element, bit 1 corresponds to the second, etc. A bit value of 1 in the OUI Response Criteria field indicates that the receiver identifies the Organization Identifier field of the corresponding Vendor Specific element in order to respond to the request and otherwise is 0. If the number of the Vendor Specific elements of the Probe Request frame is less than the number of bits of the OUI Response Criteria field, the remaining bits of the OUI Response Criteria field are 0. If the number of bits in the OUI Response Criteria field is less than the number of Vendor Specific elements in the Probe Request frame, the corresponding bits not present in the OUI Response Criteria field are assumed to be 0.

The Max Channel Time field (see 11.1.4.3.9) contains the value of MaxChannelTime parameter of the MLME-SCAN.request primitive represented in units of TUs, as an unsigned integer. Setting the Max Channel Time field to 255 is used to indicate any duration of more than 254 TUs, or an unspecified or unknown duration.

9.4.2.178 FILS Key Confirmation element

The FILS Key Confirmation element is used to convey a cryptographic proof of authentication between a STA and an AP. The format of the FILS Key Confirmation element is shown in Figure 9-645.

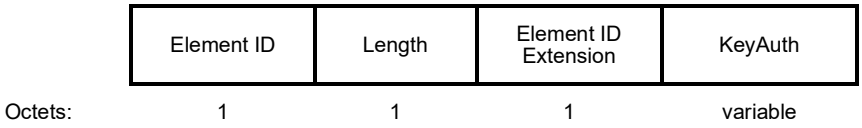

Figure 9-645—FILS Key Confirmation element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The KeyAuth field contains the cryptographic authentication information (see 12.11.2.6).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.179 FILS Session element

The FILS Session element is used to convey the (unique) identifier of an in-progress FILS authentication protocol session. The format of the FILS Session element is shown in Figure 9-646.

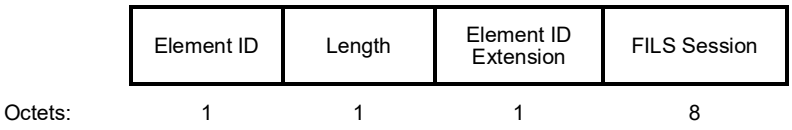

Figure 9-646—FILS Session element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The FILS Session field is chosen randomly by the non-AP STA.

9.4.2.180 FILS Public Key element

The FILS Public Key element is used to communicate the device's (certified) public key for use with the FILS authentication exchange. The format of the FILS Public Key element is shown in Figure 9-647.

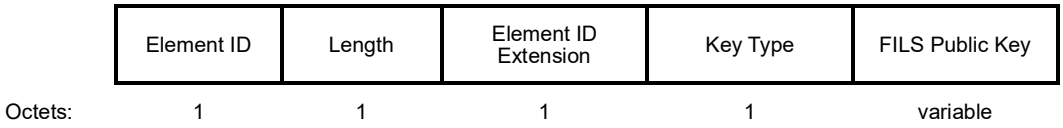

Figure 9-647—FILS Public Key element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Key Type field values are as follows:
0: Reserved.
1: FILS Public Key field contains an X.509v3 certificate encoded according to IETF RFC 5280.
2: FILS Public Key field contains an uncertified public key encoded according to IETF RFC 5480.
3: FILS Public Key field contains an uncertified public key encoded according to IETF RFC 3279.
4–255: Reserved.

9.4.2.181 AP Configuration Sequence Number (AP-CSN) element

An AP-CSN element indicates the change of system information within a BSS. The format of the AP-CSN element is shown in Figure 9-648.

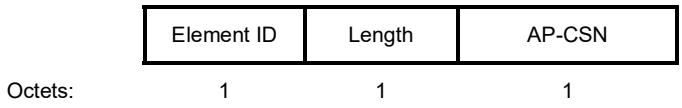

Figure 9-648—AP-CSN element format

The Element ID and Length fields are defined in 9.4.2.1.

The AP-CSN contains the version number of the BSS Configuration Parameter Set. This value increments when an update of the non-dynamic elements (all elements except dynamic elements indicated in 11.1.4.3.11) inside a Beacon frame has occurred, as described in 11.1.4.3.11.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.182 FILS Indication element

The FILS Indication element shown in Figure 9-649 contains information related to FILS authentication and higher layer setup capabilities of the AP.

	Element ID	Length	FILS Information	Cache Identifier	HESSID	Realm Identifier	Public Key Identifier
Octets:	1	1	2	0 or 2	0 or 6	variable	variable

Figure 9-649—FILS Indication element format

The Element ID and Length fields are defined in 9.4.2.1.

The FILS Information field provides information on the presence of the following optional fields in the FILS Indication element and the capability of the FILS authentication algorithms. The format of the FILS Information field is shown in Figure 9-650.

	B0 B2	B3 B5	B6	B7	B8	B9	B10	B11	B12 B15
	Number of Public Key Identifi-ers	Number of Realm Identifi-ers	FILS IP Address Configu-ration	Cache Identifier Included	HESSID Included	FILS Shared Key Authentic ation without PFS Sup-ported	FILS Shared Key Authentic ation with PFS Sup-ported	FILS Public Key Authenti cation Sup-ported	Reserved
Bits:	3	3	1	1	1	1	1	1	4

Figure 9-650—FILS Information field format

The Number of Public Key Identifiers subfield lists the number of Public Key Identifiers that are present in the Public Key Identifiers field in the FILS Indication element. When the Number of Public Key Identifiers subfield is 0, the Public Key Identifier field is not present in the FILS Indication element. Each Public Key Identifier is formatted per Figure 9-652. Up to seven Public Key Identifiers fields may be carried in a FILS Indication element.

The Number of Realm Identifiers subfield lists the number of realm identifiers that are present in the Realm Identifier field in the FILS Indication element. When the Number of Realm Identifiers subfield is 0, the Realm Identifier field is not present in the FILS Indication element. Each realm identifier is formatted per Figure 9-651. Up to seven Realm Identifiers fields may be carried in FILS Indication element.

An AP sets the FILS IP Address Configuration bit to 1 if the AP supports FILS IP address configuration and is set to 0 otherwise.

The Cache Identifier Included bit is set in the FILS Information field when PMKSA caching is supported. When the Cache Identifier Included bit is 1, a 2-octet Cache Identifier field is present in the FILS Indication element. When the Cache Identifier Included bit is 0 the Cache Identifier field is not present in the FILS Indication element. The content of the Cache Identifier field is an opaque octet string that identifies the scope in which PMKSAs are cached. The assignment of the cache identifier is outside the scope of the standard but its value must be unique per authenticator within an ESS. On the AP, dot11CacheIdentifier contains the value of the Cache Identifier.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When the HESSID Included bit is 1, a 6-octet HESSID field is present in the FILS Indication element. When the HESSID Included bit is 0, the HESSID field is not present in the FILS Indication element. The HESSID field is set to the value of dot11HESSID.

An AP sets the FILS Shared Key authentication without PFS Supported bit to 1 if the AP supports FILS Shared Key authentication without PFS and sets it to 0 otherwise. An AP sets the FILS Shared Key authentication with PFS Supported bit to 1 if the AP supports FILS Shared Key authentication with PFS and sets it to 0 otherwise. An AP sets the FILS Public Key Authentication Supported bit to 1 if the AP supports FILS Public Key authentication and sets it to 0 otherwise.

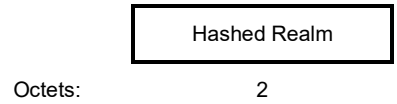

Figure 9-651—Realm Identifier field format

The Hashed Realm subfield of the Realm Identifier field entry is computed from the realm that is compliant with the preferred name syntax defined in IETF RFC 1035 (same as the domain name used in 9.4.5.15). The exact computation method for the hashed realm is given in 11.42.4.

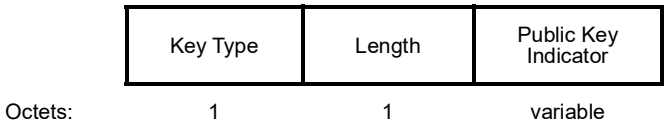

Figure 9-652—Public Key Identifier field format

The Key Type and Public Key Indicator subfields are described in Table 9-289. The Length subfield indicates the length in octets of the Public Key Indicator subfield.

Table 9-289—Key Type and Public Key Indicator subfields

Key Type subfield	Public Key Indicator subfield
0	Reserved
1	The Issuer, per IETF RFC 5280, of the AP's certificate
2	A SHA-256 hash of the AP's uncertified IETF RFC 5480 public key
3	A SHA-256 hash of the AP's uncertified IETF RFC 3279 public key
4–255	Reserved

9.4.2.183 FILS HLP Container element

The FILS HLP Container element contains higher layer protocol (HLP) packets transported during FILS association. If dot11FILSActivated is true, one or more FILS HLP Container elements may be included in a (Re)Association Request or Response frame. This element is used for higher layer protocol packet encapsulation (11.45.3.2). The format of the FILS HLP Container element is shown in Figure 9-653.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

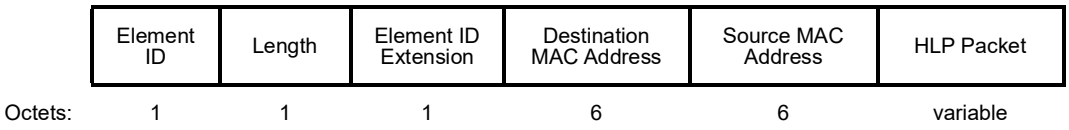

Figure 9-653—FILS HLP Container element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Destination MAC Address field and the Source MAC Address field are set as described in 11.45.3.2.

The HLP Packet field contains the HLP packet.

9.4.2.184 FILS IP Address Assignment element

9.4.2.184.1 General

The FILS IP Address Assignment element is used by a STA to request or to assign an IP address using FILS IP Address Configuration (11.45.3.3). If dot11FILSActivated is true, a FILS IP Address Assignment element may be sent in a (Re)Association Request/Response frame or a FILS Container frame. The format of the FILS IP Address Assignment element is shown in Figure 9-654.

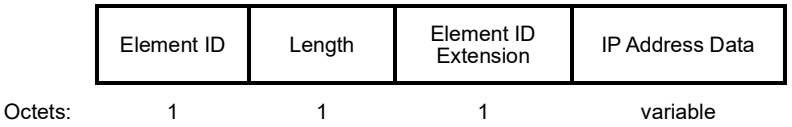

Figure 9-654—FILS IP Address Assignment element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The IP Address Data field in (Re)Association Request and FILS Container frames from a non-AP STA to an AP is described in 9.4.2.184.2. The IP Address Data field in (Re)Association Response frame and FILS Container frames from an AP to a non-AP STA is described in 9.4.2.184.3.

9.4.2.184.2 IP Address Data field for request

The format of the IP Address Data field for request is shown in Figure 9-655.

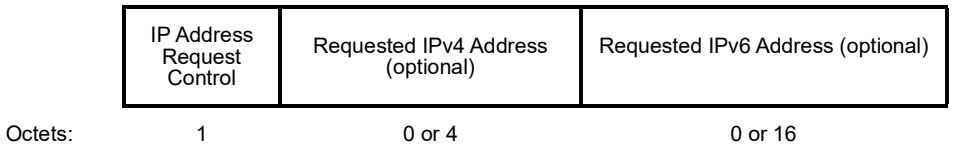

Figure 9-655—IP Address Data field format for request

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the IP Address Request Control subfield is shown in Figure 9-656.

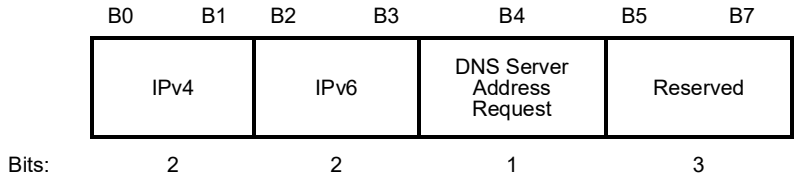

Figure 9-656—IP Address Request Control subfield format

The IPv4 subfields are set as shown in Table 9-290. The IPv6 subfields are set as shown in Table 9-291.

Table 9-290—IPv4 subfield settings

IPv4 subfield	Explanation
0	STA is not requesting an IPv4 address
1	Reserved
2	STA is requesting a new IPv4 address
3	STA is requesting the IPv4 address present in the element

Table 9-291—IPv6 subfield settings

IPv6 subfield	Explanation
0	STA is not requesting an IPv6 address
1	Reserved
2	STA is requesting a new IPv6 address
3	STA is requesting the IPv6 address present in the element

The DNS Server Address Request subfield is 1 if the STA is requesting DNS server(s) address(es). The type of DNS server requested corresponds to the type of the IP address requested. If both IPv4 and IPv6 are requested, then DNS server addresses for both types are also requested by setting this bit to 1.

The Requested IPv4 Address field (4 octets) carries the specific IPv4 address that the non-AP STA is requesting, when the IPv4 field indicates the STA is requesting a specific IPv4 address.

The Requested IPv6 Address field (16 octets) carries the specific IPv6 address that the non-AP STA is requesting, when the IPv6 field indicates the STA is requesting a specific IPv6 address.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.184.3 IP Address Data field for response

The format of the IP Address Data field for response is shown in Figure 9-657.

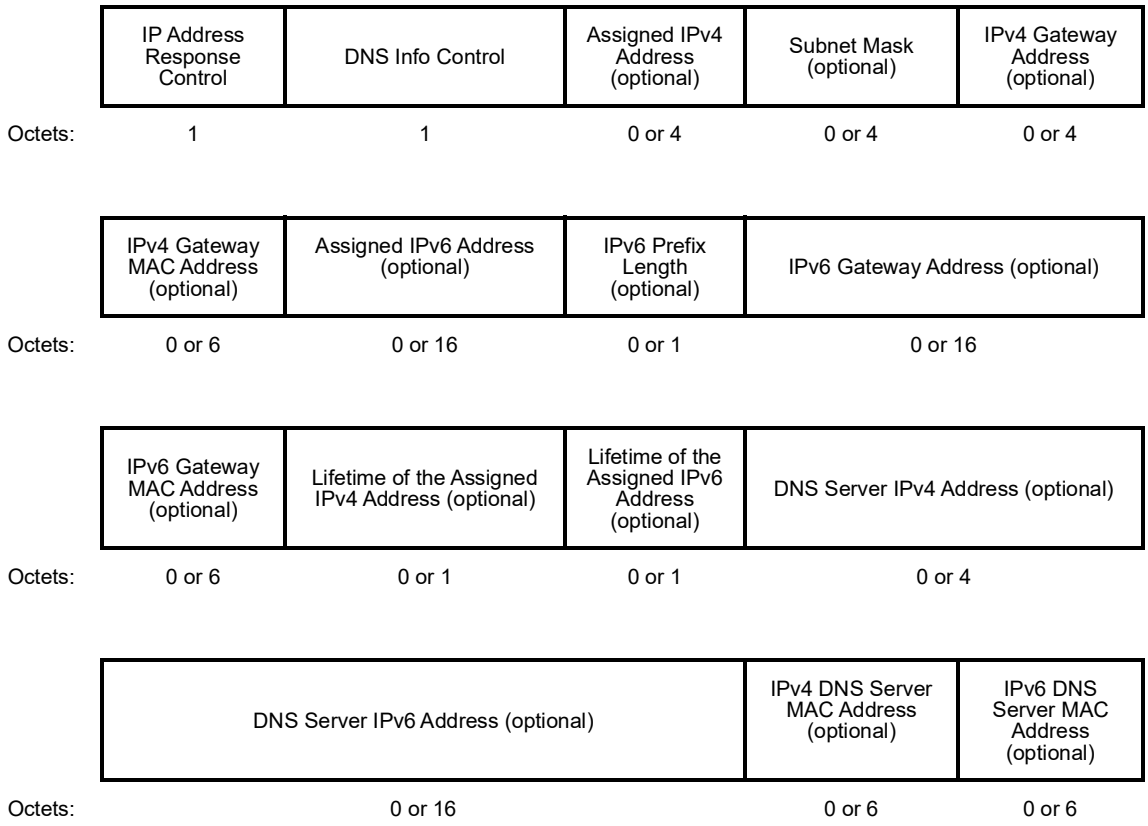

Figure 9-657—IP Address Data field format for response

NOTE—IPv4 addressing is described in IETF RFC 791. IP Subnet and Subnet Mask is described IETF RFC 917. IPv6 addressing, IPv6 prefix and prefix-length is described in IETF RFC 4291. A default gateway in computer networking is a device that is assumed to know how to forward packets on to other networks or the Internet. IPv4 Gateway Address is the IPv4 address of the default gateway when IPv4 is used. IPv6 Gateway Address is the IPv6 address of the default gateway when IPv6 is used. The IPv6 Gateway MAC address is the MAC address of the IPv6 default gateway.

Subfields of the IP Address Response Control field (8 bits) are interpreted dependent on the value of B0 (IP Address pending) as defined in Table 9-292 and Table 9-293.

Table 9-292—IP Address Response Control subfield with B0 = 0

Bit	Function of the subfield	Explanation
B0	IP address pending	Set to 0 if an IP address assignment is included in the frame. B1 to B6 are set as shown below in this table when B0 = 0.
B1	IPv4 assigned	Set to 1 if the Assigned IPv4 Address subfields are included in the element, and set to 0 otherwise.
B2	IPv4 gateway included	Set to 1 if IPv4 Gateway Address and IPv4 Gateway MAC Address subfields are included in the element and set to 0 otherwise. See NOTE.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-292—IP Address Response Control subfield with B0 = 0 *(continued)*

Bit	Function of the subfield	Explanation
B3	IPv6 assigned	Set to 1 if Assigned IPv6 Address and IPv6 Prefix Length subfields are included in the element and set to 0 otherwise.
B4	IPv6 gateway included	Set(to 1 if IPv6 Gateway Address and IPv6 Gateway MAC Address subfields are included in the element and set to 0 otherwise. See NOTE.
B5	Lifetime of the assigned IPv4 address included	Set to 1 if Assigned IPv4 Address subfield is present and the Lifetime of the Assigned IPv4 Address is included in the element. If this bit is 0, and if Assigned IPv4 Address subfield is present, then the assigned IPv4 address is valid during the entire time of association with the AP.
B6	Lifetime of the assigned IPv6 address included	Set to 1 if Assigned IPv6 Address subfield is present and the Lifetime of the Assigned IPv6 Address is included in the element. If this bit is 0, and if Assigned IPv6 Address subfield is present, then the assigned IPv6 address is valid during the entire time of association with the AP.
B7	Reserved	
NOTE—A STA in a purely local network environment might be assigned an IP address without requiring a gateway address.		

Table 9-293—IP Address Response Control subfield with B0 = 1

Bit	Function of the subfield	Explanation
B0	IP address pending	Set to 1 if an IP address is sent in a later transmission. An IP address is NOT present in the frame when set to 1. B1 to B6 are set as shown below in this table when B0 = 1.
B1–B6	IP address request timeout	IP address request timeout value is the maximum estimated time in the unit of seconds within which an IP address may be assigned and a DNS server address maybe provided to the requesting STA. The value of 0 is reserved.
B7	Reserved	

The format of the DNS Info Control subfield is shown in Figure 9-658 and the DNS Info Control subfield settings are shown in Table 9-294.

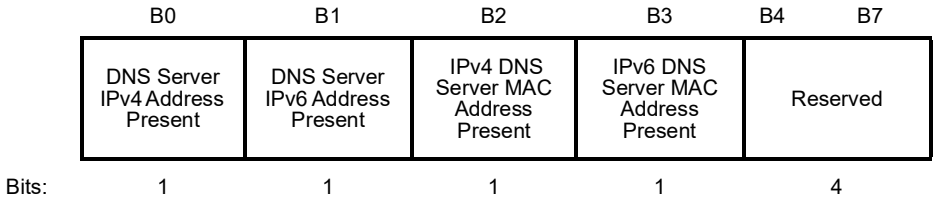

Figure 9-658—DNS Info Control subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-294—DNS Info Control subfield settings

Bit	Function of the subfield	Explanation
B0	DNS server IPv4 address included	Set to 1 if the DNS Server IPv4 Address subfield is present in the element and set to 0 otherwise. The value of the DNS Server IPv4 Address subfield is the IPv4 address of the DNS server if the DNS Server IPv4 address Present bit of the DNS Info Control subfield is 1.
B1	DNS server IPv6 address included	Set to 1 if the DNS Server IPv6 Address subfield is present in the element and set to 0 otherwise. The value of the DNS Server IPv6Address is the IPv6 address of the DNS server if the DNS Server IPv6 address Present bit of the DNS Info Control is 1.
B2	IPv4 DNS server MAC address included	Set to 1 if the MAC address to which IPv4 based DNS queries can be sent is present in the element and set to 0 otherwise. The value of the IPv4 DNS Server MAC Address subfield is the MAC address of the IPv4 DNS server if the IPv4 DNS Server MAC Address Present bit of the DNS Info Control subfield is 1.
B3	IPv6 DNS server MAC address included	Set to 1 if the MAC address to which IPv6 based DNS queries can be sent is present in the element and set to 0 otherwise. The value of the IPv6 DNS Server MAC Address subfield is the MAC address of the IPv6 DNS server if the IPv6 DNS Server MAC Address Present bit of the DNS Info Control subfield is 1.

9.4.2.185 Key Delivery element

The Key Delivery element contains the current Key RSC and one or more KDEs. This is used to communicate the Key RSC and one or more KDEs in a FILS authentication exchange. The format of the Key Delivery element is shown in Figure 9-659.

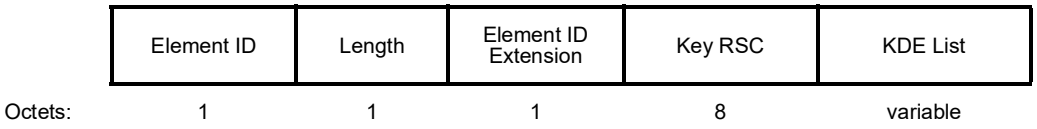

Figure 9-659—Key Delivery element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Key RSC field contains the current receive sequence counter (RSC) for the GTK being installed.

The KDE List field contains one or more KDEs encapsulated using the format shown in Figure 12-35.

9.4.2.186 DILS element

The DILS element includes the conditions for a STA to determine whether it is allowed to attempt fast initial link setup for the duration specified in the element. The DILS element is optionally present in the Beacon and Probe Response frames. The DILS element is defined in Figure 9-660.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

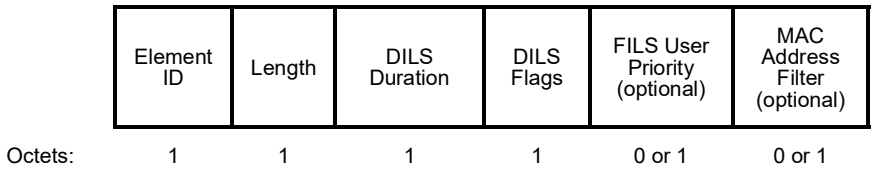

Figure 9-660—DILS element format

The Element ID and Length fields are defined in 9.4.2.1.

The DILS Duration field contains an unsigned integer that specifies the duration for the DILS restrictions (see 11.45.5.3), expressed in units of 10 ms, starting from the beginning of the frame transmission of the DILS element.

The DILS Flags field (see Figure 9-661) indicates the presence of optional fields following it.

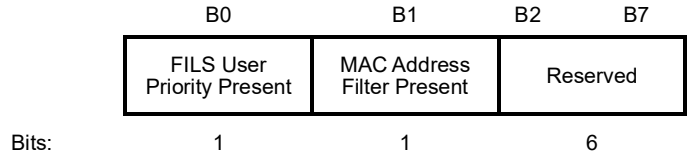

Figure 9-661—DILS Flags field format

Setting the FILS User Priority Present or MAC Address Filter Present subfields to 1 indicates that the corresponding field is present. At least one of the nonreserved bits in the DILS Flags field is set to 1.

The FILS User Priority field is defined in Figure 9-662.

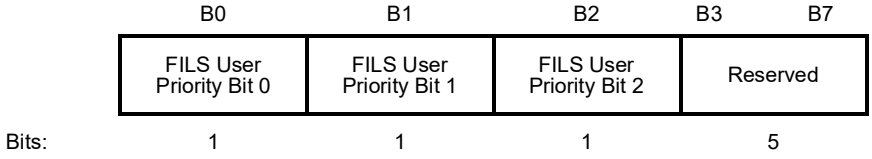

Figure 9-662—FILS User Priority field format

A value of 1 in the FILS User Priority Bit 0 subfield indicates FILS without additional delays for the STAs that have frames with User Priority 4–7 in their transmission queues, a value of 1 in the FILS User Priority Bit 1 subfield indicates high priority for the STAs that have frames with User Priority 0–3 in their transmission queues. A value of 1 in the FILS User Priority Bit 2 subfield indicates high priority for the STAs that have no frames in their transmission queues. See 11.45.5.2.

The MAC Address Filter field is defined in Figure 9-663.

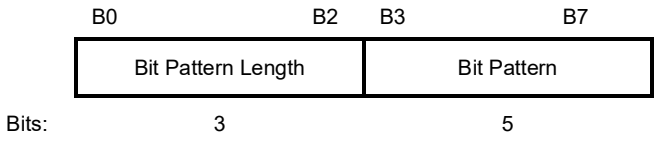

Figure 9-663—MAC Address Filter field format

The usage of the Bit Pattern Length subfield and Bit Pattern subfield is defined in Table 9-295. The Bit Pattern Length subfield specifies the number of bits and the position of the bits in the Bit Pattern subfield

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

that are used for MAC address filtering. The Bit Pattern subfield specifies the MAC addresses of the STAs that are allowed to attempt fast initial link setup. The details of MAC address filtering are described in 11.45.5.3.

Table 9-295—MAC Address Filter field

Bit Pattern Length value B0 B1 B2	Bit Pattern				
	B3	B4	B5	B6	B7
1	Reserved	Reserved	Reserved	Reserved	Used for MAC address filtering
2	Reserved	Reserved	Reserved	Used for MAC address filtering	
3	Reserved	Reserved	Used for MAC address filtering		
4	Reserved	Used for MAC address filtering			
5	Used for MAC address filtering				
0	Reserved				
6–7	Reserved				

9.4.2.187 FILS Wrapped Data element

The FILS Wrapped Data element is used for the STA and AP to communicate data used by the FILS authentication algorithm. The format of the FILS Wrapped Data element is defined in Figure 9-664.

	Element ID	Length	Element ID Extension	FILS Wrapped Data
Octets:	1	1	1	variable

Figure 9-664—FILS Wrapped Data element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The FILS Wrapped Data field is the data used by the FILS authentication algorithm (see 12.11).

9.4.2.188 Fragment element

Elements are defined to have a common general format, per 9.4.2.1. The Length field of an Element is 1 octet, and thus limited to indicate 255 octets of payload in the Information field. However, since the Element ID Extension field is optional and included in the 1-octet Length count, the actual Information payload of an Element is limited to 254 octets if the Element ID Extension is present. If the information to be represented in an element is too large for this 255 or 254 octet limit, it is necessary to fragment the information as described in 10.28.11 and 10.28.12.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Fragment element is shown in Figure 9-665.

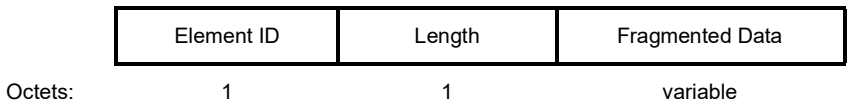

Figure 9-665—Fragment element format

The Element ID and Length fields are defined in 9.4.2.1.

The Fragmented Data field contains the data of the element that is fragmented as described in 10.28.11.

For the information being fragmented, each Fragment element contains 255 octets, except the final Fragment element that contains 1 to 255 octets.

9.4.2.189 FILS Nonce element

The FILS Nonce element is used for exchanging an additional source of randomness in the FILS authentication exchange. The format of the FILS Nonce element is shown in Figure 9-666.

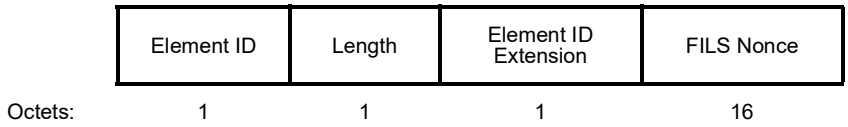

Figure 9-666—FILS Nonce element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The FILS Nonce field contains randomly generated data.

9.4.2.190 S1G Open-Loop Link Margin Index element

The S1G Open-Loop Link Margin Index element contains the link margin information. The S1G Open-Loop Link Margin Index element is optionally included in an S1G Beacon frame or a Probe Response frame without a corresponding request. The format of the S1G Open-Loop Link Margin Index element is shown in Figure 9-667.

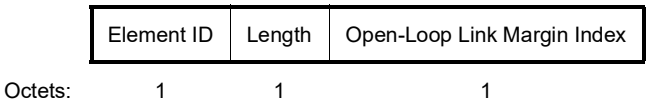

Figure 9-667—S1G Open-Loop Link Margin Index element format

The Element ID and Length fields are defined in 9.4.2.1.

The Open-Loop Link Margin Δ_{OPLM} is defined as the summation of transmit power P_{tx} and the receiver sensitivity $RX_{sensitivity}$

$$\Delta_{OPLM} = P_{tx1} + RX_{sensitivity}$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The transmit power P_{tx1} indicates the actual power used as measured at the antenna connector, in units of dBm, by a STA when transmitting the frame containing the S1G Open-Loop Link Margin Index element. The receiver sensitivity $RX_{sensitivity}$ is the minimum required receive power for reception of MCS 10 for 1 MHz channel.

The S1G Open-Loop Link Margin Δ_{OPLM} is calculated as (–128 + D × 0.5) dB, where D is called Open-Loop Link Margin Index. D is an unsigned integer value that is contained in S1G Open-Loop Link Margin Index field. For example, if the value D shown in S1G Open-Loop Link Margin Index field is 0, then it indicates the S1G Open-Loop Link Margin Δ_{OPLM} is –128 dB. If the value D shown in S1G Open-Loop Link Margin Index field is 255, then it indicates the S1G Open-Loop Link Margin Δ_{OPLM} is –0.5 dB.

The S1G Open-Loop Link Margin Index element can be used for open-loop link adaptation and open-loop transmit power control. When a STA receives the Open-loop link Margin index, it can calculate the S1G Open-Loop Link Margin Δ_{OPLM} by using (–128 + D × 0.5) dB. Then the SNR margin over the MCS 10 can be derived at the STA that receives the frame that contains S1G Open-Loop Link Margin Index based on its own transmit power P_{tx2} and the received RSSI measured for the PPDU containing the S1G Open-Loop Link Margin Index.

$$SNR_{Margin} = P_{tx2} - \Delta_{OPLM} + RSSI$$

9.4.2.191 RPS element

The RPS element contains one or more RAW Assignment subfields. Each RAW Assignment subfield contains parameters necessary to restrict medium access to one or multiple STAs within one RAW. The format of the RPS element is defined in Figure 9-668.

	Element ID	Length	RAW Assignments
Octets:	1	1	variable

Figure 9-668—RPS element format

The Element ID and Length fields are defined in 9.4.2.1.

The RAW Assignments field contains one or more RAW Assignment subfields.

The format of the RAW Assignment subfield is shown in Figure 9-669. The RAW Start Time, RAW Group, Channel Indication, and Periodic Operation Parameters subfields are conditionally present.

	RAW Control	RAW Slot Definition	RAW Start Time	RAW Group	Channel Indication	Periodic Operation Parameters
Octets:	1	2	0 or 1	0 or 3	0 or 2	0 or 3

Figure 9-669—RAW Assignment subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the RAW Control subfield is shown in Figure 9-670.

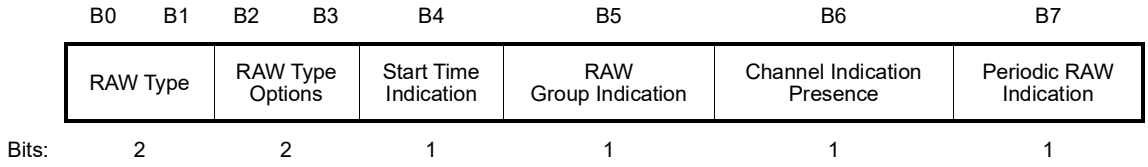

Figure 9-670—RAW Control subfield format

The value of the RAW Type field indicates the type of the RAW defined by the RAW assignment. The interpretation of the RAW Type subfields is shown in Table 9-296.

Table 9-296—Interpretation of RAW Type and RAW Type Options

RAW Type	Description	RAW Type Options subfield
0	Generic RAW	Bit 0 (Bit 2 of RAW Control subfield): Paged STA Bit 1 (Bit 3 of RAW Control subfield): RA frame
1	Sounding RAW	0: SST sounding RAW 1: SST report RAW 2: Sector sounding RAW 3: Sector report RAW
2	Simplex RAW	0: AP PM RAW 1: Non-TIM RAW 2: Omni RAW 3: Reserved
3	Triggering frame RAW	Reserved

The different types of RAWs are interpreted as follows:

- Generic RAW: used to provide restricted medium access only to a group of STAs.
- Sounding RAW: either used for SST sounding/SST report (SST RAW) or sector sounding/sector report (Sector RAW) as indicated by the RAW Type Options subfield as follows:
  - When the sounding RAW is used as an SST sounding RAW or a sector sounding RAW, non-AP STAs do not initiate a TXOP during the RAW but elect to listen to sector sounding (described in 10.53.5.2) or SST sounding (described in 10.52). Non-AP STAs are allowed to transmit response frames during the RAW.
  - When the sounding RAW is used as an SST report RAW or a sector report RAW, as a response to the preceding SST sounding RAW or sector sounding RAW, STAs in the RAW Group can transmit a report frame to the AP during the SST report RAW as described in 10.52, or transmit sector ID feedback frame to the AP during the sector report RAW as described in 10.53.5 regardless of their corresponding TIM bits.
- Simplex RAW: the Slot Definition Format Indication, Cross Slot Boundary, and Number of Slots subfields of the Slot Definition field are set to 1, and the RAW is either used for AP Power Management (as described in 11.2.3.18), for reserving channel time for S1G STAs in non-TIM mode, or for the omni RAW depending on the values of RAW Type Options subfield as follows:
  - When the RAW is used as the non-TIM RAW as indicated by the RAW Type Options subfield, the access is restricted to S1G STAs in non-TIM mode that have been previously scheduled within the RAW such as TWT STAs or doze awake cycle rescheduled STAs (as described

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

in 10.48.2). The RAW Assignment subfield for non-TIM RAW also conditionally contains the RAW Start Time, Channel Indication, and Periodic Operation Parameters subfields.
  - When the RAW is used as the AP PM RAW as indicated by the RAW Type Options subfield, the RAW Assignment subfield for AP PM RAW also conditionally contains the RAW Start Time and Periodic Operation Parameters subfields.
  - When the RAW is used as the omni RAW as indicated by the RAW Type Options subfield of the RAW Assignment subfield for omni RAW, the access is not restricted for any specific STA and this duration can be used by non-AP STAs to communicate with the AP that has scheduled the omni RAW to send the Probe Request frame or Association Request frame. The RAW assignment subfield of the omni RAW also conditionally contains the RAW Start Time, and Periodic Operation Parameters subfields.
- Triggering Frame RAW: each paged STA belonging to the RAW group is allowed to send one specific trigger frame as described in 10.23.5.4 during its assigned RAW slot. The procedure of RAW slot assignment is described in 10.23.5.3.

The Start Time Indication subfield indicates whether the RAW Start Time subfield is present in the RAW Assignment subfield or not. If it is equal to 0, the RAW Start Time subfield is not present. If it is equal to 1, the RAW Start Time subfield is present. In the first RAW assignment, the Start Time Indication subfield equal to 0 indicates that the RAW starts immediately after the S1G Beacon, the Probe Response frame, or the PV1 Probe Response that includes the RPS element. For other RAW assignments, the Start Time Indication subfield equal to 0 indicates that the current RAW starts immediately after the end of the previous RAW.

The RAW Group Indication subfield indicates whether the RAW Group subfield is present in the RAW Assignment subfield and is interpreted as follows:

- When the RAW type is generic RAW, sounding RAW, or triggering frame RAW, the RAW Group Indication subfield indicates whether the RAW group defined in the current RAW assignment is the same RAW group as defined in the previous RAW assignment. When the RAW Group Indication subfield is equal to 0, the RAW group defined in the current RAW assignment is the same as the RAW group defined in the previous RAW assignment and the RAW Group subfield is not present in this RAW assignment. When the RAW Group Indication subfield is equal to 1, the RAW Group subfield is present in this RAW assignment. The RAW Group Indication subfield in the first RAW assignment is set to 0 to indicate the RAW group in the first RAW assignment is the same as the range of AIDs in all the TIM bitmaps in the S1G Beacon frame.
- When the RAW is a non-TIM RAW, the RAW Group Indication subfield is set to 0 and the RAW Group subfield is not present.
- When the RAW is an AP PM RAW, the RAW Group Indication subfield equal to 0 indicates that the RAW group does not include any of the non-AP STAs, and the RAW Group subfield is not present. When the RAW Group Indication subfield is equal to 1, the RAW Group subfield is present.

The Channel Indication Presence subfield indicates whether the Channel Indication subfield in the current RAW assignment is present or not. If it is equal to 0, the Channel Indication subfield is not present. If it is equal to 1, the Channel Indication subfield is present.

The Periodic RAW Indication subfield indicates whether the RAW is periodic. When the Periodic RAW Indication subfield is equal to 1, the RAW is a periodic restricted access window (PRAW), and the Periodic Operation Parameters subfield is present. When the Periodic RAW Indication subfield is equal to 0, the Periodic Operation Parameters subfield is not present.

The definitions of RAW Type Options subfield are specified in Table 9-296. The RAW Type Options subfield is interpreted as follows:

— For generic RAW, Bit 0 of the RAW Type Options (Bit 2 of the RAW Control subfield) is Paged STA indication. When it is equal to 0, the RAW can be accessed by any STA (paged or unpaged) within the RAW group specified by the RAW Group subfield. When it is equal to 1, the RAW can only be accessed by paged STAs within the RAW group specified by the RAW Group subfield. Bit 1 of the RAW Type Options (Bit 3 of the RAW Control subfield) is RA Frame Indication. If it is equal to 1, the AP will transmit a Resource Allocation frame, as defined in 9.8.5.4, at the beginning of the RAW defined by the RAW Assignment subfield of the RPS element.

— For sounding RAW, the RAW Type Options subfield is treated as one subfield, the interpretation of which is defined in Table 9-296. For Simplex RAW, the RAW Type Options subfield is treated as one subfield, the interpretation of which is defined in Table 9-296.

— For Triggering Frame RAW, the RAW Type Options subfield is reserved.

The format of the RAW Slot Definition subfield is shown in Figure 9-671.

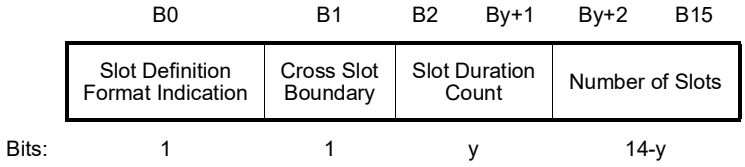

Figure 9-671—RAW Slot Definition subfield format

The Slot Definition Format Indication subfield indicates the number of bits used for the Slot Duration Count subfield, i.e., the value y in Figure 9-671 of the Slot Duration Count subfield. If it is set 0, the Slot Duration Count subfield is 8 bits (y=8). If it is equal to 1, the Slot Duration Count subfield is 11 bits (y=11). When the RAW Type is sounding RAW, the Slot Duration Count subfield is 8 bits in length (y=8).

The Cross Slot Boundary subfield indicates whether STAs are allowed to transmit after the assigned RAW slot boundary. If the bit is equal to 1, crossing a RAW slot boundary is allowed. If the bit is equal to 0, crossing a RAW slot boundary is not allowed for transmissions from STAs.

The Slot Duration Count subfield is an unsigned integer and it is used to calculate the duration of a RAW slot, or the RAW slot duration. The RAW slot duration, DSLOT, has time unit of microsecond and it is calculated as:

$$D_{\mathrm{SLOT}} = 500 + C_{\mathrm{SLOT}} \times 120$$

where

C_{SLOT} is the value of the Slot Duration Count subfield

The Number of Slots subfield is an unsigned integer and indicates the number of RAW slots (N_{RAW}) in the RAW.

The Slot Definition subfield is used to calculate the RAW duration. The RAW duration indicates the duration, in units of microsecond, of the restricted medium access assigned to a RAW. The RAW duration, D_{RAW}, indicated by the corresponding RAW assignment can be calculated as follows:

$$D_{\mathrm{RAW}} = D_{\mathrm{SLOT}} \times N_{\mathrm{RAW}}$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where

D_{SLOT} is the RAW slot duration, in microseconds

N_{RAW} is the value of the Number of Slots subfield

When the RAW Type is generic RAW or triggering frame RAW, the RAW Slot Definition subfield also provides the N_{RAW} and slot duration information for RAW slot assignment. The procedure of RAW slot assignment is described in 10.23.5.3.

The RAW Start Time subfield indicates the duration, in units of 2 TUs, from the end of the S1G Beacon, the Probe Response, or the PV1 Probe Response frame transmission that includes the RPS element to the start time of the RAW.

The format of the RAW Group subfield is shown in Figure 9-672.

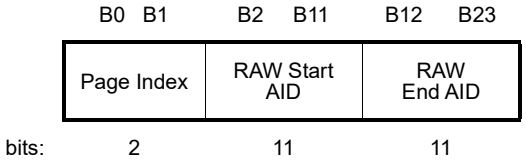

Figure 9-672—RAW Group subfield format

The RAW Group subfield indicates the STA AIDs that are allowed restricted access within the RAW period. The RAW Group subfield contains Page Index, RAW Start AID, and RAW End AID subfields according to the hierarchical addressing method of AIDs (see Figure 9-152). The Page Index subfield indicates the page index of the subset of AIDs.

The RAW Start AID field indicates the 11 LSBs of the AID of the STA with the lowest AID allocated in the RAW.

The RAW End AID field indicates the 11 LSBs of the AID of the STA with the highest AID allocated in the RAW.

The RAW Group field is set to all 0s to indicate that all STAs are allowed to access within the RAW.

The format of the Channel Indication subfield is shown in Figure 9-673. The Channel Activity Bitmap subfield shows the allowed operating channels for the STAs indicated in the RAW, as defined in 10.23.5.1. Each bit in the bitmap corresponds to one minimum width channel within the current BSS operating channels, with the least significant bit corresponding to the lowest numbered operating channel of the BSS. The Maximum Transmission Width, UL Activity, and DL Activity subfields are defined similarly as in 9.4.2.201.

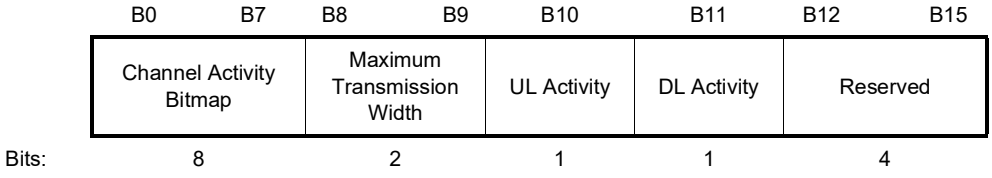

Figure 9-673—Channel Indication subfield format

The Periodic Operation Parameters subfield comprises the PRAW Periodicity, PRAW Validity, and PRAW Start Offset subfields. The format of the Periodic Operation Parameters subfield is shown in Figure 9-674.

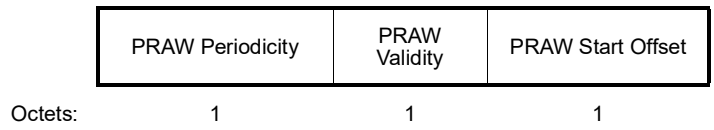

Figure 9-674—Periodic Operation Parameters subfield format

The PRAW Periodicity subfield indicates the period of current PRAW occurrence in the unit of beacon interval if dot11ShortBeaconInterval is false and in the unit of short beacon interval if dot11ShortBeaconInterval is true (see 11.1.3.10.2).

The PRAW Validity subfield indicates the number of periods that the PRAW repeats. A nonzero PRAW Validity subfield indicates the number of remaining PRAW occurrences, while a PRAW Validity subfield equal to 0 indicates that the PRAW validity is not determined.

The PRAW Start Offset subfield indicates the offset value from the end of the frame that carries the current RPS element to the S1G Beacon frame that the first window of the PRAW appears, in units of beacon interval or short beacon interval.

9.4.2.192 Page Slice element

The Page Slice element contains a subset of blocks from a single page, called a page slice. The STAs included in a page slice and indicated by the Page Slice element are served in the time intervals between Beacon frames within a page period, starting from the Beacon frame that carries the Page Slice element for the page (see 10.51). The frame format of the Page Slice element is defined in Figure 9-675.

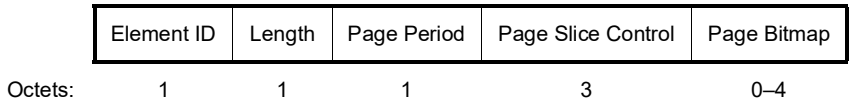

Figure 9-675—Page Slice element format

The Element ID and Length fields are defined in 9.4.2.1.

The Page Period field indicates the number of beacon intervals between successive beacons that carry the Page Slice element for the associated page.

The Page Slice Control field format is shown in Figure 9-676.

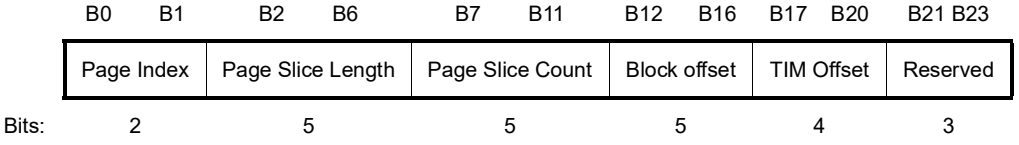

Figure 9-676—Page Slice Control field format

The Page Index subfield indicates the page whose slices are served during beacon intervals within a page period. Setting the Page Index subfield to 1 indicates the second page out of the four pages defined in the hierarchical AID addressing (see 9.4.2.5).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Page Slice Length subfield indicates the number of blocks included in each TIM for the associated page except for the last TIM. The Page Slice Length subfield is set to number of blocks in each page slice. The value 0 for the Page Slice Length subfield is reserved. For the last TIM, the size of the last page slice, PS_{last}, is computed as

$$PS_{last} = P_{length} - (PS_{count} - 1) \times PS_{length}$$

where

P_{length} is the length (in bits) of a page indicated in the Page Bitmap field and is calculated as $P_{length} = 8 \times PB_{length}$

PB_{length} is the length of the page (in octets) indicated in the Page Bitmap field

PS_{count} is the value indicated in the Page Slice Count subfield

PS_{length} is the value indicated in the Page Slice Length subfield

For example, with a Page Bitmap field of 2 octets, a value in the Page Slice Length subfield equal to 3, and a value in the Page Slice Count subfield equal to 5, the page slice consists of 4 (=16 – 3×4) blocks for the last TIM, i.e., a value greater than the value indicated in the Page Slice Length subfield. Again, for example, with a Page Bitmap field of 2 octets, a value in the Page Slice Length subfield equal to 6, and a value in the Page Slice Count subfield equal to 3, the page slice consists of 4 (=16 – 6×2) blocks for the last TIM, i.e., a value less than the value indicated in the Page Slice Length subfield.

The number of blocks assigned to all the TIMs, except the last TIM, within a DTIM interval, P_{rem}, is computed as

$$P_{rem} = P_{length} - PS_{last}$$

where

P_{length} is the length of a page indicated in the Page Bitmap field

PS_{last} is the size of the last page slice

For every TIM, a STA computes the location of its block within a page slice, SB_{STA}, using the following equation:

$$SB_{STA} = AID[6:10] - BO$$

where

AID is the association identifier of the STA

BO is the value indicated in the Block Offset subfield of the Page Slice element

If the SB_{STA} is greater than the P_{length} or less than zero, the STA is not included in the page slice for the Page Period, otherwise:

— If SB_{STA} is greater than P_{rem}, the page slice number for the STA indicated in the Page Slice Number field of the TIM element is equal to the value indicated in the Page Slice Count subfield of the Page Slice element

— Otherwise, the page slice number for the STA, PS_{number}, is computed as

$$PS_{number} = \lfloor SB_{STA} / PS_{length} \rfloor$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Page Slice Count subfield indicates the number of TIMs scheduled in one page period, except when the value is equal to 0. This field indicates a maximum of 31 TIMs that include page slices in a page period. The Page Slice Count subfield is set to 0 to indicate signaling that depends on the Page Slice Length subfield:

— If the Page Slice Length subfield is greater than 1, a 0 in the Page Slice Count field indicates that the 32nd TIM that is scheduled during this DTIM interval can contain DL BU information for non-AP STAs that do not support page slicing and for non-AP STAs whose AID is within the 32nd block of this page and do support page slicing.

— If the Page Slice Length subfield is equal to 1, a 0 in the Page Slice Count subfield indicates that all non-AP STAs for which the AP has DL BU are included in the only TIM that is scheduled within the DTIM interval.

The Block Offset subfield indicates the offset of the block in the first page slice from the first block in the page assigned within the page period. Setting the Block Offset field to 16 indicates that the first page slice starts at block 16, i.e., STAs in the second half of the page are assigned within this page period.

The TIM Offset subfield indicates the offset, in number of beacon intervals, from the DTIM Beacon frame that carries the Page Slice element of a page to the beacon that carries the first page slice of the page indicated by the corresponding Page Slice element in the DTIM Beacon frame.

The Page Bitmap field indicates the presence of buffered data for each of the one or more blocks in a page slice or all the assigned page slices within a page period. A bit in the Page Bitmap field indicates information of buffered data for STAs in one block of a page slice corresponding to the location of the bit in the bitmap. The first block indicated in the Page Bitmap field is the block indicated in the Block Offset subfield. Based on the number of page slices assigned to the TIMs, this field is of variable length from 0 to 4 octets. For example, setting the Page Bitmap field to 129 indicates that there is buffered data for at least one STA in the first block and at least one STA in the last block. The bit sequence also indicates that only a page slice of 8 blocks is assigned within a page period. Further, the bit sequence indicates that there is no downlink buffered data for any STA in blocks 2 to 7. Hence these STAs can enter the doze state after receiving the group addressed BUs that are delivered by the AP following the DTIM Beacon frame as described in 11.2.3 and can avoid to wake up for the assigned TIM in the following TBTTs or TSBTTs within the DTIM interval to check for downlink buffered data.

9.4.2.193 AID Request element

The AID Request element contains information related to the characteristics of the device of the non-AP STA requesting an AID. The format of the AID Request element is shown in Figure 9-677.

	Element ID	Length	AID Request Mode	AID Request Interval (Optional)	Peer STA Address (Optional)	Service Characteristic (Optional)	Group Address (Optional)
Octets:	1	1	1	0 or 2	0 or 6	0 or 1	0 or 6

Figure 9-677—AID Request element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of AID Request Mode field is shown in Figure 9-678.

	B0	B1	B2	B3	B4	B5	B6	B7
	AID Request Interval Present	Peer STA Address Present	Service Characteristic Present	Non-TIM Mode Switch	TIM Mode Switch	Group Address Present	Reserved	
Bits:	1	1	1	1	1	1	2	

Figure 9-678—AID Request Mode field format

The AID Request Interval Present subfield of the AID Request Mode field is set to 1 if the AID Request Interval field is present in the AID Request element and set to 0 if no AID Request Interval field is present.

The Peer STA Address Present subfield of the AID Request Mode field is set to 1 if the Peer STA Address field is present in the AID Request element and set to 0 if no Peer STA Address field is present.

The Service Characteristic Present subfield of the AID Request Mode field is set to 1 if the Service Characteristic field is present in the AID Request element and set to 0 if no Service Characteristic field is present.

The Non-TIM Mode Switch subfield of the AID Request Mode field is set to 1 if the non-AP STA requests to switch from the TIM mode to non-TIM mode. Otherwise, it is set to 0.

The TIM Mode Switch subfield of the AID Request Mode field is set to 1 if the non-AP STA requests to switch from the non-TIM mode to TIM mode. Otherwise, it is set to 0.

The Group Address Present subfield of the AID Request Mode field is set to 1 if the Group Address field is present in the AID Request element and is set to 0 if no Group Address field is present.

The AID Request Interval field indicates to the AP:

— The listen interval, in units of beacon interval or short beacon interval as defined in 9.4.1.6, during which the S1G STA in TIM mode wakes to receive S1G Beacon frames when the Non-TIM Mode Switch field is equal to 0, TIM Mode Switch field is equal to 1, and the Group Address Present field is equal to 0.

— The listen interval, in units of beacon interval or short beacon interval as defined in 9.4.1.6, during which the S1G STA in non-TIM mode is required to transmit at least one PS-Poll or trigger frame to the AP when the Non-TIM Mode Switch field is equal to 1, TIM Mode Switch is equal to 0, and the Group Address Present field is equal to 0.

— The group listen interval, in units of beacon interval or short beacon interval (see 11.1.3.10.2), during which the non-AP STA wakes up to receive the S1G Beacon frames that signal the presence of group addressed BUs for the group MAC address contained in the Group Address field. In this case the Group Address Present field is equal to 1 and the TIM Mode Switch field and Non-TIM Mode Switch field are equal to any value.

The AID Request Interval field contains a Unified Scaling Factor subfield (see Table 9-48) and has a format as defined in Figure 9-89. The AID Request Interval field is calculated as the value of the Unscaled Interval subfield multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield.

The Peer STA Address field indicates the MAC address of the peer STA for STA-to-STA communication.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Service Characteristic field indicates the service characteristic provided by the non-AP STA so that the AP can assign a particular AID to the STA based on the service characteristic when the STA associates or requests AID switch. The format of the Service Characteristic field is shown in Figure 9-679.

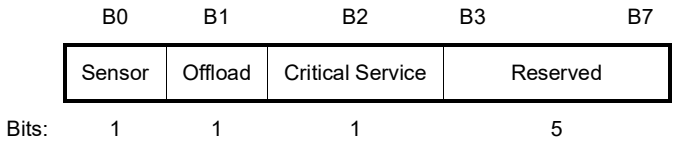

Figure 9-679—Service Characteristic field format

The Sensor subfield of the Service Characteristic field is set to 1 to indicate that the non-AP STA provides a sensor or a meter type services. Otherwise, it is set to 0. The Offload subfield of the Service Characteristic field is set to 1 to indicate that the non-AP STA provides a traffic offloading services. Otherwise, it is set to 0. The Critical Service subfield of the Service Characteristic field is set to 1 to indicate that it provides critical services such as health care, home, industrial, alarm monitoring or emergency services. Otherwise, it is set to 0.

The Group Address field indicates the group MAC address of the requesting STA. When the Group Address field is present in the AID Request element, the AID Request element is carried in an AID Switch Request frame to request a group AID.

9.4.2.194 AID Response element

The AID Response element defines information about the AID assignment. The format of AID Response element is shown in Figure 9-680.

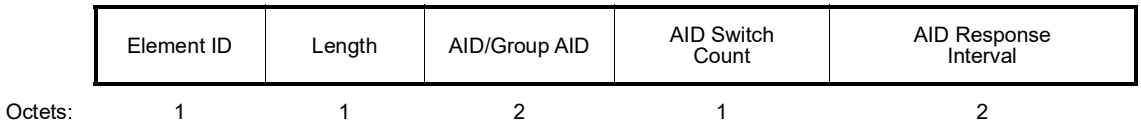

Figure 9-680—AID Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The AID/Group AID field, which has the same format as the AID field described in 9.4.1.8, indicates:

— The AID that is assigned to the non-AP STA if the AID Response element is not sent as a response to an AID Switch Request frame that contained a Group Address field. If the AP does not change the AID of the STA, this field indicates the current AID assigned to the non-AP STA. If the AP changes the AID of the STA, this field indicates the changed AID assigned to the non-AP STA.

— The group AID that is assigned to a group MAC address if the AID Response element is sent as a response to an AID Switch Request frame that contained a Group Address field carrying the group MAC address.

The AID Switch Count field indicates a countdown value, in units of beacon interval or short beacon interval, that the AP sets for the non-AP STA to switch to the new AID or to activate the group AID. The countdown value is expressed in units of beacon interval if dot11ShortBeaconInterval is false and in units of short beacon interval if dot11ShortBeaconInterval is true (see 11.1.3.10.2). The AID Switch Count field indicates the duration after which the (group) listen interval starts and the counter that corresponds to the AID Switch Count field starts upon transmission of the AID Response element. The AID Switch Count field is set to 0 in an AID Response element that is carried in a (Re)Association Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The AID Response Interval field indicates to the non-AP STA:

— The listen interval in units of beacon interval or short beacon interval as defined in 9.4.1.6, during which the S1G STA in TIM mode wakes to receive S1G Beacon frames. The S1G Beacon frames that the S1G STA in TIM mode wakes up to listen either include a TIM element that can include their new AID or include a Page Slice element that indicates the assignment of the new AID in the corresponding page slices.

— The listen interval in units of beacon interval or short beacon interval as defined in 9.4.1.6, during which the S1G STA in non-TIM mode is required to transmit at least one PS-Poll or trigger frame to the AP.

— The group listen interval, in units of beacon interval or short beacon interval (see 11.1.3.10.2), during which the non-AP STA is required to wake up for receiving the S1G Beacon frames that signal the presence of group addressed BUs for the group MAC address contained in the Group Address field of the eliciting AID Switch Request frame. The (group) listen interval will start from the first TBTT or TSBTT that follows the expiration of the AID switch counter obtained from the AID Switch Count field of this element.

The AID Response Interval field contains a Unified Scaling Factor subfield (see Table 9-48) and has a format as defined in Figure 9-89. The AID Response Interval field is calculated as the value of the Unscaled Interval subfield multiplied by the scaling factor that corresponds to the value indicated in the Unified Scaling Factor subfield.

9.4.2.195 S1G Sector Operation element

The S1G Sector Operation element includes the information necessary for a receiving STA to determine the type of sector operation, if it is allowed to transmit during a specified sector time interval and if it can perform sector training. The S1G Sector Operation element is optionally present in Probe Response, Beacon or Association Response frames.

The format of the S1G Sector Operation element is presented in Figure 9-681 and later in this subclause in Figure 9-682.

	B0 B7	B8 B15	B16	B17B22	B23	B24B26	B27 B30			
	Element ID	Length	Sectoriza-tion Type	Period	Omni	Sector ID	Number of Groups	Group IDs	Sector Duration	Pad
Bits:	8	8	1	6	1	3	4	variable	6	1, 3, 5, or 7

Figure 9-681—S1G Sector Operation element format (sectorization type is group sectorization)

The Element ID and Length fields are defined in 9.4.2.1.

The Sectorization Type field indicates the type of sectorization. When the Sectorization Type field is equal to 0, it indicates that the format of the S1G Sector Operation element is structured for group sectorization operation.

NOTE 1—The Sectorization Type field can be set to 0 only when the Sectorized Beam-Capable field setting is either 2 or 3.

The Period field specifies the time interval, in units of 10 ms, until the next transmission of frames in the sector identified by the Sector ID field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Omni field indicates if the present transmission is sectorized or omnidirectional. When it is equal to 0, it indicates sectorized. When it is equal to 1, it indicates omnidirectional.

The Sector ID field identifies the ID of the active sector. It is reserved when Omni field is equal to 1.

The Number of Groups field indicates the number of Group ID subfields in the Group IDs field following this field.

Each Group ID subfield is 6 bits and identifies the group of STAs that are allowed to transmit during this sector interval.

The Sector Duration field indicates the duration of the current sector transmissions, in units of 10 ms.

The Pad field contains 1, 3, 5, or 7 bits of 0s to make the total number of bits in the S1G Sector Operation element equal to an integer number of octets.

The S1G Sector Operation element can be provided in Association Response frame when dot11S1GSectorizationActivated is true and it indicates the group ID allocated to that STA to be used during the sectorization purpose, the type of sectorization method, the value of the Period field, and the Sector Duration field if all the sector durations are equal. If the Sector Duration field is not equal for all sectors the Sector Duration field provided at the association time is 0. The values of the Sector ID and Omni fields are omitted by the STA in the Association Response frame. By default all the STAs that support group sectorization consider themselves in group ID 0 unless is specified otherwise via the Association Response frame. This way all the STAs can transmit at any time before their association. It is expected that during the association, STAs receive a nonzero group ID, which will restrict their activity to a particular sector interval or during omnidirectional time interval. An AP can allow some STAs to have the group zero even after association, for instance public safety STAs or some high priority sensors.

The S1G Sector Operation element in the Beacon frame provides:

- Information related to the type of sectorization operation;
- Indication if the Beacon frame is sectorized or not;
- The sector ID of the current sector;
- The group ID that identifies the group allowed transmitting during the current sector duration; and
- The duration of this sector.

A STA that receives a Beacon frame that includes an S1G Sector Operation element determines if the received Beacon frame is sectorized or omnidirectional. If the received Beacon frame is omnidirectional the STAs are allowed to transmit in all geographical sectors provided that their group ID is group zero or it is listed in S1G Sector Operation element. If the received Beacon frame is sectorized, the STAs with group zero from any sector are allowed to transmit and the STAs that receive the sectorized Beacon frame and have the group ID listed in the S1G Sector Operation element are allowed to transmit during the current sector duration. A Beacon frame that not carries an S1G Sector Operation element does not impose any sectorization restriction on the receiving STAs.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When the sectorization type is TXOP-based sectorization operation, the element is presented in Figure 9-682.

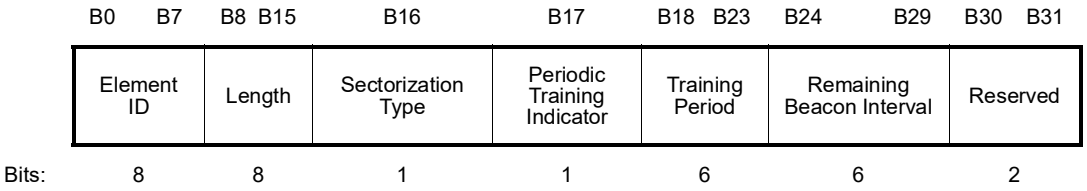

Figure 9-682—S1G Sector Operation element format (sectorization type is TXOP-based sectorization operation)

The Sectorization Type field is set to 1 to indicate that the format of the S1G Sector Operation element is structured for the TXOP-based sectorization operation.

NOTE 2—The Sectorization Type field can be set to 1 only when the Sectorized Beam-Capable field setting is 1 or 3.

The Periodic Training Indicator field is set to 1 to indicate periodic sector training is conducted by the AP and STAs can perform sector training. The Periodic Training Indicator field is set to 0 to indicate periodic sector training is not conducted by the AP.

The Training Period field is set to the number of beacon intervals in which the AP repeats the sector training.

The Remaining Beacon Interval field is set to the number of beacon intervals remaining before the next sector training commences. Setting the field to indicates the sector training is conducted in the current beacon interval.

9.4.2.196 S1G Beacon Compatibility element

The S1G Beacon Compatibility element carries the information that is shown in Figure 9-683.

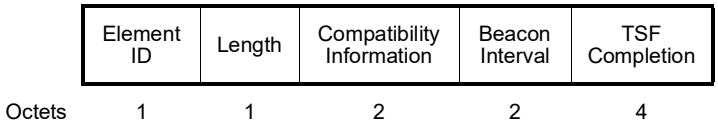

Figure 9-683—S1G Beacon Compatibility element format

The Element ID and Length fields are defined in 9.4.2.1.

The Compatibility Information field contains all the subfields defined in 9.4.1.4 except for the subfield located in B6 of the field, which is defined as the TSF Rollover Flag subfield. An S1G AP sets the TSF Rollover Flag subfield to the value of the most significant bit of the 4 least significant octets of the TSF timer at the time the TSF timer is read for the purpose of creating the element carrying the Compatibility Information field.

The Beacon Interval field in the element is defined in 9.4.1.3.

The TSF Completion field carries the 4 most significant octets of the TSF timer at the AP at the time of generation of the element carrying the TSF Completion field.

9.4.2.197 Short Beacon Interval element(

The Short Beacon Interval element carries the short beacon interval and its format is shown in Figure 9-684.

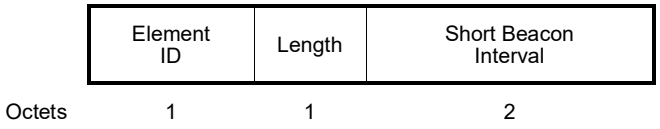

Figure 9-684—Short Beacon Interval element format

The Element ID and Length fields are defined in 9.4.2.1.

The Short Beacon Interval field represents the number of time units (TU)s between target short beacon transmission times (TSBTT)s.

9.4.2.198 Change Sequence element

The Change Sequence element indicates a change of system information within a BSS. The format of the Change Sequence element is shown in Figure 9-685.

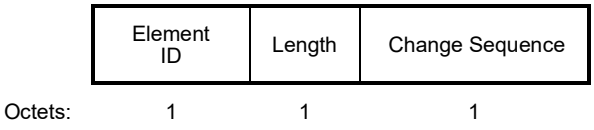

Figure 9-685—Change Sequence element format

The Element ID and Length fields are defined in 9.4.2.1.

The Change Sequence field is defined as an unsigned integer, initialized to 0, that increments when a critical update occurs to any of the elements inside an S1G Beacon frame; see 10.46.2.

9.4.2.199 TWT element

The TWT element is shown in Figure 9-686.

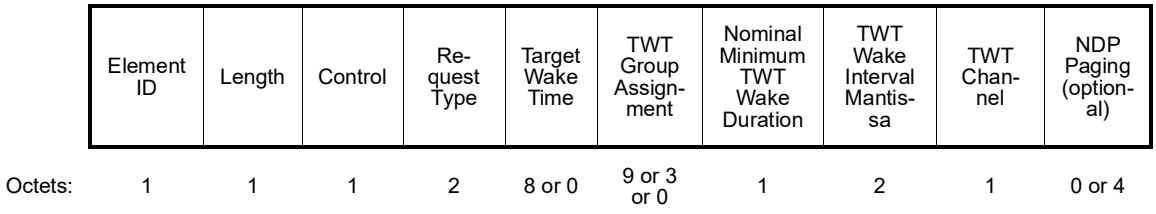

Figure 9-686—TWT element format

The Element ID and Length fields are defined in 9.4.2.1.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Control field is shown in Figure 9-687.

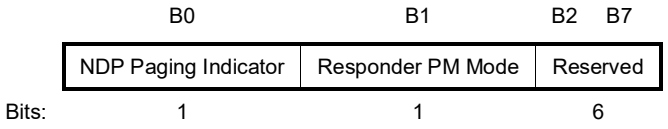

Figure 9-687—Control field format

The NDP Paging field is present if the NDP Paging Indicator subfield is equal to 1; otherwise, the NDP Paging field is not present.

The Responder PM Mode subfield indicates the power management mode as defined in 11.2.

The format of the Request Type field is shown in Figure 9-688.

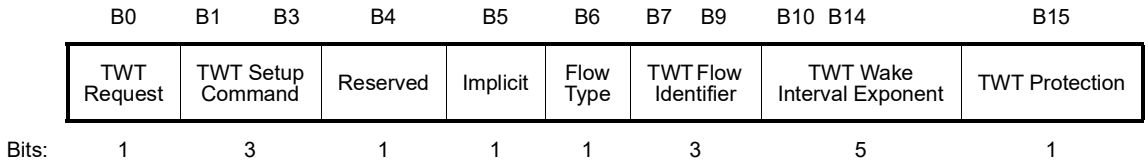

Figure 9-688—Request Type field format

A STA that transmits a TWT element with the TWT Request subfield equal to 1 is a TWT requesting STA. Otherwise, it is a TWT responding STA.

The TWT Setup Command subfield values indicate the type of TWT command, as shown in Table 9-297.

Table 9-297—TWT Setup Command field values

TWT Setup Command field value	Command name	Description when transmitted by a TWT requesting STA	Description when transmitted by a TWT responding STA
0	Request TWT	The Target Wake Time field of the TWT element contains 0s as the TWT responding STA specifies the target wake time value for this case, other TWT parameters are suggested by the TWT requesting STA in the TWT request (see NOTE).	N/A
1	Suggest TWT	TWT requesting STA includes a set of TWT parameters such that if the requested target wake time value and/ or other TWT parameters cannot be accommodated, then the TWT setup might still be accepted.	N/A

Table 9-297—TWT Setup Command field values *(continued)*

TWT Setup Command field value	Command name	Description when transmitted by a TWT requesting STA	Description when transmitted by a TWT responding STA
2	Demand TWT	TWT requesting STA includes a set of TWT parameters such that if the requested target wake time value and/ or other TWT parameters cannot be accommodated, then the TWT setup is not accepted.	N/A
3	TWT Grouping	N/A	TWT responding STA suggests TWT group parameters that are different from the suggested or demanded TWT parameters of the TWT requesting STA
4	Accept TWT	N/A	TWT responding STA accepts the TWT request with the TWT parameters (See NOTE) indicated in the TWT element transmitted by the responding STA
5	Alternate TWT	N/A	TWT responding STA suggests TWT parameters that are different from TWT requesting STA suggested or demanded TWT parameters
6	Dictate TWT	N/A	TWT responding STA demands TWT parameters that are different from TWT requesting STA TWT suggested or demanded parameters
7	Reject TWT	N/A	TWT responding STA rejects TWT setup

NOTE—TWT Parameters are TWT, Nominal Minimum TWT Wake Duration, TWT Wake Interval, and TWT Channel subfield values indicated in the element.

When transmitted by a TWT requesting STA, the Implicit subfield is set to 1 to request an implicit TWT.

When transmitted by a TWT requesting STA, the Implicit subfield is set to 0 to request an explicit TWT.

The Flow Type subfield indicates the type of interaction between the TWT requesting STA and the TWT responding STA at a TWT. Setting the Flow Type subfield to 0 indicates an announced TWT in which the TWT requesting STA will send a PS-Poll or an APSD trigger frame (see 11.2.3.5) to signal its awake state to the TWT responding STA before a frame is sent from the TWT responding STA to the TWT requesting STA. Setting the Flow Type subfield to 1 indicates an unannounced TWT in which the TWT responding STA will send a frame to the TWT requesting STA at TWT without waiting to receive a PS-Poll or an APSD trigger frame from the TWT requesting STA.

The TWT Flow Identifier subfield contains a 3-bit value, which identifies the specific information for this TWT request uniquely from other requests made between the same TWT requesting STA and TWT responding STA pair.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In a TWT element transmitted by a TWT requesting STA, the TWT wake interval is equal to the average time that the TWT requesting STA expects to elapse between successive TWT SPs. In a TWT element transmitted by a TWT responding STA, the TWT wake interval is equal to the average time that the TWT-responding STA expects to elapse between successive TWT SPs. The TWT Wake Interval Exponent subfield is set to the value of the exponent of the TWT wake interval value in microseconds, base 2. The TWT wake interval of the requesting STA is equal to (TWT Wake Interval Mantissa) × $2^{(\text{TWT Wake Interval Exponent})}$.

When transmitted by a TWT requesting STA, the Target Wake Time field contains a positive integer corresponding to a TSF time at which the STA requests to wake, or 0 when the TWT Setup Command subfield contains the value corresponding to the command "Request TWT". When a TWT responding STA with dot11TWTGroupingSupport equal to 0 transmits a TWT element to the TWT requesting STA, the TWT element contains a value in the Target Wake Time field corresponding to a TSF time at which the TWT responding STA requests the TWT requesting STA to wake and it does not contain the TWT Group Assignment field.

When a TWT responding STA with dot11TWTGroupingSupport equal to 1 transmits the TWT element to the TWT requesting STA from which it received a frame containing an S1G Capabilities element with the TWT Grouping Support subfield equal to 1, the TWT element does not contain the Target Wake Time field and it does contain the TWT Group Assignment field in order to indicate the TWT group of the requesting STA and the assigned TWT value. The presence of the TWT Group Assignment field is indicated by a TWT responding STA by using the TWT Grouping command in the TWT Setup Command subfield (see Table 9-297) within the TWT element.

The TWT Group Assignment field provides information to a requesting STA about the TWT group to which the STA is assigned. This field contains the TWT Group ID, Zero Offset of Group (optional), TWT Unit, and TWT Offset subfields. The TWT Group Assignment field and the corresponding subfields are depicted in Figure 9-689.

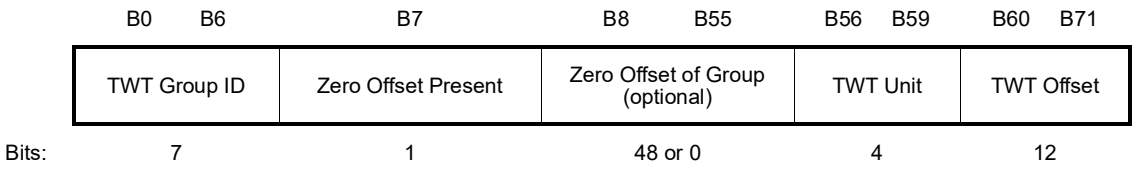

Figure 9-689—TWT Group Assignment field format

The TWT Group ID subfield is an unsigned integer and indicates the identifier of the TWT group to which the requesting STA is assigned. A TWT group is a group of STAs that have TWT values that lie within a specific interval of TSF values. The value zero in the TWT Group ID subfield is used to indicate the unique TWT group, which contains all STAs in the BSS.

The Zero Offset Present subfield indicates whether the following Zero Offset of Group subfield is included in the TWT Group Assignment field of the TWT element. Setting the Zero Offset Present subfield to 0 indicates that the Zero Offset of the Group subfield is not included in the TWT Group Assignment field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Zero Offset of Group subfield indicates the initial TWT value for the TWT group identified by the TWT group ID. The Zero Offset of Group subfield is 6 octets and contains the initial TWT value for the TWT group with the given TWT group ID. When the Zero Offset of Group subfield is present, it contains the value of the 6 least significant octets of the TSF timer corresponding to the TWT group offset time. The Zero Offset of Group subfield is optionally present in the TWT Group Assignment field. If a STA transmits multiple TWT requests for multiple TWT flows, the next TWT Group Assignment field transmitted in a response to a TWT request can optionally exclude the Zero Offset of the Group subfield from an included TWT Group Assignment field provided that a previous response included a Zero Offset of the Group subfield. The receipt of a TWT response with a TWT Group Assignment field with no Zero Offset of the Group subfield implies that the Zero Offset of the Group subfield value for that TWT is the same as the Zero Offset of the Group subfield value for the most recently received Zero Offset of the Group subfield for the same TWT group ID from the TWT responding STA.

The TWT Unit subfield indicates the unit of increment of the TWT values within the TWT group identified by the TWT group ID. The TWT Unit subfield encoding is shown in Table 9-298.

Table 9-298—TWT Unit subfield encoding

TWT Unit subfield value	TWT Unit time value
0	32 μs
1	256 μs
2	1024 μs
3	8.192 ms
4	32.768 ms
5	262.144 ms
6	1.048576 s
7	8.388608 s
8	33.554432 s
9	268.435456 s
10	1073.741824 s
11	8589.934592 s
12–15	Reserved

The TWT Offset subfield indicates the position within the indicated group, of the STA corresponding to the RA of the frame containing the TWT element.

A non-AP STA uses the TWT Group ID, Zero Offset of Group, TWT Unit, and TWT Offset subfield values to compute its TWT value within the TWT group. A STA's TWT value is equal to the value of the Zero Offset of Group subfield plus TWT Offset subfield times the value of TWT Unit subfield.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Nominal Minimum TWT Wake Duration field indicates the minimum amount of time, in units of 256 μs, that the TWT requesting STA expects that it needs to be awake in order to complete the frame exchanges associated with the TWT flow identifier for the period of TWT wake interval, where TWT wake interval is the average time that the TWT requesting STA expects to elapse between successive TWT SPs.

The TWT Wake Interval Mantissa subfield is set to the value of the mantissa of the TWT wake interval value in microseconds, base 2.

When transmitted by a TWT requesting STA that is negotiating SST operation, the TWT Channel field contains a bitmap indicating the channel the STA requests to use as a temporary primary channel during a TWT SP. When transmitted by a TWT responding STA that is negotiating SST operation, the TWT Channel field contains a bitmap indicating which channel the TWT requesting STA is allowed to use as a temporary channel during the TWT SP. When transmitted by a STA that is not negotiating SST operation, the TWT Channel field is reserved.

Each bit in the bitmap corresponds to one minimum width channel for the band in which the TWT responding STA's associated BSS is currently operating, with the least significant bit corresponding to the lowest numbered channel of the operating channels of the BSS.The minimum width channel is equal to the SST Channel Unit field of the SST Operation element if such an element has been previously received or is equal to 1 MHz for a BSS with a BSS primary channel width of 1 MHz and 2 MHz for a BSS with a BSS primary channel width of 2 MHz if no such element has been previously received from the AP to which the SST STA is associated. Setting a position in the bitmap transmitted to 1 by a TWT requesting STA means that operation with that channel as the primary channel is requested during a TWT SP. Setting a position in the bitmap transmitted to 1 by a TWT responding STA means that operation with that channel as the primary channel is allowed during the TWT SP.

A TWT requesting STA sets the TWT Protection subfield to 1 to request the TWT responding STA to provide protection of the set of TWT SPs corresponding to the requested TWT flow identifier by allocating RAW(s) that restrict access to the medium during the TWT SP(s) for that(those) TWTs. A TWT requesting STA sets the TWT Protection subfield to 0 if TWT protection by RAW allocation is not requested for the corresponding TWT(s).

When transmitted by a TWT responding STA that is an AP, the TWT Protection subfield indicates whether the TWT SP(s) identified in the TWT element will be protected. A TWT responding STA sets the TWT Protection subfield to 1 to indicate that the TWT SP(s) corresponding to the TWT flow identifier(s) of the TWT element will be protected by allocating RAW(s) that restrict access to the medium during the TWT SP(s) for that(those) TWT(s). A TWT responding STA sets the TWT Protection subfield to 0 to indicate that the TWT SP(s) identified in the TWT element might not be protected from S1G STAs in TIM mode by allocating RAW(s).

The format of the NDP Paging field is defined in Figure 9-690.

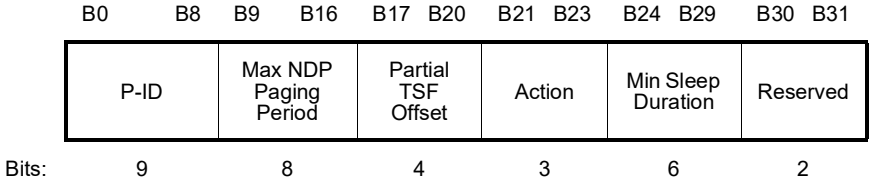

Figure 9-690—NDP Paging field format

The P-ID field is the identifier of the paged STA, as described in 10.47.6.

The Max NDP Paging Period field indicates the maximum number of TWT wake intervals between two NDP Paging frames.

The Partial TSF Offset field includes timing indications, as described in 10.47.6.

Upon reception of an NDP Paging frame with matching P-ID field as defined in 10.47.6, the TWT STA that is an NDP Paging requester takes an action indicated by the Action field as described in Table 9-299.

Table 9-299—Action field

Action	Options
0	Send a PS-Poll or uplink trigger frame
1	Wake up at the time indicated by the Min Sleep Duration field
2	Wake up to receive the beacon
3	Wake up to receive the DTIM beacon
4	Wakeup at the time indicated by the sum of the Min Sleep Duration field and the ASD subfield in the APDI field of the NDP Paging frame
5–7	Reserved

The Min Sleep Duration field in the NDP Paging Request indicates in units of SIFS the minimum duration that STA will be in the doze state after receiving an NDP Paging frame with a matching P-ID.

9.4.2.200 S1G Capabilities element

9.4.2.200.1 S1G Capabilities element structure

An S1G STA declares that it is an S1G STA by transmitting the S1G Capabilities element.

The S1G Capabilities element contains a number of fields that are used to advertise S1G capabilities of an S1G STA. The S1G Capabilities element is defined in Figure 9-691.

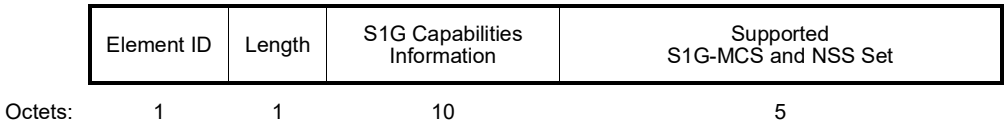

Figure 9-691—S1G Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The subfields of the S1G Capabilities Information field are defined in Table 9-300.

Table 9-300—Subfields of the S1G Capabilities Information field

Subfield	Definition	Encoding
S1G_LONG Support	Indicates support for the reception of S1G_LONG PPDUs. See 23.3.2.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 1 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW1.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 2 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW2.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 4 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW4.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 8 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW8.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 16 MHz	Indicates short GI support for the reception of PPDUs transmitted with TXVECTOR parameters FORMAT equal to S1G and CH_BANDWIDTH equal to CBW16.	Set to 0 if not supported. Set to 1 if supported.
Supported Channel Width	Indicates the channel widths supported by the STA. See 10.46.	Set to 0 if the STA supports 1 MHz and 2 MHz operation. Set to 1 if the STA supports 1 MHz, 2 MHz, and 4 MHz operation. Set to 2 if the STA supports 1 MHz, 2 MHz, 4 MHz, and 8 MHz operation. Set to 3 if the STA supports 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz operation.
Rx LDPC	Indicates support for receiving LDPC encoded PPDUs.	Set to 0 if not supported. Set to 1 if supported.
Tx STBC	Indicates support for the transmission of at least 2×1 STBC.	Set to 0 if not supported. Set to 1 if supported.
Rx STBC	Indicates support for the reception of PPDUs using STBC.	Set to 0 if not supported. Set to 1 if supported.
SU Beamformer Capable	Indicates support for operation as an SU beamformer (see 10.36.5).	Set to 0 if not supported. Set to 1 if supported.
SU Beamformee Capable	Indicates support for operation as an SU beamformee (see 10.36.5).	Set to 0 if not supported. Set to 1 if supported.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-300—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Beamformee STS Capability	The maximum number of space-time streams that the STA can receive in an S1G NDP, the maximum value for $N_{STS,total}$ that can be sent to the STA in an S1G MU PPDU if the STA is MU beamformee capable and the maximum value of *Nr* that the STA transmits in a VHT Compressed Beamforming frame.	If SU beamformee capable, set to maximum number of space-time streams that the STA can receive in an S1G NDP minus 1. Otherwise reserved.
Number Of Sounding Dimensions	Beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for an S1G NDP.	If SU beamformer capable, set to the maximum supported value of the TXVECTOR parameter NUM_STS minus 1. Otherwise reserved.
MU Beamformer Capable	Indicates support for operation as an MU beamformer (see 10.36.5).	Set to 0 if not supported or if SU Beamformer Capable is set to 0 or if sent by a non-AP STA. Set to 1 if supported and SU Beamformer Capable is equal to 1.
MU Beamformee Capable	Indicates support for operation as an MU beamformee (see 10.36.5).	Set to 0 if not supported or if SU Beamformee Capable is set to 0 or if sent by an AP. Set to 1 if supported and SU Beamformee Capable is equal to 1.
+HTC-VHT Capable	Indicates whether or not the STA supports receiving a VHT variant HT Control field.	Set to 0 if not supported. Set to 1 if supported.
Traveling Pilot Support	Indicates support for the reception of PPDUs with a traveling pilots. See 23.3.9.10.	Set to 1 if dot11S1GTravelingPilotOptionActivated is true, and reception of traveling pilot for one space-time stream is supported but reception of traveling pilot for two space-time streams with STBC is not supported. Set to 3 if dot11S1GTravelingPilotOptionActivated is true, and reception of traveling pilot for both one space-time stream and two space-time streams with STBC is supported. Set to 0 if dot11S1GTravelingPilotOptionActivated is false. Value 2 is reserved.
RD Responder	Indicates support for acting as a reverse direction responder, i.e., the STA can use an offered RDG to transmit data to an RD initiator using the reverse direction protocol described in 10.29.	Set to 0 if not supported. Set to 1 if supported.
Maximum MPDU Length	Indicates the maximum MPDU length (see 10.11).	Set to 0 for 3895 octets. Set to 1 for 7991 octets.
Maximum A-MPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive. EOF padding is not included in this limit.	The length defined by this field is equal to $2^{(13+\text{Maximum A-MPDU Length Exponent})} - 1$ octets.

Table 9-300—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP. See 10.12.3.	Set to 0 for no restriction. Set to 1 for 1/4 μs. Set to 2 for 1/2 μs. Set to 3 for 1 μs. Set to 4 for 2 μs. Set to 5 for 4 μs. Set to 6 for 8 μs. Set to 7 for 16 μs.
Uplink Sync Capable	If sent by an AP, this subfield indicates support for sync frame transmission for uplink. If sent by a non-AP STA, this subfield indicates request for sync frame transmission for uplink. See 10.49.	If sent by an AP: Set to 0 if not supported. Set to 1 if supported. If sent by a non-AP STA: Set to 0 if not requested. Set to 1 if requested.
Dynamic AID	The STA sets the Dynamic AID field to 1 when dot11DynamicAIDActivated is true, and sets it to 0 otherwise. See 10.20.	Set to 1 if dot11DynamicAIDActivated is true. Set to 0 otherwise.
BAT Support	The BAT Support subfield indicates support for the use of the Block Acknowledgment TWT (BAT) frame in Block Agreements. When dot11BATImplemented is true, this field is set to 1 to indicate support for BAT frames as both originator and recipient.	Set to 1 if dot11BATImplemented is true. Set to 0 otherwise.
TIM ADE Support	This bit indicates support of the ADE mode of TIM bitmap encoding as described in 9.4.2.5.5.	Set to 1 if dot11TIMADEImplemented is true. Set to 0 otherwise.
Non-TIM Support	This bit indicates support of non-TIM mode.	In a non-AP STA: Set to 0: The non-AP STA does not support non-TIM mode; it needs TIM entry as in legacy PS mode. Set to 1: The non-AP STA supports non-TIM mode and does not need TIM entry when in non-TIM mode. In an AP: Set to 0: The AP does not support the STA's non-TIM mode. Set to 1: The AP supports the STA's non-TIM mode.
Group AID Support	This bit indicates support of group traffic delivery using a group AID as described in 10.55.	Set to 1 if dot11GroupAIDActivated is true. Set to 0 otherwise.

Table 9-300—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
STA Type Support	If sent by an AP, this subfield indicates the STA types that are supported by the AP. If sent by a non-AP STA, this subfield indicates the STA type of the non-AP STA.	If sent by an AP: Set to 0 if the AP supports both sensor STAs and non-sensor STAs. Set to 1 if the AP supports only sensor STAs. Set to 2 if the AP supports only non-sensor STAs. 3 is reserved. If sent by a non-AP STA: Set to 1 if the STA is a sensor STA. Set to 2 if the STA is a non-sensor STA. 0 and 3 are reserved.
Centralized Authentication Control	This field indicates support of the centralized authentication control defined in 11.3.9.2.	Set to 1 if dot11S1GCentralizedAuthenticationControlActivated is true. Set to 0 otherwise.
Distributed Authentication Control	This field indicates support of the distributed authentication control defined in 11.3.9.3.	Set to 1 if dot11S1GDistributedAuthenticationControlActivated is true. Set to 0 otherwise.
A-MSDU Supported	This bit indicates support of Aggregated MSDU.	Set to 1 if dot11AMSDUImplemented is true. Set to 0 otherwise.
A-MPDU Supported	This bit indicates support of Aggregated MPDU.	Set to 1 if dot11AMPDUImplemented is true. Set to 0 otherwise.
Asymmetric BA Supported	This bit indicates support of Asymmetric BA.	Set to 1 if dot11AsymmetricBlockAckActivated is true. Set to 0 otherwise.
Flow Control Supported	Indicates support for flow control operation.	Set to 0 if not supported Set to 1 if supported
Sectorized Beam-Capable	The Sectorized Beam-Capable subfield indicates the type of sectorization operation supported by the STA.	If sent by an AP: Set to 0 if sectorization operation is not supported, Set to 1 if only TXOP-based sectorization operation is supported, Set to 2 if only group sectorization operation is supported, Set to 3 if both group sectorization and TXOP-based sectorization operations are supported. If sent by a non-AP STA: Set to 0 if not supported, Set to 1 if supported When equal to 1, a non-AP STA supports both group sectorization and TXOP-based sectorization operation.
OBSS Mitigation Support	The OBSS Mitigation Support subfield indicates whether the STA supports channel width reduction during a TXOP for OBSS mitigation.	Set to 1 to indicate that the STA supports channel width reduction during a TXOP for OBSS mitigation. Set to 0 otherwise.

Table 9-300—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Fragment BA Support	This bit indicates support for fragment BA.	Set to 1 if dot11FragmentBAOptionImplemented is true. Set to 0 otherwise.
NDP PS-Poll Supported	This bit indicates support for NDP PS-Poll frames.	Set to 1 if dot11NDPPSPollSupport is true. Set to 0 otherwise.
RAW Operation Support	This bit indicates support of RAW Participating as described in 10.23.5.1.	Set to 1 if dot11RAWOperationImplemented is true. Set to 0 otherwise.
Page Slicing Support	This bit indicates support of Page Slicing as described in 10.51.	Set to 1 if dot11PageSlicingImplemented is true. Set to 0 otherwise.
TXOP Sharing Implicit Ack Support	This bit indicates support of Implicit Ack in TXOP sharing.	Set to 1 if dot11TXOPSharingImplicitACKImplemented is true. Set to 0 otherwise.
VHT Link Adaptation Capable	Indicates whether or not the STA supports link adaptation using VHT variant HT Control field.	If +HTC-VHT Capable is 1: Set to 0 (No Feedback) if the STA does not provide VHT MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited VHT MFB. Set to 3 (Both) if the STA can provide VHT MFB in response to VHT MRQ and if the STA provides unsolicited VHT MFB. The value 1 is reserved. Reserved if +HTC-VHT Capable is 0.
TACK Support as PS-Poll Response	This bit indicates whether the AP supports the using of TACK frame as the response to a PS-Poll frame with the Poll Type subfield equal to 1 as described in 10.48.2.	Set to 1 if dot11PollTACKResponseImplemented is true. Set to 0 otherwise.
Duplicate 1 MHz Support	This bit indicates support for transmission of S1G 1 MHz duplicate PPDUs.	Set to 1 if generation of a PPDU in duplicate 1 MHz format is supported as a response to an eliciting frame transmitted by the peer STA. Set to 0 otherwise.
MCS Negotiation Support	Indicates if the STA supports control response MCS negotiation feature.	Set to 0 if not supported. Set to 1 if supported.
1 MHz Control Response Preamble Support	Indicates if the STA supports transmitting control response frames with 1 MHz preamble as the response of ≥2 MHz PPDUs.	Set to 0 if not supported. Set to 1 if supported.
NDP Beamforming Report Poll Supported	Indicates support for reception of NDP Beamforming Report Poll frames.	Set to 0 if not supported. Set to 1 if supported.
Unsolicited Dynamic AID	The STA sets the Unsolicited Dynamic AID field to 1 when dot11UnsolicitedDynamicAIDActivated is true, and sets it to 0 otherwise. See 10.20.	Set to 1 if dot11UnsolicitedDynamicAIDActivated is true. Set to 0 otherwise.

Table 9-300—Subfields of the S1G Capabilities Information field *(continued)*

Subfield	Definition	Encoding
Sector Training Operation Supported	This bit indicates support of sector training operation described in 10.53.5.	Set to 0 if not supported. Set to 1 if supported. When equal to 1, a STA supports sector training operation.
Temporary PS Mode Switch	This bit indicates whether the STA supports the temporary PS Mode switch as described in 10.48.2 while in non-TIM mode.	Set to 1 if supported. Set to 0 otherwise.
TWT Grouping Support	This bit indicates support of TWT grouping described in 10.47.5.	Set to 0 if not supported. Set to 1 if supported.
BDT Capable	Indicates the support of bidirectional TXOP operation described in 10.50.	Set to 0 if not supported. Set to 1 if supported.
COLOR	Indicates the value that is used for the TXVECTOR parameter COLOR in frames transmitted by members of this BSS, as described in 10.21.	Set to an unsigned integer if sent by an AP. Otherwise reserved.
TWT Requester Support	This bit indicates support for the role of TWT requesting STA as described in 10.47.	Set to 1 if dot11TWTOptionActivated is true and the STA supports TWT requester STA functionality (see 10.47). Set to 0 otherwise.
TWT Responder Support	This bit indicates support for the role of TWT responding STA	Set to 1 if dot11TWTOptionActivated is true and the STA supports TWT responding STA functionality (see 10.47). Set to 0 otherwise.
PV1 Frame Support	Indicates support for PV1 MPDUs	Set to 0 if not supported. Set to 1 if supported.
Link Adaptation Without NDP CMAC PPDU Capable	Indicate whether or not link adaptation through a Control frame that is not an NDP CMAC PPDU is allowed	Set to 0 if not supported. Set to 1 if supported.

9.4.2.200.3 Supported S1G-MCS and NSS Set field

The Supported S1G-MCS and NSS Set field is used to convey the combinations of S1G-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The structure of the field is shown in Figure 9-693.

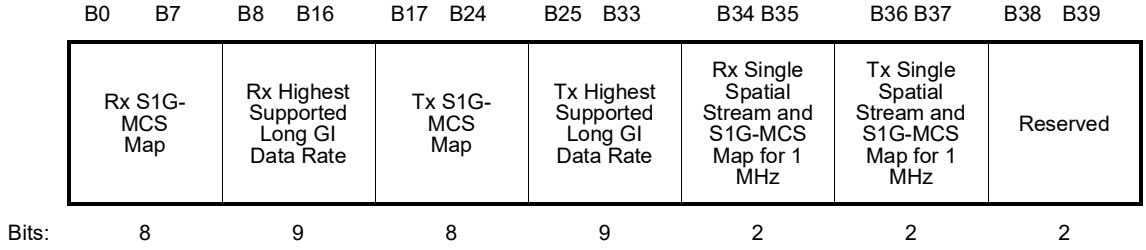

Figure 9-693—Supported S1G-MCS and NSS Set field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Supported S1G-MCS and NSS Set subfields are defined in Table 9-301.

Table 9-301—Supported S1G-MCS and NSS Set subfields

Subfield	Definition	Encoding
Rx S1G-MCS Map	Indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-694 and the associated description. If Rx Single Spatial Stream and S1G-MCS Map for 1 MHz subfield is greater than or equal to 1, then only the value of the Max S1G-MCS For 1 SS subfield that is indicated by the Rx Single Spatial Stream and S1G-MCS Map subfield is applicable for 1 MHz channel width.
Rx Highest Supported Long GI Data Rate	Indicates the highest long GI S1G data rate that the STA is able to receive.	The largest integer value less than or equal to the highest long GI S1G PPDU data rate in Mb/s the STA is able to receive (see 10.6.14.1). The value 0 indicates that this subfield does not specify the highest long GI S1G PPDU data rate that the STA is able to receive.
Tx S1G-MCS Map	Indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be transmitted at all channel widths supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-694 and the associated description. If Tx Single Spatial Stream and S1G-MCS Map for 1 MHz subfield is greater than or equal to 1, then only the value of the Max S1G-MCS For 1 SS subfield that is indicated by the Tx Single Spatial Stream and S1G-MCS Map subfield is applicable for 1 MHz channel width.
Tx Highest Supported Long GI Data Rate	Indicates the highest long GI S1G PPDU data rate at which the STA is able to transmit.	The largest integer value less than or equal to the highest long GI S1G PPDU data rate in Mb/s that the STA is able to transmit (see 10.6.14.2). The value 0 indicates that this subfield does not specify the highest long GI S1G PPDU data rate that the STA is able to transmit.
Rx Single Spatial Stream and S1G-MCS Map for 1 MHz	Indicates whether only a single spatial stream PPDU can be received at 1 MHz channel width by this STA.	0: same number of spatial streams and same Max S1G-MCS as indicated by Rx S1G-MCS Map field. 1: single spatial stream only and with Max S1G-MCS as indicated by a 0 in the S1G-MCS for 1 SS subfield. 2: single spatial stream only and with Max S1G-MCS as indicated by a 1 in the S1G-MCS for 1 SS subfield. 3: single spatial stream only and with Max S1G-MCS as indicated by a 2 in the S1G-MCS for 1 SS subfield.
Tx Single Spatial Stream and S1G-MCS Map for 1 MHz	Indicates whether only a single spatial stream PPDU can be transmitted at 1 MHz channel width by this STA.	0: same number of spatial streams and same Max S1G-MCS as indicated by Tx S1G-MCS Map field. 1: single spatial stream only and with Max S1G-MCS as indicated by a 0 in the S1G-MCS for 1 SS subfield. 2: single spatial stream only and with Max S1G-MCS as indicated by a 1 in the S1G-MCS for 1 SS subfield. 3: single spatial stream only and with Max S1G-MCS as indicated by a 2 in the S1G-MCS for 1 SS subfield.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Rx S1G-MCS Map subfield and the Tx S1G-MCS Map subfield have the structure shown in Figure 9-694.

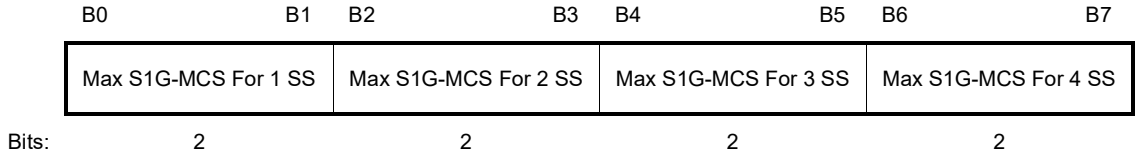

Figure 9-694—Rx S1G-MCS Map and Tx S1G-MCS Map subfields and Basic S1G-MCS and NSS Set field format

The Max S1G-MCS for *n* SS subfield (where *n*=1,...,4) is encoded as follows:

— 0 indicates support for S1G-MCS 2 for n spatial streams
— 1 indicates support for S1G-MCS 7 for n spatial streams
— 2 indicates support for S1G-MCS 9 for n spatial streams
— 3 indicates that n spatial streams is not supported

NOTE 1—An S1G-MCS indicated as supported in the S1G-MCS Map fields for a particular number of spatial streams might not be valid at all bandwidths (see 23.5) and might be limited by the declaration of Tx Highest Supported Long GI Data Rates and Rx Highest Supported Long GI Data Rates and might be affected by 10.6.14.3.

NOTE 2—For 1 MHz, MCS 10 is always supported.

9.4.2.201 Subchannel Selective Transmission (SST) element

The Subchannel Selective Transmission (SST) element is shown in Figure 9-695.

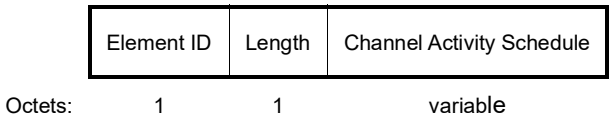

Figure 9-695—Subchannel Selective Transmission element format

The Element ID and Length fields are defined in 9.4.2.1.

The Channel Activity Schedule subfield contains one or more channel activity schedules.

The format of the Channel Activity Schedule subfield is shown in Figure 9-696 and Figure 9-697.

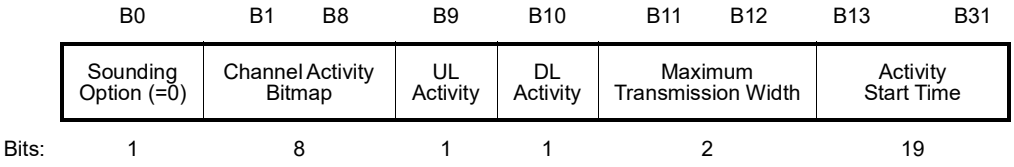

Figure 9-696—Channel Activity Schedule subfield format (Sounding Option = 0)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

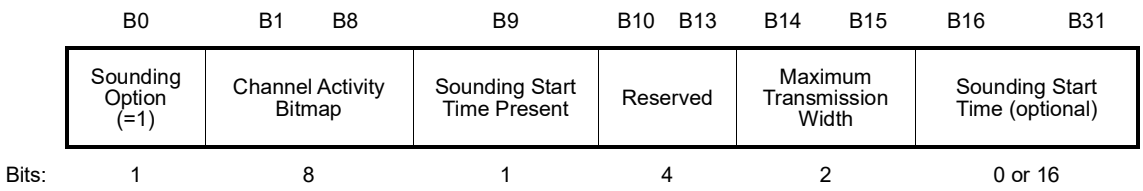

Figure 9-697—Channel Activity Schedule subfield format (Sounding Option = 1)

The Sounding Option subfield is set to 0 to indicate that the Channel Activity Schedule field is the AP Activity schedule.

When the Sounding Option subfield is equal to 0, the Channel Activity Bitmap subfield contains a bitmap indicating on which channels transmission is either expected or permitted by the AP during a given time period. Each bit in the bitmap corresponds to one minimum width channel for the band of operation with the LSB corresponding to the lowest numbered operating channel of the BSS. A 1 in a bit position in the bitmap means that the AP expects activity and/or permits transmissions with bandwidth less than or equal to the bandwidth indicated in the Maximum Transmission Width subfield and that include that channel, after the time indicated in the Activity Start Time subfield. Only one bit in the bitmap can be set to 1 within each channel activity schedule. The minimum width channel is equal to the SST Channel Unit field of the SST Operation element if such an element has been previously transmitted or is equal to 2 MHz if no such element has been previously received from the AP to which the SST STA is associated.

The UL Activity subfield is set to 1 to indicate that the SST AP (that transmits the SST element) permits the STAs associated with it to transmit frames that are not immediate response frames on the channel(s) identified by the Channel Activity Bitmap and Maximum Transmission Width subfields at the time indicated in the Activity Start Time subfield. Otherwise it is set to 0.

The DL Activity subfield is set to 1 to indicate that the AP that transmits the SST element intends to transmit frames that are not immediate response frames on the channel(s) identified by the Channel Activity Bitmap and Maximum Transmission Width subfields at the time indicated in the Activity Start Time subfield. Otherwise it is set to 0.

The Maximum Transmission Width subfield indicates the maximum PPDU bandwidth permitted by the AP for a transmission on the indicated channel and cannot exceed the BSS operating channel width specified by the AP in a transmitted S1G Operation element. In order to abide by the rules of each regulatory domain, the maximum operating channel width is limited by the BSS operating channel width even if the Maximum Transmission Width field specifies otherwise. The maximum permitted PPDU bandwidth is in MHz and is determined based on the Maximum Transmission Width subfield as shown in Table 9-302.

Table 9-302—Mapping between Maximum Transmission Width subfield and maximum permitted PPDU bandwidth

Maximum Transmission Width	Maximum permitted PPDU bandwidth (MHz)
0	channel width unit
1	4
2	8
3	16

NOTE—The channel width unit is equal to 1 MHz if the SST Channel Unit field of the most recently received SST Operation element from the SST AP is equal to 1. If no SST Operation element has been received or the SST Channel Unit field of the received SST Operation element is equal to 0 then the channel width unit is equal to 2 MHz.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Activity Start Time subfield contains a value that defines a start time for when the AP expects frame transmissions to begin on the channel(s) indicated in the corresponding Channel Activity Bitmap field. The start time is triggered when the 19 least significant bits of the TSF timer for the BSS match the value that is indicated in the Activity Start Time subfield of the SST element. The count down to the start time is initiated at the end of the transmission of the frame containing the SST element.

The Sounding Option subfield is set to 1 in order to indicate that the Channel Activity Schedule field is the SST sounding schedule.

When the Sounding Option subfield is equal to 1, the Channel Activity Bitmap subfield contains a bitmap indicating on which channels there is an SST sounding transmission activity at a given time. Each bit in the bitmap corresponds to one minimum width channel for the band of operation with the LSB corresponding to the lowest numbered operating channel of the BSS. A 1 in a bit position in the bitmap means that the AP transmits one more PIFS-separated sounding NDPs.

The Sounding Start Time Present subfield indicates whether the Sounding Start Time subfield is present in the Channel Activity Schedule field. If the subfield is equal to 1, the Sounding Start Time subfield is present. If this subfield is equal to 0, the Sounding Start Time subfield is not present.

The Maximum Transmission Width subfield indicates the channel bandwidth of the sounding NDP and is shown in Table 9-302.

The Sounding Start Time subfield contains a value that defines a start time when the AP transmits one or more sounding NDPs on the channel(s) indicated in the corresponding Channel Activity Bitmap subfield. If the Sounding Start Time subfield is not present, the AP transmits one or more PIFS-separated sounding NDPs starting after the transmission of the Beacon frame containing the SST element. If the Sounding Start Time subfield is present, the AP transmits one or more PIFS-separated sounding NDPs starting at the time indicated in the Sounding Start Time field. The start time is triggered when the 16 least significant bits of the TSF timer for the BSS match the value that is indicated in the Sounding Start Time subfield of the SST element. The count down to the start time is initiated at the end of the transmission of the frame containing the SST element.

9.4.2.202 Authentication Control element

The notation of Authentication-Request and Authentication-Response refers to the definition in Clause 13.

The Authentication Control element contains the information required to mitigate contention among Authentication Request frames (see 11.3.9).

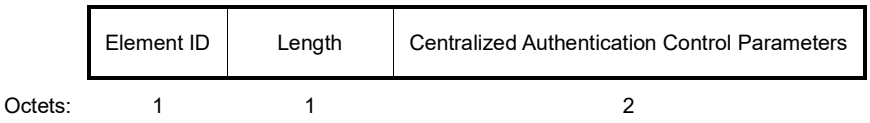

Figure 9-698—Authentication Control element format (Control subfield equal to 0)

The Element ID and Length fields are defined in 9.4.2.1.

The Information field starts with a 1-bit Control subfield.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When the Control subfield is equal to 0, the Authentication Control element format is as shown in Figure 9-698. The Authentication Control element indicates whether the recipient STA can transmit an Authentication Request frame to the AP that sends the element. The remaining part of the Centralized Authentication Control Parameters field Information field following the Control subfield contains the Deferral, Reserved and the Authentication Control Threshold subfields.

The Centralized Authentication Control Parameters field format is shown in Figure 9-699.

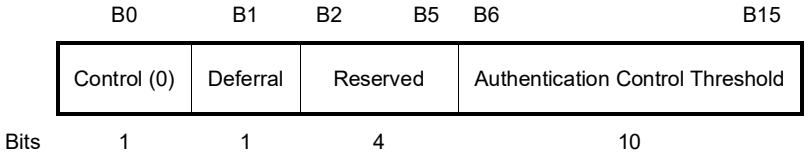

Figure 9-699—Centralized Authentication Control Parameters format

The Authentication Control Threshold subfield contains a number with a range from 0 to 1023. When the Deferral subfield is equal to 0, the value of the Authentication Control Threshold subfield is used by the recipient STA to determine whether or not the AP is allowing it to transmit an Authentication Request frame. When the Deferral subfield is equal to 1, the Authentication Control Threshold subfield value is a time value, expressed in TUs, indicating a minimum amount of deferred time for channel access that is required before the transmission of an Authentication-Request frame and is set as described in 11.3.9.2.

When the Control subfield is equal to 1, the Authentication Control element contains the Distributed Authentication Control Parameters field as shown in Figure 9-700.

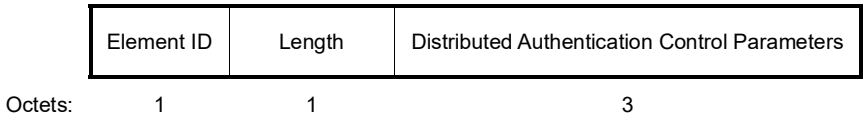

Figure 9-700—Authentication Control element format (Control subfield equal to 1)

The Distributed Authentication Control Parameters field format is shown Figure 9-701.

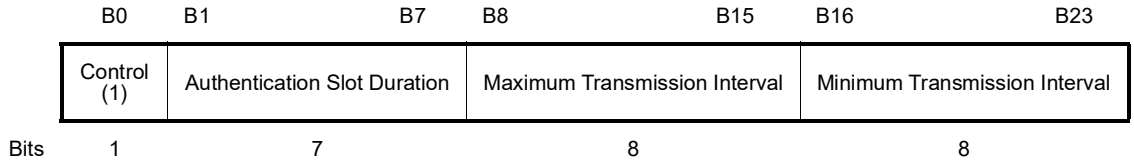

Figure 9-701—Distributed Authentication Control Parameters format

The Authentication Slot Duration subfield is expressed in units of TUs and indicates the authentication slot duration.

The Minimum Transmission Interval subfield is expressed in units of beacon intervals and indicates the minimum transmission interval (see 11.3.9.3).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.203 TSF Timer Accuracy element

The TSF Timer Accuracy element, shown in Figure 9-702, specifies fields describing the accuracy of TSF timer. This information is used by a receiving STA to estimate the clock accuracy of the transmitting STA and to schedule wake-up time for Beacon frame reception by taking this clock accuracy into account.

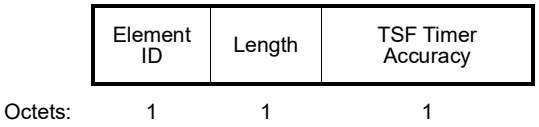

Figure 9-702—TSF Timer Accuracy element format

The Element ID and Length fields are defined in 9.4.2.1.

The TSF Timer Accuracy field is a 1-octet unsigned integer that specifies the accuracy of the TSF timer of transmitting STA. The unit of the TSF Timer Accuracy field is ppm. The values between 125 and 255 are reserved for future expansion.

9.4.2.204 S1G Relay element

The S1G Relay element contains parameters necessary to support the relay operation and its format is shown in Figure 9-703.

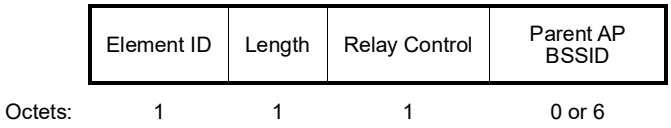

Figure 9-703—S1G Relay element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of Relay Control field is shown in Figure 9-704.

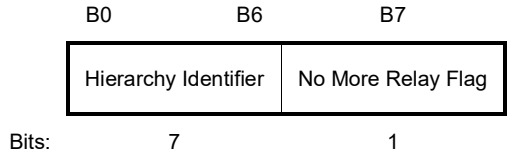

Figure 9-704—Relay Control field format

The Hierarchy Identifier subfield indicates whether the AP is a root AP or whether it relays an SSID, as specified in Table 9-303.

Table 9-303—Hierarchy Identifier subfield

Hierarchy Identifier	Meaning
0	Parent AP
1	S1G Relay AP that relays frames within the BSS identified by the BSSID contained in the RootAP BSSID field
2–127	Reserved

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The No More Relay Flag subfield is set to 1, to indicate that the AP does not accept any more requests for operating as relays from its associated non-AP STAs. Otherwise it is set to 0.

The Parent AP BSSID field indicates the BSSID of the parent AP's BSS. The Parent AP BSSID field is present if the Hierarchy Identifier subfield is set to a nonzero value. Otherwise the Parent AP BSSID field is not present.

9.4.2.205 Reachable Address element

The format of the Reachable Address element is shown in Figure 9-705.

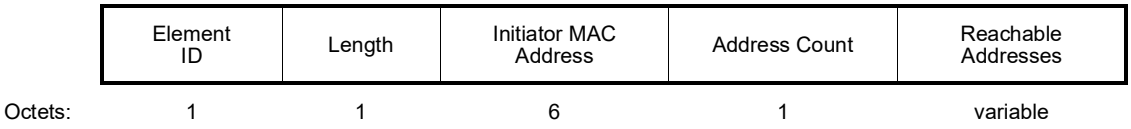

Figure 9-705—Reachable Address element format

The Element ID and Length fields are defined in 9.4.2.1.

The Initiator MAC Address field indicates the MAC address of the relay STA that transmits the Reachable Address element.

The Address Count field is an integer representing the number of addresses in the Reachable Addresses field.

The Reachable Addresses field contains one or more Reachable Address subfields

The Reachable Address subfields indicate the MAC addresses that can be reached through the relay STA. The format of the Reachable Address subfield is shown in Figure 9-706.

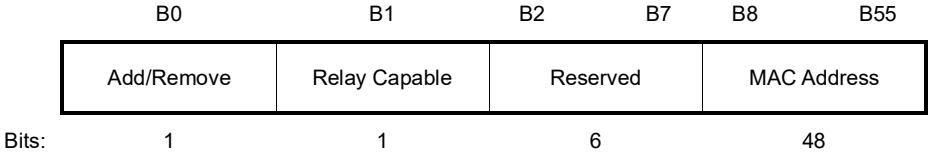

Figure 9-706—Reachable Address subfield format

The Add/Remove subfield is set to 1 if the MAC address is the address of a new STA joining the relay. Add/Remove subfield is set to 0 if the MAC address is the address of a STA leaving the relay. The Add/Remove subfield is set to 1 if the Reachable Address element is included within a (Re)Association Request frame.

The Relay Capable subfield is set to 1 if the STA is relay capable, otherwise it is set to 0.

The MAC Address subfield is set to the MAC address of the STA that joins or leaves the BSS.

9.4.2.206 S1G Relay Activation element

The format of the S1G Relay Activation element is shown in Figure 9-707.

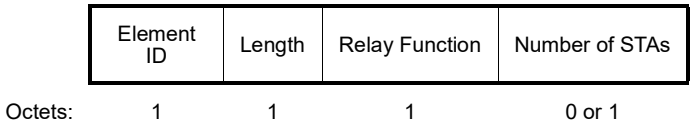

Figure 9-707—S1G Relay Activation element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Relay Function field is shown in Figure 9-708.

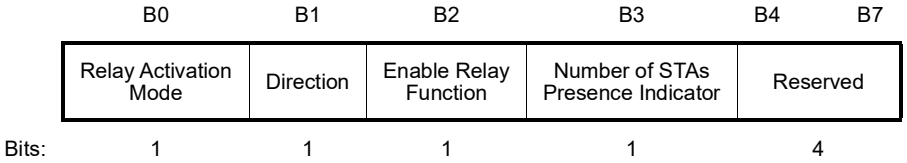

Figure 9-708—Relay Function field format

The Relay Activation Mode subfield is set to 1 to indicate that this element is a relay activation request. The Relay Activation Mode subfield is set to 0 to indicate the relay activation response.

The Direction subfield is set to 1 if the S1G Relay Activation element is sent by the AP. The Direction subfield is set to 0 if the S1G Relay Activation element is sent by the non-AP STA.

The Enable Relay Function subfield is set to a value based on the Direction and Relay Activation Mode subfield as described in Table 9-304.

Table 9-304—Enable Relay Function subfield values

	Relay Activation Mode=1 (Request)	**Relay Activation Mode=0 (Response)**
Direction=1 (from AP)	If the Enable Relay Function subfield is set to 1, it indicates that the non-AP STA can operate as a relay and if it is set to 0 it indicates AP demands the non-AP STA to terminate the relay function.	If the Enable Relay Function subfield is set to 1, it indicates that the non-AP STA is allowed to operate as a relay and if it is set to 0, it indicates that the non-AP STA cannot operate as a relay.
Direction=0 (from non-AP STA)	If the Enable Relay Function subfield is set to 1, it indicates that the non-AP STA requests to activate its relay function and if it is set to 0, it indicates that the non-AP STA requests to terminate its relay function.	If the Enable Relay Function subfield is set to 1, it indicates that the non-AP STA activates its relay function and if it is set to 0, it indicates that the non-AP STA terminates its relay function.

When the S1G Relay Activation element is sent by an AP, the Number of STAs Presence Indicator subfield is set to 1 to indicate that a Number of STAs field is included in the S1G Relay Activation element. Otherwise, it is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Number of STAs field is 1 octet in length, and contains an unsigned integer. The Number of STAs field is used to calculate the maximum number of STAs, N_{max}, that an S1G relay AP is allowed to associate. N_{max} is determined as follows:

N_{max} = Number of STAs × 32

9.4.2.207 S1G Relay Discovery element

The S1G Relay Discovery element is shown in Figure 9-709.

	Element ID	Length	Relay Discovery Control	UL/DL Data Rate (optional)	Delay Bound Requirement/ Channel Utilization (optional)	Min PHY Rate Requirement/ Relay Station Count (optional)
Octets:	1	1	1	0 to 6	0 or 1	0 or 1

Figure 9-709—S1G Relay Discovery element format

The Element ID and Length fields are defined in 9.4.2.1.

The Relay Discovery Control field contains information indicating whether some or all following fields (see Figure 9-710) are included in the S1G Relay Discovery element. The structure of Relay Discovery Control field is shown later in this subclause in Figure 9-711.

	UL Min Data Rate (optional)	UL Mean Data Rate (optional)	UL Max Data Rate (optional)	DL Min Data Rate (optional)	DL Mean Data Rate (optional)	DL Max Data Rate (optional)
Octets:	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

Figure 9-710—UL/DL Data Rate field format

When UL Min Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the UL minimum data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When UL Min Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the UL minimum data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When UL Mean Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the UL mean data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When UL Mean Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the UL mean data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When UL Max Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the UL maximum data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When UL Max Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the UL maximum data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When DL Min Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the DL minimum data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When DL Min Data Rate field is included in an S1G Relay Discovery element in a Probe

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Response or Beacon frame, it indicates the DL minimum data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When DL Mean Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the DL mean data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When DL Mean Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the DL mean data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When DL Max Data Rate field is included in an S1G Relay Discovery element in a Probe Request frame, it indicates the DL maximum data rate of the direct link between the non-AP STA and AP in the unit of 100 kb/s. When DL Max Data Rate field is included in an S1G Relay Discovery element in a Probe Response or Beacon frame, it indicates the DL maximum data rate of the relay link between the relay and its associated AP in the unit of 100 kb/s.

When included in the S1G Relay Discovery element of a Probe Request frame and the Delay and Rate Requirement Included field in the Relay Discovery Control field of the S1G Relay Discovery element is equal to 1, the Delay Bound Requirement/Channel Utilization field indicates the delay bound requirement of the connection through the relay. When included in the S1G Relay Discovery element that is included in a Probe Response or a Beacon frame and the Utilization and Count Included field in the Relay Discovery Control field of the S1G Relay Discovery element is equal to 1, the Delay Bound Requirement/Channel Utilization field denotes the ratio of time that relay observes the busy level on the relay link between the relay and the AP, with value 100 indicating 100% busy level and value 0 indicating idle (values from 101 to 255 are reserved).

When included in the S1G Relay Discovery element of a Probe Request frame and the Delay and Min PHY Rate Requirement Included field in the Relay Discovery Control field of the S1G Relay Discovery element is equal to 1, the Min PHY Rate Requirement/Relay Station Count field indicates the minimum PHY data rate set required by the requesting STA. When included in the S1G Relay Discovery element of a Probe Response or a Beacon frame and the Utilization and Relay Count Included field in the Relay Discovery Control field of the S1G Relay Discovery element is equal to 1, the Min PHY Rate Requirement/Relay Station Count field denotes the number of non-AP STAs currently associated with the relay.

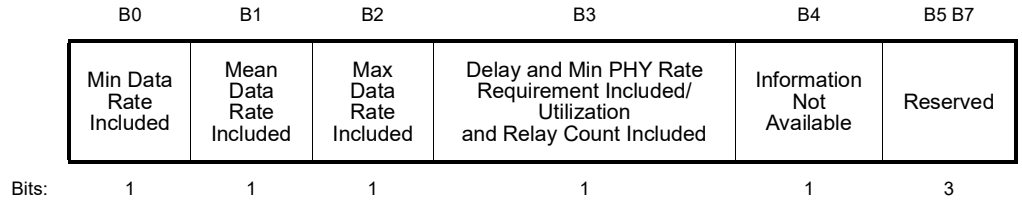

Figure 9-711—Relay Discovery Control field format

The Min Data Rate Included field is set to 1 if UL Min Data Rate field and DL Min Data Rate field are included in the S1G Relay Discovery element. Otherwise, the Min Data Rate Included field is set to 0.

The Mean Data Rate Included field is set to 1 if UL Mean Data Rate field and DL Mean Data Rate field are included in the S1G Relay Discovery element. Otherwise, the Mean Data Rate Included field is set to 0.

The Max Data Rate Included field is set to 1 if UL Max Data Rate field and DL Max Data Rate field are included in the S1G Relay Discovery element. Otherwise, the Max Data Rate Included field is set to 0.

The Delay and Rate Requirement Included/Utilization and Count Included field is set to 1 if Delay Bound Requirement/Channel Utilization field and Min PHY Rate Requirement/Relay Station Count field are

included in the S1G Relay Discovery element. Otherwise, the Delay and Rate Requirement Included/ Utilization and Count Included field is set to 0.

The Information Not Available field is set to 1 if the relay does not provide the requested information. Otherwise, the Information Not Available field is set to 0.

9.4.2.208 AID Announcement element

The AID Announcement element is used to provide the mapping table between STA MAC Address and STA AID. The format of the AID Announcement element is shown in Figure 9-712.

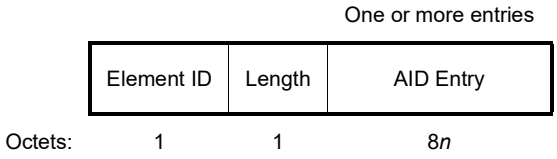

Figure 9-712—AID Announcement element format

The Element ID and Length fields are defined in 9.4.2.1.

The AID Entry field includes one or more STA MAC address and association ID pairs. The format of AID Entry field is shown in Figure 9-713.

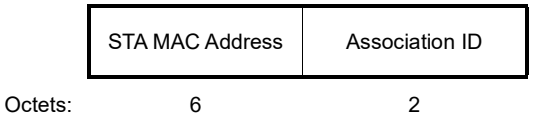

Figure 9-713—AID Entry field format

The STA MAC Address field indicates the MAC address of STA. The Association ID field, which has the same format as the AID field described in 9.4.1.8, includes the AID for the corresponding STA. If AID Announcement element is included in a frame that is transmitted by a relay STA and the Association ID field equals to 0, the STA MAC Address field indicates the BSSID of the relay AP's BSS.

9.4.2.209 PV1 Probe Response Option element

The PV1 Probe Response Option element is included in the Probe Request frame to indicate the optional information requested to be included in the PV1 Probe Response frame that is transmitted by the responding STAs.

The optional information requested by the STA is indicated as bitmaps in the PV1 Probe Response Option element.

The format of the PV1 Probe Response Option element is shown in Figure 9-714.

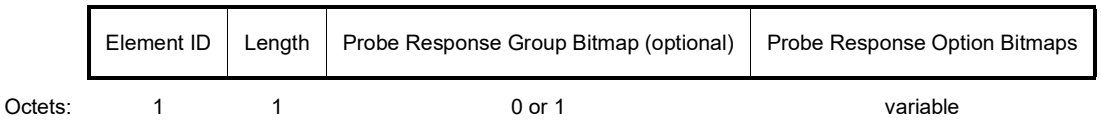

Figure 9-714—PV1 Probe Response Option element format

The Element ID and Length fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Probe Response Group Bitmap field indicates the Probe Response Option Bitmap subfield(s) included in the PV1 Probe Response Option element. If Probe Response Option Bitmap subfield *i* is included in the PV1 Probe Response Option element, then *i*-th bit in the Probe Response Group Bitmap field is set to 1.

The Probe Response Option Bitmaps field contains one or more Probe Response Option Bitmap subfields.

Each Probe Response Option Bitmap subfield is 1 octet and indicates the optional information requested to be included in the PV1 Probe Response frame by the responding STAs. Setting a bit in a Probe Response Option Bitmap subfield to 1 indicates that the corresponding information is requested to be included in the PV1 Probe Response frame if the responding STA supports the indicated information.The bit is set to 0 to indicate that the information is not requested.

The optional information requested to be included in the PV1 Probe Response is categorized into 8 bitmaps (Probe Response Option bitmap 0 ~ 7).

Only Probe Response Option Bitmap subfields with at least one bit equal to 1 is included in the PV1 Probe Response Option element. For example, if only Probe Response Option Bitmap subfield 0 and 2 have bits that are equal to 1, then these two Probe Response Group Bitmap fields are included in the PV1 Probe Response Option element and the Probe Response Group Bitmap field is set to 10100000 to indicate that only the Probe Response Option Bitmap subfields 0 and 2 are included in the PV1 Probe Response Option element. When the Probe Response Group Bitmap field is included in the PV1 Probe Response Option element, at least one bit of the Probe Response Group Bitmap field is equal to 1.

Probe Response Option Bitmap subfield 0 is defined to be a default bitmap that indicates most frequently requested information. If the default bitmap is the only Probe Response Option Bitmap subfield that is included in the PV1 Probe Response Option element, then the Probe Response Group Bitmap field is omitted. In that case, only Element ID, Length, and the default bitmap (Probe Response Option Bitmap subfield 0) are included in the PV1 Probe Response Option element.

Table 9-305 to Table 9-310 define the Probe Response Option bitmap from 0 to 5, respectively.

NOTE—Probe Response Option bitmap 6 and 7 are reserved for future extension.

Table 9-305—Probe Response Option Bitmap subfield 0 (Default Bitmap)

Bit position	Subfield	Item requested	Reference
0	Request Full SSID	Full SSID element if the bit is set to 1, and Compressed SSID field if the bit is set to 0	9.4.2.2 and 9.8.5.3
1	Request Next TBTT	Next TBTT field	9.8.5.3

9.4.2.210 EL Operation element

The EL Operation element is used by a STA to inform the associated AP or peer TDLS STA about operating limitations of the STA, in terms of the maximum continuous time the STA is capable of being in the awake state, and the minimum continuous time the STA stays in doze state in between Awake periods. The format of the EL Operation element is presented in Figure 9-715.

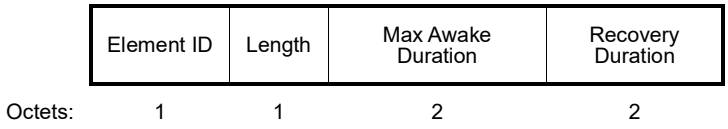

Figure 9-715—EL Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The Max Awake Duration field indicates a time in units of 40 μs, used as defined in 11.46; a value 0 indicates that no limit applies.

The Recovery Duration field indicates a time in units of 40 μs, used as defined in 11.46.

9.4.2.211 Sectorized Group ID List element

The Sectorized Group ID List element includes the information necessary for a receiving STA to determine its sectorization group membership. An example of group use is the sector operation. In sector operation, only a set of STA groups is allowed to transmit during the sector duration. The Sectorized Group ID List element can be provided in Probe Response or (Re)Association Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Sectorized Group ID List element is presented in Figure 9-716.

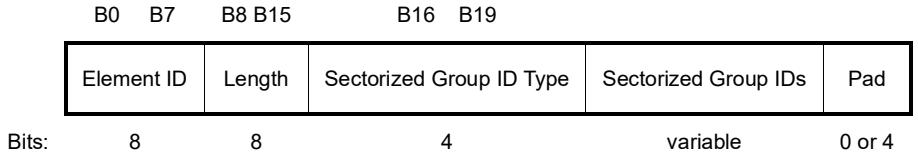

Figure 9-716—Sectorized Group ID List element format

The Element ID and Length fields are defined in 9.4.2.1.

The Sectorized Group ID Type field indicates the sectorized group IDs usage. Setting the Sectorized Group ID Type field to 0 indicates that the values in the Sectorized Group ID subfields refer to STAs in sectorization use. The values of the Sectorized Group ID Type field other than 0 are reserved for other purposes.

The Sectorized Group IDs field contains one or more Sectorized Group ID subfields.

Each Sectorized Group ID subfield is 4 bits and indicates a new sectorized group ID that is associated with the receiver STAs. A value of 15 in the Sectorized Group ID subfield is reserved for padding bits.

The Pad field contains 0 or 4 bits of 1s to make the total number of bits in the Sectorized Group ID List element equal to an integer number of octets.

9.4.2.212 S1G Operation element

The operation of S1G STAs in the BSS is controlled by the S1G Operation element. The format of the S1G Operation element is defined in Figure 9-717.

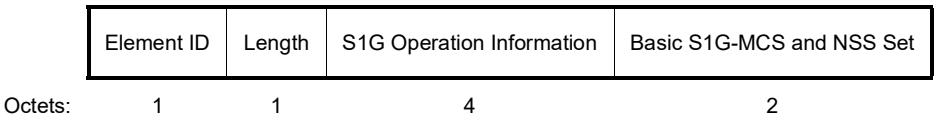

Figure 9-717—S1G Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the S1G Operation Information field is defined in Figure 9-718.

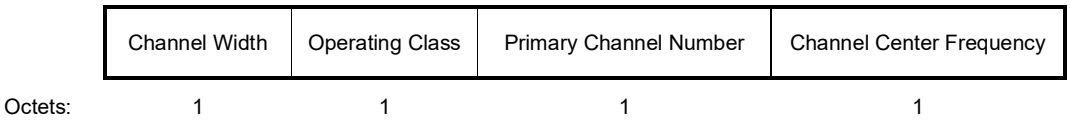

Figure 9-718—S1G Operation Information field format

The subfields of the S1G Operation Information field are defined in Table 9-311.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-311—S1G Operation Information field

Fields	Definition	Encoding
Channel Width	This field defines the BSS operating channel width (see Table 10-32 in 10.46.1 also).	Bitmap of B0–B4 indicates the primary channel width, and the operating channel widths, 1/2/4/8/16 MHz. The Primary Channel Width subfield, located in B0 of this field, and the BSS Operating Channel Width subfield, located in B1–B4 of this field, are defined in Table 10-32. B5 bits indicates the location of 1 MHz primary channel within the 2 MHz primary channel — B5 is set to 0 to indicate that is located at the lower side of 2 MHz primary channel. — B5 is set to 1 to indicate that is located at the upper side of 2 MHz primary channel. B6 is reserved. B7 is set to 1 to indicate that it is recommended that a STA does not use MCS 10.
Operating Class	This field defines the operating class in which the BSS is operating.	The operating class of the BSS.
Primary Channel Number	Primary Channel Number field indicates the channel number of 2 MHz primary channel or 1 MHz primary channel.	Channel number of the primary channel.
Channel Center Frequency	Defines the channel center frequency.	Indicates the channel index of the BSS operating channel (see 23.3.14).

The Basic S1G-MCS and NSS Set field indicates the S1G-MCSs for each number of spatial streams in S1G PPDUs that are supported by all S1G STAs in the BSS. The format of the Basic S1G-MCS and NSS Set field is shown in Figure 9-719.

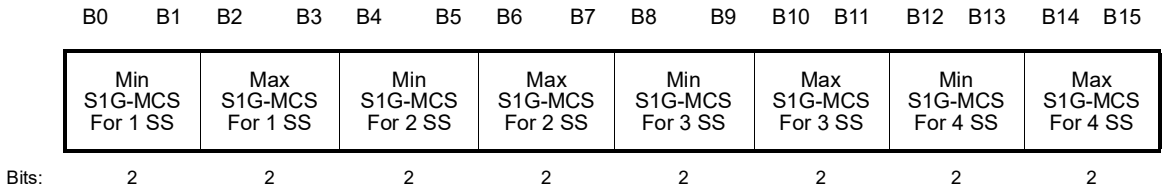

Figure 9-719—Basic S1G-MCS and NSS Set field format

Each Max S1G-MCS indicates the supported S1G-MCS set for NSS from 1 to 4 while each Min S1G-MCS indicates whether certain S1G-MCS values are not recommended for NSS from 1 to 4.

The Max S1G-MCS For *n* SS subfield (where *n* = 1,...,4) is same as the field with the same name that is defined in the S1G Capabilities element.

The Min S1G-MCS For *n* SS subfield (where *n* = 1,...,4) is encoded as follows:

— 0 indicates no minimum MCS restriction for n spatial streams.
— 1 indicates S1G-MCS 0 for *n* spatial streams is not recommended.
— 2 indicates S1G-MCS 0 and 1 for *n* spatial streams is not recommended.
— 3 is reserved.

9.4.2.213 Header Compression element

The Header Compression element is used by a STA to inform its intended receiver regarding frame header fields that will be compressed and that it needs to store. The format of the Header Compression element is shown in Figure 9-720.

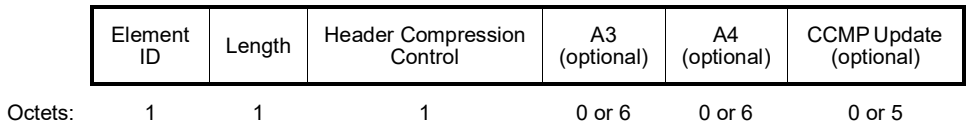

Figure 9-720—Header Compression element format

The Element ID and Length fields are defined in 9.4.2.1.

The Header Compression Control field is shown in Figure 9-721.

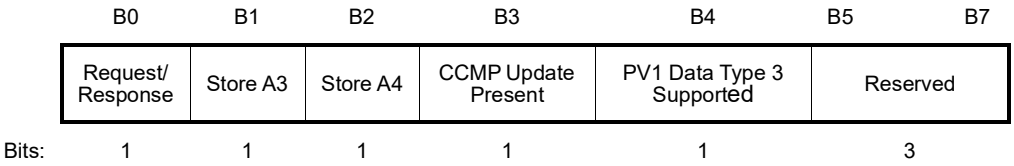

Figure 9-721—Header Compression Control field format

The Request/Response subfield is set to 0 to indicate a header compression request and set to 1 to indicate a header compression response.

The Store A3 subfield is set to 1 in the header compression request to request the intended receiver of the frame to store the A3 field and is set to 1 in the header compression response to confirm storage of the A3 field. Otherwise, it is set to 0 in the header compression request to indicate no storage request for the A3 field and is set to 0 in the header compression response to indicate unsuccessful storage or release of the stored A3 field.

The Store A4 subfield is set to 1 to request the intended receiver of the header compression request to store the A4 field and is set to 1 in the header compression response to confirm storing of the A4 field. Otherwise, it is set to 0 in the header compression request to indicate no storage request for the A4 field and is set to 0 in the header compression response to indicate unsuccessful storage or release of the stored A4 field.

The CCMP Update Present subfield is set to 1 to indicate the intended receiver of the header compression request to update the base packet number (BPN) and Key ID fields for the specified TID/ACI in the CCMP Update field and is set to 1 in the header compression response to confirm the update of the fields or to indicate decryption error for the specified TID/ACI. Otherwise, it is set to 0 in the header compression request to indicate no CCMP update request and is set to 0 in the header compression response to indicate no CCMP update confirmation.

The PV1 Data Type 3 Supported subfield is set to 1 to indicate that reception of PV1 frames with Type field equal to 3 is enabled. Otherwise, it is set to 0.

The A3 field in the Header Compression element is present if the Request/Response subfield is 0 and the Store A3 subfield is 1. Otherwise, it is not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The A4 field in the Header Compression element is present if the Request/Response subfield is 0 and the Store A4 subfield is 1. Otherwise, it is not present.

The CCMP Update field in the Header Compression element is present if the CCMP Update Present subfield is 1. Otherwise, it is not present.

The CCMP Update field contains the BPN and Key ID for a given TID/ACI, as shown in Figure 9-722.

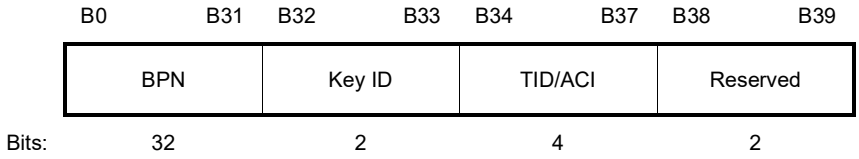

Figure 9-722—CCMP Update field format

The BPN subfield contains the BPN for the TID/ACI in the CCMP Update field. The BPN subfield consists of the PN2, PN3, PN4, and PN5 octets, as shown in Figure 9-723.

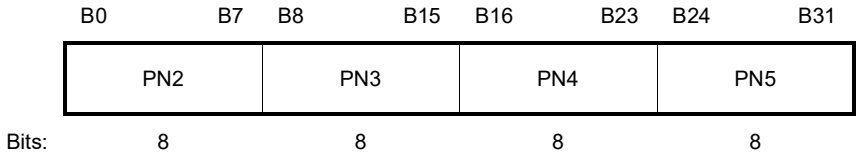

Figure 9-723—BPN subfield format

The Key ID subfield contains the Key ID for the TID/ACI included in the CCMP Update field.

The TID/ACI subfield contains the TID/ACI for which the BPN and the Key ID subfields apply.

9.4.2.214 SST Operation element

The Subchannel Selective Transmission (SST) Operation element is shown in Figure 9-724

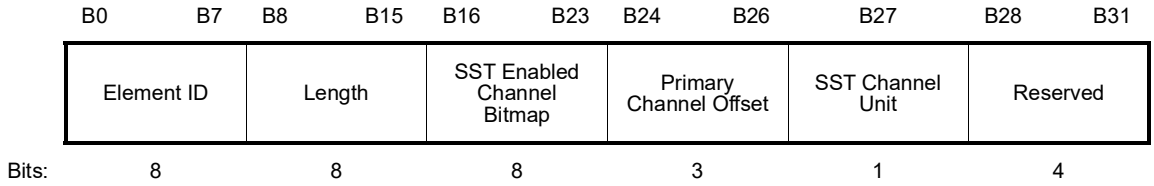

Figure 9-724—SST Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The SST Enabled Channel Bitmap field contains a bitmap indicating the channels that are enabled for SST operation. Each bit in the bitmap corresponds to one channel of width equal to the value of SST Channel Unit field, with the least significant bit corresponding to the lowest numbered subchannel in the SST Enabled Channel Bitmap field. The channel number of each of the channels in the SST Enabled Channel Bitmap field is equal to PCN minus OPC plus POS, where PCN is the value of the Primary Channel Number subfield in the most recently transmitted S1G Operation element, OPC is the offset of the primary channel relative to the lowest numbered subchannel in the bitmap as specified by the value of the Primary Channel Offset field and POS is the position of the channel in the bitmap. Setting a bit position in the bitmap to 1

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

indicates that the subchannel is enabled for SST operation but transmissions from SST STAs in that subchannel are allowed subject to the rules defined in 10.52. More than one bit in the bitmap can be equal to 1.

The Primary Channel Offset field indicates the relative position of the primary channel with respect to the lowest numbered channel in the SST Enabled Channel Bitmap field. For example, setting the Primary Channel Offset field to 2 indicates that the primary channel is the third subchannel in the SST Enabled Channel Bitmap.

The SST Channel Unit field indicates the channel width unit of each SST channel. Setting the field to 1 indicates that the channel width unit is 1 MHz and setting the field to 0 indicates that the channel width unit is 2 MHz.

9.4.2.215 MAD element

The MAD element is shown in Figure 9-725.

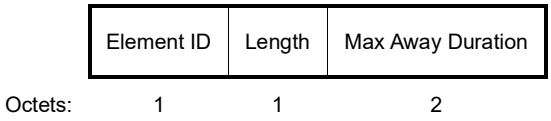

Figure 9-725—MAD element format

The Element ID and Length fields are defined in 9.4.2.1.

The Max Away Duration field indicates the maximum duration that the AP can be out of reach for the STA (operating in other channels, enter power save mode, or operating in other RAWs). The value of the Max Away Duration field is expressed in units of TU.

9.4.2.216 Password Identifier element

The Password Identifier element contains a string used to look up a password. The format of the element is defined in Figure 9-726.

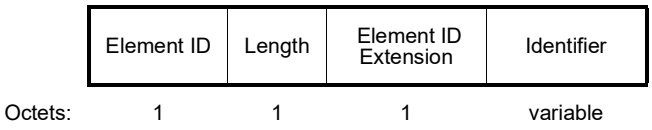

Figure 9-726—Password Identifier element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Identifier field is a variable-length string that identifies a password as specified in 12.4.

9.4.2.217 Max Channel Switch Time element

The Max Channel Switch Time element indicates the time delta between the time the last beacon is transmitted by the AP in the current channel and the expected time of the first beacon transmitted by the AP in the new channel. The format of the element is defined in Figure 9-727.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

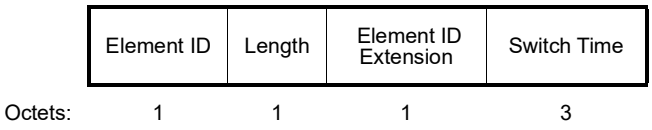

Figure 9-727—Max Channel Switch Time element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Length field is set to 4.

The Switch Time field is a 3-octet field indicating the maximum time delta between the time the last Beacon frame is transmitted by the AP in the current channel and the expected time of the first Beacon frame in the new channel, expressed in TUs.

This element is optionally present in Beacon and Probe Response frames when a Channel Switch Announcement or Extended Channel Switch Announcement element is also present.

9.4.2.218 Vendor Specific Request element

This element is placed in a Probe Request frame or Information Request frame to request that the responding STA include the requested information in the Probe Response frame or Information Response frame, respectively. It is used to make one or more requests to the responding STA using Vendor Specific Information. The format of the element is shown in Figure 9-728.

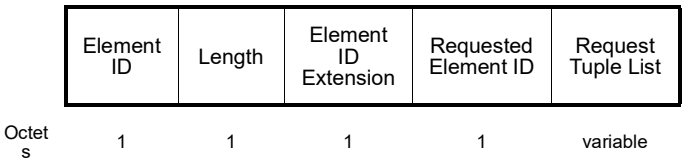

Figure 9-728—Extended Request element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Requested Element ID field is set to 221 (Vendor Specific as defined in 9.4.2.1).

The Request Tuple List field contains one or more Request Tuple fields. The format of a Request Tuple field is shown in Figure 9-729.

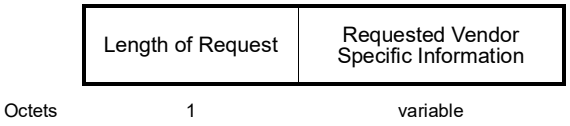

Figure 9-729—Request Tuple field format

The Length of Request field is the length of the Requested Vendor Specific Information field. The Requested Vendor Specific Information field is a sequence of octets that comprise individual requests. The requested vendor specific information sequence must start with an Organization Identifier field as described in 9.4.1.31 (Organization Identifier field).

See 11.1.4.3.9 for additional requirements.

9.4.2.219 CDMG Capabilities element

9.4.2.219.1 General

The capabilities of a CDMG STA include the capabilities indicated by both the DMG Capabilities element (9.4.2.127) and the CDMG Capabilities element (9.4.2.219). The CDMG Capabilities element contains a STA identifier and several fields to indicate the capabilities that are applicable for a CDMG STA; they are not applicable for a DMG STA. A CDMG STA uses the CDMG Capabilities element to advertise the support of optional CDMG capabilities. The element is present in Association Request, Association Response, Reassociation Request, Reassociation Response, Probe Request, and Probe Response frames and is optionally present in DMG Beacon, Information Request, and Information Response frames. The CDMG Capabilities element is formatted as defined in Figure 9-730.

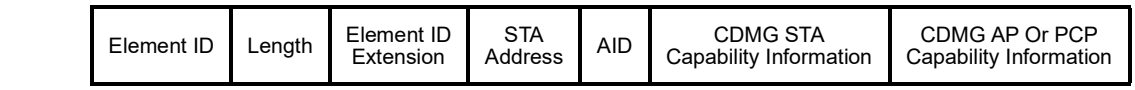

Figure 9-730—CDMG Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The STA Address field contains the MAC address of the STA.

The AID field contains the AID assigned to the STA by the AP or CP. The AID field is reserved in Association Request, Reassociation Request, and Probe Request frames and when used in an IBSS.

9.4.2.219.2 CDMG STA Capability Information field

The CDMG STA Capability Information field, shown in Figure 9-731, represents the transmitting STA capabilities irrespective of the role of the STA.

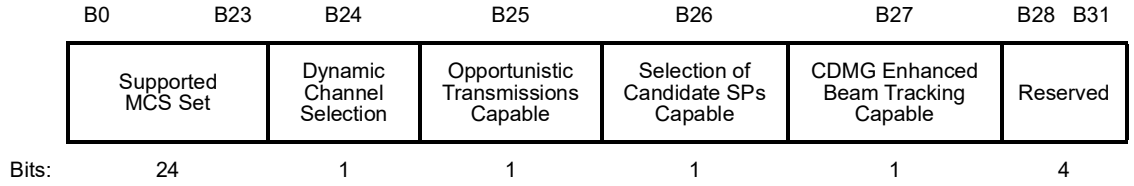

Figure 9-731—CDMG STA Capability Information field format

The Supported MCS Set subfield indicates the MCSs a CDMG STA supports. A MCS is identified by a MCS index, which is represented by an integer in the range 0 to 23. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the CDMG PHY, see Clause 24. The structure of the Supported MCS Set subfield is defined in Figure 9-732.

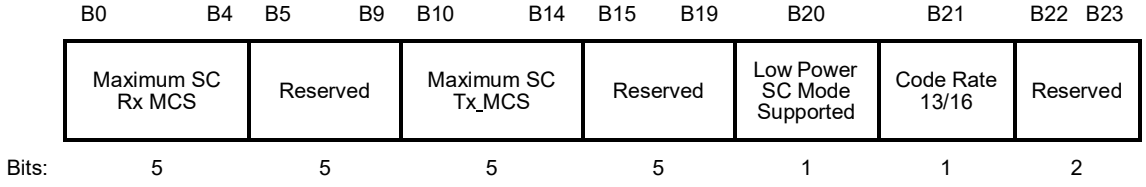

Figure 9-732—Supported MCS Set subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Maximum SC Rx MCS subfield contains the value of the maximum MCS index the CDMG STA supports for reception of single-carrier frames. Values 0-8 of this subfield are reserved. Possible values for this subfield are shown in Table 24-4.

The Maximum SC Tx MCS subfield contains the value of the maximum MCS index the CDMG STA supports for transmission of single-carrier frames. Values 0-8 of this subfield are reserved. Possible values for this subfield are shown in Table 24-4.

The Low-Power SC Mode Supported subfield is set to 1 to indicate that the CDMG STA supports the low-power SC mode (24.6). Otherwise, it is set to 0. If the CDMG STA supports the low-power SC mode, it supports all low-power SC mode MCSs indicated in Table 24-6.

The Code Rate 13/16 subfield specifies whether the CDMG STA supports rate 13/16. It is set to 1 to indicate that the CDMG STA supports rate 13/16 and is set to 0 otherwise. If this subfield is 0, MCSs with 13/16 code rate specified in Table 24-4 is not supported regardless of the value in Maximum SC Tx/Rx MCSMCS subfields.

The Dynamic Channel Selection subfield is set to 1 if the STA supports DCS procedures as defined in 11.47 and is set to 0 otherwise.

The Opportunistic Transmissions Capable subfield is set to 1 if the STA supports opportunistic transmission in alternative channels for CDMG STAs as defined in 10.39.11 and is set to 0 otherwise.

The Selection of Candidate SPs Capable subfield is set to 1 if the STA supports selection of candidate SPs for spatial sharing as described in Annex W.1 and is set to 0 otherwise.

The CDMG Enhanced Beam Tracking Capable subfield is set to 1 if the STA supports CDMG enhanced beam tracking as defined in 10.42.9 and Annex W.3 and is set to 0 otherwise.

9.4.2.219.3 CDMG AP Or PCP Capability Information field

The CDMG AP Or PCP Capability Information field, defined in Figure 9-733, represents the capabilities, when the transmitting CDMG STA performs in the role of AP or PCP, that are in addition to the capabilities in the CDMG STA Capability Information field.

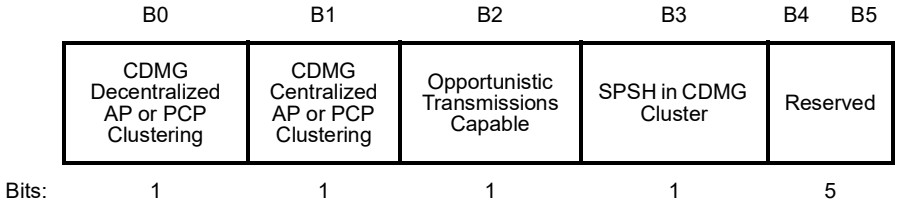

Figure 9-733—CDMG AP Or PCP Capability Information field format

The CDMG Decentralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing decentralized AP or PCP clustering as described in 10.37 and is set to 0 otherwise.

The CDMG Centralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing centralized AP or PCP clustering and is set to 0 otherwise. An AP or PCP that is incapable of performing centralized AP or PCP clustering is subject to requirements as described in 10.37.

The SPSH in CDMG Cluster subfield is set to 1 if the STA supports spatial sharing in a CDMG AP or PCP cluster as defined in 10.41.6 and is set to 0 otherwise. If both the CDMG Decentralized AP or PCP

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Clustering subfield and the CDMG Centralized AP or PCP Clustering subfield are equal to 0, the SPSH in CDMG Cluster subfield is reserved.

9.4.2.220 Dynamic Bandwidth Control element

The Dynamic Bandwidth Control element defines the information from the CDMG AP or PCP to support the dynamic bandwidth control mechanism described in 10.64 and the CDMG AP or PCP clustering mechanism described in 10.64. The format of the Dynamic Bandwidth Control element is shown in Figure 9-734.

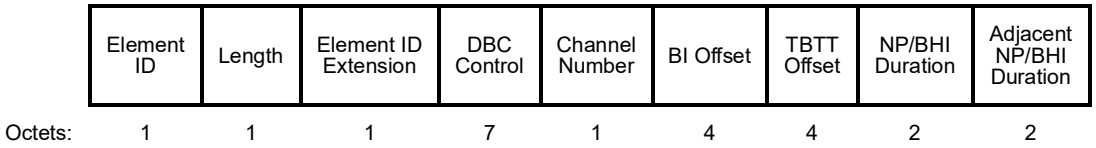

Figure 9-734—Dynamic Bandwidth Control element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the DBC Control field is shown in Figure 9-735.

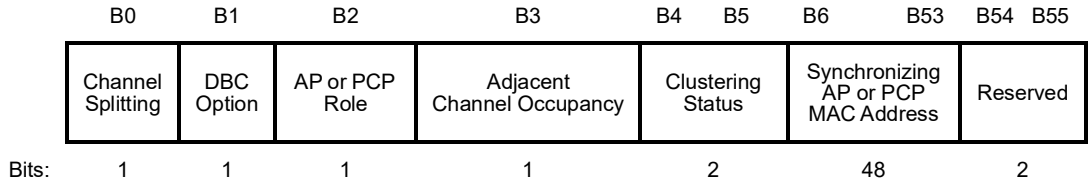

Figure 9-735—DBC Control field format

The Channel Splitting subfield is set to 0 to indicate that an AP or PCP operates on a 2.16 GHz channel and the following subfields are reserved. Otherwise, this subfield is set to 1 to indicate that an AP or PCP operates on a 1.08 GHz channel.

The DBC Option subfield indicates the DBC option that an AP or PCP selects to operate on a 1.08 GHz channel. It is set to 0 to indicate that beacon intervals or BHIs are present on the 1.08 GHz channel and otherwise set to 1.

The AP or PCP Role subfield is set to 0 to indicate that the transmitting AP or PCP operating on a 1.08 GHz channel can provide a time reference to the AP or PCP operating on the adjacent 1.08 GHz channel. Otherwise, this subfield is set to 1 to indicate that the transmitting AP or PCP scans for DMG Beacon frames transmitted from the AP or PCP operating on the adjacent 1.08 GHz channel to maintain synchronization among them following the rules defined in 10.64.2.3.

The Adjacent Channel Occupancy subfield is set to 0 to indicate that the adjacent 1.08 GHz channel of the transmitting AP or PCP is occupied by another AP or PCP. Otherwise, this subfield is set to 1.

The Clustering Status subfield indicates the cluster status of the two 1.08 GHz channel within the same 2.16 GHz channel. The first/second bit is set to 0 to indicate that a cluster starts in the current/adjacent 1.08 GHz channel. Otherwise, the first/second bit of this field is set to 1.

The Synchronizing AP or PCP MAC Address subfield indicates the MAC address of the AP or PCP that provides the time reference for the transmitting AP or PCP. If the AP or PCP Role subfield is 0, this subfield

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

is set to the MAC address of itself. Otherwise, this subfield is set to the MAC address of the AP or PCP operating on the adjacent 1.08 GHz channel.

The Channel Number field is set to the number of the channel on which the transmitting STA is operating.

The BI Offset field contains the time offset of the TBTT of the first beacon interval that the transmitting AP or PCP starts on a 1.08 GHz channel relative to the TBTT of the beacon interval that the transmitting AP or PCP starts on the 2.16 GHz channel encompassing this 1.08 GHz channel. This field is reserved if the DBC Option subfield is 1.

The TBTT Offset field contains the time offset of the target starting time of the NP/BHI on a 2.16 GHz channel of the transmitting AP or PCP operating on one of the 1.08 GHz channels relative to that of another AP or PCP operating on the adjacent 1.08 GHz channel.

The NP/BHI Duration field is set to the length of the NP/ BHI duration on a 2.16 GHz channel by the transmitting AP or PCP operating on one of the 1.08 GHz channels.

The Adjacent NP/BHI Duration field is set to the length of the NP/ BHI duration on a 2.16 GHz channel by the AP or PCP operating on the adjacent 1.08 GHz channel of the transmitting AP or PCP.

9.4.2.221 CDMG Extended Schedule element

The CDMG Extended Schedule element is defined in Figure 9-736. Like the Extended Schedule element (9.4.2.131), the AP or PCP can split the Allocation fields in the CDMG Extended Schedule element into more than one CDMG Extended Schedule element entry in the same DMG Beacon frame or Announce frame. Despite this splitting, the set of CDMG Extended Schedule element entries conveyed within a DMG Beacon or Announce frame is considered to be a single schedule for the beacon interval and, in this standard, is referred to simply as CDMG Extended Schedule element unless otherwise noted.

	Element ID	Length	Element ID Extension	Allocation List
Octets:	1	1	1	$n \times 19$

Figure 9-736—CDMG Extended Schedule element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Allocation List field contains one or more (n) Allocation fields. The Allocation fields are ordered by increasing allocation start time with allocations beginning at the same time arbitrarily ordered.

The Allocation field is defined in Figure 9-737.

	Allocation Control	BF Control	Source AID	Destination AID	Allocation Start
Octets:	2	2	1	1	4

	Allocation Block Duration	Number of Blocks	Allocation Block Period	Number of Alternate TX BI	Number of Suspension BI
Octets:	2	1	2	2	2

Figure 9-737—Allocation field format

The Allocation Control subfield format is the same as defined in 9.4.2.131, including Allocation ID, AllcationType, Pseudo-static, Truncatable, Extendable, PCP Active, and LP SC Used subfields and reserved bits.

The Allocation ID subfield is the same as defined in 9.4.2.131.

The AllocationType subfield defines the channel access mechanism during the allocation, with the possible values listed in Table 9-312 for CDMG STAs:

Table 9-312—AllocationType subfield values for CDMG STAs

Bit 4	Bit 5	Bit 6	Meaning
0	0	0	SP allocation in dedicated channel
1	0	0	CBAP allocation in dedicated channel
0	1	0	SP allocation in alternative channel
1	1	0	CBAP allocation in alternative channel
All other combinations			Reserved

The Pseudo-static, Truncatable, Extendable, PCP Active, and LP SC Used subfields are the same as defined in 9.4.2.131.

The BF Control subfield is defined in Figure 9-738 and Figure 9-739.

	B0	B1	B2	B3 B9	B10 B11	B12	B13 B15
	Beamforming Training	IsInitiator TXSS	IsResponder TXSS	Total Number of Sectors	Number of RX DMG Antennas	NoPrimary Channel	Reserved
Bits:	1	1	1	7	2	1	3

Figure 9-738—BF Control field format when both IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1 and the BF Control field is transmitted in Grant or Grant Ack frames

	B0	B1	B2	B3 B8	B9 B10	B11	B12 B15
	Beamforming Training	IsInitiator TXSS	IsResponder TXSS	RXSS Length	RXSSTxRate	NoPrimary Channel	Reserved
Bits:	1	1	1	6	2	1	4

Figure 9-739—BF Control field format in all other cases

The BeamformingTraining, IsInitiatorTXSS, IsResponderTXSS, Total Number of Sectors, Number of RX DMG Antennas, RXSS Length, RXSSTxRate subfields are the same as defined in 9.5.5.

The NoPrimaryChannel subfield is set to 1 to indicate that the CDMG initiator does not need to perform SLS on the primary channel. It is set to 0 to indicate that the CDMG initiator needs to perform SLS on the primary channel. This subfield is reserved when it is transmitted by an AP or PCP.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Source AID, Destination AID, Allocation Start, Allocation Block Duration, Number of Blocks, and Allocation Block Period subfields are the same as defined in 9.4.2.131.

The Number of Alternate TX BI subfield indicates the duration of transmission phase in the alternate channel in terms of number of beacon intervals.

The Number of Suspension BI subfield indicates the duration of the suspension phase in the alternate channel in terms of the number of beacon intervals.

9.4.2.222 SSW Report element

The SSW Report element is used by a non-AP and non-PCP CDMG STA to report beamforming training information to an CDMG AP or PCP (see 11.30.1) or used by a responder STA to deliver the backup sector information to an initiator STA. The SSW Report element is defined in Figure 9-740.

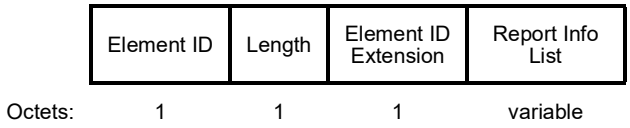

Figure 9-740—SSW Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Report Info List field contains one or more Report Info fields.

A Report Info field is formatted as defined in Figure 9-741 when its SSW Report Control subfield is 1; otherwise, a Report Info field is formatted as defined in Figure 9-742.

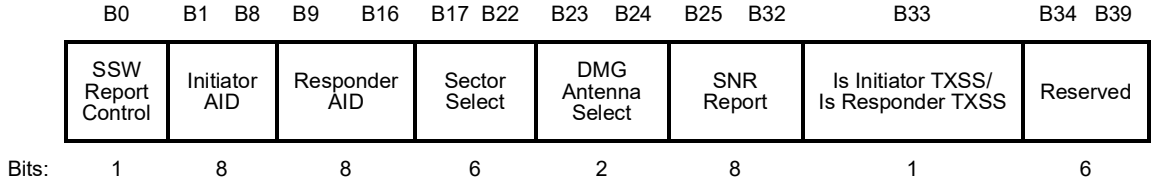

Figure 9-741—Report Info field format when the SSW Report Control subfield is 1

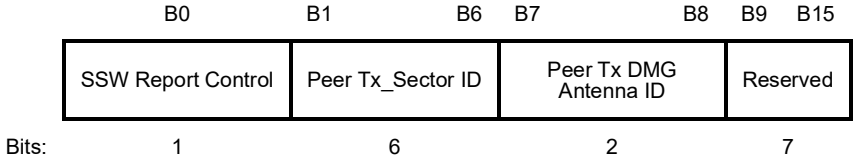

Figure 9-742—Report Info field format when the SSW Report Control subfield is 0

The SSW Report Control subfield indicates the format of the Report Info field.

The Initiator AID subfield identifies the STA that is the initiator of the beamforming training.

The Responder AID subfield identifies the STA that is the responder of the beamforming training.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Sector Select subfield is defined in 9.5.3.

The DMG Antenna Select subfield is defined in 9.5.3.

The SNR Report subfield is defined in 9.5.3.

The Is Initiator TXSS/Is Responder TXSS subfield is set to 1 to indicate that an initiator TXSS has been performed between the initiator and the responder. This subfield is set to 0 to indicate that a responder TXSS has been performed between the initiator and the responder.

If the SSW Report Control subfield is 0, the Peer Tx_Sector ID subfield indicates the Sector ID of the alternative Tx sector of the peer STA. The determination of the alternative Tx sector is implementation dependent. Possible values of this subfield range from 0 to 63. Otherwise, the Peer Tx_Sector ID subfield is reserved.

If the SSW Report Control subfield is 0, the Peer Tx DMG Antenna ID subfield indicates the alternative DMG antenna ID of the alternative Tx DMG antenna of the peer STA. The determination of the alternative Tx DMG antenna is implementation dependent. Otherwise, the Peer Tx DMG Antenna ID subfield is reserved.

9.4.2.223 Cluster Probe element

The Cluster Probe element is used to probe the presence of a CDMG AP or PCP cluster operating on the common 2.16 GHz channel by the CDMG AP or PCP operating on a 1.08 GHz channel. This element can be included in a DMG Beacon, Announce, or Probe Request frame. The Cluster Probe element is shown in Figure 9-743.

	Element ID	Length	Element ID Extension	Request Token	SP Offset	SP Space	SP Duration	Repetition Count
Octets:	1	1	1	2	2	4	2	1

Figure 9-743—Cluster Probe element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Request Token field is set to a nonzero value chosen by the requesting AP or PCP.

The SP Offset field is set to the offset of the start of the first SP from the frame that contains this element, expressed in TUs. The reference time is the start of the preamble of the PPDU that contains this element.

The SP interval field is set to the spacing between the start of two consecutive SP intervals, expressed in TUs.

The SP Duration field is set to duration of a single SP, expressed in TUs.

The Repetition Count field is set to the number of requested SPs.

9.4.2.224 Extended Cluster Report element

The Extended Cluster Report element is used to report the cluster synchronization and control information to the cluster probe requesting CDMG AP or PCP by the S-AP or S-PCP of a CDMG AP or PCP cluster. The Extended Cluster Report element is also used by an S-AP to report the cluster information of the S-APs

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

within the same CCSS for an AP or PCP that intends to join the centralized cluster. This element can be included in a DMG Beacon, Announce, or Probe Response frame transmitted by a CDMG AP or PCP. The Extended Cluster Report element is shown in Figure 9-744.

	Element ID	Length	Element ID Extension	Extended Cluster Report Control	Request Token	Next BTI Offset	Reported Clustering Control	Reported BI Duration	Cluster Channel Number	Available Cluster Offset Bitmap
Octets:	1	1	1	1	0 or 2	4	8	0 or 2	0 or 1	0 or 4

Figure 9-744—Extended Cluster Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

If the Extended Cluster Report Control field is 0, this element is used in decentralized clustering mechanism, and the Reported BI Duration, Cluster Channel Number, and Available Cluster Offset Bitmap fields are not present in this element. Otherwise, this element is used in centralized clustering mechanism, and the Request Token field is not present in this element.

The Request Token field value is copied from the corresponding received Cluster Probe element.

The Next BTI Offset field contains the low order 4 octets of the TSF for the earliest time at which the next BTI in a subsequent beacon interval starts.

The Reported Clustering Control field is defined in 9.3.4.1 and contains the Clustering Control field in the last transmitted DMG Beacon frame of the S-AP or S-PCP or the reported S-AP.

The Reported BI Duration field is set to the beacon interval value of the reported S-AP, expressed in TUs.

The Cluster Channel Number field is set to the operating channel number of the reported S-AP.

The Available Cluster Time Offset Bitmap field is set to the Available Cluster Time Offset Bitmap field of the reported S-AP's ECAPC Policy element.

9.4.2.225 Cluster Switch Announcement element

A CDMG AP or PCP transmits the Cluster Switch Announcement element to its original cluster before switching from a cluster to another. One of the synchronization pair APs or PCPs also transmits the Cluster Switch Announcement element to its peer CDMG AP or PCP before joining a cluster. The Cluster Switch Announcement element can be included in the DMG Beacon frame or Announce frame transmitted by a CDMG AP or PCP and received by other member CDMG APs or member CDMG PCPs. The format of the Cluster Switch Announcement element is shown in Figure 9-745.

	Element ID	Length	Element ID Extension	New Channel Number	Reference Timestamp	Reported Clustering Control	Reported BI Duration	Cluster Switch Count
Octets:	1	1	1	2	2	4	2	1

Figure 9-745—Cluster Switch Announcement element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The New Channel Number field is set to the operating channel number of the target cluster after cluster switching.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the STA's MAC received the DMG Beacon frame of the S-AP or S-PCP of the target cluster.

The Reported Clustering Control field contains the Clustering Control field included in the received DMG Beacon frame of the S-AP or S-PCP.

The Reported BI Duration field is set to the beacon interval value of the reported S-AP or S-PCP, expressed in TUs.

The Cluster Switch Count field either is set to the number of TBTTs until the AP or PCP sending the Cluster Switch Announcement element switches to the new cluster or is set to 0. This field is set to 1 to indicate that the switch occurs immediately before the next TBTT. It is set to 0 to indicate that the switch occurs at any time after the frame containing the element is transmitted.

9.4.2.226 Enhanced Beam Tracking element

The Enhanced Beam Tracking element is used to configure the alternative link of a CDMG STA, track the alternative link of the enhanced beam tracking initiator and responder, and switch to an alternative link from the current link. The element can be included in a BRP, DMG Beacon, Information Request, or Information Response frame transmitted by a CDMG STA.

The format of the Enhanced Beam Tracking element is shown in Figure 9-746.

	Element ID	Length	Element ID Extension	E-BT Control	Peer Tx Antenna Parameter
Octets:	1	1	1	1	1

Figure 9-746—Enhanced Beam Tracking element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.225.

The E-BT Control field is defined in Figure 9-747.

B0	B1	B2	B3	B4	B5	B6	B7
Backup AWV Setting		Peer E-BT-R Request	E-BT-R Enabled	Peer E-BT-T Request	E-BT-T Enabled	Switching to Backup AWV Request	Switching to Backup AWV Enabled
Bits: 2		1	1	1	1	1	1

Figure 9-747—E-BT Control field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Backup AWV Setting subfield is used to set the alternative AWV of the peer STA. The default alternative AWV of the peer STA is set to omnidirectional. If the Backup AWV Setting subfield is 0, the peer STA does not update the alternative AWV. If the Backup AWV Setting subfield is 1, the peer STA set the alternative AWV according to the AWV specified by the Peer Tx Antenna Parameter field. If the Backup AWV Setting subfield is 2, the current received AWV of peer is used to update the alternative AWV; if the Backup AWV Setting subfield is 3, the last transmitted AWV of peer is used to update the alternative AWV.

The Peer E-BT-R Request subfield is set to 1 to indicate that the peer STA is requested to enable enhanced beam tracking to receive the e-TRN-R training sequences; otherwise, it is set to 0.

The E-BT-R Enabled subfield is set to 1 to indicate that the requested peer STA acknowledges that it has enabled enhanced receive beam tracking to receive the e-TRN-R training sequences; otherwise, it is set to 0.

The Peer E-BT-T Request subfield is set to 1 to indicate that the peer STA is requested to enable enhanced transmit beam tracking to transmit the e-TRN-T training sequences; otherwise, it is set to 0.

The E-BT-T Enabled subfield is set to 1 to indicate that the requested peer STA acknowledges that it has enabled enhanced transmit beam tracking to transmit the e-TRN-T training sequences; otherwise, it is set to 0.

The Switching to Backup AWV Request subfield is set to 1 to indicate that the peer STA is requested to switch to the alternative AWV; otherwise, it is set to 0.

The Switching to Backup AWV Enabled subfield is set to 1 to indicate that the requested STA acknowledges that its antenna setting is to be switched to the alternative AWV before the next frame and to set the AWV of the current link as the new alternative AWV; otherwise, it is set to 0.

The Peer TX Antenna Parameter field is defined in Figure 9-748.

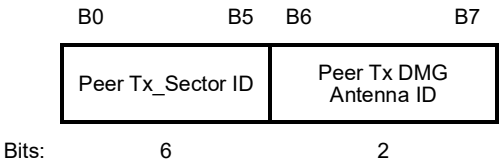

Figure 9-748—Peer TX Antenna Parameter field format

If the Backup AWV Setting subfield is 1, the Peer Tx_Sector ID field is set to the Sector ID of the alternative Tx AWV of the peer STA. Otherwise, the Peer Tx_Sector ID field is reserved.

If the Backup AWV Setting subfield is 1, the Peer Tx DMG Antenna ID field indicates the DMG antenna ID of the alternative Tx AWV of the peer STA. Otherwise, the Peer Tx DMG Antenna ID field is reserved.

9.4.2.227 SPSH Report element

The SPSH Report element is used for an AP or PCP in a cluster to report the possibility of spatial sharing and coexistence between links in other BSSs and links in its own BSS. The SPSH Report element is transmitted in the DMG Beacon frame by a CDMG AP or PCP and is defined in Figure 9-749. Because the length parameter supports only 255 octets of payload in an element, the AP or PCP can split the SPSH List fields into more than one SPSH Report element entry in the same DMG Beacon or Announce frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

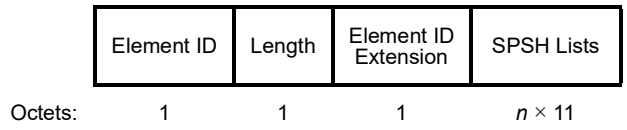

Figure 9-749—SPSH Report element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The SPSH Lists field contains one or more (*n*) SPSH List fields.

The SPSH List field contains information of non-interfering links and is defined in Figure 9-750.

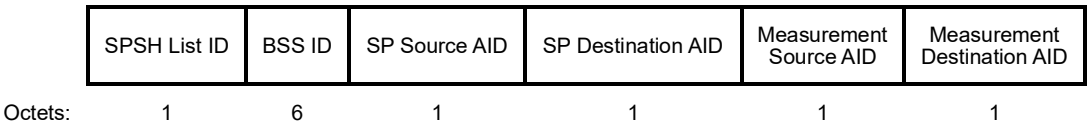

Figure 9-750—SPSH List field format

The SPSH List ID subfield indicates the identification of the SPSH List field, which is the same as the index of the corresponding field in the SPSH Report Element. It indicates that the channel measurement, between the two STAs indicated by the following Measurement Source AID subfield and the Measurement Destination AID subfield, shows no severe interference while the STA indicated by the SP Source AID subfield communicates with the STA indicated by the SP Destination AID subfield.

The BSS ID subfield indicates the identification of the measured infrastructure BSS or PBSS, which is the MAC address of the AP or PCP in the measured infrastructure BSS or PBSS.

The SP Source AID subfield indicates the AID of the transmitter STA of the link in the measured infrastructure BSS or PBSS.

The SP Destination AID subfield indicates the AID of the receiver STA of the link in the measured infrastructure BSS or PBSS. The SP Source AID and SP Destination AID subfields uniquely identify the link from the source AID STA to the destination AID STA in the BSS identified by the BSSID field.

The Measuring Source AID subfield indicates the AID of the transmitter of the link that is conducting SPSH measurement in the measured infrastructure BSS or PBSS, and the measured link does not interfere with it.

The Measuring Destination AID subfield indicates the AID of the receiver of the link that is conducting SPSH measurement in the measured infrastructure BSS or PBSS, and the measured link does not interfere with it. The Measuring Source AID and Measuring Destination AID subfields uniquely identify the link from the measuring source AID STA to the measuring destination AID STA in the BSS.

9.4.2.228 Clustering Interference Assessment element

The S-AP or S-PCP in a CDMG AP or PCP cluster uses a Clustering Interference Assessment element to enable spatial sharing in the cluster and sets channel quality measurement and control parameters of spatial sharing for their member APs or member PCPs. The Clustering Interference Assessment element can be included in the DMG Beacon frames transmitted by the CDMG S-AP or S-PCP, as shown in Figure 9-751.

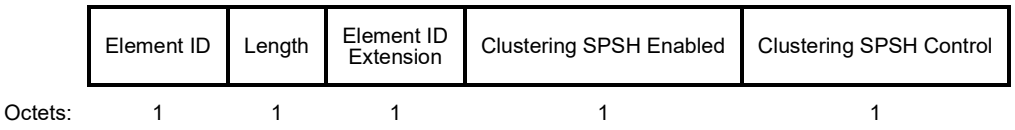

Figure 9-751—Clustering Interference Assessment element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Clustering SPSH Enabled field is set to 0 to indicate that a SPSH measurement phase starts. The Clustering SPSH Enabled field is set to 1 to indicate that the SPSH measurement phase for all member APs or member PCPs terminates and SP spatial sharing among BSSs starts. Other values are reserved. The Clustering SPSH Enabled field is set as the same as the SPSH Measurement Enabled subfield in the Clustering Control field defined in 9.3.4.2.

The Clustering SPSH Control field is defined in Figure 9-752.

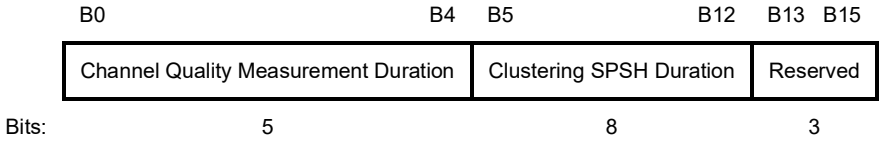

Figure 9-752—Clustering SPSH Control field format

The Channel Quality Measurement Duration subfield is set to a duration of directional channel quality measurement for all member APs or member PCPs in a CDMG AP or PCP cluster, in units of beacon intervals.

The Clustering SPSH Duration subfield is set to a duration of spatial sharing among BSSs for all member APs or member PCPs in a CDMG AP or PCP cluster, in units of beacon intervals.

9.4.2.229 CMMG Capabilities element

9.4.2.229.1 CMMG Capabilities element structure

The CMMG Capabilities element contains a number of fields that are used to advertise the CMMG capabilities of STA. The CMMG Capabilities element is defined in Figure 9-753.

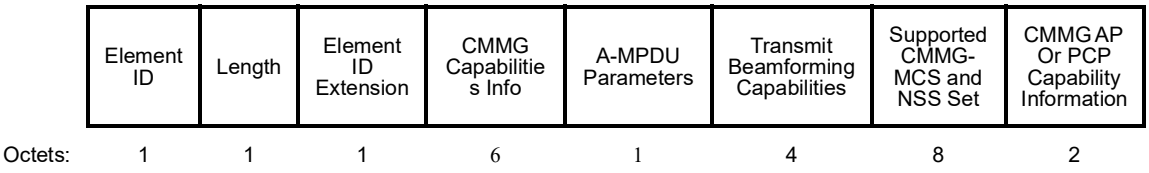

Figure 9-753—CMMG Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.229.2 CMMG Capabilities Info field

The structure of the CMMG Capabilities Info field is defined in Figure 9-754.

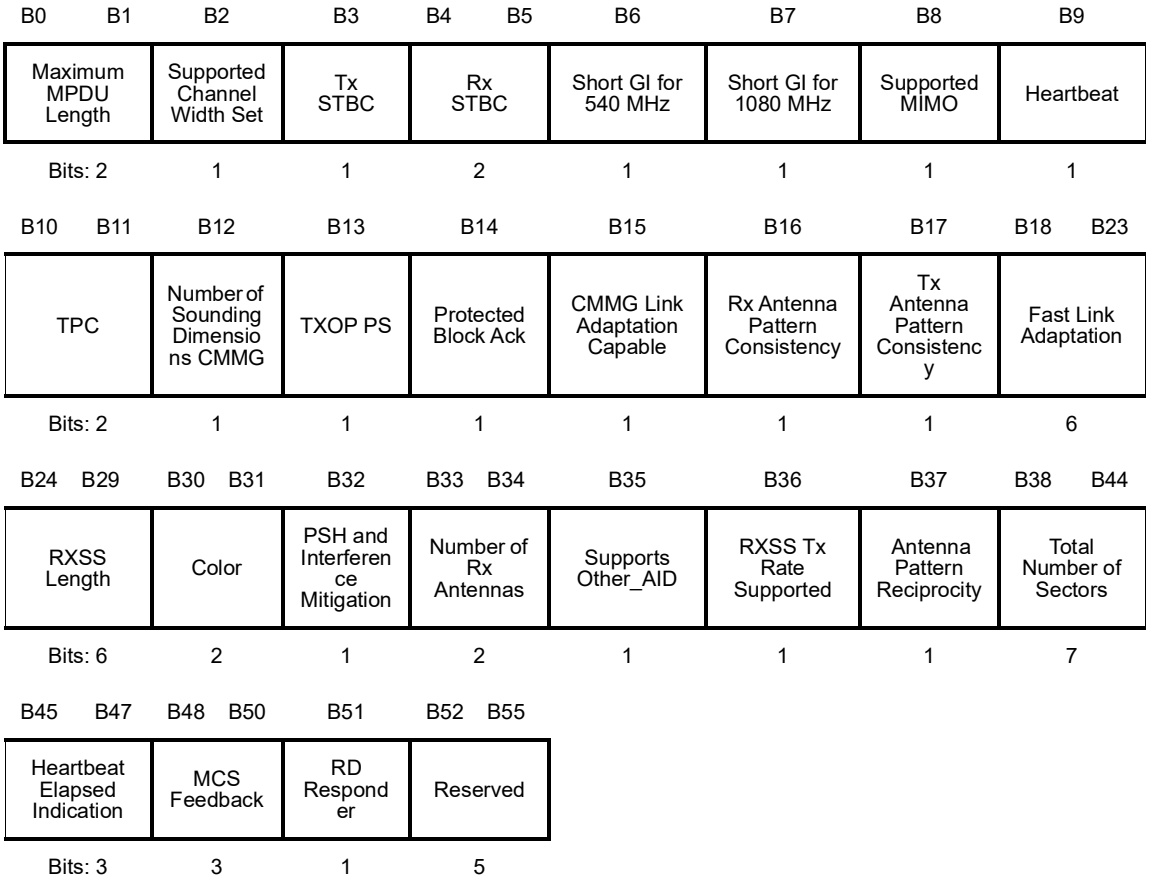

Figure 9-754—CMMG Capabilities Info field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The subfields of the CMMG Capabilities Info field are defined in Table 9-313.

Table 9-313—Subfields of the CMMG Capabilities Info field

Subfield	Definition	Encoding
Maximum MPDU Length	Indicates the maximum MPDU length (see 10.12).	Set to 0 for 3895 octets. Set to 1 for 7991 octets. Set to 2 for 11 454 octets. The value 3 is reserved.
Supported Channel Width Set	Indicates the channel widths supported by the STA. See 11.47.	Set to 0 if the STA does not support 1080 MHz. Set to 1 if the STA supports 1080 MHz.
Tx STBC	Indicates support for the transmission of at least 2x1 STBC.	Set to 0 if not supported. Set to 1 if supported.
Rx STBC	Indicates support for the reception of PPDUs using STBC.	Set to 0 for no support. Set to 1 for support of one spatial stream. Set to 2 for support of one and two spatial streams. The value 3 is reserved.
Short GI for 540 MHz	Indicates short GI support for the reception of PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH set to CMMG_CBW540.	Set to 0 if not supported. Set to 1 if supported.
Short GI for 1080 MHz	Indicates short GI support for the reception of PPDUs transmitted with the TXVECTOR parameter CH_BANDWIDTH set to CMMG_CBW1080.	Set to 0 if not supported. Set to 1 if supported.
Supported MIMO	Indicates whether the STA supports MIMO.	The Supported MIMO field is set to 1 if the STA supports the SC and OFDM MIMO and is set to 0 otherwise.
Heartbeat	Indicate that whether the STA expects to receive a frame from the AP or PCP during the ATI and expects to receive a frame with the CMMG Control modulation from a source CMMG STA at the beginning of an SP or TXOP.	Set to 1 to indicate that the STA expects to receive a frame from the AP or PCP during the ATI and expects to receive a frame with the CMMG Control modulation from a source CMMG STA at the beginning of an SP or TXOP. Otherwise, this field is set to 0.
TPC	Indicates whether the STA supports TPC.	The TPC field is set to 1 if the STA supports the TPC as defined in 11.7 and is set to 0 otherwise.
Number of Sounding Dimensions	Beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for a CMMG NDP.	If beamformer capable, set to the maximum supported value of the TXVECTOR parameter NUM_STS minus 1. Otherwise, reserved.
TXOP PS	Indicates whether the AP supports CMMG TXOP power save mode or whether the non-AP STA has enabled CMMG TXOP power save mode.	Set to 0 if the AP does not support TXOP power save mode. Set to 1 if the AP supports TXOP power save mode. Set to 0 if the non-AP STA does not enable TXOP power save mode. Set to 1 if the non-AP STA enables TXOP power save mode.

Table 9-313—Subfields of the CMMG Capabilities Info field *(continued)*

Subfield	Definition	Encoding
Protected Block Ack	Indicates support for protected block ack operation. See 10.25.7.	Set to 0 if not supported. Set to 1 if supported. Support indicates that the STA is able to accept an ADDBA request for protected block ack.
CMMG Link Adaptation Capable	Indicates whether the STA supports link adaptation using CMMG variant HT Control field.	Set to 0 (No Feedback) if the STA does not provide CMMG MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited CMMG MFB. Set to 3 (Both) if the STA can provide CMMG MFB in response to CMMG MRQ and if the STA provides unsolicited CMMG MFB. The value 1 is reserved.
Rx Antenna Pattern Consistency	Indicates the possibility of a receive antenna pattern change.	Set to 0 if the receive antenna pattern might change during the lifetime of the current association. Set to 1 if the receive antenna pattern does not change during the lifetime of the current association. See 11.48.6.
Tx Antenna Pattern Consistency	Indicates the possibility of a transmit antenna pattern change.	Set to 0 if the transmit antenna pattern might change during the lifetime of the current association. Set to 1 if the transmit antenna pattern does not change during the lifetime of the current association. See 11.48.6.
Fast Link Adaptation	Indicates whether the STA supports fast link adaptation.	The Fast Link Adaptation field is set to 1 to indicate that the STA supports the CMMG fast link adaptation procedure described in 10.44.3. Otherwise, it is set to 0.
RXSS Length	Specifies the total number of receive sectors combined over all receive antennas of the STA.	The value represented by this field is in the range 2 to 128 and is given by (RXSS Length+1)×2. The maximum number of SSW frames transmitted during an RXSS is equal to the value of (RXSS Length+1)×2 times the total number of transmit antennas of the peer device.
Color	Indicates the value that is used for the TXVECTOR parameter COLOR in frames transmitted by members of this BSS, as described in 10.19.	Set to an unsigned integer if sent by an AP. Otherwise reserved.
SPSH and Interference Mitigation	Indicate whether the STA is capable of performing the function of SPSH and interference mitigation or not.	Set to 1 if the STA is capable of performing the function of SPSH and interference mitigation and if dot11RadioMeasurementActivated is true and is set to 0 otherwise (see 10.34).
Number of Rx Antennas	Indicates the total number of receive antennas of the STA.	Set to the number of antennas minus 1.
Supports Other_AID	Indicate that the STA sets its AWV configuration according to the Other_AID subfield in the BRP Request field.	Set to 1 if the value of the Other_AID subfield is different from zero. Otherwise, this field is set to 0.
RXSSTxRate Supported	Indicate whether the STA can perform an RXSS with the SSW frames transmitted at MCS 1 of the CMMG SC modulation class or not.	Set to 1 to indicate that the STA can perform an RXSS with the SSW frames transmitted at MCS 1 of the CMMG SC modulation class. Otherwise, it is set to 0.

Table 9-313—Subfields of the CMMG Capabilities Info field *(continued)*

Subfield	Definition	Encoding
Antenna Pattern Reciprocity	Indicate whether the transmit antenna pattern associated with an AWV is the same as the receive antenna pattern for the same AWV or not.	Set to 1 to indicate that the transmit antenna pattern associated with an AWV is the same as the receive antenna pattern for the same AWV. Otherwise, this field is set to 0.
Total Number of Sectors	Indicates the total number of transmit sectors the STA uses in a transmit sector sweep combined over all antennas.	Set to the number of transmit sectors minus 1.
Heartbeat Elapsed Indication	Used to calculate the value of the heartbeat elapsed time.	The heartbeat elapsed time is computed according to the following equation: $T_{HE} = \begin{cases} 0, F_{HE} = 0 \\ \frac{2^{F_{HE}}}{4}, F_{HE} > 0 \end{cases}$ where T_{HE} is the heartbeat elapsed time (in milliseconds); F_{HE} is the value of the Heartbeat Elapsed Indication subfield.
MCS Feedback	Indicates whether the STA can provide MFB.	Set to 0 (No Feedback) if the STA does not provide MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited MFB. Set to 3 (Both) if the STA can provide MFB in response to MRQ (either Delayed or Immediate, see 10.32) as well as unsolicited MFB The value 1 is reserved.
RD Responder	Indicates support for acting as a reverse direction responder, i.e., the STA might use an offered RDG to transmit data to an RD initiator using the reverse direction protocol described in 10.27.	Set to 0 if not supported. Set to 1 if supported.
NOTE—The value for the Maximum MPDU Length subfield in the CMMG Capabilities Info field imposes a constraint on the allowed value of the Maximum MPDU Length in the CMMG Capabilities Info field of the CMMG Capabilities element carried in the same frame (see 10.11).

9.4.2.229.3 A-MPDU Parameters field

The structure of the A-MPDU Parameters field of the CMMG Capabilities element is shown in Figure 9-755. The definition for the subfields of the A-MPDU Parameters field is shown in Table 9-314.

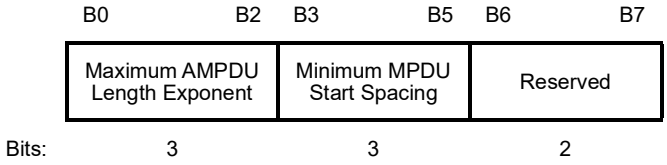

Figure 9-755—A-MPDU Parameters field format

Table 9-314—Subfields of the A-MPDU Parameters field

Subfield	Definition	Encoding
Maximum AMPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive. EOF padding is not included in this limit.	The length defined by this field is equal to $2^{(13 + \text{MaximumA} - \text{PPDUULenghtExponent}))}$ octets.
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP. See 9.7.3.	Set to 0 for no restriction. Set to 1 for 16 ns. Set to 2 for 32 ns. Set to 3 for 64 ns. Set to 4 for 128 ns. Set to 5 for 256 ns. Set to 6 for 512 ns. Set to 7 for 1024 ns.

9.4.2.229.4 Supported CMMG-MCS and NSS Set field

The Supported CMMG-MCS and NSS Set field is used to convey the combinations of CMMG-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The structure of the field is shown in Figure 9-756.

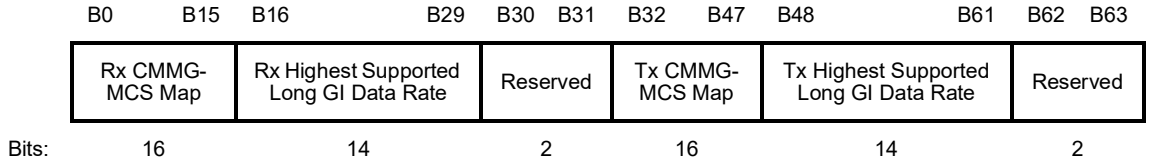

Figure 9-756—Supported CMMG-MCS and NSS Set field format

The Supported CMMG-MCS and NSS Set subfields are defined in Table 9-315.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-315—Supported CMMG-MCS and NSS Set subfields

Subfield	Definition	Encoding
Rx CMMG-MCS Map	Indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-757 and the associated description.
Rx Highest Supported Long GI Data Rate	Indicates the highest CMMG PPDU data rate that the STA is able to receive.	The largest integer value less than or equal to the highest CMMG PPDU data rate in Mb/s the STA is able to receive (see 10.6.15.1). The value 0 indicates that this subfield does not specify the highest CMMG PPDU data rate that the STA is able to receive.
Tx CMMG-MCS Map	Indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams.	The format and encoding of this subfield are defined in Figure 9-757 and the associated description.
Tx Highest Supported Long GI Data Rate	Indicates the highest CMMG PPDU data rate at which the STA is able to transmit.	The largest integer value less than or equal to the highest CMMG PPDU data rate in Mb/s the STA is able to receive/transmit (see 10.6.15.2). The value 0 indicates that this subfield does not specify the highest CMMG PPDU data rate that the STA is able to receive transmit.

The Rx CMMG-MCS Map subfield and the Tx CMMG-MCS Map subfield have the structure shown in Figure 9-757.

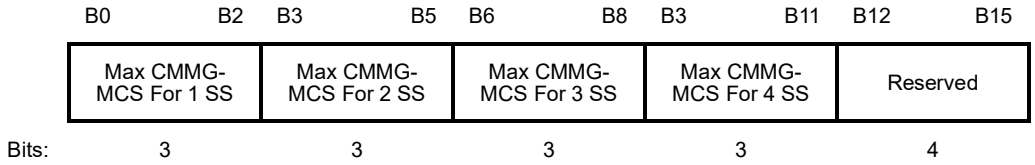

Figure 9-757—Rx CMMG-MCS Map and Tx CMMG-MCS Map subfields and Basic CMMG-MCS and NSS Set field format

The Max CMMG-MCS For *n* SS subfield (where *n* = 1, 2, 3, 4) is encoded as follows:

— 0 indicates support for SC CMMG-MCSs 1 to 5 or OFDM CMMG-MCSs 9 to 13 for *n* spatial streams
— 1 indicates support for SC CMMG-MCSs 1 to 6 or OFDM CMMG-MCSs 9 to 14 for *n* spatial streams
— 2 indicates support for SC CMMG-MCSs 1 to 7 or OFDM CMMG-MCSs 9 to 15 for *n* spatial streams
— 3 indicates support for SC CMMG-MCSs 1 to 8 or OFDM CMMG-MCSs 9 to 16 for *n* spatial streams
— 4–7 indicate that *n* spatial streams are not supported

9.4.2.229.5 Transmit Beamforming Capabilities field

The structure of the Transmit Beamforming Capabilities field is defined in Figure 9-758.

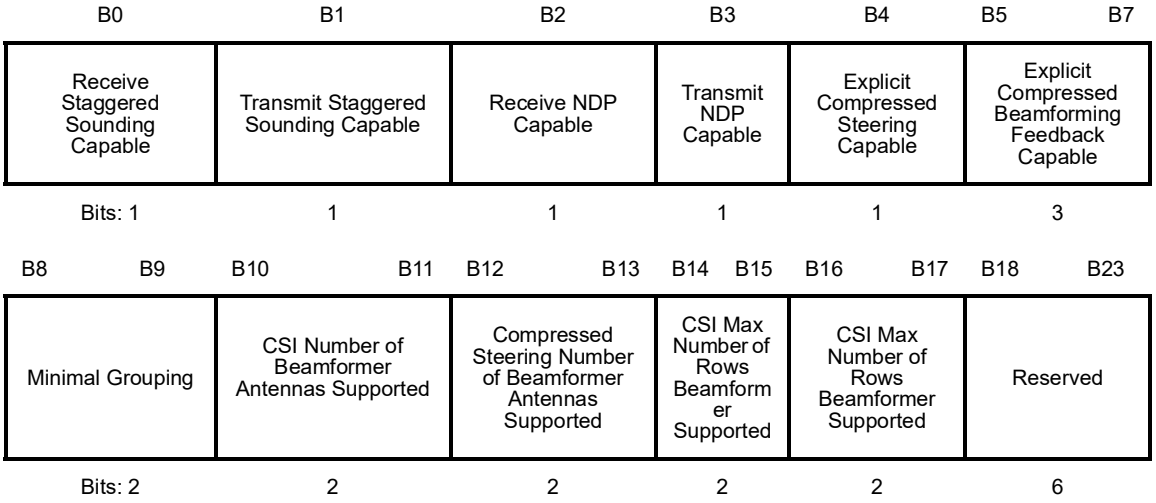

Figure 9-758—Transmit Beamforming Capabilities field format

The subfields of the Transmit Beamforming Capabilities field are defined in Table 9-316.

Table 9-316—Subfields of the Transmit Beamforming Capabilities field

Subfield	Definition	Encoding
Receive Staggered Sounding Capable	Indicates whether this STA can receive staggered sounding frames.	Set to 0 if not supported. Set to 1 if supported.
Transmit Staggered Sounding Capable	Indicates whether this STA can transmit staggered sounding frames.	Set to 0 if not supported. Set to 1 if supported.
Receive NDP Capable	Indicates whether this receiver can interpret null data PPDUs as sounding frames.	Set to 0 if not supported. Set to 1 if supported.
Transmit NDP Capable	Indicates whether this STA can transmit null data PPDUs as sounding frames.	Set to 0 if not supported. Set to 1 if supported.
Explicit Compressed Steering Capable	Indicates whether this STA can apply transmit beamforming using compressed beamforming feedback matrix explicit feedback in its transmission.	Set to 0 if not supported. Set to 1 if supported.
Explicit Compressed Beamforming Feedback Capable	Indicates whether this receiver can return compressed beamforming feedback matrix explicit feedback.	Set to 0 if not supported. Set to 1 for delayed feedback. Set to 2 for immediate feedback. Set to 3 for delayed and immediate feedback.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-316—Subfields of the Transmit Beamforming Capabilities field *(continued)*

Subfield	Definition	Encoding
Minimal Grouping	Indicates the minimal grouping used for explicit feedback reports.	Set to 0 if the STA supports groups of 1 (no grouping). Set to 1 indicates groups of 1, 2. Set to 2 indicates groups of 1, 4. Set to 3 indicates groups of 1, 2, 4. Set to 4 indicates groups of 1, 6. Set to 5 indicates groups of 1, 2, 6. Set to 6 indicates groups of 1, 4, 6. Set to 7 indicates groups of 1, 2, 4, 6.
CSI Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the CMMG beamformee can support when CSI feedback is required.	Set to 0 for single Tx antenna sounding. Set to 1 for 2 Tx antenna sounding. Set to 2 for 3 Tx antenna sounding. Set to 3 for 4 Tx antenna sounding.
Compressed Steering Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the beamformee can support when compressed beamforming feedback matrix is required.	Set to 0 for single Tx antenna sounding. Set to 1 for 2 Tx antenna sounding. Set to 2 for 3 Tx antenna sounding. Set to 3 for 4 Tx antenna sounding.
CSI Max Number of Rows Beamformer Supported	Indicates the maximum number of rows of CSI explicit feedback from the CMMG beamformee that a CMMG beamformer can support when CSI feedback is required.	Set to 0 for a single row of CSI. Set to 1 for 2 rows of CSI. Set to 2 for 3 rows of CSI. Set to 3 for 4 rows of CSI.
Channel Estimation Capability	Indicates the maximum number of space-time streams (columns of the MIMO channel matrix) for which channel dimensions can be simultaneously estimated when receiving an NDP sounding PPDU or the extension portion of the MCTFs in a staggered sounding PPDU.	Set 0 for 1 space-time stream. Set 1 for 2 space-time streams. Set 2 for 3 space-time streams. Set 3 for 4 space-time streams.
NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the MCTFs corresponding to the data portion of the packet is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the CMMG Capabilities Info field. Both fields are part of the CMMG Capabilities element.		

9.4.2.229.6 CMMG AP Or PCP Capability Information field

The CMMG AP Or PCP Capability Information field, defined in Figure 9-759, represents the capabilities, when the transmitting STA performs in the role of AP or PCP, that are in addition to the capabilities in the CMMG Capabilities Info field.

The TDDTI (time division data transfer interval) subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing channel access as defined in 10.39.6 and 11.4 and is set to 0 otherwise.

The Pseudo-static Allocations subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing pseudo-static allocations as defined in 10.39.6.4 and is set to 0 otherwise. The Pseudo-static Allocations subfield is set to 1 only if the TDDTI subfield in the CMMG AP Or PCP Capability Information field is equal to 1. The Pseudo-static Allocations subfield is reserved if the TDDTI subfield in the CMMG AP Or PCP Capability Information field is equal to 0.

The PCP Handover field is set to 1 if the STA, while operating as a PCP, is capable of performing a PCP handover as defined in 11.29.2 and is set to 0 if the STA does not support PCP handover.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

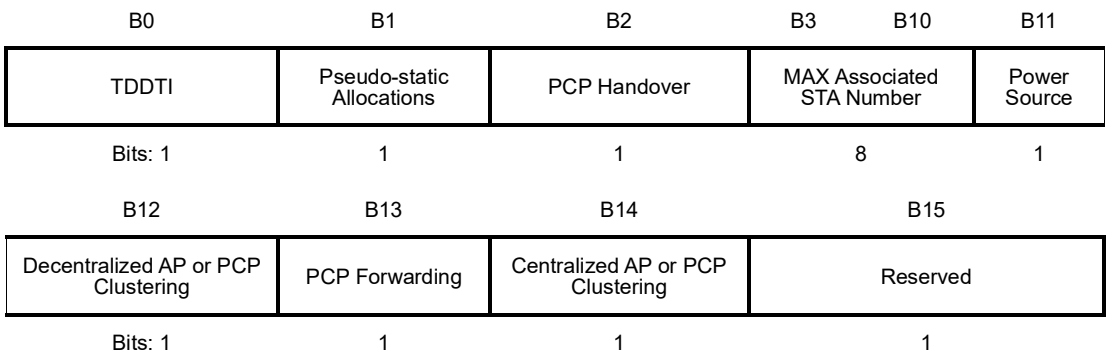

Figure 9-759—CMMG AP Or PCP Capability Information field format

The MAX Associated STA Number field indicates the maximum number of STAs that the STA can perform association with if operating as an AP or PCP. The value of this field includes the STAs, if any, that are collocated with the AP or PCP.

The Power Source field is set to 0 if the STA is battery powered and is set to 1 otherwise.

The Decentralized AP or PCP Clustering field is set to 1 if the STA, when operating as an AP or PCP, is capable of performing decentralized AP or PCP clustering and is set to 0 otherwise.

The PCP Forwarding field is set to 1 if the STA, while operating as a PCP, is capable of forwarding frames it receives from a non-PCP STA and destined to another non-PCP STA in the PBSS. This field is set to 0 otherwise.

The Centralized AP or PCP Clustering field is set to 1 if the STA, when operating as an AP or PCP, is capable of performing centralized AP or PCP clustering and is set to 0 otherwise. An AP or PCP that is incapable of performing centralized AP or PCP clustering is subject to requirements as described in 10.40.2.2.

9.4.2.230 CMMG Operation element

The operation of CMMG STAs in the BSS is controlled by the CMMG Operation element. The format of the CMMG Operation element is defined in Figure 9-760.

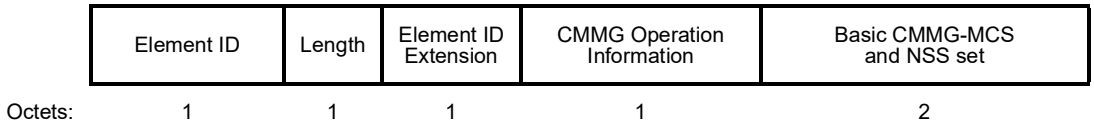

Figure 9-760—CMMG Operation element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The structure of the CMMG Operation Information field is defined in Figure 9-761.

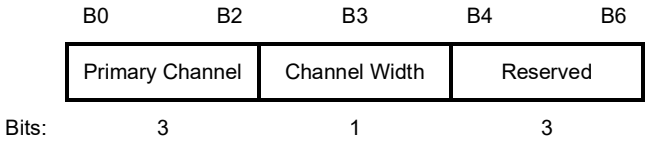

Figure 9-761—CMMG Operation Information field format

The subfields of the CMMG Operation Information field are defined in Table 9-317.

Table 9-317—CMMG Operation Information field format

Subfield	Definition	Encoding
Primary Channel	Indicates the channel number of the primary channel; see 25.10.	Channel number of the primary channel.
Channel Width	This field defines the BSS operating channel width.	Set to 0 for 540 MHz operating channel width. Set to 1 for 1080 MHz operating channel width.

The Basic CMMG-MCS and NSS Set field indicates the CMMG-MCSs for each number of spatial streams in CMMG PPDUs that are supported by all CMMG STAs in the BSS (including IBSS and MBSS). The Basic CMMG-MCS and NSS Set field is a bitmap of size 2 bits. The Basic CMMG-MCS and NSS Set field is defined in Figure 9-757.

9.4.2.231 CMMG Operating Mode Notification element

The CMMG Operating Mode Notification element is used to notify STAs that the transmitting STA is changing its operating channel width, the maximum number of spatial streams it can receive, or both. The format of the CMMG Operating Mode Notification element is defined in Figure 9-762.

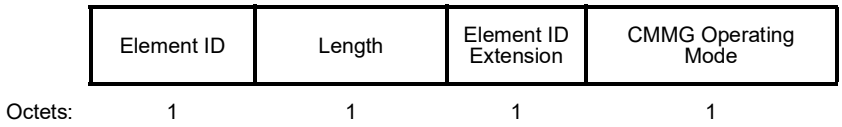

Figure 9-762—CMMG Operating Mode Notification element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The CMMG Operating Mode field is defined in 9.4.1.63.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.232 CMMG Link Margin element

9.4.2.232.1 General

The format of the CMMG Link Margin element is shown in Figure 9-763. The CMMG Link Margin element is included in a Link Measurement Report frame.

	Element	Length	Element ID Extension	Activity	MCS	Link Margin	SNR	Reference Timestamp
Octets:	1	1	1	1	1	1	1	4

Figure 9-763—CMMG Link Margin element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Activity field is set to a preferred action that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame execute. The method by which the sending STA determines a suitable action for the peer STA is implementation specific. The Activity field is defined in 9.4.2.232.2.

The MCS field is set to an MCS value that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame use to transmit frames to this STA. The reference PER for selection of the MCS is for an MPDU length of 4096 octets. The method by which the sending STA determines a suitable MCS for the peer STA is implementation specific. The Link Margin field contains the measured link margin of the Data frames received from the peer STA indicated in the RA field of the Link Measurement Report frame and is coded as a 2s complement signed integer in units of decibels. Setting the field to –128 indicates that no link margin is provided. The measurement method of link margin is beyond the scope of this standard.

The SNR field indicates the SNR measured during the reception of a PPDU. Values are from –13 dB to 50.75 dB in 0.25 dB steps.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA indication (IDLE) signal that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

9.4.2.232.2 Activity field

The Activity field values are defined in Table 9-318.

Table 9-318—Activity field values

Preferred Action value	Meaning
0	No change preferred
1	Change(d) MCS
2	Decrease(d) transmit power
3	Increase(d) transmit power

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-318—Activity field values *(continued)*

Preferred Action value	Meaning
4	Fast session transfer (FST)
5	Power conserve mode
6	Perform SLS
7–255	Reserved

9.4.2.233 CMMG Link Adaptation Acknowledgment element

The format of the CMMG Link Adaptation Acknowledgment element is shown in Figure 9-764. The CMMG Link Adaptation Acknowledgment element is carried in the Optional Subelements field of the Link Measurement Report frame.

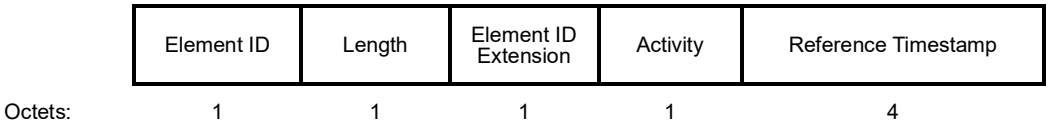

Figure 9-764—CMMG Link Adaptation Acknowledgment element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Activity field is set to the action that the STA sending this element has executed following the reception of the recommended activity in a Link Measurement Report frame. The method by which the sending STA determines the action is described in 10.32, and the Activity field is defined in 9.4.2.232.2.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA indication (IDLE) signal that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

9.4.2.234 GLK-GCR Parameter Set element

The GLK-GCR Parameter Set element is included in an Association Request or a Reassociation Request frame transmitted by a non-AP STA to indicate its buffering capability to support GLK-GCR. The GLK-GCR Parameter Set element is included in the corresponding Association Response or Reassociation Response frame transmitted by an AP to define the parameters that are used when the GLK AP transmits groupcast frames using GLK-GCR to the associated GLK non-AP STAs. Figure 9-765 shows the fields that make up the GLK-GCR Parameter Set element.

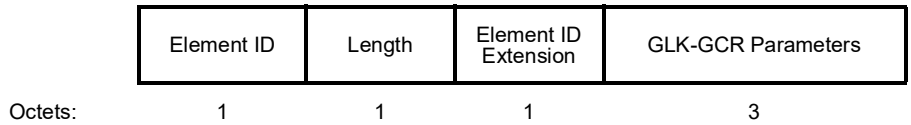

Figure 9-765—GLK-GCR Parameter Set element format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The GLK-GCR Parameters field is shown in Figure 9-766.

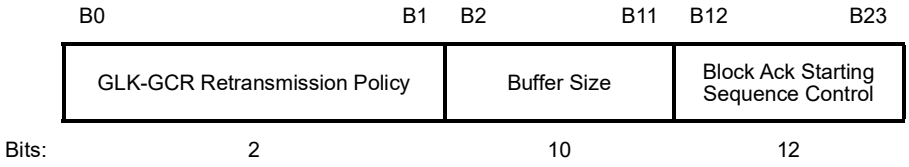

Figure 9-766—GLK-GCR Parameters field format

The GLK-GCR Retransmission Policy subfield is described in Table 9-319. This subfield is reserved when the corresponding GLK-GCR Parameters Set element is part of an Association Request or a Reassociation Request frame.

Table 9-319—GLK-GCR Retransmission Policy subfield

B0	B1	Description of the corresponding GLK-GCR mode
0	0	Reserved
0	1	GLK-GCR not operational
1	0	Operating in GLK-GCR unsolicited retry mode
1	1	Operating in GLK-GCR block ack mode

The Buffer Size subfield indicates the maximum number of buffers in the GLK-GCR block ack block. Each buffer is capable of holding a number of octets equal to the maximum size of an A-MSDU that is supported by the STA.

In an Association Request or a Reassociation Request frame, the Buffer Size subfield in a GLK-GCR Parameter Set element is intended to provide guidance for the recipient to decide its reordering buffer size. If the transmitter has no guidance for the receivers reordering buffer size it sets the Buffer Size subfield to 0.

In an Association Response or Reassociation Response frame, the Buffer Size subfield in a GLK-GCR Parameters field in the GLK-GCR Parameter Set element is set to a value greater than or equal to 1, if the GLK-GCR retransmission policy indicates GLK-GCR block ack mode. Otherwise this subfield is reserved.

The Block Ack Starting Sequence Control subfield indicates the sequence number of the first MSDU or A-MSDU for this GLK-GCR block ack agreement, and is defined in 9.3.1.8. This subfield is reserved when the corresponding GLK-GCR Parameters Set element is part of an Association Request or Reassociation Request frame.

9.4.2.235 Estimated Service Parameters Outbound element

The Estimated Service Parameters Outbound element is used by a STA to provide information to another STA that can then use the information as input to an algorithm to generate an estimate of outbound throughput between the two STAs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Estimated Service Parameters Outbound element is shown in Figure 9-767.

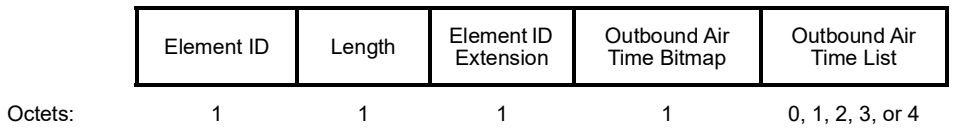

Figure 9-767—Estimated Service Parameters Outbound element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Outbound Air Time Bitmap field contains a bitmap indicating the presence or absence of an Outbound Air Time Information field for each of the four EDCA Access Categories. The format of the Outbound Air Time Bitmap field is shown in Figure 9-768.

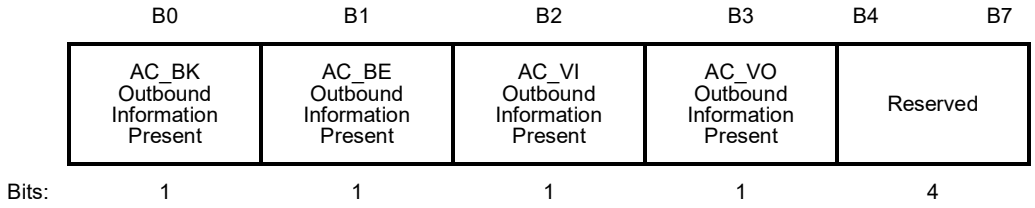

Figure 9-768—Outbound Air Time Bitmap field format

The Outbound Air Time List field contains from 0 to 4 Outbound Air Time Information fields, each corresponding to an access category for which estimated air time information for outbound traffic is provided. The Outbound Air Time Information field with the lowest numbered bits of the Outbound Air Time List field contains the outbound information corresponding to the AC of the lowest numbered bit of the Outbound Air Time Bitmap field that has a value of 1. The next Outbound Air Time Information field, if present, corresponds to the next higher numbered Outbound Air Time Bitmap field bit that has a value of 1, and so forth. If no Outbound Air Time Bitmap field bit has the value of 1, then no Outbound Air Time Information field is present. The format of the Outbound Air Time Information field is shown in Figure 9-769.

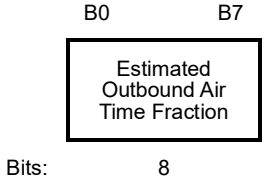

Figure 9-769—Outbound Air Time Information field format

The Estimated Outbound Air Time Fraction subfield of the Outbound Air Time Information field contains an unsigned integer that represents the predicted percentage of time, linearly scaled with 255 representing 100% and 0 representing 0%, that a new STA joining the BSS can expect to be available for the transmission of PPDUs by that STA, including overhead, where such PPDUs contain MPDUs with the Type subfield equal to Data that belong to the access category corresponding to the position of the Outbound Air Time Information field in the Outbound Air Time Bitmap field and any other MPDUs in the PPDU are considered to be overhead. A new STA joining the BSS might have a different view of the medium than the STA transmitting the Estimated Outbound Air Time Fraction, e.g. due to hidden nodes. In such cases, the new STA might experience a different actual outbound airtime fraction than that advertised in the element.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.236 OCI element

The format of the OCI element is shown in Figure 9-770.

	Element ID	Length	Element ID Extension	Operating Class	Primary Channel Number	Frequency Segment 1 Channel Number	OCT Operating Class (optional)	OCT Primary Channel Number (optional)	OCT Frequency Segment 1 Channel Number (optional)
Octets:	1	1	1	1	1	1	0 or 1	0 or 1	0 or 1

Figure 9-770—OCI element format

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Class field is set to the global operating class that corresponds to the widest bandwidth currently being used by the transmitting STA. See Annex E, Table E-4 for description of the global operating classes.

The Primary Channel Number field is set to the primary channel being used currently. The Primary Channel Number field is one of the channels from the row corresponding to the operating class as defined in Annex E or the primary 20 MHz (sub)channel allowed for HT or non-HT operation for operating classes that specify only channel center frequency indices.

The Frequency Segment 1 Channel Number field is set to the channel center frequency index of the secondary segment (frequency segment 1) being used currently, if applicable, or set to 0 otherwise. The value of the Frequency Segment 1 Channel Number field is one of the center frequency indices from the row corresponding to the operating class as defined in Annex E.

The OCT Operating Class, OCT Primary Channel Number and OCT Frequency Segment 1 fields are present if the OCI element is contained in a frame sent using the OCT procedure, i.e. an MMPDU included in an MLME-OCTunnel.request or MLME-OCTunnel.response primitive (see 11.31.5); otherwise they are not present. They have the same definition as the Operating Class, Primary Channel Number and Frequency Segment 1 fields, except that they pertain to the channel used by the STAs corresponding to the TR-MLMEs to transmit and receive PPDUs containing On-channel Tunnel Request frames.

9.4.2.237 Service Hint element

The Service Hint element provides a probabilistic representation of a set of services that are available to the BSS. The format of the Service Hint element is shown in Figure 9-771.

	Element ID	Length	Element ID Extension	Bloom Filter Information	Bloom Filter Bit Array
Octets:	1	1	1	1	variable

Figure 9-771—Service Hint element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Bloom Filter Information field represents the stochastic characteristics of a Bloom filter (Tarkoma et al. [B59]) that conveys the probabilistic data. The format of the Bloom Filter Information field is shown in Figure 9-772.

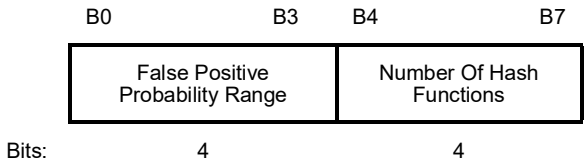

Figure 9-772—Bloom Filter Information field format

The False Positive Probability Range subfield represents the false positive probability range of the Bloom filter. The False Positive Probability Range subfield is shown in Table 9-320.

Table 9-320—False Positive Probability Range subfield values

Value	False positive probability range, p
0	$p > 25\%$
1	$20\% < p \leq 25\%$
2	$15\% < p \leq 20\%$
3	$10\% < p \leq 15\%$
4	$5\% < p \leq 10\%$
5	$1\% < p \leq 5\%$
6	$0.5\% < p \leq 1\%$
7	$0.1\% < p \leq 0.5\%$
8	$0.05\% < p \leq 0.1\%$
9	$0.01\% < p \leq 0.05\%$
10	$p \leq 0.01\%$
11–15	Reserved

The Number Of Hash Functions subfield is set to a value equal to k-1, where k is the number of hash functions used by the Bloom filter as described in 11.23.5.

The Bloom Filter Bit Array field provides an indication of the services offered by or through the AP or PCP with a target probability of false positive p. The length of the Bloom Filter Bit Array field in octets is $\lceil m/8 \rceil$ where m is the size of the Bloom filter in bits. How the size of the Bloom filter is determined is out of the scope of this standard. The maximum length of the Bloom Filter Bit Array field is 128 octets.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.2.238 Service Hash element

The Service Hash element contains one or more service hashes. The format of the Service Hash element is shown in Figure 9-773.

	Element ID	Length	Element ID Extension	Service Hashes
Octets:	1	1	1	variable

Figure 9-773—Service Hash element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Service Hashes field contains one or more 6-octet service hash values. See 11.23.4 for procedures for generating a service hash used in the Service Hash element.

9.4.2.239 GAS Extension element

The GAS Extension element is defined in 9-774. When present in the GAS Initial Request frame, the GAS Extension element indicates whether the STA is capable of receiving a Group Addressed GAS Response frame.

	Element ID	Length	Element ID Extension	GAS Flags	Maximum Channel Time	Fragment ID	Number of Response Map Duples	Response Map Duples
Octets:	1	1	1	0 or 1	0 or 1	0 or 1	0 or 1	variable

Figure 9-774—GAS Extension element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The GAS Flags field is defined in Figure 9-775.

	B0	B1	B2	B3	B4	B5 B7
	Group-addressed GAS	Fragment Retransmission	Maximum Channel Time Flag	Fragment ID Flag	Response Map Flag	Reserved
Bits:	1	1	1	1	1	3

Figure 9-775—GAS Flags field format

The Group-addressed GAS subfield is set to 1 to indicate that the STA is capable of receiving Group Addressed GAS Request and Group Addressed GAS Response frames and is set to 0 otherwise.

The Fragment Retransmission subfield, when present in a GAS Initial Response frame, is set to 1 to indicate that the responding STA is capable of retransmitting a GAS Query Response fragment upon request and is set to 0 otherwise.

The Maximum Channel Time Flag subfield is set to 1 to indicate that the Maximum Channel Time field is present in the element and is set to 0 otherwise.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Fragment ID Flag subfield is set to 1 to indicate that Fragment ID field is present in the element and is set to 0 otherwise.

The Response Map Flag subfield is set to 1 to indicate that the Number of Response Map Duples field and the Response Map Duples field are present in the element and is set to 0 otherwise.

The Maximum Channel Time field indicates the maximum duration the STA will, or needs to, remain on the channel to receive a GAS Initial Response, a GAS Comeback Response, or Group Addressed GAS Response, expressed as a multiple of 10 TUs beginning from the end of the PPDU carrying this element. The field has a valid range of 1–255.

The Fragment ID field, when present in the GAS Comeback Request, indicates the fragment the STA is requesting. It is present only when the Fragment ID Flag subfield is set to 1 in the GAS Flags field.

The Number of Response Map Duples field indicates the number of Response Map Duple subfields contained in the Response Map Duples field. It is present only when the Response Map Flag subfield is set to 1 in the GAS Flags field. When present, the Number of Response Map Duples field is set to a nonzero value and the value of zero is reserved.

The Response Map Duples field is present only when the Number of Response Map Duples field is present and contains a nonzero value. The Response Map Duples field, when present, contains one or more Response Map Duple subfields as indicated by the Number of Response Map Duples field. The format of the Response Map Duple subfield is shown in Figure 9-776. The Response Map Duples field is included in a Group Addressed GAS Response frame.

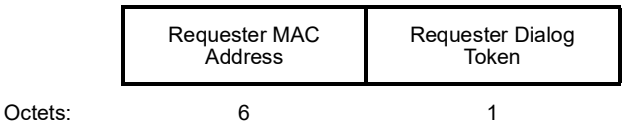

Figure 9-776—Response Map Duple subfield format

The Response Map Duple subfield contains a Requester MAC Address subfield and a Requester Dialog Token subfield. An AP or PCP includes one or more Response Map Duple subfields in a Group Addressed GAS Response frame.

9.4.2.240 Non-Inheritance element

The Non-Inheritance element when present in the Nontransmitted BSSID Profile subelement of a Multiple BSSID element identifies one or more elements that are not inherited by the BSS corresponding to the nontransmitted BSSID profile that carried it. The identified elements are present in the Management frame of the transmitted BSSID that carried the Multiple BSSID element.

The format of the Non-Inheritance element is shown in Figure 9-777.

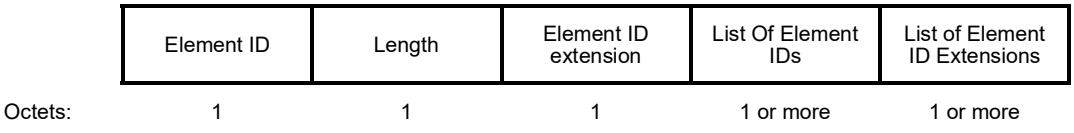

Figure 9-777—Non-Inheritance element format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the List Of Element IDs field is shown in Figure 9-778. The Length subfield of the List of Element IDs field is set to the number of elements listed in the Element ID List subfield. If the Element ID List subfield is not present, the Length subfield is set to 0. The Element ID List subfield consists of a list of Element ID values, each one octet in length. Element ID values are in increasing order and no value occurs more than once. The List Of Element IDs field does not list elements that contain an Element ID Extension field (see 9.4.2.1).

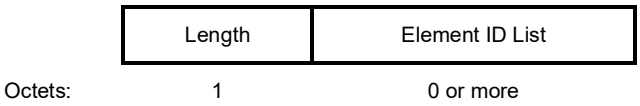

Figure 9-778—List Of Element IDs field format

The format of the List Of Element ID Extensions field is shown in Figure 9-779. The Length subfield of the List Of Element ID Extensions field is set to the number of elements listed in the Element ID Extension List subfield. If the Element ID Extension List subfield is not present, the Length subfield is set to 0. The Element ID Extension List subfield consists of a list of Element ID Extension values, each one octet in length. Element ID Extension values are in increasing order and no value occurs more than once. The List of Element ID Extensions field lists only elements that have an Element ID value of 255 (see 9.4.2.1).

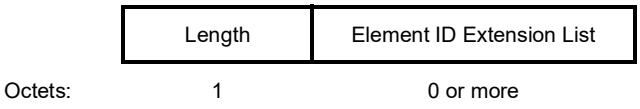

Figure 9-779—List Of Element ID Extensions field format

9.4.2.241 RSN Extension element (RSNXE)

The RSNXE field contains additional information required to establish an RSNA. The format of the RSNXE field is defined in Figure 9-780.

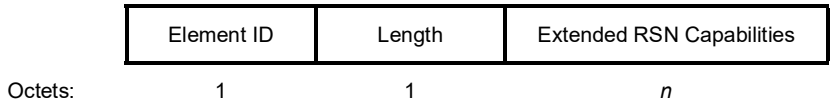

Figure 9-780—RSNXE format

The Element ID and Length fields are defined in 9.4.2.1.

The Extended RSN Capabilities field, except its first 4 bits, is a bit field indicating the extended RSN capabilities being advertised by the STA transmitting the element. The length of the Extended RSN Capabilities field is a variable *n*, in octets, as indicated by the first 4 bits in the field. The Extended RSN Capabilities field is shown in Table 9-321.

If a STA does not support any of capabilities defined in the RSNXE, then the RSNXE is not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-321—Extended RSN Capabilities field

Bit	Information	Notes
0–3	Field length	The length of the Extended RSN Capabilities field, in octets, minus 1, i.e., $n - 1$.
4	Protected TWT Operations Support	The STA sets the Protected TWT Operations Support field to 1 when dot11ProtectedTWTOperationsImplemented is true, and sets it to 0 otherwise. See 10.47.1.
5	SAE hash-to-element	The STA supports directly hashing to obtain the PWE instead of looping. See 12.4.4.2.3 and 12.4.4.3.3.
6– (8×n – 1)	Reserved	

9.4.2.242 TCLAS Mask element

The TCLAS Mask element contains a set of parameters necessary to classify incoming MSDUs into streams based on a classifier mask. The structure of this element is shown in Figure 9-781.

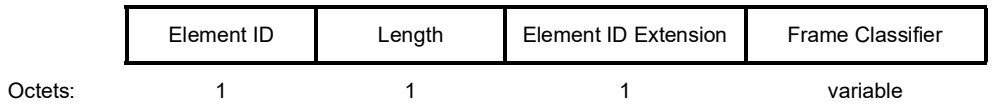

Figure 9-781—TCLAS Mask element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The Frame Classifier field specifies the parameters that are used to classify incoming MSDUs into streams. The field is defined in 9.4.2.30 (see Figure 9-303), except that, in the Classifier Parameters subfield, all subfields other than the following (if present) are reserved:

— Filter Offset subfield
— Filter Mask subfield(s) (including MAC Header Filters in Match Specification subfields)
— Protocol Number or Next Header subfield

9.4.2.243 MSCS Descriptor element

The MSCS Descriptor element defines information about the parameters used to classify streams using the procedures defined in 11.25.3. The format of the MSCS Descriptor element is shown in Figure 9-782.

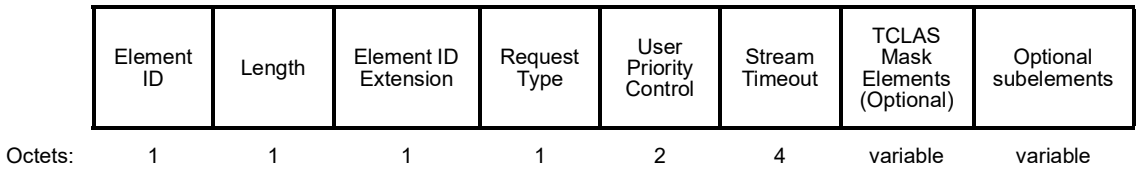

Figure 9-782—MSCS Descriptor element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The Request Type field is defined in 9.4.2.121.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The User Priority Control field is shown in Figure 9-783. This field is reserved when the Request Type field is "Remove", when the element is present in a (Re)Association Response frame with a value of "SUCCESS" in the Data field of the MSCS Status subelement, or when the element is present in a (Re)Association Response frame with a value other than "SUCCESS" in the Data field of the MSCS Status subelement and a value of "Add" in the Request Type field.

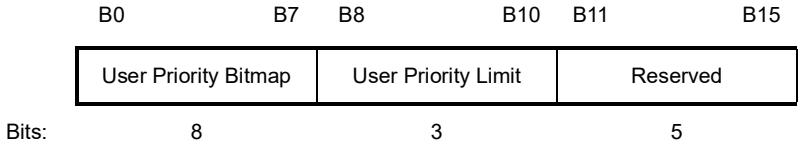

Figure 9-783—User Priority Control field format

Each bit in the User Priority Bitmap subfield corresponds to a user priority (UP), with the least significant bit corresponding to UP value of 0, and the most significant bit corresponding to UP value of 7. A value of 1 in a bit position in the bitmap indicates that the corresponding UP is used when assigning a UP to streams classified by MSCS; a value of 0 in a bit position indicates that the corresponding UP is not used for this purpose.

The User Priority Limit subfield has a value between 0 and 7; it defines the maximum limit for the UP that is assigned to incoming MSDUs in the streams classified by MSCS.

The Stream Timeout subfield indicates the minimum timeout value, in TUs, for maintaining a variable *UP{tuple}* in the MSCS list. This subfield is reserved when the Request Type field is "Remove", when the element is present in a (Re)Association Response frame with a value of "SUCCESS" in the Data field of the MSCS Status subelement, or when the element is present in a (Re)Association Response frame with a value other than "SUCCESS" in the Data field of the MSCS Status subelement and a value of "Add" in the Request Type field.

The TCLAS Mask Elements field contains zero or more TCLAS Mask elements to specify how incoming MSDUs are classified into streams in MSCS, as defined in 9.4.2.242. One or more TCLAS Mask elements are present when the Request Type field is "Add" or "Change"; no TCLAS Mask elements are present when the Request Type field is "Remove", when the element is present in a (Re)Association Response frame with a value of "SUCCESS" in the Data field of the MSCS Status subelement, or when the element is present in a (Re)Association Response frame with a value other than "SUCCESS" in the Data field of the MSCS Status subelement and a value of "Add" in the Request Type field.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The subelements allowed in the MSCS Descriptor element are defined in Table 9-322.

Table 9-322—Optional subelement IDs for MSCS Descriptor element

Subelement ID	Name	Extensible
0	Reserved	
1	MSCS Status	No
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MSCS Status subelement Data field has the same format as the Status Code field shown in Figure 9-92 and contains the status of the requested MSCS setup, as indicated in Table 9-50.

The use of the MSCS Descriptor element is described in 11.25.3.

9.4.2.244 Supplemental Class 2 Capabilities element

The Supplemental Class 2 Capabilities element contains a number of fields that advertise supported rates of a Class 2 ERP or Class 2 HT STA. The Supplemental Class 2 Capabilities element is defined in Figure 9-784.

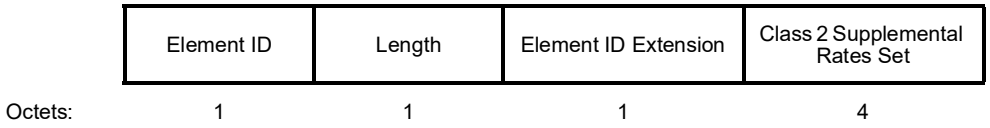

Figure 9-784—Supplemental Class 2 Capabilities element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The format of the Class 2 Supplemental Rates Set field is defined in Figure 9-785.

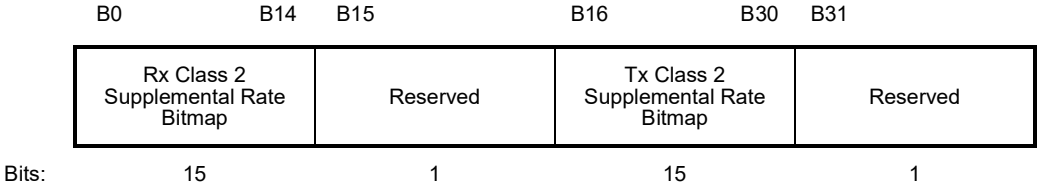

Figure 9-785—Class 2 Supplemental Rates Set field format

The Rx Class 2 Supplemental Rate Bitmap field is encoded as follows:

a) Bits B0-B1 represent support for receiving 1, 2 Mb/s (DSSS), respectively;
b) Bits B2-B3 represent support for receiving 5.5, 11 Mb/s (HR/DSSS), respectively;
c) Bits B4-B6 represent support for receiving 6, 12, 24 Mb/s (ERP-OFDM), respectively;
d) Bits B7-B14 represent support for receiving 6.5, 13, 19.5, 26, 39, 52, 58.5, 65 Mb/s $N_{SS} = 1$ (HT), respectively.

The Tx Class 2 Supplemental Rate Bitmap field is encoded as follows:

a) Bits 16-17 represent support for transmitting 1, 2 Mb/s (DSSS), respectively;
b) Bits 18-19 represent support for transmitting 5.5, 11 Mb/s (HR/DSSS), respectively;
c) Bits 20-22 represent support for transmitting 6, 12, 24 Mb/s (ERP-OFDM), respectively;
d) Bits 23-30 represent support for transmitting 6.5, 13, 19.5, 26, 39, 52, 58.5, 65 Mb/s $N_{SS} = 1$ (HT), respectively.

9.4.2.245 OCT Source element

The OCT Source element is used to specify the MLME that is the source of an OCT MMPDU. The format of the OCT Source element is shown in Figure 9-786.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

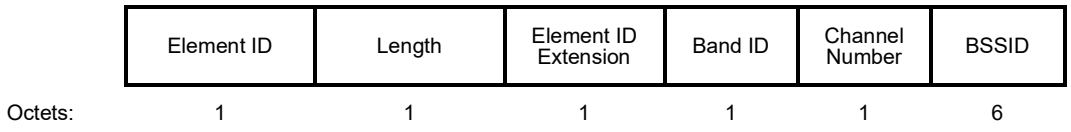

Figure 9-786—OCT Source element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Band ID field identifies the band on which the source MLME operates, as defined in Table 9-67.

The Channel Number field contains the channel number on which the source MLME operates.

The BSSID field contains the BSSID of the BSS in which the source MLME operates.

9.4.2.246 Rejected Groups element

The Rejected Groups element lists the finite cyclic groups, using the octet ordering conventions of 9.2.2, that have been rejected by a peer for use in SAE. The format of the Rejected Groups element is shown in Figure 9-787.

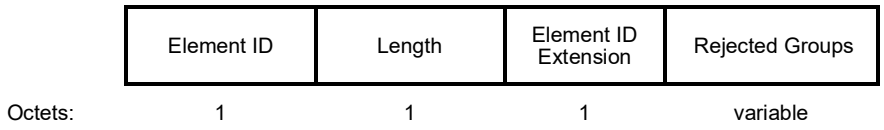

Figure 9-787—Rejected Groups element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Rejected Groups field contains a list of Finite Cyclic Group fields indicating finite cyclic groups that have been rejected by a peer in a previous authentication attempt.

9.4.2.247 Anti-Clogging Token Container element

The Anti-Clogging Token Container element is used to carry an Anti-Clogging Token field in contexts where an information element is needed. The format of an Anti-Clogging Token Container element is shown in Figure 9-788.

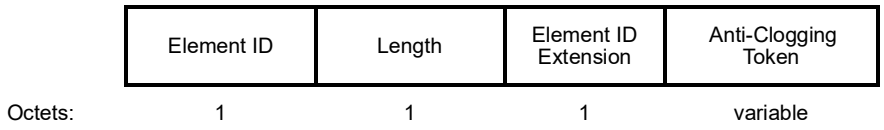

Figure 9-788—Anti-Clogging Token Container element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The Anti-Clogging Token field is defined in 9.4.1.38.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.3 Subelements

Subelements are defined to have a common general format consisting of a 1-octet element-specific Subelement ID field, a 1-octet Length field, and a variable length subelement-specific Data field. Each subelement is assigned a subelement ID that is unique within the containing element or subelement. The Length field specifies the number of octets in the Data field. See Figure 9-789.

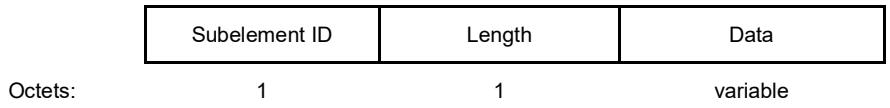

Figure 9-789—Subelement format

At the location in this standard that a subelement is defined, the definition might indicate if the subelement is extensible, typically using a table column called Extensible in the table in which subelement IDs are defined. A subelement that is indicated as extensible (typically with Yes in the Extensible column) might be extended in future revisions or amendments of this standard. A subelement that is indicated as extensible through subelements (typically with Subelements in the Extensible column) might be extended in future revisions or amendments of this standard by defining (additional) subelements within the subelement.

If the definition of a subelement does not indicate whether it is extensible (e.g., there is no Extensible column in a table defining it) that subelement is not extensible.

A subelement that is not defined as extensible will not be extended in future revisions or amendments of this standard.

Subelements within an element and subelements in a field outside of an element are in each case ordered by nondecreasing Subelement ID. See 10.28.9.

Unless stated otherwise, no more than one subelement with the same Subelement ID, apart from Vendor Specific subelements, is present within an element.

9.4.4 TLV encodings

9.4.4.1 General

The following TLV encodings are used to convey parameters within MAC Management frames (9.3.3, 9.4, and 9.6). TLV tuples with type values that are unknown, not specified in this subclause, or specified as “reserved” are discarded upon receipt. The form of TLVs is shown in Table 9-323.

Table 9-323—General TLV format

Name	Type	Length (octets)	Value	Scope/ Country code
The name of the TLV	1	variable	Single Octet, Single Value, or Compound TLV tuples.	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE—This standard is complete regarding the endianness of multi-octet fields as they are covered by 9.2.2. Be aware that most protocols above the MAC operate in the opposite endianness.

The Name field is the name of the TLV tuple.

The '*m.n*' syntax in the Type field means that the TLV has type *n*, an unsigned 1-octet integer, and is embedded in the Value field of a TLV of type *m*. The length of the Type field is 1 octet.

The format of the Length field is an unsigned number of size 1 octet, and the value in the Length field specifies the number of octets in the Value field.

A single octet TLV has a Value field that is 1 octet, a single value TLV has a Value field larger than 1- octet, and a compound TLV has a Value field that represents more than 1-octet fields.

When a Scope field entry contains two characters, it identifies the country or other entity to which the STA's operation is bound. If the two-character value stands for a country or other entity, then the value matches a code defined in ISO 3166-1. When a Scope field entry contains more than two characters, it identifies a scope for the TLV tuple.

9.4.4.2 Common TLVs

9.4.4.2.1 General

The general form of common TLVs is shown in Table 9-323 and is used in 9.4.4.2.2 to 9.4.4.2.6.

9.4.4.2.2 Device Class

This parameter contains the intended class of device for operation in TVWS band after it receives the available channel list at its location. The Device Class field format is shown in Table 9-324.

Table 9-324—Device Class field definition

Name	Type	Length (octets)	Value	Scope/ Country code
Device Class	2	1	The Device Class field contains an integer that indicates the device's TVWS band mode of operation as follows: 0: GDD non-AP STA 1: GDD geolocated non-AP STA 2: GDD AP 3: GDD fixed STA 4–255: Reserved	CAQ, GDDENABLEMENT, WSM

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.4.2.3 Device Identification Information

This parameter contains the identification information of the device initiating the channel availability query. The Device Identification Information field format is shown in Table 9-325 and related Device Identification Information Value fields tables in E.2 for specific regulatory domains.

Table 9-325—Device Identification Information field definition

Name	Type	Length (octets)	Value	Scope/ Country code
Device Identification Information	3	variable	One or more TLV fields as defined in Table E-9 for a specific regulatory domain.	CAQ, GDDENABLEMENT, CSM

9.4.4.2.4 Device Location Information

This parameter contains the location information of the device initiating the channel availability query. The Device Location Information field format is shown in Table 9-326.

Table 9-326—Device Location Information field definition

Name	Type	Length (octets)	Value	Scope/ Country code
Device Location Information	10	16	The Device Location Information field contains the latitude, longitude, and altitude information of the device in the format specified by the Device Location Information Body fields in Figure 9-139. When the Device Type subfield (see Table 9-324) is not GDD fixed STA, the altitude information (Altitude Type, Altitude Uncertainty, and Altitude subfields) of the Device Location Information field remain unused.	CAQ

9.4.4.2.5 Channel Schedule Descriptor

This parameter contains the channel number associated with channel schedule information used for channel schedule management. The Channel Schedule Descriptor Tuple attribute format is shown in Table 9-327 and Table 9-328. Channel Schedule Descriptor field is constructed with either Channel Availability Starting Time field or Channel Availability Starting Timestamp field present or neither of these two fields present.

Table 9-327—Channel Schedule Descriptor Tuple attribute definition

Name	Type	Length (octets)	Value	Scope/ Country code
Channel Schedule Descriptor	11	variable	Compound TLVs in Table 9-328.	CSM

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-328—Channel Schedule Descriptor Value fields

Name	Subtype	Length (octets)	Value	Scope/ Country code
Operating Class	1	1	The Operating Class field is the number of the operating class of the channel, which is defined in E.1.	CSM
Channel Number	2	1	The Channel Number field is the number of the channel, which is the subject of the value of Channel Schedule Management Mode field. If the Channel Schedule Management Mode field indicates the schedule information is based on WLAN channels, the Channel Number is a channel from the STA's operating class as defined in E.1; otherwise, the Operating Class compound TLV is not present, and the Channel Number is a positive integer value as defined in D.1 to indicate the available TV channel for WLAN operation.	CSM
Channel Availability Starting Time	3	8	The Channel Availability Starting Time field indicates the starting time in Coordinated Universal Time (UTC) from when the channel indicated in the Channel Number field is available for operation. When neither this field nor a Channel Availability Starting Timestamp is present, the STA takes the time that the response element is received as the starting time of the channel availability. NOTE—The Channel Availability Starting Time field follows the UTC time definition of the Time Value field of the Time Advertisement element in 9.4.2.60, and the first 6 octets are used to indicate the UTC time until minutes. The left 2 octets are reserved.	CSM
Channel Availability Starting Timestamp	4	8	The Channel Availability Starting Timestamp field indicates the starting timestamp from when the channel indicated in the Channel Number field is available for operation. When neither this field nor a Channel Availability Starting Time field is present, the STA takes the time that the response element is received as the starting time of the channel availability.	CSM
Channel Availability Offset Time	5	2	The Channel Availability Offset Time field indicates the offset of channel availability time with respect to the time that the Channel Schedule Descriptor is received. This field is present when the Channel Availability Starting Time field is not present in the response TLV and the channel is not available at the moment the TLV is received.	CSM
Channel Availability Duration	6	2	The Channel Availability Duration field indicates the duration in minutes of the availability of the channel that indicated in the Channel Number field.	CSM

9.4.4.2.6 WSM information values

The format of the WSM information values is shown in Table 9-329. If the WSM Type field of the White Space Map element (9.4.1.57) is set to 1, the WSM Information field specifies available channel information for TVWS, which is country-specific.

Table 9-329—WSM information values

Name	Type	Length (octets)	Value	Scope/ Country code
WSM Information	12	variable	Single value TLV comprising fields in related table in E.2 for a specific regulatory domain.	WSM

The format of the WSM Information Value fields is shown in Table 9-330.

Table 9-330—WSM Information Value fields

Name	Length (octets)	Value	Scope/ Country code
Device Class	1	Single octet TLV comprising fields in Table 9-324.	WSM
Map ID	1	Bit 0: Type bit indicates whether the following channel list is a full channel list or a partial channel list. If the Type bit is 1, the following channel list is a full channel list; and if the Type bit is 0, the following channel list is a partial channel list. Bits 1–7: Map version identifies the version of the WSM.	WSM
Channel Number	1	Channel Number field in related WSM Information Value fields table in E.2.	WSM
Maximum Power Level	1	Maximum Power Level field in related WSM Information Value fields table in E.2.	WSM
Validity	1	The Validity field indicates the duration in minutes for which the Channel Number is available with the allowed maximum power level, where the Validity field is provided for each available Channel Number.	WSM, UK
Maximum Channel Bandwidth	2	Limits on the maximum contiguous and maximum noncontiguous instantaneous bandwidths of STA specified as $n \times 0.1$ MHz, where $n > 0$.	WSM, UK

The Device Class field is defined in 9.4.4.2.2 and identifies the device class used by the WSM. It determines the length of the channel availability tuple consisting of the Channel Number, Maximum Power Level, and Validity fields, which is repeated as indicated by the Length field of the WSM element. If the Device Class field is 0, the Validity field in WSM Information Value field is not present. Otherwise, the Validity field exists in the WSM Information Value field.

9.4.5 Access network query protocol (ANQP) elements

9.4.5.1 General

ANQP-elements are defined to have a common format consisting of a 2-octet Info ID field (information identifier), a 2-octet Length field, and a variable length ANQP-element-specific Information field. Each element is assigned a unique Info ID as defined in this standard. The ANQP-element format is shown in Figure 9-790. See R.2 for the ANQP usage.

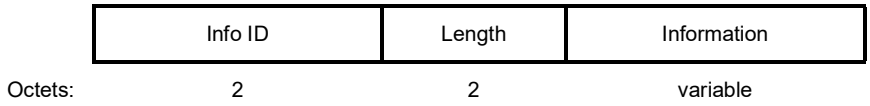

Figure 9-790—ANQP-element format

Each ANQP-element in 9.4.5 is assigned a unique 2-octet Info ID. The set of valid Info IDs are defined in Table 9-331.

Table 9-331—ANQP-element definitions

ANQP-element name	InfoID	ANQP-element (subclause)
Reserved	0–255	—
Query List	256	9.4.5.2
Capability List	257	9.4.5.3
Venue Name	258	9.4.5.4
Emergency Call Number	259	9.4.5.5
Network Authentication Type	260	9.4.5.6
Roaming Consortium	261	9.4.5.7
IP Address Type Availability	262	9.4.5.9
NAI Realm	263	9.4.5.10
3GPP Cellular Network	264	9.4.5.11
AP Geospatial Location	265	9.4.5.12
AP Civic Location	266	9.4.5.13
AP Location Public Identifier URI/FQDN	267	9.4.5.14
Domain Name	268	9.4.5.15
Emergency Alert Identifier URI	269	9.4.5.16
TDLS Capability	270	9.4.5.18
Emergency NAI	271	9.4.5.17
Neighbor Report	272	9.4.5.19
Query AP List	273	9.4.5.24
AP List Response	274	9.4.5.25
Reserved	275	—

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-331—ANQP-element definitions *(continued)*

ANQP-element name	InfoID	ANQP-element (subclause)
CAG	276	9.4.5.26
Venue URL	277	9.4.5.20
Advice of Charge	278	9.4.5.21
Local Content	279	9.4.5.22
Network Authentication Type with Timestamp	280	9.4.5.23
Service Information Request	281	9.4.5.27
Service Information Response	282	9.4.5.28
Local MAC Address Policy	283	9.4.5.29
Reserved	284–56 796	—
Vendor Specific	56 797	9.4.5.8
Reserved	56 798–65 535	—

The Length field specifies the number of octets in the Information field.

The ANQP-elements that can be configured are shown in Table 9-331. If information is not configured for a particular ANQP-element, then a query for that element will return that element with all optional fields not present.

9.4.5.2 Query List ANQP-element

The Query List ANQP-element provides a list of identifiers of ANQP-elements for which the requesting STA is querying; see 11.22.3.3.2.

The format of the Query List ANQP-element is shown in Figure 9-791.

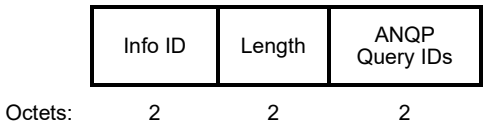

Figure 9-791—Query List ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The ANQP Query IDs field contains one or more 2-octet ANQP Query ID subfields.

Each ANQP Query ID subfield value is an Info ID drawn from Table 9-331. Including an Info ID in the Query List ANQP-element declares that the STA performing the ANQP request is requesting the ANQP-element corresponding to that Info ID be returned in the ANQP response. The Info IDs included in the Query List ANQP-element are ordered by monotonically increasing Info ID value. The ANQP response is defined in 11.22.3.3.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.5.3 Capability List ANQP-element

The Capability List ANQP-element provides a list of information/capabilities that has been configured on a STA. The Capability List ANQP-element is returned in response to a Query List ANQP-element containing the Info ID of the Capability List ANQP-element.

The format of the Capability List ANQP-element is shown in Figure 9-792.

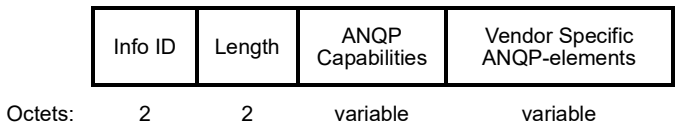

Figure 9-792—Capability List ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The ANQP Capabilities field contains one or more 2-octet ANQP Capability subfields.

Each ANQP Capability subfield value is an Info ID drawn from Table 9-331. If included in the Capability List ANQP-element, it declares that a Query List ANQP-element including that Info ID will return the requested ANQP-element. The Info ID for Capability List ANQP-element is always included in the Capability List ANQP-element returned in a GAS Query Response. The list does not include any duplicate Info IDs, except possibly the Info ID for each Vendor Specific ANQP-element. The Info IDs returned in the Capability List ANQP-element are ordered by nondecreasing Info ID value.

The Vendor Specific ANQP-elements field contains one or more variable length Vendor Specific ANQP-elements.

The Vendor Specific ANQP-element is defined in 9.4.5.8. The Vendor Specific ANQP-element is structured such that the first 2 octets of the Vendor Specific ANQP-element is the Info ID whose value corresponds to the Vendor Specific ANQP-element (see Table 9-331). When a Vendor Specific ANQP-element is present in the Capability List ANQP-element, the Vendor Specific ANQP-element contains the capabilities of that vendor-specific query protocol.

9.4.5.4 Venue Name ANQP-element

The Venue Name ANQP-element provides zero or more venue names associated with the BSS. The format of the Venue Name ANQP-element is shown in Figure 9-793. The Venue Name ANQP-element might be used to provide additional metadata on the BSS. For example, the information might be used to assist a user in selecting the appropriate BSS of which to become a member.

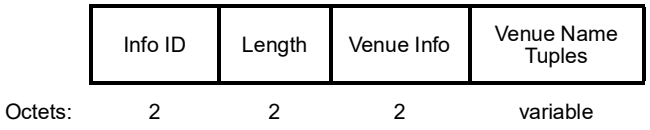

Figure 9-793—Venue Name ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Venue Info field is defined in 9.4.1.34.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Venue Name Tuples field contains zero or more variable length Venue Name Tuple subfields.

The format of the Venue Name Tuple subfield is shown in Figure 9-794.

— The Length field is equal to 3 plus the number of octets in the Venue Name field.
— The Language Code field contains an ASCII-encoded language code selected from ISO 639, and defines the language used in the Venue Name field. A two character language code has 0 (ASCII NUL) appended.
— The Venue Name field is a UTF-8 string containing the venue's name. The maximum length of this field is 252 octets.

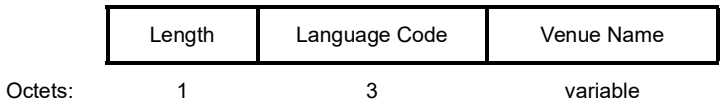

Figure 9-794—Venue Name Tuple subfield

A URL associated with the Venue Name field can be specified by the Venue URL ANQP-element defined in 9.4.5.20.

9.4.5.5 Emergency Call Number ANQP-element

The Emergency Call Number ANQP-element provides a list of emergency phone numbers to an emergency responder, such as directed by a public safety answering point (PSAP), that is used in the geographic location of the STA. The format of the Emergency Call Number ANQP-element is shown in Figure 9-795.

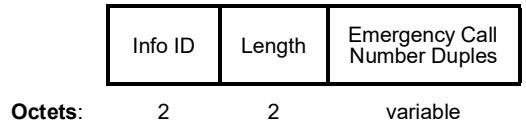

Figure 9-795—Emergency Call Number ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency Call Number Duples field contains zero or more variable length Emergency Call Number Duple subfields.

Each Emergency Call Number Duple subfield has the structure shown in Figure 9-796.

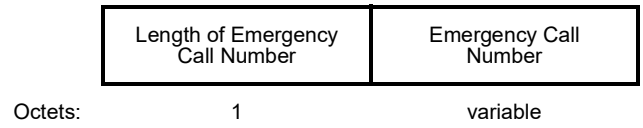

Figure 9-796—Emergency Call Number Duple subfield format

The Length of Emergency Call Number field is set to the length of the Emergency Call Number field.

The Emergency Call Number field is a UTF-8 string containing information, used to reach emergency services, from the network [e.g., dialed digits, emergency service URN label (IETF RFC 5031 [B44])].

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When this field is transmitted by an AP, with the intention of the field being received by a STA in a 3GPP capable device, the recommended format and content of this field is defined in Annex I of 3GPP TS 24.302.

9.4.5.6 Network Authentication Type ANQP-element

The Network Authentication Type ANQP-element provides a list of authentication types when ASRA is set to 1. The format of the Network Authentication Type ANQP-element is shown in Figure 9-797.

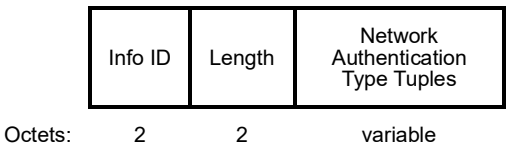

Figure 9-797—Network Authentication Type ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Network Authentication Type Tuples field contains zero or more variable length Network Authentication Type Tuple subfields.

Each Network Authentication Type Tuple subfield has the structure shown in Figure 9-798.

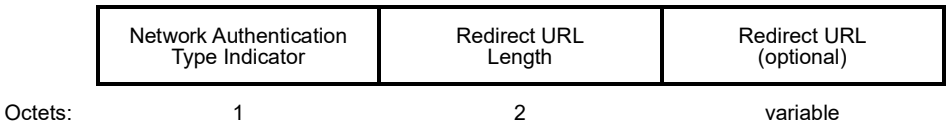

Figure 9-798—Network Authentication Type Tuple subfield format

The Network Authentication Type Indicator field is set to one of the values shown in Table 9-332.

Table 9-332—Network Authentication Type Indicator definitions

Value	Meaning
0	Acceptance of terms and conditions
1	On-line enrollment supported
2	http/https redirection
3	DNS redirection
4–255	Reserved

Each Network Authentication Type Indicator defines additional information that can be communicated.

If the Network Authentication Type Indicator field is 0, the network requires the user to accept terms and conditions. The Redirect URL can be used by the non-AP STA to obtain the terms and conditions. If the Redirect URL is not present, then the Redirect URL Length is set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the Network Authentication Type Indicator field is 1, the network supports on-line enrollment. Higher layer protocols on the non-AP STA might indicate to the user that accounts might be created. When the Network Authentication Type Indicator is 1, the Redirect URL Length is set to 0 and the Redirect URL is not present.

If the Network Authentication Type Indicator field is 2, the network infrastructure performs http/https redirect. The ReDirect URL is used by the non-AP STA to perform additional steps required for network access.

If the Network Authentication Type Indicator field is 3, the network supports DNS redirection. Higher layer software on the non-AP STA exchanges credentials with the network, the Redirect URL Length is set to 0 and the Redirect URL is not present.

The Redirect URL Length field contains the length of the Redirect URL. The the Redirect URL Length field is set to 0 whenever the Redirect URL is not present.

The Redirect URL field is a variable length field that is optionally included if the Network Authentication Type Indicator is either 0 or 2. If the Network Authentication Type Indicator is other than 0 or 2, a Redirect URL is not included. The URL is formatted in accordance with IETF RFC 3986.

9.4.5.7 Roaming Consortium ANQP-element

The Roaming Consortium ANQP-element provides a list of information about the Roaming Consortium and/or SSPs whose networks are accessible via this AP. This list can be returned in response to a GAS Query Request using procedures in 11.22.3.3.3. The format of the Roaming Consortium ANQP-element is shown in Figure 9-799.

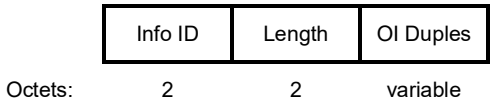

Figure 9-799—Roaming Consortium ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

OIs contained within the Roaming Consortium element (see 9.4.2.95) are also included in this ANQP-element. The value of the OI subfield(s) in this ANQP-element are equal to the values of the OI(s) in the dot11RoamingConsortiumTable.

The OI Duples field contains zero or more variable length OI Duple subfields.

The format of the OI Duple subfield is shown in Figure 9-800.

— The OI Length field is set to the number of octets in the OI field.
— The OI field is defined in 9.4.1.31. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP.

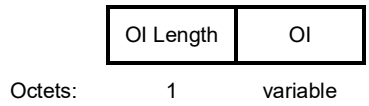

Figure 9-800—OI Duple subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.5.8 Vendor Specific ANQP-element

The Vendor Specific ANQP-element is used to query for information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and interoperability is more easily achieved in the presence of nonstandard information. The ANQP-element is in the format shown in Figure 9-801.

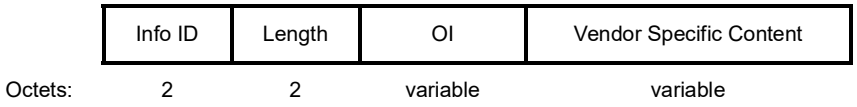

Figure 9-801—Vendor Specific ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The OI field is defined in 9.4.1.31.

The Vendor Specific Content field is a variable length field whose content is defined by the entity identified in the OI field.

9.4.5.9 IP Address Type Availability ANQP-element

The IP Address Type Availability ANQP-element provides STA with the information about the availability of IP address version and type that could be allocated to the STA after successful association. The format of the IP Address Type Availability ANQP-element is shown in Figure 9-802.

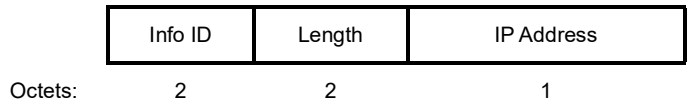

Figure 9-802—IP Address Type Availability ANQP-element

The Info ID and Length fields are defined in 9.4.5.1.

The format of the IP Address field shown in Figure 9-803.

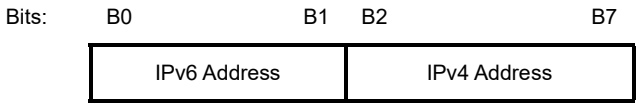

Figure 9-803—IP Address field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The IPv6 Address field values are shown in Table 9-333.

Table 9-333—IPv6 Address field values

Address value	Meaning
0	Address type not available
1	Address type available
2	Availability of the address type not known
3	Reserved

The IPv4 Address field values are shown in Table 9-334.

Table 9-334—IPv4 Address field values

Address value	Meaning
0	Address type not available
1	Public IPv4 address available
2	Port-restricted IPv4 address available
3	Single NATed private IPv4 address available
4	Double NATed private IPv4 address available
5	Port-restricted IPv4 address and single NATed IPv4 address available
6	Port-restricted IPv4 address and double NATed IPv4 address available
7	Availability of the address type is not known
8–63	Reserved

9.4.5.10 NAI Realm ANQP-element

The NAI Realm ANQP-element provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are accessible via this AP; optionally included for each NAI realm is a list of one or more EAP Method subfields, which that NAI realm uses for authentication. The format of the NAI Realm ANQP-element is shown in Figure 9-804.

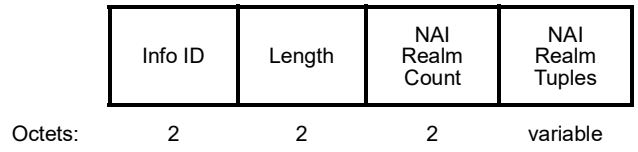

Figure 9-804—NAI Realm ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The NAI Realm Count field specifies the number of NAI realms included in the NAI Realm ANQP-element.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The NAI Realm Tuples field contains zero or more variable length NAI Realm Tuple subfields.

The format of the NAI Realm Tuple subfield is shown in Figure 9-805.

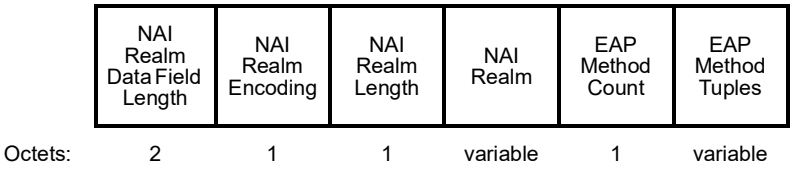

Figure 9-805—NAI Realm Tuple subfield format

The NAI Realm Data Field Length subfield is equal to 3 plus the length of the NAI Realm subfield plus the sum of the lengths of the EAP Method subfields.

The NAI Realm Encoding subfield is shown in Figure 9-806.

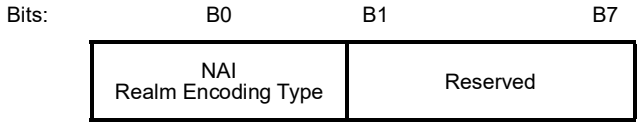

Figure 9-806—NAI Realm Encoding subfield format

The NAI Realm Encoding Type subfield is set to 0 to indicate that the NAI Realm in the NAI Realm subfield is formatted in accordance with IETF RFC 4282. It is set to 1 to indicate it is a UTF-8 string that is not formatted in accordance with IETF RFC 4282.

NOTE—This encoding is to facilitate roaming consortium or other entities that use nonstandard NAI Realm formats.

The NAI Realm Length subfield is the length in octets of the NAI Realm subfield.

The NAI Realm subfield is one or more NAI Realms formatted as defined in the NAI Realm Encoding Type bit of the NAI Realm Encoding subfield. If there is more than one NAI Realm in this subfield, the NAI Realms are delimited by a semicolon character (i.e., ";", which is encoded in UTF-8 as 0x3B). All of the realms included in the NAI Realm subfield support all of the EAP methods identified by the EAP Method subfields, if present. The maximum length of this subfield is 255 octets.

The EAP Method Count subfield specifies the number of EAP methods subfields for the NAI realm. If the count is 0, there is no EAP method information provided for the NAI realm.

The EAP Method Tuples field contains zero or more variable length EAP Method Tuple subfields.

The format of the optional EAP Method Tuple subfield is shown in Figure 9-807. Each EAP Method subfield contains a set of Authentication Parameters associated with the EAP-Method.

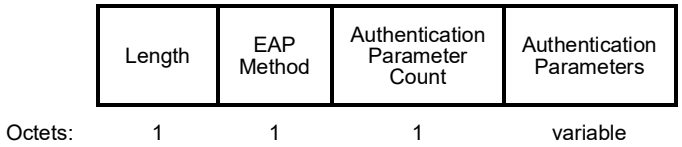

Figure 9-807—EAP Method Tuple subfield format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Length subfield is 2 plus the length of the Authentication Parameters subfield.

The EAP method subfield is set to the EAP Type value as given in IANA EAP Method Type Numbers.

The Authentication Parameter Count indicates how many additional Authentication Parameter subfields are specified for the supported EAP Method. If the Authentication Parameters Count subfield is 0, there are no Authentication Parameters subfields present, meaning no additional Authentication Parameters are specified for the EAP Method.

The Authentication Parameters field contains zero or more variable length Authentication Parameter subfields.

The format of the Authentication Parameter subfield is shown in Figure 9-808.

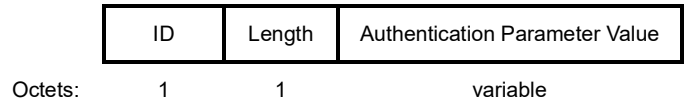

Figure 9-808—Authentication Parameter subfield format

The ID subfield indicates the type of authentication information provided.

The Length subfield indicates the length of the Authentication Parameter Value subfield.

The Authentication Parameter Value subfield is a variable length subfield containing the value of the parameter indicated by the ID.

The ID and its associated formats are specified in Table 9-335. Each ID indicates a different type of information. Use of multiple Authentication Parameter subfields allows all of the required authentication parameter requirements to be provided.

Table 9-335—Authentication Parameter types

Authentication information	ID	Description	Length (octets)
Reserved	0		
Expanded EAP Method	1	Expanded EAP Method Subfield	7
Non-EAP Inner Authentication Type	2	Enum (0 - Reserved, 1 - PAP, 2 - CHAP, 3 - MSCHAP, 4 - MSCHAPV2)	1
Inner Authentication EAP Method Type	3	Value drawn from IANA EAP Method Type Numbers	1
Expanded Inner EAP Method	4	Expanded EAP Method Subfield	7
Credential Type	5	Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - none [see NOTE], 9 - Reserved, 10 - Vendor Specific)	1

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-335—Authentication Parameter types *(continued)*

Authentication information	ID	Description	Length (octets)
Tunneled EAP Method Credential Type	6	Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - Reserved, 9 - Anonymous, 10 - Vendor Specific)	1
Reserved	7–220		
Vendor Specific	221	Variable	variable
Reserved	222–255		
NOTE—None means server-side authentication only.			

If the EAP Method type is an Expanded EAP type (the EAP Method value is 254), the Authentication Parameter is used to specify additional information on the EAP method. Table 9-336 describes the Authentication Parameter format for the Expanded EAP method; values for the Vendor ID and Vendor Type are specified in IETF RFC 3748. The Vendor ID and Vendor Type fields are expressed in big endian octet order.

Table 9-336—Authentication Parameter format for the Expanded EAP method

Parameters	Length (octets)
ID	1
Length	1
Vendor ID	3
Vendor Type	4

The Non-EAP Inner Authentication Type is specified as a single enumerated value given in Table 9-335. This Authentication Information type is used for non-EAP Inner Authentication methods. The possible values are PAP (as specified in IETF RFC 1334 [B24]), CHAP (as specified in IETF RFC 1994 [B25]), MSCHAP (as specified in IETF RFC 2433 [B29]), and MSCHAPv2 (as specified in IETF RFC 2759 [B32]).

The Inner Authentication EAP Method Type is specified as the EAP number as defined in IANA EAP Method Type Numbers. This Authentication Information type is used when the Inner Authentication method is an EAP method. If the Inner Authentication EAP Method Type is equal to 254 indicating an Expanded EAP Type, then the Expanded EAP Method Authentication Parameter is included.

A Credential Type is specified as a single enumerated value as shown in Table 9-335. If the value is equal to the “Vendor Specific” value, then a Vendor-Specific Authentication Parameter is included.

Vendor-Specific Authentication Parameters are specified as shown in Table 9-337.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-337—Vendor Specific Authentication Parameters

Parameters	Length (octets)
ID	1
Length	1
OI	variable
Authentication Parameter Value	Vendor-specific content

9.4.5.11 3GPP Cellular Network ANQP-element

The 3GPP Cellular Network ANQP-element contains cellular information such as network advertisement information e.g., network codes and country codes to assist a non-AP STA in selecting an AP to access 3GPP networks. The format of the 3GPP Cellular Network ANQP-element is shown in Figure 9-809.

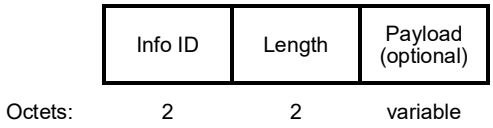

Figure 9-809—3GPP Cellular Network ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Payload field is a variable length field and is a generic container. An example of the format and content is defined in Annex H of 3GPP TS 24.302.

9.4.5.12 AP Geospatial Location ANQP-element

The AP Geospatial Location ANQP-element provides the AP's location in LCI format; see 9.4.2.21.10. This information is taken from dot11APLCITable.

The format of the AP Geospatial Location ANQP-element is shown in Figure 9-810.

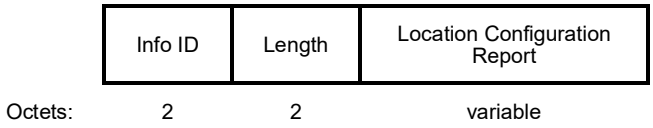

Figure 9-810—AP Geospatial Location ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Location Configuration Report field is of variable length and defined in 9.4.2.21.10. The Z and Usage Rules/Policy subelements are optionally present in the Location Configuration Report field, when it is used in the AP Geospatial Location ANQP element. The Co-Located BSSID List subelement is present when there is at least one other BSS that is co-located within the same physical device as the reporting BSS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.5.13 AP Civic Location ANQP-element

The AP Civic Location ANQP-element provides the AP's location in civic format. The format of the AP Civic Location ANQP-element is shown in Figure 9-811.

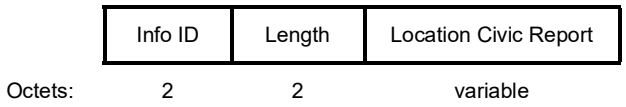

Figure 9-811—AP Civic Location ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Location Civic Report field is a variable length field and the format is provided in 9.4.2.21.13. This information is taken from dot11APCivicLocationTable. The Co-Located BSSID List subelement is present when there is at least one other BSS that is co-located within the same physical device as the reporting BSS and the Co-Located BSSID List subelement is not present in the Geospatial Location ANQP-element; this subelement is not present otherwise.

9.4.5.14 AP Location Public Identifier URI/FQDN ANQP-element

The AP Location Public Identifier URI/FQDN ANQP-element provides an indirect reference to the location information for the AP. This list element can be returned in response to a GAS Query Request using the procedures in 11.22.3.3. The format of the AP Location Public Identifier URI/FQDN ANQP-element is shown in Figure 9-812.

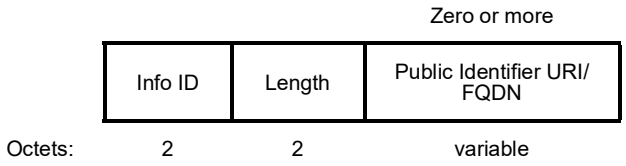

Figure 9-812—AP Location Public Identifier URI/FQDN ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Public Identifier URI/FQDN field is a variable length field containing zero or more Public Identifier URI/FQDN subelements, as defined in 9.4.2.21.14.

9.4.5.15 Domain Name ANQP-element

The Domain Name ANQP-element provides a list of one or more domain names of the entity operating the IEEE 802.11 access network. Domain Names in this ANQP-element are taken from dot11DomainNameTable. The format of the Domain Name ANQP-element is shown in Figure 9-813.

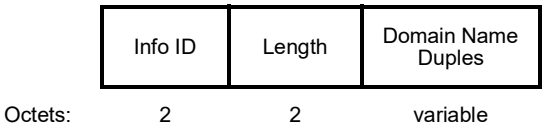

Figure 9-813—Domain Name ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Domain Name Duples field contains zero or more variable length Domain Name Duple subfields.

The format of the Domain Name Duple subfield is shown in Figure 9-814.

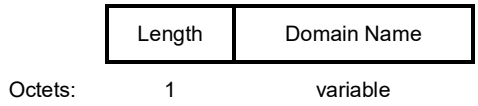

Figure 9-814—Domain Name Duple subfield format

The Length subfield indicates the length in octets of the Domain Name subfield.

The Domain Name subfield is of variable length and contains a domain name compliant with the "Preferred Name Syntax" as defined in IETF RFC 1035. The maximum length of this field is 255 octets.

9.4.5.16 Emergency Alert URI ANQP-element

The Emergency Alert URI ANQP-element provides a URI for EAS message retrieval.

The format of the Emergency Alert URI ANQP-element is shown in Figure 9-815.

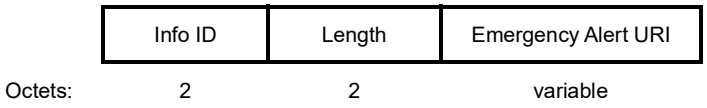

Figure 9-815—Emergency Alert URI ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency Alert URI field is a variable length field used to indicate the URI at which an EAS message can be retrieved as described in 11.22.7. The Emergency Alert URI field is formatted in accordance with IETF RFC 3986.

9.4.5.17 Emergency NAI ANQP-element

The Emergency NAI ANQP-element contains an emergency string that is available for use by a STA as its identity to indicate emergency access request. The format of the Emergency NAI ANQP-element is shown in Figure 9-816.

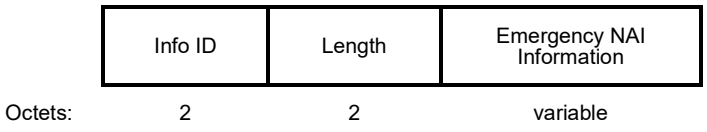

Figure 9-816—Emergency NAI ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency NAI Information field is a UTF-8 string formatted in accordance with IETF RFC 4282.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.4.5.18 TDLS Capability ANQP-element

The TDLS Capability ANQP-element is used by a STA to discover the TDLS capabilities of a peer STA. The format of the TDLS Capability ANQP-element is shown in Figure 9-817.

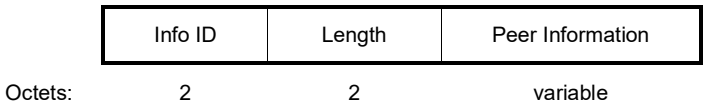

Figure 9-817—TDLS Capability ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Peer Information field is a variable length field containing information that a STA can use to establish a TDLS link and is defined as an XML schema (see R.6). An example of the peer information is described in 11.22.3.3.10.

9.4.5.19 Neighbor Report ANQP-element

The Neighbor Report ANQP-element provides zero or more neighbor reports about neighboring APs. This is of benefit to a STA in a preassociated state. The format of the Neighbor Report ANQP-element is defined in Figure 9-818.

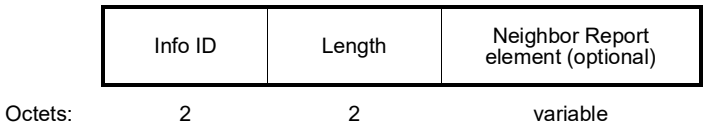

Figure 9-818—Neighbor Report ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The format of the Neighbor Report element is shown in Figure 9-336 defined in 9.4.2.36. The Co-Located BSSID List subelement is present in the Measurement Report subelement when there is at least one other BSS that is co-located within the same physical device as the reporting BSS.

9.4.5.20 Venue URL ANQP-element

The Venue URL ANQP-element provides a list of one or more URLs that can be used for web page advertising services or providing information, particular to a venue's BSS, to a STA. The format of the Venue URL ANQP-element is defined in Figure 9-819.

Figure 9-819—Venue URL ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Venue URL Duples field contains one or more Venue URL Duple fields as shown in Figure 9-820.

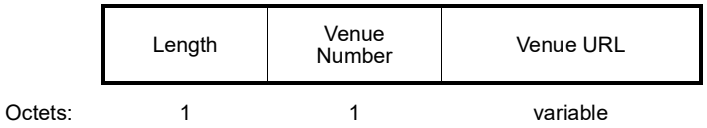

Figure 9-820—Venue URL Duple field

The Length field is set to 1 plus the number of octets in the Venue URL field.

The Venue Number field identifies the position (1 = 1st, 2 = 2nd, and so on) of the corresponding Venue Name Tuple subfield in the Venue Name ANQP-element from the same STA, as defined in 9.4.5.4. If that same STA does not advertise a Venue Name ANQP-element, or does not advertise any Venue Name Tuple subfields in the Venue Name ANQP-element, then the Venue Number field is set to 0.

The Venue URL field is a variable length field that indicates the URL at which information relevant to the corresponding Venue Name Tuple subfield, indicated by the Venue Number, might be retrieved. This is further described in 11.22.3.3.11. If no Venue URL is provided this field is left empty. The Venue URL field is formatted in accordance with IETF RFC 3986.

9.4.5.21 Advice of Charge ANQP-element

The Advice of Charge ANQP-element provides a list of one or more financial advice of charges related to access to a BSS. The format of the Advice of Charge ANQP-element is defined in Figure 9-821.

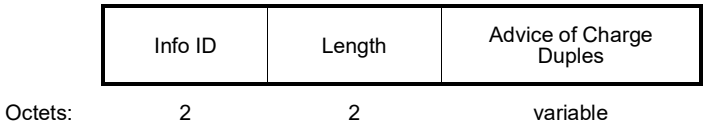

Figure 9-821—Advice of Charge ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Advice of Charge Duples field contains one or more Advice of Charge Duple fields as shown in Figure 9-822.

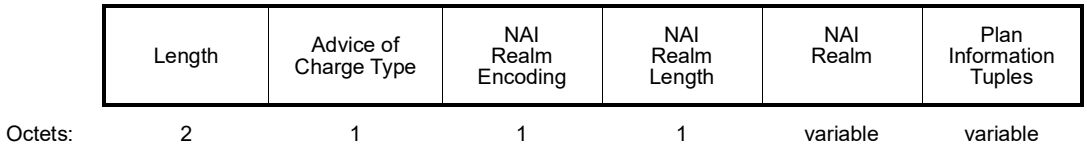

Figure 9-822—Advice of Charge Duple field

The Length field is set to 3 plus the number of octets in the NAI Realm and Plan Information Tuples fields.

The Advice of Charge Type field is set to one of the values defined in Table 9-338.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-338—Advice of Charge Type field values

Advice of Charge Type Value	Description
0	Time-based
1	Data-volume-based
2	Time-and-data-volume-based
3	Unlimited
4–255	Reserved

The NAI Realm Encoding and NAI Realm Length are defined in 9.4.5.10. The NAI Realm subfield is one or more NAI Realms formatted as defined in 9.4.5.10.

The format of the Plan Information Tuples field is defined in Figure 9-823.

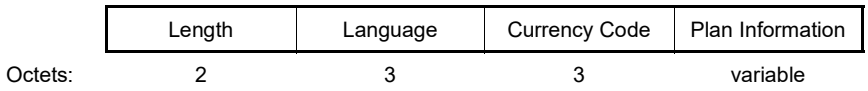

Figure 9-823—Plan Information Tuple field format

The Length field is set to the number of octets in the Language, Currency Code, and Plan Information fields.

The Language Code field contains an ASCII-encoded language code selected from ISO 639, and defines the language used in the Cost Information field. A two character language code has 0 (ASCII NUL) appended.

The Currency Code field is a 3-octet string (e.g., “USD”) representing an ISO 4217 currency numeric code.

The Plan Information field is a UTF-8 string that carries an XML description of an Advice of Charge plan. The schema and semantics of this description are outside the scope of this standard.

9.4.5.22 Local Content ANQP-element

The Local Content ANQP-element provides a list of one or more URLs that can be used to display local content related to the BSS. The format of the Local Content ANQP-element is defined in Figure 9-824.

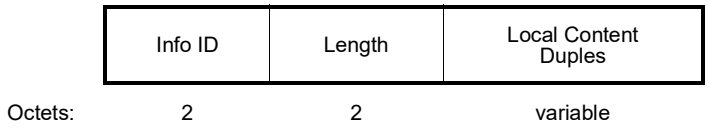

Figure 9-824—Local Content ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Local Content Duples field contains one or more Local Content Duple fields as shown in Figure 9-825.

	Length	State	Local Content URL Length	Local Content URL	Label Length (optional)	Label (optional)
Octets:	1	1	1	variable	0 or 1	variable

Figure 9-825—Local Content Duple field format

The Length field is set to 2 plus the number of octets in the Local Content URL, Label Length and Label fields.

The State field is defined in Table 9-339.

Table 9-339—Local Content State values

State	Name
0	Not authenticated
1	Authenticated
2	Failure during authentication
3	Incorrect credentials
4	Credentials expired
5–255	Reserved

The Local Content URL Length field contains the length of the Local Content URL field in octets.

The Local Content URL field is a variable length field containing a URL that is used for directing the device to local content. The Local Content URL field is formatted in accordance with IETF RFC 3986.

The Label Length field contains the value of the length of the Label field in octets. If the Label field is not present, this field is not present.

The Label field is a UTF-8 string containing a text description of the URL suitable for display on a user interface. It provides the type and potential usage of the URL.

9.4.5.23 Network Authentication Type with Timestamp ANQP-element

The Network Authentication Type with Timestamp ANQP-element provides similar information to that of the Network Authentication Type as defined in 9.4.5.6. In addition, a timestamp field is optionally provided to indicate to the requesting STA a timestamp corresponding to the time at which the received terms and conditions were most recently modified. With this timestamp, the requesting STA can determine if previously received information is stale.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Network Authentication Type with Time ANQP-element is shown in Figure 9-826.

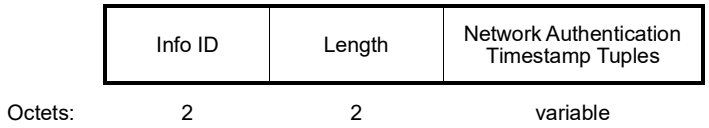

Figure 9-826—Network Authentication Type with Timestamp ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Network Authentication Timestamp Tuples field contains zero or more variable length Network Authentication Timestamp Tuple subfields.

Each Network Authentication Timestamp Tuple subfield has the structure shown in Figure 9-827.

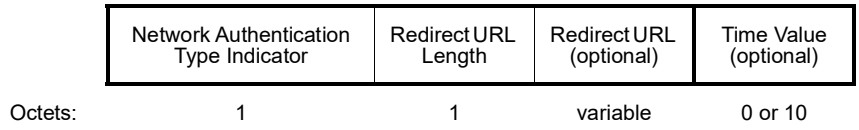

Figure 9-827—Network Authentication Timestamp Tuple subfield format

The Network Authentication Type Indicator field is defined in 9.4.5.6

The Redirect URL Length field and the Redirect URL field are defined in 9.4.5.6.

The Time Value field is defined in Table 9-192 using the Timing Capability equal to 2 encoding. This field is used by the responding STA to set a time of the ANQP response.

9.4.5.24 Query AP List ANQP-element

The Query AP List ANQP-element provides a list of APs and a list of Info IDs of ANQP-elements that the requesting STA is requesting from each AP in the list. The Query AP List ANQP-element declares that the STA performing the ANQP request is requesting that the ANQP-element corresponding to each Info ID be returned in the AP List Response ANQP-element. This element allows an optimization of the single ANQP request procedure (see 9.4.5.2) by having multiple ANQP requests in a single ANQP-element thus reducing the time necessary for network discovery and selection. See 11.22.3.3.14 for information on the Query AP list procedure.

The format of the Query AP List ANQP-element is shown in Figure 9-828.

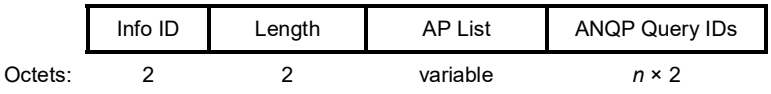

Figure 9-828—Query AP List ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The AP List field is a variable length field defined in Figure 9-829 that contains the list of BSSIDs for requested information.

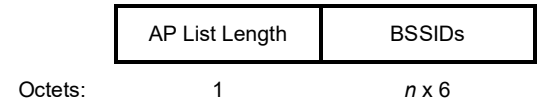

Figure 9-829—AP List field format

The AP List Length field indicates the length of the BSSIDs field.

The BSSIDs field contains one or more BSSID fields. Each BSSID field is 6 octets in length and indicates the BSSID of the BSS of an AP that the requesting STA wants to query.

The ANQP Query IDs field contains one or more ANQP Query ID fields that are ordered by increasing info ID value. Each ANQP Query ID field is an unsigned integer of length two octets.

The ANQP Query ID field value is drawn from Table 9-331.

9.4.5.25 AP List Response ANQP-element

The AP List Response ANQP-element provides the response to the Query AP List ANQP-element request. The ANQP response is defined in 11.22.3.3. The format of the AP List Response ANQP-element is defined in Figure 9-830.

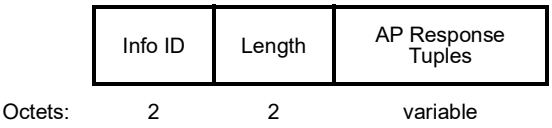

Figure 9-830—AP List Response ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The AP Response Tuples field contains zero or more AP Response Tuple fields.

The format of the AP Response Tuple field is defined in Figure 9-831.

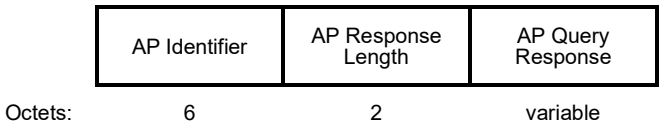

Figure 9-831—AP Response Tuple field format

The AP Identifier field indicates the BSSID of the BSS of the AP that the requesting STA queries.

The AP Response Length field indicates the number of octets in the following AP Query Response field.

The AP Query Response field contains an ANQP response corresponding to the ANQP Query ID in the received Query AP List ANQP-element as specified in 9.4.5.24. Each ANQP response comprises one or more ANQP-elements (Table 9-331).

9.4.5.26 CAG ANQP-element

The CAG ANQP-element provides the info IDs for the ANQP-elements contained within a CAG associated with ANQP, or ANQP with Service Information Registry, and the current value of the ANQP CAG version, indicating the version of information within the CAG associated with ANQP, or ANQP with Service Information Registry. The format of the CAG ANQP-element is defined in Figure 9-832. The selection of the specific number of info IDs and the specific values of info IDs in a CAG associated with ANQP is left to the implementation and is beyond the scope of this standard.

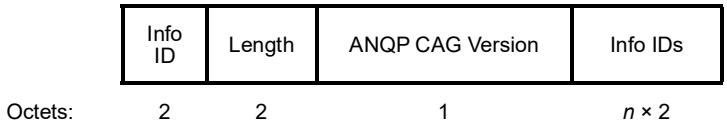

Figure 9-832—CAG ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The ANQP CAG Version field indicates the current version of the CAG associated with ANQP, or ANQP with Service Information Registry.

The Info IDs field contains zero or more Info ID fields. The Info ID field is an unsigned integer of length two octets and contains the info ID of an ANQP-element Info ID specified in Table 9-294.

9.4.5.27 Service Information Request ANQP-element

The Service Information Request ANQP-element contains a generic request for service information associated with the service hash(es) provided.

The format of the Service Information Request ANQP-element is shown in Figure 9-833.

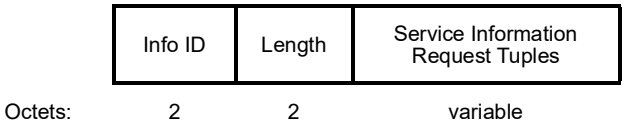

Figure 9-833—Service Information Request ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Service Information Request Tuples field contains one or more Service Information Request Tuple subfields. The format of the Service Information Request Tuple subfield is shown in Figure 9-834.

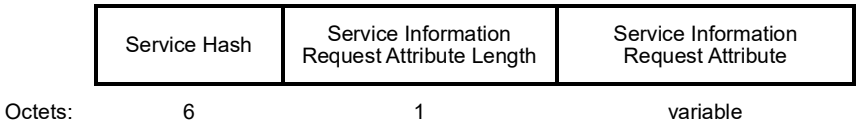

Figure 9-834—Service Information Request Tuple subfield format

The Service Hash field contains a 6-octet service hash value. See 11.23.4 for procedures for generating a service hash.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Service Information Request Attribute Length subfield indicates the length of the Service Information Request Attribute subfield.

The Service Information Request Attribute subfield contains a service-specific query. The value of this subfield is out of the scope of this standard.

9.4.5.28 Service Information Response ANQP-element

The Service Information Response ANQP-element contains the detailed service information in response to a Service Information Request ANQP-element.

The format of the Service Information Response ANQP-element is shown in Figure 9-835.

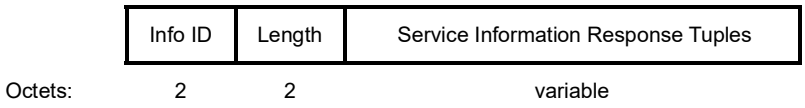

Figure 9-835—Service Information Response ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Service Information Response Tuples field contains zero or more Service Information Response Tuple subfields.

The format of the Service Information Response Tuple subfield is shown in Figure 9-836.

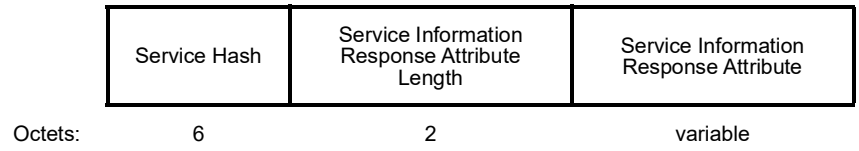

Figure 9-836—Service Information Response Tuple subfield format

The Service Hash field contains a 6-octet service hash value. See 11.23.4 for procedures for generating a service hash.

The Service Information Response Attribute Length subfield indicates the length of the Service Information Response Attribute subfield.

The content of the Service Information Response Attribute subfield is service specific based on the corresponding Service Information Request Attribute subfield in the Service Information Request Tuples of the Service Information Request ANQP-element as described in 9.4.5.27.

9.4.5.29 Local MAC Address Policy ANQP-element

The Local MAC Address Policy ANQP-element provides an indication of the local MAC address policy of the ESS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Local MAC Address Policy ANQP-element is specified in Figure 9-837.

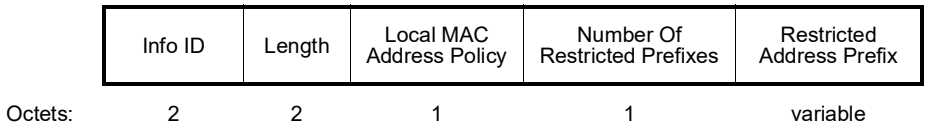

Figure 9-837—Local MAC Address Policy ANQP-element format

The Info ID and Length fields are specified in 9.4.5.1.

The Local MAC Address Policy field is a bitmap advertising policies supported by the ESS regarding its support for local MAC address. The values of the bits are specified in Table 9-340.

Table 9-340—Local MAC Address Policy field bits

Bitmap value	Description
Bit 0 (MSB)	Reserved
Bit 1	Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 00
Bit 2	Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 01
Bit 3	Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 10
Bit 4	Randomization subject to Restricted Address Prefixes supported in SLAP Quadrant 11
Bit 5	Reserved
Bit 6	Reserved
Bit 7	Reserved

The bitmap values provided in Table 9-340 indicate, to the receiving STA, aspects of the local MAC address policy of the ESS. The bits are independent and not mutually exclusive. They make reference to the Structured Local Address Plan (SLAP) introduced into IEEE Std 802 via the amendment IEEE Std 802c-2017. The bit value indications are as follows:

— Bit 0 is reserved.
— Bit 1, when set to 1, indicates the support of an address chosen by the STA randomly, in SLAP Quadrant 00 (i.e., the SLAP AAI quadrant, with 0100 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 1, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 00.
— Bit 2, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 01 (i.e., the SLAP ELI quadrant, with 0101 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 2, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 01.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— Bit 3, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 10 (i.e., the SLAP Reserved quadrant, with 0110 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 3, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 10.
— Bit 4, when set to 1, represents the support of an address chosen by the STA randomly, in SLAP Quadrant 11 (i.e., the SLAP SAI quadrant, with 0111 as the M, X, Y, and Z bits, respectively) but avoiding addresses beginning with any prefix specified in the Restricted Address Prefix field. Bit 4, when set to 0, indicates that the ESS provides no rules on MAC address use within SLAP Quadrant 11.

The Number Of Restricted Prefixes field specifies the number of Restricted Address Prefix subfields in the Restricted Address Prefix field.

NOTE 1—If Local MAC Address Policy field bits 1-4 are set to 1 and Number Of Restricted Prefixes to 0, the Local MAC Address Policy ANQP-element indicates that the ESS supports randomized address throughout local address range. In this case, the AP STA sets the Local MAC Address Policy field in the Extended Capabilities field to 0, indicating that local MAC addresses are not restricted, and consequently the Local MAC Address Policy ANQP-element is redundant.

The Restricted Address Prefix field contains zero or more Restricted Address Prefix subfields, each specifying the prefix of local MAC addresses supported in the ESS. Each such prefix indicates support for MAC addresses assigned as extensions of the indicated prefix, provided that the assignment is made according to the procedures specified for the use of that prefix, or, in the case that a MAC address is an extension of multiple indicated prefixes, the longest of those prefixes.

NOTE 2—The detailed specification of the use of local MAC addresses is provided in IEEE Std 802. Per its amendment IEEE Std 802c-2017, an SAI is assigned by a protocol specified in an IEEE 802 standard, and specification of the use of ELI addresses is provided by the assignee of a CID duly assigned by the IEEE Registration Authority.

The format of the Restricted Address Prefix subfield is described in Figure 9-838.

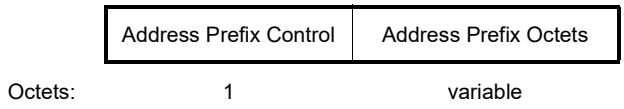

Figure 9-838—Restricted Address Prefix subfield format

The format of the Address Prefix Control subfield is described in Figure 9-839.

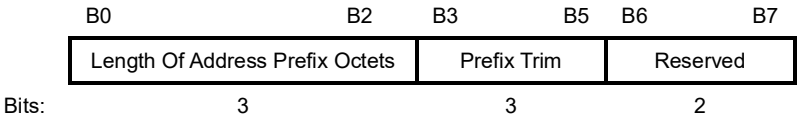

Figure 9-839—Address Prefix Control subfield format

The Length Of Address Prefix Octets subfield indicates the length (in octets) of the Address Prefix Octets field. Values 0 and 7 are reserved.

The Prefix Trim subfield indicates the number of bits to be truncated from the end of the value of the Address Prefix Octets subfield in order to obtain the MAC address prefix. In other words, the MAC address prefix is the value of the Address Prefix Octets subfield after truncation of some of the most significant bits of the last octet, with the number of truncated bits equal to the value of the Prefix Trim subfield. If the

Length of Address Prefix Octets subfield is set to 1, then the value of the Prefix Trim subfield is not be set to 7; this provides that the length of the MAC address prefix is at least two bits. The bit and octet ordering of the MAC address prefix is per Figure 9-1.

9.4.6 Registered location query protocol (RLQP) elements

9.4.6.1 General

RLQP-elements are defined to have a common format consisting of a 2-octet Info ID field, a 2-octet Length field, and a variable length RLQP-element-specific Information field. Each element is assigned a unique Info ID as defined in this standard. The RLQP-element format is shown in Figure 9-840.

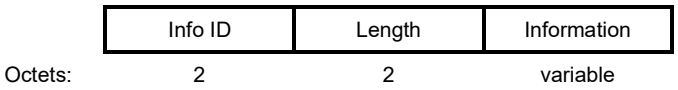

Figure 9-840—RLQP-element format

Each RLQP-element in 9.4.6 is assigned a unique 2-octet Info ID. The set of valid Info IDs is defined in Figure 9-840.

The Length field indicates the number of octets in the Information field.

The RLQP-elements are shown in Table 9-341. Info ID 56 797 stands for Vendor Specific information.

Table 9-341—RLQP-element definitions

RLQP-element name	Info ID	RLQP-element (subclause)
Reserved	0–272	N/A
Channel Availability Query	273	9.4.6.2
Channel Schedule Management	274	9.4.6.3
Network Channel Control	275	9.4.6.4
Reserved	276–56 796	N/A
Vendor Specific	56 797	9.4.6.5
Reserved	56 798–65 535	N/A

9.4.6.2 Channel Availability Query RLQP-element

The Channel Availability Query element is used to exchange the requests and responses for the channel availability query process using the GAS protocol. The Channel Availability Query RLQP-element is included in a GAS Query Request or returned in a response to a GAS Query Request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The element is in the format shown in Figure 9-841.

	Info ID	Length	Requester STA Address	Responder STA Address	Reason Result Code	Channel Query Info	Device Class	Device Identification Information	Device Location Information	WSM Information
Octets:	2	2	6	6	1	1	variable	variable	variable	variable

Figure 9-841—Channel Availability Query RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the channel query process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that responds to the channel query requesting STA. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a channel availability query was generated. It also indicates the result of the query as successful or not and the reason when the query is not successful. The length of the Reason Result Code field is 1 octet. The Reason Result Code field values that have been allocated are shown in Table 9-342.

Table 9-342—Reason Result Code field values

Reason Result Code field value	Name	Description
0		Reserved.
1		Channel availability list requested.
2	SUCCESS	Success with the available channel list result for a Device Location Information field.
3	SUCCESS_MULTIPLE	Success with an available channel list result for a bounded geographic area defined by multiple Device Location Information fields.
4	REFUSED	Request declined.
5	DEVICE_VERIFICATION_FAILURE	Request not successful because of device identification verification failure. NOTE—Failure of providing an authorized identification of the corresponding regulatory organization can cause the responding STA to reject the query and return such a Reason Result Code.
6	Continuation frame	This frame continues the fields from the previous CAQ frame.
7–255		Reserved.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Channel Query Info field is used to indicate the type of Channel Query request and associated parameters. The format of the Channel Query Info field is shown in Figure 9-842.

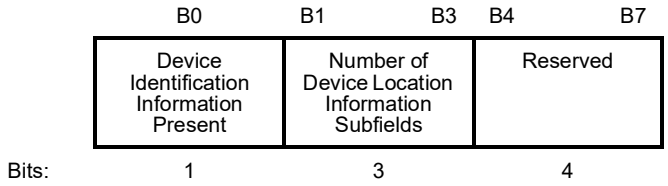

Figure 9-842—Channel Query Info field format

The Device Identification Information Present subfield value is set to 1 to indicate that the Device Identification Information field is present in the Channel Availability Query element; otherwise it is set to 0 to indicate that the Device Identification Information field is not provided.

The Number of Device Location Information Subfields subfield indicates the number of device location information subfields presented in the Channel Availability Query element. When no device location is present, the Number of Device Location Information Subfields subfield is set to 0.

The Device Class field is used to indicate the characteristics of STA requesting the channel availability query. The format of the Device Class field is specified in 9.4.4.2.2. The Device Class field is present only when the Reason Result Code field value is 1.

The Device Identification Information field is used to indicate the identification of the STA requesting the channel availability query. The format of the Device Identification Information field is specified in 9.4.4.2.3.

The Device Location Information field is used to provide the location of the STA requesting the channel availability query, which is provided in the format specified in 9.4.4.2.4.

The WSM Information field is defined in the White Space Map element (see 9.4.2.169). The WSM Information field is present only when the Reason Result Code field value is 2 or 3, as the successful result of the query.

9.4.6.3 Channel Schedule Management RLQP-element

The Channel Schedule Management element is used by an GDD enabling STA to query the RLSS or another GDD enabling STA for channel schedule information. The element is in the format shown in Figure 9-843.

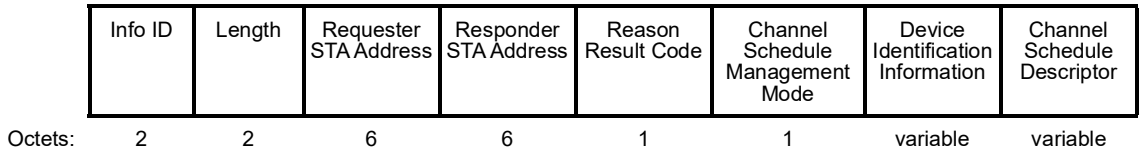

Figure 9-843—Channel Schedule Management RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The Requester STA Address field is the MAC address of the requesting STA that initiates the channel schedule management process.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested channel schedule management.

The remaining fields are as defined in the Channel Schedule Management element (see 9.6.7.26).

9.4.6.4 Network Channel Control RLQP-element

The Network Channel Control element is used to request network channel control and respond to network channel requests using the GAS protocol. The element is in the format shown in Figure 9-844.

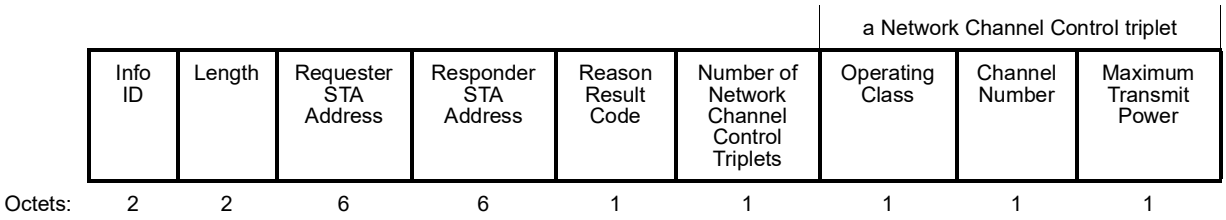

Figure 9-844—Network Channel Control RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the network channel control process.

The ResponderSTAAddress field is the MAC address of the STA that responds to the STA that requested network channel control.

The Reason Result Code field is used to indicate the reason that a Network Channel Control frame was generated. The length of the Reason Result Code field is 1 octet. The encoding of the Reason Result Code field is shown in Table 9-343.

Table 9-343—Reason Result Code field values

Reason Result Code field value	Name	Description
0	REQUEST	Network channel request.
1	SUCCESS	Success.
2	REFUSED	Request declined.
3	TOO_MANY_SIMULTANEOUS_REQUESTS	Network channel request denied because the GDD enabling STA is unable to handle additional GDD dependent STAs.
4	Continuation frame	This frame continues the fields from the previous NCC frame.
5–255		Reserved.

The Number of Network Channel Control Triplets field indicates the number of triplets of Operating Class, Channel Number, and Transmit Power Constraint fields.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Operating Class field indicates the channel set for which the network channel control request applies. The Operating Class field and Channel Number field are used together to specify the channel frequency and channel bandwidth for which the network channel control applies. Values for the Operating Class field are shown in E.1.

In a request, the Channel Number field of a Network Channel Control frame indicates the channel that the requesting STA intends to operate on. In a response, the Channel Number field in the Network Channel Control frame indicates the channels that the responding STA permits the requesting STA to operate on. The Channel Number is defined within an Operating Class as shown in E.1.

The Maximum Transmit Power field gives the intended maximum transmit power in dBm for operation in the request frame and indicates the maximum allowable transmit power in dBm for operation in the response frame. The field is coded as a 2s complement signed integer in units of 0.5 dBm. The field is set to –128 when a requesting STA requests a responding STA to provide a network channel control response without specifying in the request the intended maximum transmit power.

9.4.6.5 Vendor Specific RLQP-element

The Vendor Specific RLQP-element is used to carry information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The RLQP-element is in the format shown in Figure 9-845.

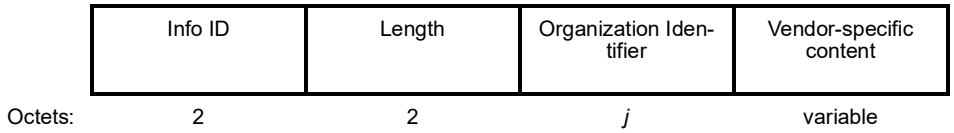

Figure 9-845—Vendor Specific RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The Organization Identifier field identifies (see 9.4.1.31) the entity that has defined the content of the particular Vendor Specific RLQP-element. See 9.4.1.31 for the definition of *j*.

9.5 Fields used in Management and Extension frame bodies and Control frames

9.5.1 Sector Sweep field

The format of the sector sweep (SSW) field is shown in Figure 9-846.

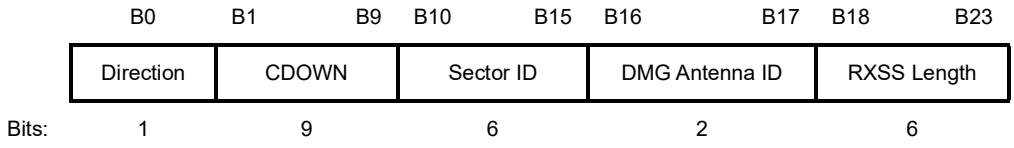

Figure 9-846—SSW field format

The Direction subfield is set to 0 to indicate that the frame is transmitted by the beamforming initiator and set to 1 to indicate that the frame is transmitted by the beamforming responder.

The CDOWN subfield is a down counter indicating the number of remaining DMG Beacon frame transmissions to the end of the TXSS, or the number of remaining SSW frame transmissions to the end of

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

the TXSS/RXSS. This subfield is set to 0 in the last frame DMG Beacon and SSW frame transmission. Possible values range from 0 to 511.

The Sector ID subfield is set to indicate the sector number through which the frame containing this SSW field is transmitted.

The DMG Antenna ID subfield indicates the antenna (for a CMMG STA) or DMG antenna (for a DMG STA) the transmitter is currently using for this transmission.

The RXSS Length subfield is valid only when transmitted in a CBAP and is reserved otherwise. The RXSS Length subfield specifies the length of a receive sector sweep as required by the transmitting STA and is defined in units of an SSW frame. The length of the sector sweep is given by $(\text{RXSS Length} + 1) \times 2$.

9.5.2 Dynamic Allocation Info field

The format of the Dynamic Allocation Info field is shown in Figure 9-847.

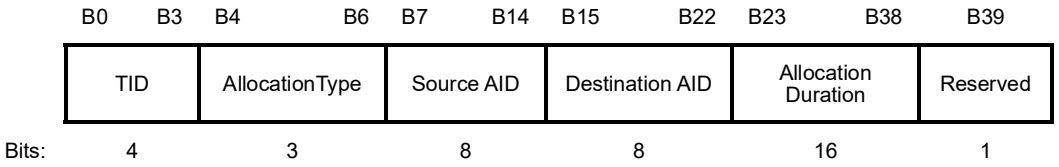

Figure 9-847—Dynamic Allocation Info field format

The TID subfield identifies the TC or TS for the allocation request or grant.

NOTE—Unlike pseudo-static allocations, nonpseudo-static allocations are not labeled with an allocation ID, and are associated to a TID.

The AllocationType subfield is defined in 9.4.2.131.

The Source AID subfield identifies the STA that is the source of the allocation.

The Destination AID subfield identifies the STA that is the destination of the allocation.

When the Dynamic Allocation Info field is transmitted within an SPR frame, the Allocation Duration subfield contains the requested duration in microseconds. When the Dynamic Allocation Info subfield is transmitted within a Grant frame by an AP or PCP in an ATI or GP, the Allocation Duration subfield contains the granted duration of the SP or CBAP allocation in microseconds (see 10.39.3, 10.39.7, 10.39.8, and 10.39.9). Possible values range from 0 to 32 767 for an SP allocation and a CBAP allocation. Setting the Allocation Duration subfield transmitted to 0 within a Grant frame means that the STA can transmit one PPDU followed by any relevant acknowledgment plus one RTS/DMG CTS handshake.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame in a CBAP, the value of the Allocation Duration field indicates the purpose of the Grant frame transmission. Two purposes are possible:

a) Beyond current TXOP: in this case, the Allocation Duration subfield values range from 0 to 32 767. The value of the Allocation Duration field plus the Duration field of the Grant frame indicates the time offset from the PHY-TXEND.indication primitive of the Grant frame when the STA transmitting the Grant frame will attempt to initiate access for communication with the STA indicated by the RA field of the Grant frame.
b) Within current TXOP: in this case, the Allocation Duration subfield is set to 32 768.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame with RA set to broadcast address by a source or destination STA of an SP, the Allocation Duration subfield values range from 0 to 32 767.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame with RA set to individual address by a source STA of an SP, the Allocation Duration subfield is set to 32 768.

9.5.3 Sector Sweep Feedback field

When the SSW Feedback field is transmitted as part of an ISS, the format of the field is as shown in Figure 9-848. Otherwise, the format of the SSW Feedback field is as shown in Figure 9-849.

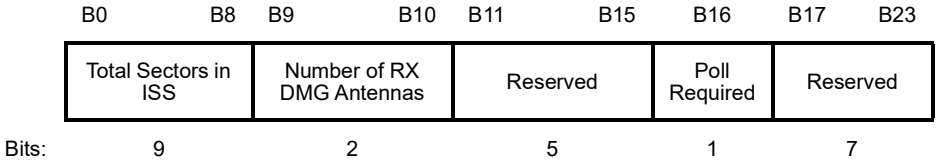

Figure 9-848—SSW Feedback field format when transmitted as part of an ISS

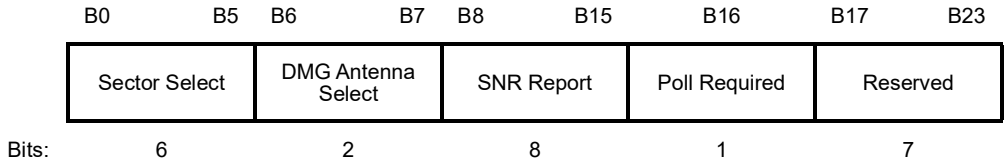

Figure 9-849—SSW Feedback field format when not transmitted as part of an ISS

The Total Sectors in ISS subfield indicates the total number of sectors that the initiator uses in the ISS, including any repetition performed as part of multi-antenna beamforming. Possible values range from 0 to 511, representing 1 to 512 sectors.

The Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the initiator uses during the following RSS. This subfield is set to the number of receive DMG antennas used minus 1.

The Sector Select subfield contains the value of the Sector ID subfield of the SSW field within the frame that was received with best quality in the immediately preceding sector sweep. The determination of which frame was received with best quality is implementation dependent. Possible values of this subfield range from 0 to 63.

The DMG Antenna Select subfield indicates the value of the DMG Antenna ID subfield of the SSW field within the frame that was received with best quality in the immediately preceding sector sweep. The determination of which frame was received with best quality is implementation dependent.

The SNR Report subfield is set to the value of the SNR from the frame that was received with best quality during the immediately preceding sector sweep and is indicated in the Sector Select field. This subfield is encoded as 8-bit 2s complement value of 4×(SNR-19), where SNR is measured in dB. This covers from –13 dB to 50.75 dB in 0.25 dB steps.

The Poll Required subfield is set to 1 by a non-AP and non-PCP STA to indicate that it requires the AP or PCP to initiate communication with the non-AP and non-PCP. This subfield is set to 0 to indicate that the

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

non-AP and non-PCP has no preference about whether the AP or PCP initiates the communication. This subfield is reserved when transmitted by an AP or PCP.

9.5.4 BRP Request field

The BRP Request field is defined in Figure 9-850.

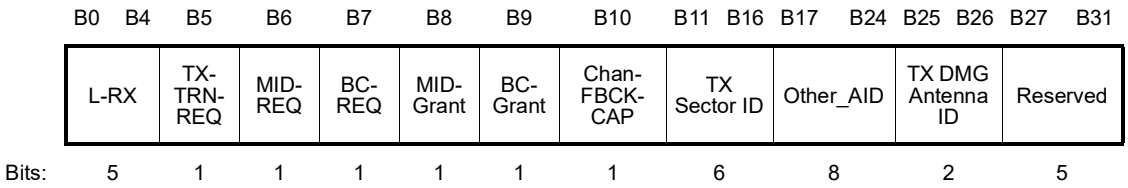

Figure 9-850—BRP Request field format

If the MID-REQ subfield is set to 0, the L-RX subfield indicates the number of TRN units requested by the transmitting STA for RX training as part of beam refinement. The L-RX subfield contains an unsigned integer between 0 and 16. Values outside this range are reserved. The number of requested TRN-R subfields is equal to the value of the L-RX subfield multiplied by 4. Other values are reserved. If the subfield is set to 0, the transmitting STA does not request receive training as part of beam refinement. If the MID-REQ subfield is set to 1, the L-RX subfield indicates the number of TRN units the STA uses during the MID phase for each TX sector/AWV.

The TX-TRN-REQ subfield is set to 1 to indicate that the STA requests transmit training as part of beam refinement. Otherwise, it is set to 0.

A STA sets the MID-REQ subfield to 1 in SSW-Feedback or BRP frames to indicate a request for an I-MID subphase or R-MID subphase; otherwise, the STA sets the subfield to 0 to indicate it is not requesting an I-MID subphase or R-MID subphase. In case an R-MID subphase is requested, the STA can include information on the TX sector IDs to be used by the STA receiving this request. The STA receiving this request sets the MID-grant subfield in SSW-Ack or BRP frames to 1 to grant this request or otherwise sets it to 0.

A STA sets the BC-REQ subfield to 1 in SSW-Feedback or BRP frames to indicate a request for an I/R-BC subphase; otherwise, the STA sets the subfield to 0 to indicate it is not requesting an I/R-BC subphase. In case an R-BC subphase is requested, the STA can include information on the TX sector IDs to be used by the STA receiving this request. The STA receiving this request sets the BC-grant subfield in SSW-Ack or BRP frames to 1 to grant this request; otherwise, the STA sets it to 0 to reject the request.

The Chan-FBCK-CAP subfield is set to 1 to indicate the STA is capable to return channel measurement during beam refinement. The Chan-FBCK-CAP subfield is set to 0 to indicate the STA is able to return only BS-FBCK during beam refinement.

NOTE—Regardless of the value of the Chan-FBCK-CAP subfield, 10.42.6.4 requires a DMG STA to return the SNR values from the last TXSS if it receives a BRP frame with the TXSS-FBCK-REQ field and the SNR Requested subfield within the FBCK-REQ field both set to 1.

The TX Sector ID subfield indicates the sector ID that is used when transmitting the PPDU. If the PPDU is transmitted using a pattern that is not a sector that has been used in the sector sweep, this subfield is set to 0x63.

The Other_AID subfield is set to the AID of an additional STA referenced in the BRP procedure as described in 10.42.6.4.4 and 20.9.2.2.6. Otherwise, if the additional STA is not used, this subfield is set to 0.

The TX DMG Antenna ID subfield indicates the DMG antenna ID that is used when transmitting the PPDU.

9.5.5 Beamforming Control field

The Beamforming Control field is formatted as shown in Figure 9-851 when both the IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1, and the Beamforming Control field is transmitted in either a Grant or Grant Ack frames. In all other cases, the Beamforming Control field is formatted as shown in Figure 9-852.

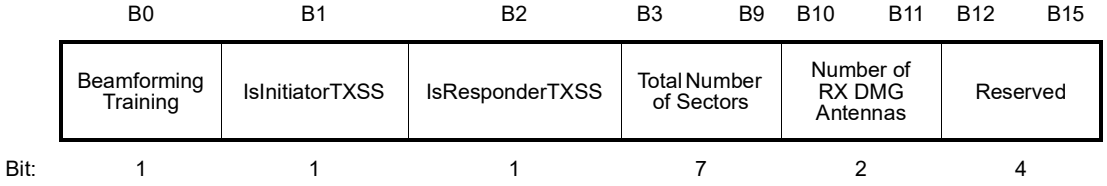

Figure 9-851—BF Control field format when both IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1 and the BF Control field is transmitted in Grant or Grant Ack frames

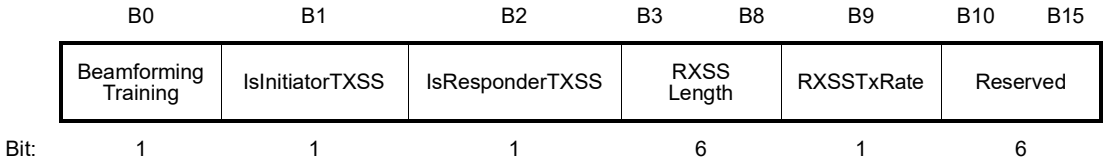

Figure 9-852—BF Control field format in all other cases

The Beamforming Training subfield is set to 1 to indicate that the source DMG STA intends to initiate beamforming training with the destination DMG STA at the start of the allocation and is set to 0 otherwise. If the Beamforming Training subfield is set to 0, all other subfields of the Beamforming Control field are reserved.

The IsInitiatorTXSS subfield is set to 1 to indicate that the source DMG STA starts the beamforming training with an initiator TXSS. This subfield is set to 0 to indicate that the source DMG STA starts the BF training with an initiator RXSS.

The IsResponderTXSS subfield is set to 1 to indicate that the destination DMG STA starts the RSS with a responder TXSS. This subfield is set to 0 to indicate that the destination DMG STA is to initiate the RSS with a responder RXSS.

When the Beamforming Control field is transmitted within an Extended Schedule element, either the IsInitiatorTXSS subfield or the IsResponderTXSS subfield is set to 0, but not both.

The RXSS Length subfield is valid only if at least one of IsInitiatorTXSS subfield or IsResponderTXSS subfield is equal to 0 and is reserved otherwise. The value represented by the RXSS Length subfield specifies the total number of receive sectors combined over all receive DMG antennas of the STA, including any LBIFS as necessary for DMG antenna switching. The value represented by this subfield is in the range 2 to 128 and is given by (RXSS Length+1)×2.

The RXSSTxRate subfield is valid only if the RXSS Length subfield is valid and the value of the RXSS Length subfield is greater than 0. Otherwise, the RXSSTxRate subfield is reserved. The RXSSTxRate subfield is set to 0 to indicate that all frames transmitted as part of the RXSS use the DMG Control

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

modulation class (10.6.7.1). The RXSSTxRate subfield is set to 1 to indicate that only the first frame transmitted as part of the RXSS use the DMG Control modulation class and the remaining frames use MCS 1 of the DMG SC modulation class. If both the IsInitiatorTXSS and IsResponderTXSS subfields are set to 0 and the BF Control field is sent within a Grant frame, the RXSSTxRate subfield refers to the RSS only. If both the IsInitiatorTXSS and IsResponderTXSS subfields are set to 0 and the BF Control field is sent within a Grant Ack frame, the RXSSTxRate subfield refers to the ISS only.

When the BF Control field is transmitted in a Grant frame, the Total Number of Sectors subfield indicates the total number of sectors the initiator uses during the ISS, including any LBIFS required for DMG antenna switching (see 10.42). When the BF Control field is transmitted in a Grant Ack frame, the Total Number of Sectors subfield indicates the total number of sectors the responder uses during the RSS. In both cases, this field is set to the total number of sectors used minus 1.

When the BF Control field is transmitted in a Grant frame, the Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the initiator uses during the RSS. When the BF Control field is transmitted in a Grant Ack frame, the Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the responder uses during the ISS. In both cases, this subfield is set to the number of receive DMG antennas used minus 1.

When the BF Control field is transmitted in a Grant Ack frame in response to a Grant frame with the Beamforming Training field equal to 0, the following fields are reserved: IsInitiatorTXSS, IsResponderTXSS, Total Number of Sectors, and Number of RX DMG Antennas.

9.5.6 Beamformed Link Maintenance field

The Beamformed Link Maintenance field is shown in Figure 9-853 and provides a DMG STA with the value of dot11BeamLinkMaintenanceTime.

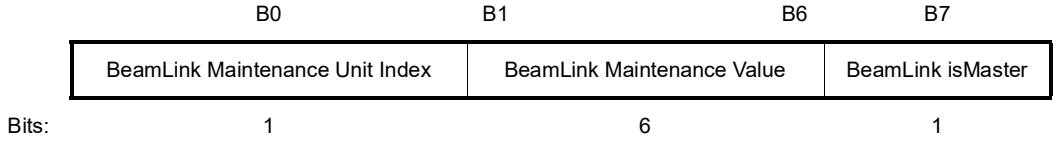

Figure 9-853—Beamformed Link Maintenance field format

The encoding of the BeamLink Maintenance Unit Index subfield is specified in Table 9-344.

Table 9-344—Encoding of BeamLink Maintenance Unit Index

BeamLink Maintenance Unit Index	BeamLink Maintenance Unit (μs)
0	32
1	2000

If the content of the BeamLink Maintenance Value subfield is greater than 0, it is used to calculate dot11BeamLinkMaintenanceTime as follows:

$$dot11BeamLinkMaintenanceTime = BLMU \times BLMV$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where

BLMU is the value of the BeamLink Maintenance Unit corresponding to the value of the BeamLink Maintenance Unit Index subfield (see Table 9-344)

BLMV is the value of the BeamLink Maintenance Value subfield

Otherwise, if the BeamLink Maintenance Value subfield is set to 0, the dot11BeamLinkMaintenanceTime is left undefined. An undefined value of the dot11BeamLinkMaintenanceTime indicates that the STA does not participate in beamformed link maintenance.

The BeamLink isMaster subfield is set to 1 to indicate that the STA is the master of the data transfer and set to 0 otherwise. The STAs use the BeamLink isMaster subfield to negotiate the dot11BeamLinkMaintenanceTime as specified in Table 9-345.

NOTE—In Table 9-345, STA-A and STA-B refer to any of the STAs performing the Beamformed Link Maintenance negotiation procedure in no particular order.

Table 9-345—The Beamformed Link Maintenance negotiation

BeamLink isMaster subfield (STA-A)	BeamLink isMaster subfield (STA-B)	dot11BeamLinkMaintenanceTime (STA-A) vs. dot11BeamLinkMaintenanceTime (STA-B)	Result
0	0	≥	dot11BeamLinkMaintenanceTime (STA-A)
1	0	>, <, =	dot11BeamLinkMaintenanceTime (STA-A)
1	1	=	dot11BeamLinkMaintenanceTime (STA-A)
0 or 1	0 or 1	If either dot11BeamLinkMaintenanceTime (STA-A) or dot11BeamLinkMaintenanceTime (STA-B) is undefined	Undefined

9.6 Action frame format details

9.6.1 Introduction

Subclause 9.6 describes the Action field formats allowed in each of the action categories defined in Table 9-51 in 9.4.1.11. The frames defined in this subclause are Action frames, unless stated explicitly to be Action No Ack frames.

9.6.2 Spectrum Management Action frames

9.6.2.1 General

Five Action frame formats are defined for spectrum management. A Spectrum Management Action field, in the field immediately after the Category field, differentiates the five formats. The Spectrum Management Action field values associated with each frame format are defined in Table 9-346.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-346—Spectrum Management Action field values

Spectrum Management Action field value	Description
0	Spectrum Measurement Request
1	Spectrum Measurement Report
2	TPC Request
3	TPC Report
4	Channel Switch Announcement
5–255	Reserved

9.6.2.2 Spectrum Measurement Request frame format

The Spectrum Measurement Request frame is transmitted to request another STA to measure one or more channels. The format of the Spectrum Measurement Request frame Action field is shown in Figure 9-854.

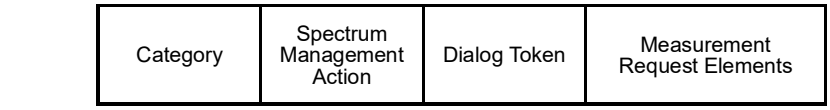

Figure 9-854—Spectrum Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The Measurement Request Elements field contains one or more of the Measurement Request elements described in 9.4.2.20. The number and length of the Measurement Request elements in a Spectrum Measurement Request frame are limited by the maximum allowed MMPDU size.

9.6.2.3 Spectrum Measurement Report frame format

The Spectrum Measurement Report frame is transmitted in response to a Spectrum Measurement Request frame or transmitted autonomously providing measurement information. The format of the Spectrum Measurement Report frame Action field is shown in Figure 9-855.

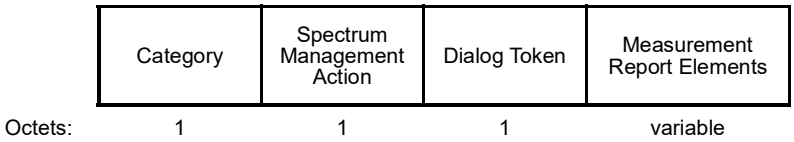

Figure 9-855—Spectrum Measurement Report frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is set to the same value as the Dialog Token field of the corresponding Spectrum Measurement Request frame. If the Spectrum Measurement Report frame is not being transmitted in response to a Spectrum Measurement Request frame, then the dialog token is set to 0.

The Measurement Report Elements field contains one or more of the Measurement Report elements described in 9.4.2.21. The number and length of the Measurement Report elements in a Spectrum Measurement Report frame are limited by the maximum allowed MMPDU size.

9.6.2.4 TPC Request frame format

The TPC Request frame is transmitted requesting another STA for transmit power and link margin information. The format of the TPC Request frame Action field is shown in Figure 9-856.

	Category	Spectrum Management Action	Dialog Token	TPC Request element
Octets:	1	1	1	2

Figure 9-856—TPC Request frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The TPC Request element is set as described in 9.4.2.15.

9.6.2.5 TPC Report frame format

The TPC Report frame is transmitted in response to a TPC Request frame. The format of the TPC Report frame Action field is shown in Figure 9-857.

	Category	Spectrum Management Action	Dialog Token	TPC Report element
Octets:	1	1	1	4

Figure 9-857—TPC Report frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is set to the value of the Dialog Token field in the corresponding TPC Request frame.

The TPC Report element is set as described 9.4.2.16.

9.6.2.6 Channel Switch Announcement frame format

The Channel Switch Announcement frame is transmitted by a non-DMG AP, non-DMG IBSS STA, or mesh STA to advertise a channel switch. The format of the Channel Switch Announcement frame Action field is shown in Figure 9-858.

						Optional	Zero or more
	Category	Spectrum Management Action	Channel Switch Announcement element	Secondary Channel Offset element	Mesh Channel Switch Parameters element	Wide Bandwidth Channel Switch element	New Transmit Power Envelope element
Octets:	1	1	5	0 or 3	0 or 8	0 or 5	variable

Figure 9-858—Channel Switch Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Channel Switch Announcement element is set as described 9.4.2.18.

The Secondary Channel Offset element is defined in 9.4.2.19. This element is present when switching to a 40 MHz or wider channel. It can be present when switching to a 20 MHz channel (in which case the Secondary Channel Offset field is set to SCN); see 11.38.4.

The Mesh Channel Switch Parameters element is defined in 9.4.2.102. This element is present when a mesh STA performs MBSS channel switching. Otherwise, the Mesh Channel Switch Parameters element is not present.

The Wide Bandwidth Channel Switch element is defined in 9.4.2.160. This element is present when switching to a channel width wider than 40 MHz.

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.161) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the local maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.38.1).

9.6.3 QoS Action frame details

9.6.3.1 General

Several Action frame formats are defined for QoS purposes. These frames are identified by the single octet QoS Action field, which follows immediately after the Category field. The values of the QoS Action field are defined in Table 9-347.

Table 9-347—QoS Action field values

QoS Action field value	Meaning
0	ADDTS Request
1	ADDTS Response
2	DELTS
3	Schedule
4	QoS Map Configure
5	ADDTS Reserve Request
6	ADDTS Reserve Response
7–255	Reserved

Two variants are defined for the ADDTS frames: a Basic ADDTS frame variant and a DMG ADDTS frame variant. These variants use different TSPEC formats. The variant of the frame is indicated by the Element ID in the fourth field of the ADDTS Request frame Action field format (see Table 9-350 and Table 9-351) and sixth field of the ADDTS Response frame Action field format (see Table 9-352 and Table 9-353). The Element ID is the first octet of each of these fields. The encoding of the ADDTS frame variants is shown in Table 9-348 and Table 9-349.

Table 9-348—Encoding of the ADDTS Request frame variant

Element ID of fourth field of ADDTS Request frame	ADDTS Request frame variant
13 (TSPEC)	Basic ADDTS Request frame
146 (DMG TSPEC)	DMG ADDTS Request frame

Table 9-349—Encoding of the ADDTS Response frame variant

Element ID of sixth field of ADDTS Response frame	ADDTS Response frame variant
13 (TSPEC)	Basic ADDTS Response frame
146 (DMG TSPEC)	DMG ADDTS Response frame

9.6.3.2 Basic and DMG ADDTS Request frame format

9.6.3.2.1 Basic ADDTS Request frame variant

The ADDTS frames are used to carry TSPEC and optionally TCLAS elements to set up and maintain TSs using the procedures defined in 11.4.

The Action field of the ADDTS Request frame contains the information shown in Table 9-350.

Table 9-350—Basic ADDTS Request frame variant Action field format

Order	Information	Notes
1	Category	
2	QoS Action	
3	Dialog token	
4	TSPEC	
5	TCLAS	Optional
6	TCLAS Processing	Optional
7	U-APSD Coexistence	Optional
8	Expedited Bandwidth Request	Optional
9	Intra-Access Category Priority	Optional
10	Higher Layer Stream ID	Only in AP-initiated TS setup
11	Multi-band	Optional
12	U-PID	Optional
13	Multiple MAC Sublayers	Optional

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The values of the Dialog Token, TCLAS, and subsequent fields of this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.request primitive that causes the frame to be sent. Some of the TSPEC parameters have the same values as the corresponding parameters in the invocation of the MLME-ADDTS.request primitive, while the values of the other fields (i.e., Surplus Bandwidth Allowance, Minimum Service Interval, Maximum Service Interval, and Minimum PHY Rate) are generated within the MAC.

The TSPEC element, defined in 9.4.2.29, and the optional TCLAS element, defined in 9.4.2.30, contain the QoS parameters that define the TS. The TS is identified by the TSID and Direction fields within the TSPEC element. The TCLAS element is optional at the discretion of the STA that sends the ADDTS Request frame, regardless of the setting of the access policy (EDCA, SPCA, or HCCA). There are zero or more TCLAS elements in the ADDTS frame. The TCLAS Processing element is present when there is more than one TCLAS element and is defined in 9.4.2.32. An Expedited Bandwidth Request element is optionally present, which is defined in 9.4.2.93.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The U-APSD Coexistence element, defined in 9.4.2.90, contains the coexistence parameters requested by the non-AP STA when using the U-APSD coexistence capability as described in 11.2.3.5.2. The U-APSD Coexistence element is optionally present.

An Intra-Access Category Priority element is optionally present, which is defined in 9.4.2.120 and described in 11.4.1.

The Higher Layer Stream ID element (9.4.2.124) provides the stream identifier from a higher layer protocol. The Higher Layer Stream ID element is present only in the AP-initiated TS setup (11.4.4.3).

When present in an ADDTS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDTS Request frame applies and contains band-specific information.

When present in the ADDTS Request frame, the U-PID element indicates the upper layer protocol associated with the TID/TSID specified within the TSPEC element contained in this frame.

When present in the ADDTS Request frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster.

9.6.3.2.2 DMG ADDTS Request frame variant

The DMG ADDTS Request frame is used by DMG STAs in a PBSS and in an infrastructure BSS. The Action field of the DMG ADDTS Request frame contains the information shown in Table 9-351.

Table 9-351—DMG ADDTS Request frame variant Action field format

Order	Information	Notes
1	Category	
2	Action	
3	Dialog Token	
4	DMG TSPEC	
5	TSPEC	Optional
6	TCLAS	Optional
7	TCLAS Processing	Optional
8	Multi-band	Optional
9	U-PID	Optional
10	Multiple MAC Sublayers	Optional
11	Higher Layer Stream ID	Optional

The values of the Dialog Token, DMG TSPEC, TSPEC, TCLAS, and subsequent fields of this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.request primitive that causes the frame to be sent.

The DMG TSPEC element contains the parameters that define an allocation. The allocation uniquely identified by the Source AID, Allocation ID, and Destination AID subfields within the DMG TSPEC element.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The optional TSPEC element defines a TS that can use the allocation if the allocation is created successfully.

The optional TCLAS element is used to identify the destination non-AP and non-PCP DMG STA of the ADDTS Request frame. If a TSPEC element is not present, then the TCLAS element is not present. There can be one or more TCLAS elements in the DMG ADDTS Request frame. The TCLAS Processing element is present if there is more than one TCLAS element.

When present in a DMG ADDTS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the TS identified by the optional TSPEC element applies.

When present in the DMG ADDTS Request frame, the U-PID element indicates the upper layer protocol associated with the TS identified by the optional TSPEC element contained in this frame. If a TSPEC element is not present in the frame, the U-PID element is not present in the frame.

When present in the DMG ADDTS Request frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster.

9.6.3.3 Basic and DMG ADDTS Response frame format

9.6.3.3.1 Basic ADDTS Response frame variant

The ADDTS Response frame is transmitted in response to an ADDTS Request frame. The Action field of the ADDTS Response frame contains the information shown in Table 9-352.

Table 9-352—Basic ADDTS Response frame variant Action field format

Order	Information	Notes
1	Category	
2	QoS Action	
3	Dialog Token	
4	Status Code	
5	TS Delay	
6	TSPEC	
7	TCLAS	Optional
8	TCLAS Processing	Optional
9	Schedule	Optionally present if the status code is equal to SUCCESS; otherwise not present
10	Expedited Bandwidth Request	Optional
11	Higher Layer Stream ID	Only in AP-initiated TS setup
12	Multi-band	Optional
13	U-PID	Optional
14	Multiple MAC Sublayers	Optional

The Category field is defined in 9.4.1.11.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The QoS Action field is defined in 9.6.3.1.

The Status Code field is defined in 9.4.1.9.

The values the Dialog Token, TS Delay, TSPEC, TCLAS, and subsequent fields in this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay element is present in an ADDTS Response frame only if the status code is equal to REJECTED_FOR_DELAY_PERIOD.

The Schedule element, defined in 9.4.2.33, is present in an ADDTS Response frame only if the status code is equal to SUCCESS(i.e., when the TS is admitted).

The Higher Layer Stream ID element is present only in AP-initiated TS setup. The Higher Layer Stream ID element (9.4.2.124) contains the stream identifier provided by a higher layer protocol.

When present in an ADDTS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDTS Response frame applies and contains band-specific information.

When present in the ADDTS Response frame, the U-PID element indicates the upper layer protocol associated with the TID/TSID specified within the TSPEC contained in this frame.

When present in the ADDTS Response frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster (see 11.32).

9.6.3.3.2 DMG ADDTS Response frame variant

The DMG ADDTS Response frame is used by DMG STAs in a PBSS and in an infrastructure BSS. The Action field of the DMG ADDTS Response frame contains the information shown in Table 9-353.

Table 9-353—DMG ADDTS Response frame variant Action field format

Order	Information	Notes
1	Category	
2	Action	
3	Dialog Token	
4	Status code	
5	TS Delay	
6	DMG TSPEC	
7	TSPEC	Optional
8	TCLAS	Optional
9	TCLAS Processing	Optional
10	Multi-band	Optional
11	U-PID	Optional
12	Multiple MAC Sublayers	Optional
13	Higher Layer Stream ID	Optional

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The values of the Dialog Token, TS Delay, DMG TSPEC, TSPEC, TCLAS, and subsequent fields in this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay element is present in a DMG ADDTS Response frame only if the status code is set to REJECTED_FOR_DELAY_PERIOD (9.4.1.9).

When present in a DMG ADDTS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the TS identified by the optional TSPEC element applies.

When present in the DMG ADDTS Response frame, the U-PID element indicates the upper layer protocol associated with the TS identified by the optional TSPEC contained in this frame. If a TSPEC element is not present in the frame, the U-PID element is not present in the frame.

When present in the DMG ADDTS Response frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster (see 11.32).

9.6.3.4 DELTS frame format

The DELTS frame is used to delete a TS or an allocation using the procedures defined in 11.4.9.

The Action field of a DELTS frame contains the information shown in Table 9-354.

Table 9-354—DELTS frame Action field format

Order	Information
1	Category
2	QoS Action
3	TS Info
4	Reason Code
5	DMG Allocation Info (optional)
6	Multi-band (optional)

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The TS Info field is defined in 9.4.2.29. Either the field identifies an existing TS created using the TSPEC element, or all its subfields are set to 0. The DMG Allocation Info field, defined in 9.4.2.133, is present when an existing DMG allocation is being deleted. When a DMG allocation is being deleted, the DMG Allocation Info field identifies an existing allocation created using the DMG TSPEC element. When a DMG allocation is not being deleted, all subfields in the DMG Allocation Info field are set to 0.

The Reason Code field is defined in 9.4.1.7.

A DELTS frame is used to delete a TS characterized by the TS Info field or to delete a DMG allocation identified by the DMG Allocation Info field in the frame. A DELTS frame can be sent from the HC or PCP to the source STA of that TS, or vice versa, to indicate an imperative request, to which no response is required from the recipient STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When present in an DELTS frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the DELTS frame applies.

9.6.3.5 Schedule frame format

The Schedule frame is transmitted by the HC to announce the schedule of delivery of data and polls. The Action field of the Schedule frame contains the information shown in Table 9-355.

Table 9-355—Schedule frame Action field format

Order	Information
1	Category
2	QoS Action
3	Schedule

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The Schedule element is defined in 9.4.2.33.

9.6.3.6 QoS Map Configure frame format

The QoS Map Configure frame is used by an AP to provide the QoS Map information to a non-AP STA using the procedures defined in 11.22.9.

The Action field of the QoS Map Configure frame contains the information shown in Table 9-356.

Table 9-356—QoS Map Configure frame Action field format

Order	Information
0	Category
1	QoS Action
2	QoS Map
3	Intra-Access Category Priority elements (optional)

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The QoS Map element is defined in 9.4.2.94.

Zero or more Intra-Access Category Priority elements are present, which are defined in 9.4.2.120.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.3.7 ADDTS Reserve Request frame format

The ADDTS Reserve Request frame is transmitted by an AP to a non-AP STA in response to a higher layer protocol. See 11.4.4.3.

The Action field of the ADDTS Reserve Request frame contains the information shown in Table 9-357.

Table 9-357—ADDTS Reserve Request frame Action field format

Order	Information
1	Category
2	QoS Action
3	TSPEC
4	Schedule
5	Higher Layer Stream ID

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The TSPEC element contains the QoS parameters that define the TS. The QoS parameters in the TSPEC are equivalent to the QoS parameters of the higher level stream identified by the Higher Level Stream ID. The TS is identified by the TSID and Direction fields within the TSPEC element.

The Schedule element is defined in 9.4.2.33 and set to reflect schedule information corresponding to the TSPEC specification.

The Higher Layer Stream ID element (defined in 9.4.2.124) provides the stream identifier from a higher layer protocol.

9.6.3.8 ADDTS Reserve Response frame format

An ADDTS Reserve Response frame is used by a non-AP STA to indicate the completion of an AP-initiated TS setup procedure (11.4.4.3). The Action field of the ADDTS Reserve Response frame contains the information shown in Table 9-358.

Table 9-358—ADDTS Reserve Response frame Action field format

Order	Information
1	Category
2	QoS Action
3	Higher Layer Stream ID
4	Status Code

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The Higher Layer Stream ID field contains a Higher Layer Stream ID element (see 9.4.2.124).

The Status Code field is defined in 9.4.1.9.

9.6.4 Block Ack Action frame details

9.6.4.1 General

ADDBA Request and ADDBA Response frames are used to set up or, if a STA is PBAC, to modify Block Ack operation for a specific TC, TS, or GCR group address. A Block Ack Action field, in the octet immediately after the Category field, differentiates the Block Ack Action frame formats. The Block Ack Action frames are used to negotiate several parameters of a block ack agreement and the type of BlockAck frames that are used: BlockAck, NDP BlockAck and Block Acknowledgment TWT frames (see 10.25.2). The Block Ack Action field values associated with each frame format within the Block Ack category are defined in Table 9-359.

Table 9-359—Block Ack Action field values

Block Ack Action field values	Meaning
0	ADDBA Request
1	ADDBA Response
2	DELBA
3–127	Reserved
128	NDP ADDBA Request
129	NDP ADDBA Response
130	NDP DELBA
131	Reserved
132	BAT ADDBA Request
133	BAT ADDBA Response
134	BAT DELBA
135–255	Reserved

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.4.2 ADDBA Request frame format

An ADDBA Request frame is sent by an originator of block ack to another STA. The Action field of an ADDBA Request frame contains the information shown in Table 9-360.

Table 9-360—ADDBA Request frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	Dialog Token
4	Block Ack Parameter Set
5	Block Ack Timeout Value
6	Block Ack Starting Sequence Control
7	GCR Group Address element (optional)
8	Multi-band (optional)
9	TCLAS (optional)
10	ADDBA Extension (optional)

The Category field is defined in 9.4.1.11.

The Block Ack Action field is set to 0, 128, or 132 (representing ADDBA request). The meaning for each value is described in 9.6.4.1.

The Dialog Token field is set to a nonzero value chosen by the STA.

The Block Ack Parameter Set field is defined in 9.4.1.13.

The Block Ack Timeout Value field is defined in 9.4.1.14.

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control field (see Figure 9-37) contains the sequence number of the first or next (in the case of a renegotiation of a block ack agreement) MSDU to be sent under this block ack agreement. The Fragment Number subfield is set to 0.

If the GCR Group Address element is present, the TID field within the Block Ack Parameter Set field is reserved.

The GCR Group Address element contains the group address for which a block ack agreement is requested.

When present in an ADDBA Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDBA Request frame applies and contains band-specific information.

The ADDBA Extension element is defined in 9.4.2.139.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.4.3 ADDBA Response frame format

The ADDBA Response frame is sent in response to an ADDBA Request frame. The Action field of an ADDBA Response frame contains the information shown in Table 9-361.

Table 9-361—ADDBA Response frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	Dialog Token
4	Status Code
5	Block Ack Parameter Set
6	Block Ack Timeout Value
7	GCR Group Address element (optional)
8	Multi-band (optional)
9	TCLAS (optional)
10	ADDBA Extension (optional)
11	Originator Preferred MCS (optional)

The Category field is defined in 9.4.1.11.

The Block Ack Action field is set to 1, 129, or 133 (representing ADDBA response). The meaning for each value is described in 9.6.4.1.

The Dialog Token field value is copied from the corresponding received ADDBA Request frame.

The Status Code field is defined in 9.4.1.9.

The Block Ack Parameter Set field is defined in 9.4.1.13.

The Block Ack Timeout Value field is defined in 9.4.1.14.

If the GCR Group Address element is present, the TID field within the Block Ack Parameter Set field is reserved.

The GCR Group Address element contains the group address for which a block ack agreement is requested.

When present in an ADDBA Response frame, the Multi-band element indicates the frequency band ID, operating class, and channel number to which the ADDBA Response frame applies and contains band-specific information.

The ADDBA Extension element is defined in 9.4.2.139.

The Originator Preferred MCS field is present if dot11S1GOptionImplemented is true, and the Block Ack Action field is 1, and it is defined in 9.4.1.15. Otherwise, it is not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.4.4 DELBA frame format

The DELBA frame is sent by either the originator of the traffic or the recipient to terminate the block ack participation. The Action field of a DELBA frame contains the information shown in Table 9-362.

Table 9-362—DELBA frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	DELBA Parameter Set
4	Reason Code
5	DELBA GCR Group Address
6	Multi-band (optional)
7	TCLAS (optional)

The Category field is defined in 9.4.1.11.

The Block Ack Action field is set to 2, 130, or 134 (representing DELBA). The meaning for each value is described in 9.6.4.1.

The DELBA Parameter Set field is defined in 9.4.1.16.

The Reason Code field is defined in 9.4.1.7.

The DELBA GCR Group Address field is defined in 9.4.2.125 and contains the GCR group address whose block ack agreement is being terminated.

When present in an DELBA frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the DELBA frame applies.

9.6.5 Vendor-specific action details

The Vendor Specific frame is defined for vendor-specific signaling. The format of the Action field of the Vendor Specific frame is shown in Figure 9-859.

NOTE—If management frame protection is negotiated, then Vendor Specific Protected Action frames (see Table 9-51) are protected; otherwise they are unprotected.

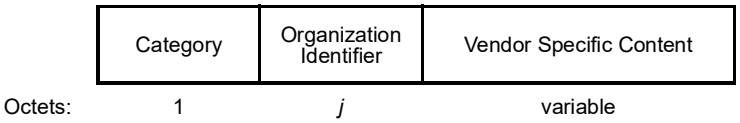

Figure 9-859—Vendor Specific frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Organization Identifier field contains a organization identifier assigned by the IEEE and is specified in 9.4.1.31. The order of the Organization Identifier field is described in 9.2.2.

The Vendor Specific Content field contains vendor-specific field(s). The length of the vendor specific content in a Vendor Specific frame is limited by the maximum allowed MMPDU size.

9.6.6 Radio Measurement action details

9.6.6.1 General

Several Action frame formats are defined for radio measurement purposes. A Radio Measurement Action field, in the field immediately after the Category field, differentiates the formats. The Radio Measurement Action field values associated with each frame format are defined in Table 9-363.

Table 9-363—Radio Measurement Action field values

Radio Measurement Action field value	Description
0	Radio Measurement Request
1	Radio Measurement Report
2	Link Measurement Request
3	Link Measurement Report
4	Neighbor Report Request
5	Neighbor Report Response
6–255	Reserved

9.6.6.2 Radio Measurement Request frame format

The Radio Measurement Request frame is transmitted to another STA to request that it makes one or more measurements on one or more channels. The format of the Action field in the Radio Measurement Request frame is shown in Figure 9-860.

	Category	Radio Measurement Action	Dialog Token	Number of Repetitions	Measurement Request Elements
Octets:	1	1	1	2	variable

Figure 9-860—Radio Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the radio measurement request to identify the request/report transaction.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Number of Repetitions field contains the requested number of repetitions for all of the Measurement Request elements in this frame. Setting the Number of Repetitions field to 0 indicates Measurement Request elements are executed once without repetition. Setting the Number of Repetitions field to 65 535 indicates Measurement Request elements are repeated until the measurement is canceled or superseded.

The Measurement Request Elements field contains zero or more of the Measurement Request elements described in 9.4.2.20. The number and length of the Measurement Request elements in a Measurement Request frame are limited by the maximum allowed MMPDU size.

9.6.6.3 Radio Measurement Report frame format

The Radio Measurement Report frame is transmitted in response to a Radio Measurement Request frame or by a STA providing a triggered autonomous measurement report. The format of the Action field in the Radio Measurement Report frame is shown in Figure 9-861.

	Category	Radio Measurement Action	Dialog Token	Measurement Report Elements
Octets:	1	1	1	variable

Figure 9-861—Radio Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is set to the value in the corresponding Radio Measurement Request frame. If the Radio Measurement Report frame is not being transmitted in response to a Radio Measurement Request frame then the dialog token is set to 0.

The Measurement Report Elements field contains one or more Measurement Report elements described in 9.4.2.21. The number and length of the Measurement Report elements in a single Radio Measurement Report frame are limited by the maximum allowed MMPDU size. Subclause 11.10.6 describes the required behavior for multiframe Radio Measurement Report frame responses.

9.6.6.4 Link Measurement Request frame format

The Link Measurement Request frame is transmitted by a STA to request another STA to respond with a Link Measurement Report frame to enable measurement of link path loss and estimation of link margin. In a non-DMG BSS, a Link Measurement Request frame is an Action frame and in a DMG BSS, a Link Measurement Request frame is an Action or an Action No Ack frame. The format of the Action field in the Link Measurement Request frame is shown in Figure 9-862.

	Category	Radio Measurement Action	Dialog Token	Transmit Power Used	Max Transmit Power
Octets:	1	1	1	1	1

Figure 9-862—Link Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The Transmit Power Used field is set to the transmit power used to transmit the frame containing the Link Measurement Request, as described in 9.4.1.20.

The Max Transmit Power field provides the upper limit on the transmit power as measured at the antenna connector to be used by the transmitting STA on its operating channel. This field is described in 9.4.1.19. The Max Transmit Power field is a 2s complement signed integer, providing an upper limit, in a dBm scale, on the transmit power as measured at the antenna connector to be used by the transmitting STA on its operating channel. The Max Transmit Power field is set to the minimum of the maximum powers at which the STA is permitted to transmit in the operating channel by device capability, policy, and regulatory authority.

9.6.6.5 Link Measurement Report frame format

The Link Measurement Report frame is transmitted in response to a Link Measurement Request frame. In a non-DMG BSS, a Link Measurement Report frame is an Action frame and in a DMG BSS, a Link Measurement Report frame is an Action or an Action No Ack frame. The format of the Action field in the Link Measurement Report frame is shown in Figure 9-863.

	Category	Radio Measurement Action	Dialog Token	TPC Report element	Receive Antenna ID	Transmit Antenna ID	RCPI	RSNI	DMG Link Margin	DMG Link Adaptation Acknowledgment
Octets:	1	1	1	4	1	1	1	1	variable	variable

Figure 9-863—Link Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is set to the value of the Dialog Token field in the corresponding Link Measurement Request frame.

The TPC Report element is set as described in 9.4.2.16.

The Receive Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used to receive the corresponding Link Measurement Request frame. The antenna ID or DMG antenna ID is defined in 9.4.2.39.

The Transmit Antenna ID field contains the identifying number for the antenna(s) or DMG antenna used to transmit this Link Measurement Report frame. The antenna ID or DMG antenna ID is defined in 9.4.2.39.

The RCPI field indicates the received channel power of the corresponding Link Measurement Request frame, which is a logarithmic function of the received signal power, as defined in 9.4.2.37.

The RSNI field indicates the received signal-to-noise indication for the corresponding Link Measurement Request frame, as described in 9.4.2.40.

The DMG Link Margin field is optionally present. When present, it contains a DMG Link Margin element (see 9.4.2.142).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The DMG Link Margin Adaptation Acknowledgment field is optionally present. When present, it contains a DMG Link Margin Adaptation Acknowledgment element (see 9.4.2.143).

9.6.6.6 Neighbor Report Request frame format

The Neighbor Report Request frame is transmitted requesting information in the neighbor report about neighboring APs. The format of the Action field in the Neighbor Report Request frame is shown in Figure 9-864.

	Category	Radio Measurement Action	Dialog Token	SSID (optional)	LCI Measurement Request (optional)	Location Civic Measurement Request (optional)
Octets:	1	1	1	variable	variable	variable

Figure 9-864—Neighbor Report Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The SSID field is optionally present. If present, it contains an SSID element. The presence of an SSID element in a Neighbor Report Request frame indicates a request for a list of neighbor reports for the specified SSID in the SSID element. The absence of an SSID element indicates the request is for the ESS of which the transmitting STA is a member.

The LCI Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to LCI (see Table 9-98), which indicates a request for a Measurement Report subelement with Measurement Type field equal to LCI for each Neighbor Report element (see 11.10.10.2). The Enable bit in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-110). The Request, Report and Duration Mandatory bits within the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.20.1).

The Location Civic Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to Location Civic (see Table 9-98). The element indicates a request for a Measurement Report subelement with Measurement Type field equal to Location Civic for each Neighbor Report element (see 11.10.10.2). The Enable bit in the Measurement Request Mode field within the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is equal to Location Subject Remote (see Table 9-110). The Location Service Interval Units field in the Measurement Request field of the Measurement Request element is set to 0. The Request, Report and Duration Mandatory bits in the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.20.1).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.6.7 Neighbor Report Response frame format

The Neighbor Report Response frame is transmitted in response to a Neighbor Report Request frame. The format of the Action field in the Neighbor Report Response frame is shown in Figure 9-865.

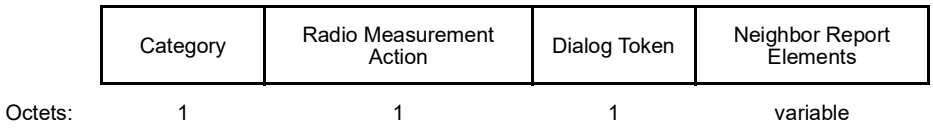

Figure 9-865—Neighbor Report Response frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.6.1.

The Dialog Token field set to the value in the corresponding Neighbor Report Request frame. If the Neighbor Report Response frame is not being transmitted in response to a Neighbor Report Request frame, then the dialog token is set to 0.

The Neighbor Report Elements field contains the Neighbor Report elements for validated APs described in 9.4.2.36. If the STA has no information in response to the Neighbor Report Request, the Neighbor Report elements are omitted. The number and length of the Neighbor Report elements in a Neighbor Report Response frame is limited by the maximum allowed MMPDU size.

NOTE—Under some circumstances, a Neighbor Report element is included for the STA transmitting the frame. See 11.10.10.3.

9.6.7 Public Action details

9.6.7.1 Public Action frames

The Public Action frame is defined to allow the following:

— Inter-BSS and AP to unassociated-STA communications
— Intra-BSS communication
— GAS

A Public Action field, in the octet immediately after the Category field, differentiates the Public Action frame formats. The defined Public Action frames are listed in Table 9-364.

Table 9-364—Public Action field values

Public Action field value	Description
0	20/40 BSS Coexistence Management
1	DSE Enablement
2	DSE Deenablement
3	DSE Registered Location Announcement
4	Extended Channel Switch Announcement

46–255	Reserved

9.6.7.2 20/40 BSS Coexistence Management frame format

The format of the 20/40 BSS Coexistence Management frame Action field is defined in Table 9-365.

Table 9-365—20/40 BSS Coexistence Management frame Action field format

Order	Information	Notes
1	Category	
2	Public Action	
3	20/40 BSS Coexistence (see 9.4.2.59)	
4	20/40 BSS Intolerant Channel Report (see 9.4.2.57)	Appears zero or more times

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

9.6.7.3 Measurement Pilot frame format

The format of the Action field of the Measurement Pilot frame is shown in Figure 9-866.

	Category	Public Action	Condensed Capability Information	Condensed Country String	Operating Class	Channel	Measurement Pilot Interval	Optional Subelements
Octets:	1	1	1	2	1	1	1	variable

Figure 9-866—Measurement Pilot frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Condensed Capability Information field contains two subfields as shown in Figure 9-867.

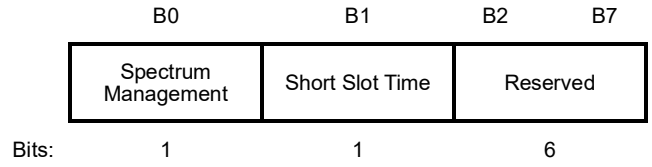

Figure 9-867—Condensed Capability Information field

The Spectrum Management subfield is set to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.

The Short Slot Time subfield is set to 1 if dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true. Otherwise, the Short Slot Time subfield is set to 0.

The Condensed Country String field is set to the first two octets of the value contained in dot11CountryString.

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class value for the operating channel. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for the operating channel. Valid operating classes are listed in Annex E, excluding Operating Classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the operating channel. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the operating channel, and the Operating Class and Channel Number together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Measurement Pilot Interval field is set to the value contained in dot11RMMeasurementPilotPeriod.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-366.

Table 9-366—Optional subelement IDs for Measurement Pilot frame

Subelement ID	Name	Extensible
0–70	Reserved	
71	Multiple BSSID	Subelements
72–162	Reserved	
163	Wide Bandwidth Channel Switch	Yes
164–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.160) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Multiple BSSID and Vendor Specific subelements have the same format as the Multiple BSSID and Vendor Specific elements (see 9.4.2.45 and 9.4.2.25, respectively). Zero or more Vendor Specific subelements are included in the list of optional subelements.

9.6.7.4 DSE Enablement frame format

The DSE Enablement frame is transmitted as part of enablement. The format of the DSE Enablement frame Action field is shown in Figure 9-868.

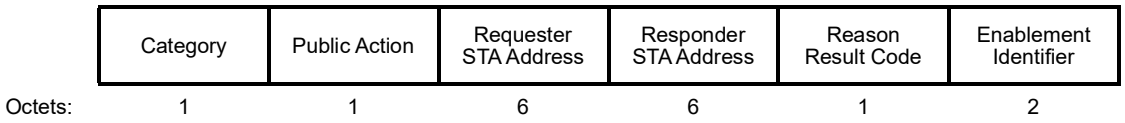

Figure 9-868—DSE Enablement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the enablement process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the enablement responder. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Enablement frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 9-367.

Table 9-367—Reason Result Code field values

Reason Result Code field value	Name	Description
0		Reserved
1		Reserved
2		Enablement requested
3	SUCCESS	Success
4	REFUSED	Request declined
5	INVALID_PARAMETERS	Request not successful as one or more parameters have invalid values
6	TOO_MANY_ SIMULTANEOUS_REQUESTS	Enablement denied because the enabling STA is unable to handle additional dependent STAs
7–255		Reserved

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Enablement Identifier field is a 16-bit number assigned by an enabling STA to a dependent STA; otherwise, it is 0, set using the procedures defined in 11.11.

9.6.7.5 DSE Deenablement frame format

The DSE Deenablement frame is transmitted as part of deenablement. The format of the DSE Deenablement frame Action field is shown in Figure 9-869.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code
Octets:	1	1	6	6	1

Figure 9-869—DSE Deenablement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the deenablement process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that becomes deenabled. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Deenablement frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 9-368.

Table 9-368—Reason Result Code field values

Reason Result Code field value	Description
0	Reserved
1	Reserved
2	Deenablement requested
3–255	Reserved

9.6.7.6 DSE Registered Location Announcement frame format

The DSE Registered Location Announcement frame is transmitted by a dependent STA to advertise the registered location of its enabling STA. The format of the DSE Registered Location Announcement frame Action field is shown in Figure 9-870.

	Category	Public Action	DSE Registered Location Information
Octets:	1	1	20

Figure 9-870—DSE Registered Location Announcement frame Action field format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The DSE Registered Location Information field is defined in 9.4.2.51.

9.6.7.7 Extended Channel Switch Announcement frame format

The Extended Channel Switch Announcement frame is transmitted by an AP, IBSS STA, or mesh STA to advertise a channel switch. The format of the Extended Channel Switch Announcement frame Action field is shown in Figure 9-871.

								Zero or one	Zero or one	Zero or more
	Category	Public Action	Channel Switch Mode	New Operating Class	New Channel Number	Channel Switch Count	Mesh Channel Switch Parameters element	New Country element	Wide Bandwidth Channel Switch element	New Transmit Power Envelope element
Octets:	1	1	1	1	1	1	0 or 8	variable	variable	variable

Figure 9-871—Extended Channel Switch Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Channel Switch Mode, New Operating Class, New Channel Number, and Channel Switch Count fields are as described in the Extended Channel Switch Announcement element (see 9.4.2.52).

The Mesh Channel Switch Parameters element is defined in 9.4.2.102. This element is present when a mesh STA performs MBSS channel switching. The Mesh Channel Switch Parameters element is not included for channel switching other than for an MBSS channel switch.

The New Country element is present when an AP or mesh STA performs extended channel switching to a new Country, new Operating Class Table, or a changed set of operating classes relative to the contents of the Country element sent in the Beacon; otherwise, this element is not present. The format of the New Country element is defined to be the same as the format of the Country element (see 9.4.2.8), except that no Subband Triplet fields are present in the New Country element. The Country String field in the New Country element indicates the Country and Operating Class Table of the BSS after extended channel switching and Operating Triplet fields within the New Country element indicate the operating classes of the BSS after extended channel switching (see 11.38.1).

This Wide Bandwidth Channel Switch element is present when extended channel switching to a channel width wider than 40 MHz, or when extended channel switching is to a channel width wider than 1 MHz and the frame carrying the element is an S1G PPDU; otherwise, this element is not present. The Wide Bandwidth Channel Switch element is defined in 9.4.2.160. The Wide Bandwidth Channel Switch element indicates the BSS bandwidth after extended channel switching (see 11.38.1 and 10.46.1).

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.161) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after extended channel switching (see 11.38.1).

9.6.7.8 DSE Measurement Request frame format

The DSE Measurement Request frame requests a DSE measurement report. It is transmitted using the procedures defined in 11.11. The format of the DSE Measurement Request frame Action field is shown in Figure 9-872.

	Category	Public Action	Requester STA Address	Responder STA Address	Operating Class	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	1	6	6	1	1	8	2

Figure 9-872—DSE Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the STA that requests the DSE measurement report. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Start Time field is set to the timing synchronization function (TSF) at the time (± 1 TU) at which the requested DSE request measurement starts. Setting the field to 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in number of time units (TUs).

9.6.7.9 DSE Measurement Report frame format

The DSE Measurement Report frame is transmitted using the procedures defined in 11.11. The format of the DSE Measurement Report frame Action field is shown in Figure 9-873.

	Category	Public Action	Requester STA Address	Responder STA Address	Length	Operating Class	Channel Number	Measurement Report Mode	Actual Measurement Start Time	Measurement Duration	Reported DSE LCI fields
Octets:	1	1	6	6	2	1	1	1	8	2	n × 26

Figure 9-873—DSE Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the STA that requested the DSE measurement report. The length of the RequesterSTAAddress field is 6 octets.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 13.

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Report Mode field is defined in 9.4.2.21 (see Figure 9-223).

The Actual Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time (± 1 TU) at which the DSE measurement started.

The Measurement Duration field is set to the duration over which the requested measurement was measured, expressed in number of TUs.

The reported DSE LCI fields contain the DSE LCI received at the measuring STA. If the reported DSE LCI fields would cause the frame to exceed the maximum MAC management protocol data unit (MMPDU) size, then the reported DSE LCI fields are truncated so that the last reported DSE LCI field is complete. The DSE LCI field format is shown in Figure 9-874.

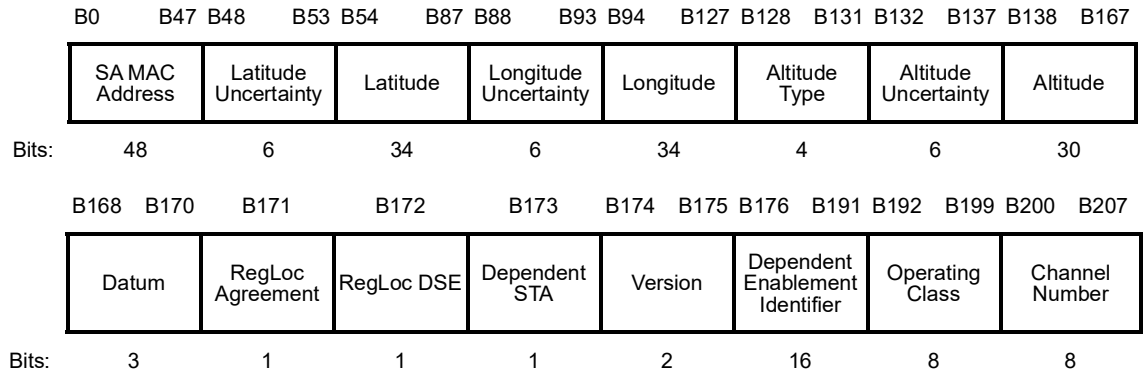

Figure 9-874—DSE LCI field format

The SA MAC Address field contains the SA MAC address from the Beacon or Public Action frame containing a DSE Registered Location element being reported.

The remaining fields are as defined in the DSE Registered Location Information field (see 9.4.2.51).

9.6.7.10 DSE Power Constraint frame format

The DSE Power Constraint frame requests that a dependent STA constrain transmit power below the regulatory limit. It is transmitted by an enabling STA as part of enablement. The format of the DSE Power Constraint frame Action field is shown in Figure 9-875.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code	Local Power Constraint
Octets:	1	1	6	6	1	1

Figure 9-875—DSE Power Constraint frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The RequesterSTAAddress field is the MAC address of the STA that requests the DSE power constraint. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that initiates the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Power Constraint frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 9-369.

Table 9-369—Reason Result Code field values

Reason Result Code field value	Name	Description
0		Reserved
1		Reserved
2		Power constraint requested
3	SUCCESS	Success
4	REFUSED	Refused — no reason specified
5	INVALID_PARAMETERS	Request not successful as one or more parameters have invalid values
6–255		Reserved

The Local Power Constraint field is coded as an unsigned integer in units of decibels relative to 1 mW. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel in the DSE Power Constraint frame.

9.6.7.11 Vendor Specific Public Action frame format

The Vendor Specific Public Action frame is defined for vendor-specific signaling between unassociated STAs. The format of the Action field of the Vendor Specific Public Action frame is shown in Figure 9-876.

	Category	Public Action	Organization Identifier	Vendor Specific Content
Octets:	1	1	variable	variable

Figure 9-876—Vendor Specific Public Action frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Organization Identifier field contains a organization identifier assigned by the IEEE and is specified in 9.4.1.31. The order of the Organization Identifier field is described in 9.2.2. The length of the Organization Identifier field is variable, as specified in 9.4.1.31.

The Vendor Specific Content field contains vendor-specific field(s). The length of the vendor specific content in a Vendor Specific frame is limited by the maximum allowed MMPDU size.

9.6.7.12 GAS Initial Request frame format

The GAS Initial Request frame is transmitted by a requesting STA to request information from another STA. The format of the GAS Initial Request frame Action field is shown in Table 9-370.

Table 9-370—GAS Initial Request frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Advertisement Protocol element
4	Query Request Length
5	Query Request
6	Multi-band (optional)
7	CAG Number (optional)
8	GAS Extension (optional)

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The Advertisement Protocol element is defined in 9.4.2.92. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Request Length field is defined in Figure 9-877. The value of the Query Request Length field is set to the total number of octets in the Query Request field.

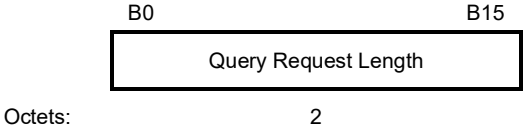

Figure 9-877—Query Request Length field

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Query Request field is defined in Figure 9-878. The Query Request field is a generic container whose value is formatted in accordance with the protocol identified in the Advertisement Protocol element.

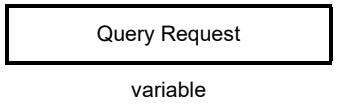

Figure 9-878—Query Request field

When present in a GAS Initial Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Request frame applies.

When present in a GAS Initial Request frame, the CAG Number element includes one or more Common Advertisement Group (CAG) tuples. Each CAG tuple specifies a pair of CAG Version and CAG Information Type cached by the requesting STA and associated with the query request contained in the Query Request field.

The GAS Extension element indicating the STA support for GAS extension in GAS frame exchanges is optionally present if dot11GASExtensionImplemented is true.

9.6.7.13 GAS Initial Response frame format

The GAS Initial Response frame is transmitted in response to a GAS Initial Request frame or a Group Addressed GAS Request frame. The format of the GAS Initial Response frame Action field is shown in Table 9-371.

Table 9-371—GAS Initial Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	GAS Comeback Delay
5	Advertisement Protocol element
6	Query Response Length
7	Query Response (optional)
8	Multi-band (optional)
9	GAS Extension (optional)

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is copied from the corresponding GAS Initial Request frame or Group Addressed GAS Request frame.

The Status Code values are defined in Table 9-50.

The GAS Comeback Delay field specifies the delay time value in TUs. The GAS Comeback Delay field format is shown in Figure 9-879. The behavior is described in 11.22.3.2. The value 0 will be returned by the STA when a Query Response is provided in this frame.

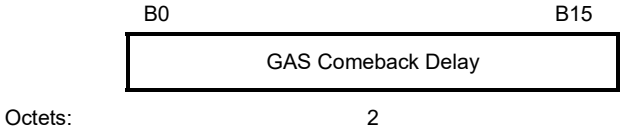

Figure 9-879—GAS Comeback Delay field format

The Advertisement Protocol element is defined in 9.4.2.92. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field is defined in Figure 9-880. The Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

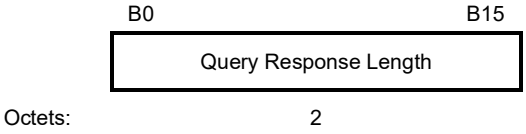

Figure 9-880—Query Response Length field format

The Query Response field is defined in Figure 9-881. The Query Response field is a generic container whose value is formatted in accordance with the protocol specified in the Advertisement Protocol element.

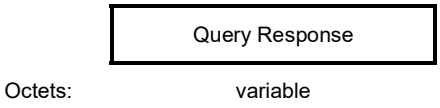

Figure 9-881—Query Response field format

When present in a GAS Initial Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Response frame applies.

The GAS Extension element indicating the STA support for GAS extension in GAS frame exchanges is optionally present if dot11GASExtensionImplemented is true. It is included as a response to a GAS Initial Request frame containing a GAS Extension element.

9.6.7.14 GAS Comeback Request frame format

The GAS Comeback Request frame is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request frame Action field is shown in Table 9-372.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-372—GAS Comeback Request frame Action field(format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Multi-band (optional)
4	GAS Extension (optional)

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

When present in a GAS Comeback Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Request frame applies.

When present in a GAS Comeback Request frame, the GAS Extension element indicates a request to retransmit a GAS Query Response fragment.

9.6.7.15 GAS Comeback Response frame format

The GAS Comeback Response frame is transmitted by a responding STA to a requesting STA. The format of the GAS Comeback Response frame Action field is shown in Table 9-373.

Table 9-373—GAS Comeback Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	GAS Query Response Fragment ID
5	GAS Comeback Delay
6	Advertisement Protocol element
7	Query Response Length
8	Query Response (optional)
9	Multi-band (optional)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is copied from the Dialog Token field of the corresponding GAS Comeback Request frame. The same value of the Dialog Token field is present in all fragments of a multi-fragment query response.

The Status Code values are defined in Table 9-50. The same status code value is present in all fragments of a multi-fragment query response.

The GAS Query Response Fragment ID is defined in 9.4.1.33. If the responding STA has not received a response to the query that it posted on behalf of a requesting STA, then the responding STA sets the GAS Query Response Fragment ID to 0. When there is more than one query response fragment, the responding STA sets the GAS Query Response Fragment ID to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment Query Response. The More GAS Fragments field is set to 0 whenever the final fragment of a query response is being transmitted. A GAS Query Response Fragment ID field having a nonzero Fragment ID and the More GAS Fragments field set to 1 indicates to the requesting STA that another GAS Comeback frame exchange should be performed to continue the retrieval of the query response.

The GAS Comeback Delay field format is shown in Figure 9-879. A nonzero GAS Comeback Delay value is returned by the responding STA in this frame to indicate that the GAS Query Request being carried out on behalf of the requesting STA is still in progress.

— A nonzero value indicates to the requesting STA that another GAS Comeback frame exchange should be performed after the expiration of the GAS Comeback Delay timer in order to retrieve the query response.
— This field is set to 0 for all GAS Comeback Response frames containing a query response or a fragment of a multi-fragment query response.

The Advertisement Protocol element is defined in 9.4.2.92. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field is defined in Figure 9-880. The Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

The Query Response field is defined in Figure 9-881. The Query Response field is a generic container dependent on the advertisement protocol specified in the Advertisement Protocol element and the query itself. In a multi-fragment query response, the response to the query posted on behalf of a requesting STA is fragmented such that each fragment to be transmitted fits within the MMPDU size limitation.

When present in a GAS Comeback Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Response frame applies.

9.6.7.16 TDLS Discovery Response frame format

The format of the TDLS Discovery Response frame Action field is shown in Table 9-374.

The TDLS Discovery Response frame is transmitted directly (i.e., not via the AP) to the TDLS peer STA that sent the corresponding TDLS Discovery Request frame. See 11.20.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-374—TDLS Discovery Response frame Action field format

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	Public Action	The Public Action field is defined in 9.6.7.1.
3	Dialog Token	The dialog token is copied from the corresponding TDLS Discovery Request frame. The dialog token is specified in 9.4.1.12.
4	Capability	The Capability field indicates the capabilities of the STA. The Capability field is defined in 9.4.1.4.
5	Supported Rates and BSS Membership Selectors	The Supported Rates and BSS Membership Selectors element indicates the rates supported by the STA. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3.
6	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present whenever there are more than eight supported rates, and it is optional otherwise. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.12.
7	Supported Channels	The Supported Channels element is present if the TDLS Channel Switching subfield is equal to 1. The Supported Channels element is defined in 9.4.2.17.
8	RSNE	The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1). The RSNE is defined in 9.4.2.24.
9	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 9.4.2.26.
10	Timeout Interval (TPK key lifetime)	The Timeout Interval element contains the TPK key lifetime. It is present if security is required on the TDLS direct link (see 12.7.8.1). The Timeout Interval element is defined in 9.4.2.48.
11	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1.
12	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. The HT Capabilities element is defined in 9.4.2.55.
13	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is present when dot112040BSSCoexistenceManagementSupport is true. The 20/40 BSS Coexistence element is defined in 9.4.2.59.
14	Link Identifier	The Link Identifier element is defined in 9.4.2.61.
15	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
16	VHT Capabilities	VHT Capabilities element (optional). The VHT Capabilities element is present if dot11VHTOptionImplemented is true. The VHT Capabilities element is defined in 9.4.2.157.

9.6.7.17 Location Track Notification frame format

The Location Track Notification frame is transmitted to allow remote location determination to occur by another STA. The format of the Location Track Notification frame Action field is shown in Figure 9-882.

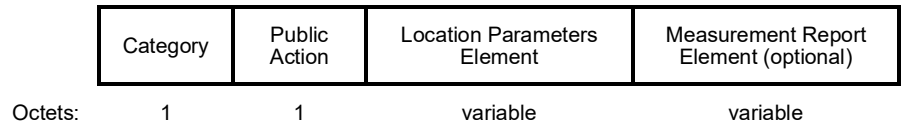

Figure 9-882—Location Track Notification frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Location Parameters Element field contains the Location Parameters subelements, described in Table 9-213. Table 9-375 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the frame.

Table 9-375—Location Parameters Element field for Location Track Notification frame

Allowed subelements	Subelement ID	Notes
Location Indication Channels	2	The Location Indication Channels subelement is included in the Location Track Notification frame.
Radio Information	4	The Radio subelement is included in the Location Track Notification frame.
Motion	5	The Motion subelement is included in the Location Track Notification frame if dot11MotionDetectionActivated is true.
Time of Departure	7	The Time of Departure subelement is included in the Location Track Notification frame if dot11TODActivated is true.
Location Indication Options	8	The Location Indication Options subelement is included in the Location Track Notification frame if the successful Location Configuration Request frame that configured the STA included a Location Indication Options subelement.

The Measurement Report Element field contains a Measurement Report element of type Beacon report as defined in 9.4.2.21.7. The Measurement Report Element field is included in the Location Track Notification frame if the Location Parameters Element field contains a Location Indication Options subelement. The Measurement Report element Measurement Token field is set to the same value of the dialog token in the Location Configuration Request frame that configured the STA.

9.6.7.18 QMF Policy frame format

The QMF Policy frame is transmitted by a requesting STA to a receiving STA with the included QMF policy. It is either sent unsolicited by the requesting STA or in response to a QMF Policy Change frame from a receiving STA. The format of the Action field of the QMF Policy frame is shown in Figure 9-883.

	Category	Public Action	Dialog Token	Status Code	QMF Policy element (optional)
Octets:	1	1	1	2	0 or 3-257

Figure 9-883—QMF Policy frame Action field contents

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is set to the value in the corresponding QMF Policy Change frame. If the QMF Policy frame is not being transmitted in response to a QMF Policy Change frame, then the Dialog Token field is set to 0.

The Status Code field is defined in Table 9.4.1.9.

The QMF Policy element is set as described in 9.4.2.119. It indicates the new access categories configured for Management frame(s). This field is included if the Status Code is SUCCESS and this frame is not being transmitted in response to a QMF Policy Change frame, and optionally included if the Status Code is REQUEST_DECLINED.

9.6.7.19 QMF Policy Change frame format

The QMF Policy Change frame is transmitted by a requesting STA to request a change to the QMF policy it most recently received from the destination STA. The format of the Action field of the QMF Policy Change frame is shown in Figure 9-884.

	Category	Public Action	Dialog Token	QMF Policy element
Octets:	1	1	1	3-257

Figure 9-884—QMF Policy Change frame Action field contents

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the QMF Policy Change frame to identify the transaction.

The QMF Policy element is set as described in 9.4.2.119. It indicates the access categories requested for Management frame(s), including any changes to the QMF policy it most recently received from the destination STA.

9.6.7.20 QLoad Request frame format

The QLoad Request frame is transmitted by an AP to request information from another AP. The format of the Action field of the QLoad Request frame is shown in Table 9-376.

Table 9-376—QLoad Request frame Action field format

Order	Information
1	Category
2	Public Action
3	Dialog Token
4	QLoad Report element

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

The QLoad Report element is defined in 9.4.2.122 and contains the QLoad report corresponding to the AP sending the request.

9.6.7.21 QLoad Report frame format

The QLoad Report frame is transmitted by an AP responding to a QLoad Request frame. The format of the Action field of the QLoad Report frame is shown in Table 9-377.

Table 9-377—QLoad Report frame Action field format

Order	Information
1	Category
2	Public Action
3	Dialog Token
4	QLoad Report element

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5. The Dialog Token field is set to 0 when an unsolicited QLoad Report frame is sent by the AP.

The QLoad Report element is defined in 9.4.2.122.

9.6.7.22 HCCA TXOP Advertisement frame

The HCCA TXOP Advertisement frame is transmitted by an AP to another AP to inform it of active and pending TXOP reservations. The format of the Action field of the HCCA TXOP Advertisement frame is shown in Figure 9-885.

	Category	Public Action	Dialog Token	Number of Reported TXOP Reservations	Number of Pending TXOP Reservations	Active TXOP Reservations	Pending TXOP Reservations
Octets:	1	1	1	1	1	variable	variable

Figure 9-885—HCCA TXOP Advertisement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and is set by the AP to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

The Number of Reported TXOP Reservations field contains a positive integer that specifies the number of active TXOP reservations reported in this frame. Setting the field to 0 indicates that no TXOP reservations are active.

The Number of Pending Reported TXOP Reservations field contains a positive integer that specifies the number of pending TXOP reservations reported in this frame. Setting the field to 0 indicates that no TXOP reservations are in the process of being activated.

The Active TXOP Reservation field contains zero or more TXOP Reservation fields as defined in 9.4.1.43. This field indicates active HCCA TXOPs that the AP has scheduled. The Start Time subfield of the TXOP Reservation field is relative to the TSF of the sending AP.

The Pending TXOP Reservation field contains zero or more TXOP Reservation fields as defined in 9.4.1.43. This field indicates new HCCA TXOPs that the AP is scheduling. The Start Time subfield of the TXOP Reservation field is relative to the TSF of the sending AP.

The use of the HCCA TXOP Advertisement frame is described in 11.26.3.

9.6.7.23 HCCA TXOP Response frame

The HCCA TXOP Response frame is transmitted by an AP to another AP to respond to an HCCA TXOP Advertisement frame. The format of the Action field of the HCCA TXOP Response frame is shown in Figure 9-886.

	Category	Public Action	Dialog Token	Status Code	Schedule Conflict	Alternate Schedule	Avoidance Request
Octets:	1	1	1	2	0 or 1	0 or 6	0 or 6

Figure 9-886—HCCA TXOP Response frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is set to the value of the Dialog Token field from the corresponding HCCA TXOP Advertisement frame.

The Status Code field is defined in 9.4.1.9 and is set to either the value SUCCESS or TS_SCHEDULE_CONFLICT.

The Schedule Conflict field is present only when the Status Code field is not SUCCESS. The Schedule Conflict field indicates the TXOP reservation from the HCCA TXOP Advertisement frame that conflicts with an existing or in-progress schedule. Its value is between 1 and the summation of the values from the Number of Reported TXOP Reservations and Number of Pending TXOP Reservations fields of the HCCA TXOP Advertisement frame. Setting the field to 1 indicates the first TXOP reservation in the HCCA TXOP Advertisement frame, setting the field to 2 indicates the second TXOP reservation in the HCCA TXOP Advertisement frame, and so on. The value of zero is reserved.

The optional Alternate Schedule field contains a TXOP Reservation field, as defined in 9.4.1.43 and is present only when the Status Code field is not SUCCESS. When the Alternate Schedule field is present, it contains an alternate to the TXOP reservation given in the corresponding HCCA TXOP Advertisement frame. The Start Time subfield of the Alternate Schedule field is relative to the TSF of the destination AP.

The optional Avoidance Request field contains a TXOP Reservation field, as defined in 9.4.1.43 and is optionally present when the Status Code field is not SUCCESS. When the Avoidance Request field is present, it indicates a TXOP schedule that the AP sending the TXOP Response frame is requesting to be avoided by the AP that is the destination of the TXOP Response frame. The Start Time subfield of the Avoidance Request field is relative to the TSF of the destination AP.

The use of the HCCA TXOP Response frame is described in 11.26.3.

9.6.7.24 Public Key frame

The Public Key frame is transmitted by an AP to provide its public key to peer APs and to request the peer's public key. The format of the Public Key frame Action field is defined in Figure 9-887.

	Category	Public Action	Public Key Frame Usage	Finite Cyclic Group	Public Key (optional)
Octets:	1	1	1	2	variable

Figure 9-887—Public Key frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Public Key Frame Usage field is set to a number to signify the usage mode of this frame. The Request Types are shown in Table 9-378.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-378—Public Key Frame Usage field values

Public Key Frame Usage	Value
Request	0
Response	1
NAK	2
Refused	3
Reserved	4–255

The Public Key Frame Usage field is set to "Request" to indicate that a public key is being requested from a peer AP.

The Public Key Frame Usage field is set to "Response" to indicate that this frame is in response to a Public Key frame.

The Public Key Frame Usage field is set to "NAK" to indicate rejection of a received Public Key frame.

The Finite Cyclic Group field is used to indicate the cryptographic group used when generating the public key and is defined in 9.4.1.42), or the preferred group when the Public Key Frame Usage field is set to "NAK".

When the Public Key Frame Usage field is set to "NAK" or "Refused", the Public Key field is not included. In all other cases, the Public Key field contains the public key of the AP that is sending this Public Key frame encoded as an octet string according to 12.4.7.2.5.

The use of the Public Key frame is described in 12.10.

9.6.7.25 Channel Availability Query frame format

The Channel Availability Query frame is transmitted as part of a channel query. The format of the Channel Availability Query frame Action field is shown in Figure 9-888.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code	Length	Channel Query Info	Device Class	Device Identification Information	Device Location Information	WSM Information
Octets:	1	1	6	6	1	1	1	variable	variable	variable	variable

Figure 9-888—Channel Availability Query frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable.

The remaining fields are as defined in the Channel Availability Query element (see 9.4.6.2) and White Space Map element (see 9.4.2.169).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.7.26 Channel Schedule Management frame format

The Channel Schedule Management frame is transmitted to exchange the channel schedule information as part of the channel schedule management procedure. The format of the Channel Schedule Management frame Action field is shown in Figure 9-889.

	Category	Public Action	Requester STA Address	Responder STA Address	Length	Reason Result Code	Channel Schedule Management Mode	Device Identification Information	Channel Schedule Descriptor
Octets:	1	1	6	6	1	1	1	variable	variable

Figure 9-889—Channel Schedule Management frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Requester STA Address field is the MAC address of the requesting STA that initiates the Channel Schedule Management process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested channel schedule management.

The Length field indicates the length of the remaining fields in octets, and the value is variable.

The Reason Result Code field indicates the reason for transmitting a query request for channel schedule information. It also indicates the result of a query as successful or not and the reason when the query is not successful. This field is defined in Table 9-379.

Table 9-379—Reason Result Code field values

Reason Result Code field values	Description
0	Request for channel schedule information from a RLSS.
1	Request for channel schedule information from a GDD enabling STA.
2	Success, returning full channel schedule information on the requested channels.
3	Success, returning additional timeslots from the list of the last query on the requested channels.
4	Success, returning timeslots deleted from the list of last query on the requested channels.
5	Success, returning deleted and added timeslots from the list of last query on the requested channels.
6	Success, returning no channel schedule changes from last query.
7	Request declined by the GDD enabling STA for unspecified reason.
8	Request declined by the GDD enabling STA because of no capability for providing schedule information on WLAN channels.
9	Request declined by RLSS for unspecified reason.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-379—Reason Result Code field values *(continued)*

Reason Result Code field values	Description
10	Request declined by RLSS because of no capability for providing schedule information on WLAN channels.
11	Unknown reason.
12	Continuation frame. This frame continues the fields from the previous CSM frame.
13–63	Reserved.

The Channel Schedule Management Mode field indicates if the schedule information of the channel availability is based on TV channels or WLAN channels. If the schedule information is based on WLAN channels, the optional Operating Class field is present in the Channel Schedule Descriptor field as defined in E.1. This field also indicates whether the optional Channel Availability Starting Time field is present in the Channel Schedule Descriptor field. This field is defined in Table 9-380.

Table 9-380—Channel Schedule Management Mode field values

Channel Schedule Management Mode value	Description
0	The channel schedule information is based on TV channels. The Reason Result Code field is set to either 0 or 1.
1	The channel schedule information is based on WLAN channels. The Reason Result Code field is set to either 0 or 1.
2–3	Reserved.

The Device Identification Information field indicates the regulatory identification of the STA that is requesting the schedule information. The Device Identification Information field is present only when Reason Result Code is either 0 or 1. The field is defined in 9.4.4.2.3.

The Channel Schedule Descriptor field indicates the channels for which the schedule information is requested, and the channel schedule information is provided in the response. The field is defined in 9.4.4.2.5. The Channel Schedule Descriptor field is repeated, as determined by the Length field.

9.6.7.27 Contact Verification Signal frame format

The Contact Verification Signal frame is transmitted by a GDD enabling STA to notify whether the available channel information from the GDB has been updated. The format of the Contact Verification Signal frame Action field is shown in Figure 9-890.

Figure 9-890—Contact Verification Signal frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Map ID field is set to a number that is equal to the Map ID of the recently received WSM. The WSM is defined in Table 9-329 in 9.4.4.2.6.

9.6.7.28 GDD Enablement Request frame format

The format of the Action field of the GDD Enablement Request frame is shown in Figure 9-891.

	Category	Public Action	Dialog Token	Device Class	Device Identification Information
Octets:	1	1	1	1	variable

Figure 9-891—GDD Enablement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is a nonzero value chosen by the STA sending the GDD Enablement Request frame to identify the request/response transaction.

The Device Class field is used to indicate the characteristic of the STA requesting the GDD Enablement Request frame. The format of the Device Class field is specified in 9.4.4.2.2.

The Device Identification Information field is used to indicate the identification of the STA requesting the GDD Enablement Request frame. The format of the Device Identification Information field is specified in 9.4.4.2.3.

9.6.7.29 GDD Enablement Response frame format

The format of the Action field of the GDD Enablement Response frame is shown in Figure 9-892.

	Category	Public Action	Dialog Token	Status Code	WSM Information
Octets:	1	1	1	2	variable

Figure 9-892—GDD Enablement Response frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is a nonzero value of the corresponding GDD Enablement Request frame. If a GDD Enablement Response frame is being transmitted other than in response to an GDD Enablement Request frame, then the Dialog Token field is 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Status Code field contains the status code in response to a GDD Enablement Request frame as defined in Table 9-50.

The remaining field is defined in the WSM element (see 9.4.2.169).

9.6.7.30 Network Channel Control frame format

The Network Channel Control frame is transmitted by a GDD dependent STA and a GDD enabling STA as part of the procedure that allows a GDD enabling STA to control the frequency usage of a GDD dependent STA's WLAN channels. The format of the Network Channel Control frame is shown in Figure 9-893.

								a Network Channel Control triplet		
	Category	Public Action	Length	Requester STA Address	Responder STA Address	Reason Result Code	Number of Network Channel Control Triplets	Operating Class	Channel Number	Maximum Transmit Power
Octets:	1	1	1	6	6	1	1	1	1	1

Figure 9-893—Network Channel Control frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 14.

The Requester STA Address field is the MAC address of the requesting STA that initiates the network channel control process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested network channel control.

The Reason Result Code field is used to indicate the reason that a Network Channel Control frame was generated. The length of the Reason Result Code field is 1 octet. The encoding of the Reason Result Code field is shown in Table 9-343.

The Number of Network Channel Control Triplets field indicates the number of triplets of Operating Class, Channel Number, and Maximum Transmit Power fields.

The Operating Class field indicates the channel set for which the network channel control request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the network channel control applies. Values for the Operating Class field are shown in E.1.

In a request, the Channel Number field of the Network Channel Control frame indicates the channel that the requesting STA intends to operate on. In the response, the Channel Number field in the Network Channel Control frame indicates the channels that the responding STA permits the requesting STA to operate on. The Channel Number is defined within an Operating Class as shown in E.1.

The Maximum Transmit Power field gives the intended maximum transmit power in dBm for operation in the request frame and indicates the maximum allowable transmit power in dBm for operation in the response frame. The field contains EIRP per channel bandwidth and is coded as a 2s complement signed integer in

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

units of 0.5 dBm. The field is set to 0 when a requesting STA requests a responding STA to provide a network channel control response without specifying in the request the intended maximum transmit power.

9.6.7.31 White Space Map Announcement frame format

The format of the Action field of the White Space Map Announcement frame is shown in Figure 9-894.

	Category	Public Action	Reason Result Code	White Space Map
Octets:	1	1	1	variable

Figure 9-894—White Space Map Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

Setting the Reason Result Code field to 1 indicates the Public Action frame is a continuation of the previous WSM Public Action frame, and any other value indicates this is not a continuation of the previous WSM Public Action frame.

The White Space Map field contains a White Space Map element (see 9.4.2.169).

9.6.7.32 Fine Timing Measurement Request frame format

The format of the Fine Timing Measurement Request frame Action field is shown in Figure 9-895.

	Category	Public Action	Trigger	LCI Measurement Request (optional)	Location Civic Measurement Request (optional)	Fine Timing Measurement Parameters (optional)
Octets:	1	1	1	variable	variable	variable

Figure 9-895—Fine Timing Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Trigger field set to 1 indicates that the initiating STA requests that the responding STA start or continue sending Fine Timing Measurement frames (see 11.21.6). The Trigger field set to 0 indicates that the initiating STA requests that the responding STA stop sending Fine Timing Measurement frames. Trigger field values 2–255 are reserved.

The LCI Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to LCI (see Table 9-98), which indicates a request for a Measurement Report element with Measurement Type field equal to LCI (see 11.21.6.7). The Enable bit in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-110). The Request, Report and Duration Mandatory bits in the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.20.1).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Location Civic Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to Location Civic (see Table 9-98), which indicates a request for a Measurement Report element with Measurement Type field equal to Location Civic (see 11.21.6.7). The Enable bit in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-110). The Location Service Interval Units field in the Measurement Request field of the Measurement Request element is set to 0. The Request, Report and Duration Mandatory bits in the Measurement Request Mode field within the Measurement Request element are reserved (see 9.4.2.20.1).

The Fine Timing Measurement Parameters field is present in the initial Fine Timing Measurement Request frame (see 11.21.6.3) and its retransmissions and is not present in subsequent Fine Timing Measurement Request frames. If present, it contains a Fine Timing Measurement Parameters element as defined in 9.4.2.167.

9.6.7.33 Fine Timing Measurement frame format

The Fine Timing Measurement frame is used to support the FTM procedure described in 11.21.6. The format of the Fine Timing Measurement frame Action field is shown in Figure 9-896.

	Category	Public Action	Dialog Token	Follow Up Dialog Token	TOD	TOA
Octets:	1	1	1	1	6	6

	TOD Error	TOA Error	LCI Report (optional)	Location Civic Report (optional)	Fine Timing Measurement Parameters (optional)	FTM Synchronization Information (optional)
Octets:	2	2	variable	variable	variable	variable

Figure 9-896—Fine Timing Measurement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The TOD Error field is structured as shown in Figure 9-897.

	B0 B4	B5 B14	B15
	Max TOD Error Exponent	Reserved	TOD Not Continuous
Bits:	5	10	1

Figure 9-897—Format of the TOD Error field

The TOA Error field is structured as shown in 9-898.

	B0 B4	B5 B15
	Max TOA Error Exponent	Reserved
Bits:	5	11

Figure 9-898—Format of the TOA Error field

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is a nonzero value chosen by the responding STA to identify the Fine Timing Measurement frame as the first of a pair, with the second or follow-up Fine Timing Measurement frame to be sent later. The Dialog Token field is set to 0 to indicate the end of the FTM session (see 11.21.6.6 and 11.21.6.4).

The Follow Up Dialog Token field is the nonzero value of the Dialog Token field of the last transmitted Fine Timing Measurement frame to indicate that it is the follow up Fine Timing Measurement frame and that the TOD, TOA, Max TOD Error Exponent and Max TOA Error Exponent fields contain the values of the timestamps captured with the first Fine Timing Measurement frame of the pair. The Follow Up Dialog Token field is 0 to indicate that the Fine Timing Measurement frame is not a follow up to a last transmitted Fine Timing Measurement frame. The value 0 in this field also indicates that TOD, TOA, TOD Error, and TOA Error fields are reserved. See 11.21.6.

The TOD and TOA fields are expressed in units of picoseconds.

The maximum errors in the TOD and TOA values are represented using the function defined in Equation (9-4).

$$E_{max} = \begin{cases} \text{unknown}, & F = 0 \\ 2^{F-1}, & 1 \le F \le 30 \\ \ge 2^{30}, & F = 31 \end{cases} \quad (9\text{-}4)$$

where

F is the Max Error Exponent

E_{max} is the maximum TOD or TOA error, respectively, in units of picoseconds

The TOD field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the last transmitted Fine Timing Measurement frame appeared at the transmit antenna connector.

The TOA field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the Ack frame to the last transmitted Fine Timing Measurement frame arrived at the receive antenna connector.

NOTE 1—The values specified in the TOD and TOA fields are described in 6.3.56.

The Max TOD Error Exponent field contains an upper bound for the error exponent in the value specified in the TOD field.

NOTE 2—For instance, setting the Max TOD Error Exponent field to 2 indicates that the value in the TOD field has a maximum error of ± 2 ps.

The TOD Not Continuous field indicates that the TOD value is with respect to a different underlying time base than the last transmitted TOA value. It is set to 1 when a discontinuity is present. Otherwise, it is set to 0.

The Max TOA Error Exponent field contains an upper bound for the error exponent in the value specified in the TOA field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Setting the Max TOD Error Exponent or the Max TOA Error Exponent field to 1 indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. Setting either field to 31 indicates that the upper bound on the error is greater than or equal to 1.073 741 824 ms.

The LCI Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to LCI (see Table 9-125), which either indicates the LCI of the transmitting STA and includes the Z and Usage Rules/Policy subelement or indicates an unknown LCI (see 11.21.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Co-Located BSSID List subelement is present in the Measurement Report element with Measurement Type field equal to LCI, when there is at least one other BSS that shares the same antenna connector with the reporting BSS.

The Location Civic Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to Location Civic (see Table 9-125), which either indicates the Civic address of the transmitting STA or an unknown Civic address (see 11.21.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Co-Located BSSID List subelement is present in the Measurement Report element with Measurement Type field equal to LCI, when there is at least one other BSS that shares the same antenna connector with the reporting BSS. When the LCI Report field contains a Co-Located BSSID List subelement, the Co-Located BSSID List subelement is not present in the Location Civic Report field.

The Fine Timing Measurement Parameters field is present in the initial Fine Timing Measurement Frame and is not present in subsequent Fine Timing Measurement frames. If present, it contains a Fine Timing Measurement Parameters element as defined in 9.4.2.167.

The FTM Synchronization Information field is present in the initial Fine Timing Measurement frame and its retransmissions if any, and in the first Fine Timing Measurement frame within each burst and its retransmissions if any; otherwise it is not present. If present, it contains an FTM Synchronization Information element with a TSF Sync Info field containing the 4 least significant octets of the TSF at the responding STA corresponding to the time the responding STA received the last Fine Timing Measurement Request frame with the Trigger field equal to 1.

9.6.7.34 QAB Request frame format

The QAB Request frame is transmitted by an AP to another AP to schedule quiet periods that facilitate the detection of other system operating in the same band. The format of the QAB Request frame Action field is shown in Table 9-381.

Table 9-381—QAB Request frame Action field format

Order	Information
1	Category
2	Public Action
3	Dialog Token
4	RequesterAP Address
5	ResponderAP Address
6	Quiet Period Request element

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is set to a nonzero value chosen by the AP.

The RequesterAP Address field is the MAC address of the AP that initiates the process. The length of this field is 6 octets.

The ResponderAP Address field is the MAC address of the responding AP. The length of this field is 6 octets. This field can be set to the broadcast address if the request is sent to multiple APs.

The Quiet Period Request element is defined in 9.4.2.149.

9.6.7.35 QAB Response frame format

A QAB Response frame is sent in response to a QAB Request frame. The format of a QAB Response frame Action field contains the information shown in Table 9-382.

Table 9-382—QAB Response frame Action field format

Order	Information
1	Category
2	Public Action
3	Dialog Token
4	RequesterAP Address
5	ResponderAP Address
6	Quiet Period Response element

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field value is copied from the corresponding received QAB Request frame.

The RequesterAP Address field is the MAC address of the AP that initiates the process. The length of this field is 6 octets.

The ResponderAP Address field is the MAC address of the responding AP. The length of this field is 6 octets.

The Quiet Period Response element is defined in 9.4.2.150.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.7.36 FILS Discovery frame format

The format of the FILS Discovery frame Action field is defined in Table 9-383.

Table 9-383—FILS Discovery frame format

Order	Information	Notes
1	Category	
2	Public Action	
3	FILS Discovery Information field	
4	Reduced Neighbor Report element	The Reduced Neighbor Report element is optionally present.
5	FILS Indication element	The FILS Indication element is optionally present.
6	Roaming Consortium element	The Roaming Consortium element is optionally present.

The Category field indicates the public category specified in Table 9-51.

The Public Action field indicates the value of the FILS Discovery frame, as specified in Table 9-364 in Table 9.6.7.1.

The FILS Discovery Information field is shown in Figure 9-899.

	FILS Discovery Frame Control	Timestamp	Beacon Interval	SSID/Short SSID	Length	FD Capability
Octets:	2	8	2	1-32	0 or 1	0 or 2

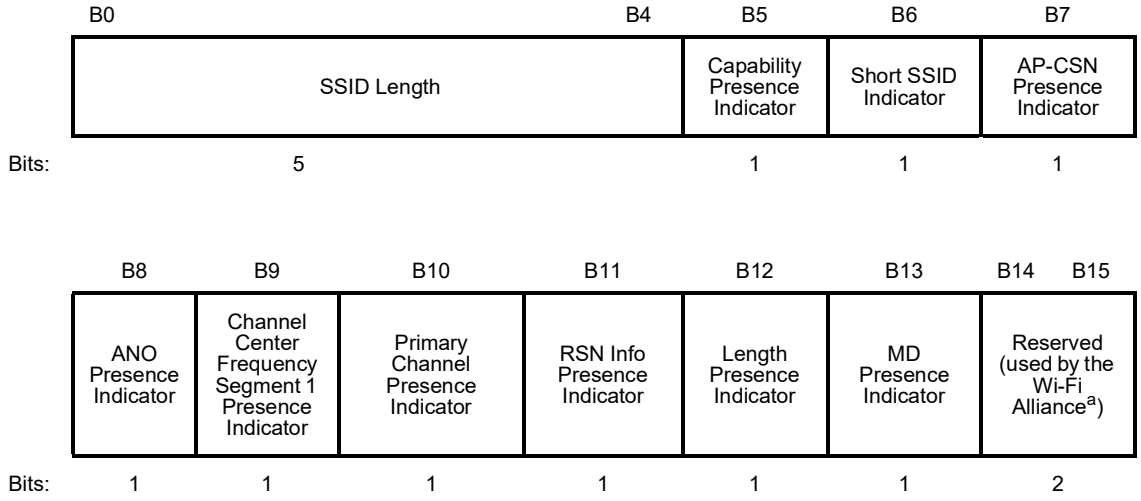
	Operating Class	Primary Channel	AP Configuration Sequence Number	Access Network Options	FD RSN Information	Channel Center Frequency Segment 1	Mobility Domain
Octets:	0 or 1	0 or 1	0 or 1	0 or 1	0 or 5	0 or 1	0 or 3

Figure 9-899—FILS Discovery Information field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the FILS Discovery Frame Control subfield is shown in Figure 9-900.



[a] Information on the Wi-Fi Alliance can be found at http://www.wi-fi.org.

Figure 9-900—FILS Discovery Frame Control subfield format

The SSID Length subfield of the FILS Discovery Frame Control subfield indicates the length, in octets, of the SSID/Short SSID subfield in the FILS Discovery frame. This subfield is equal to the length of the SSID/Short SSID subfield in octets minus 1.

NOTE 1—When the Short SSID Indicator subfield is equal to 1, the SSID Length subfield is equal to 3.

When the Capability Presence Indicator subfield is set to 1, it indicates that the FILS Discovery (FD) Capability subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the FD capability subfield is not present in the FILS Discovery frame.

A value of 1 in the Short SSID Indicator subfield indicates that a short SSID is contained in the SSID/Short SSID field of the FILS Discovery frame. A value of 0 indicates that an SSID is contained in the SSID/Short SSID field of the FILS Discovery frame.

A value of 1 in the AP-CSN Presence Indicator subfield indicates that the AP Configuration Sequence Number subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the AP-CSN subfield is not present in the FILS Discovery frame.

A value of 1 in the Access Network Options (ANO) Presence Indicator subfield indicates that the Access Network Options subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the ANO subfield is not present in the FILS Discovery frame.

A value of 1 in the Channel Center Frequency Segment 1 Presence Indicator subfield indicates that the Channel Center Frequency Segment 1 subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that Channel Center Frequency Segment 1 subfield is not present.

A value of 1 in the Primary Channel Presence Indicator subfield indicates that the Primary Channel and the Operating Class subfields are present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Primary Channel and the Operating Class subfields are not present in the FILS Discovery frame.

A value of 1 in the RSN Information Presence Indicator subfield indicates that the FD RSN Information subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the FD RSN Information subfield is not present in the FILS Discovery frame.

A value of 1 in the Length Presence Indicator subfield indicates that the Length field is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Length field is not present in the FILS Discovery frame.

Setting the MD Presence Indicator subfield to 1 indicates that the Mobility Domain subfield is present in the FILS Discovery frame. Setting the subfield to 0 indicates that the Mobility Domain subfield is not present in the FILS Discovery frame.

The Timestamp subfield carries the value of the TSF timer at the time that the start of the data symbol containing the first bit of the Timestamp field appears at the transmit antenna connector.

The Beacon Interval subfield carries the beacon interval in TUs.

The SSID/Short SSID subfield is variable length between 1 and 32 octets. When the Short SSID Indicator subfield is 1, the SSID/Short SSID field contains the short SSID (see 9.4.2.170). Otherwise, the SSID/Short SSID field contains the SSID, whose length is specified by the 5-bit SSID Length subfield in the FILS Discovery Frame Control of the FILS Discovery frame (see 9.4.2.2).

The Length subfield indicates the length of the remaining fields in the FILS Discovery Information field in octets. Its value is variable.

NOTE 2—The Length field is used to facilitate STAs parsing the FILS Discovery frame in case of future expansions of the FILS Discovery Information field; STAs can determine the end of the FILS Discovery Information field using the value indicated in the Length field even if they do not recognize one or more subfields in the FILS Discovery Information field.

The FD Capability subfield contains the information that advertises the capabilities and operational indications of the STA transmitting the FILS Discovery frame. Its presence is indicated by the Capability Presence Indicator subfield in the FILS Discovery Frame Control subfield being equal to 1. The format of the FD Capability subfield is shown in Figure 9-901.

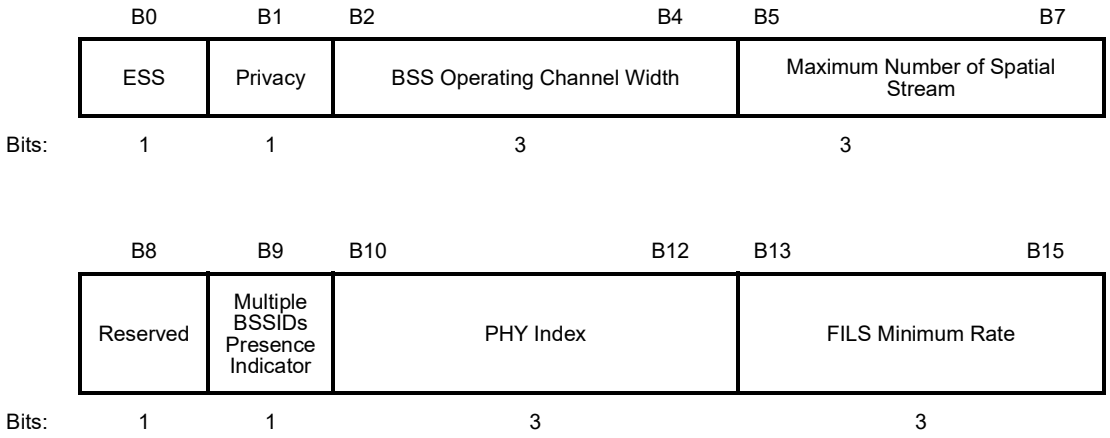

Figure 9-901—FD Capability subfield format

The ESS and Privacy subfields are interpreted as specified in 9.4.1.4.

The BSS Operating Channel Width subfield indicates the BSS operating channel width as defined in Table 9-384.

Table 9-384—BSS Operating Channel Width

BSS Operating Channel Width field	HR/DSSS, OFDM, ERP, HT, or VHT BSS operating channel width	TVHT BSS operating channel width
0	20 MHz or 22 MHz	TVHT_W
1	40 MHz	TVHT_W+W
2	80 MHz	TVHT_2W
3	160 MHz or 80+80 MHz	TVHT_4W or TVHT_2W+2W
4–7	Reserved	Reserved

The Maximum Number of Spatial Streams subfield indicates the number of the spatial streams supported by the AP. The Maximum Number of Spatial Streams subfield is coded per Table 9-385.

Table 9-385—Maximum Number of Spatial Streams

Number of Spatial Streams subfield	Maximum Number of Spatial Streams subfield
0	1
1	2
2	3
3	4
4	5–8
5–7	Reserved

The Multiple BSSIDs Presence Indicator subfield is set to 1 to indicate that the Multiple BSSID element is present in the Beacon and Probe Response frames. It is set to 0 to indicate that the Multiple BSSID element is not present in the Beacon and Probe Response frames.

The PHY Index subfield is defined as in Table 9-386.

Table 9-386—PHY Index subfield

PHY Index subfield	PHY
0	HR/DSSS (see Clause 16)
1	ERP-OFDM (see Clause 17 and Clause 18)
2	HT (see Clause 19)
3	VHT (see Clause 21) or TVHT (see Clause 22)
4–7	Reserved

The FILS Minimum Rate subfield indicates the minimum rate to be used by the AP transmitting the FILS Discovery frame and by FILS STAs in subsequent transmissions between the AP and FILS STAs. Depending on the PHY Index subfield of the received FILS Discovery frame, the minimum rate is represented as a bit rate value or as an MCS value as shown in Table 9-387. If an MCS value is provided, then the minimum rate is derived from the MCS value and the PHY Index in the FD Capability subfield.

Table 9-387—FILS Minimum Rate

FILS Minimum Rate subfield	PHY Index subfield is 0 (HR/DSSS)	PHY Index subfield is 1 (ERP-OFDM)	PHY Index subfield is 2 (HT)	PHY Index subfield is 3 (VHT or TVHT)
0	1 Mb/s	6 Mb/s	HT-MCS 0	VHT-MCS 0
1	2 Mb/s	9 Mb/s	HT-MCS 1	VHT-MCS 1
2	5.5 Mb/s	12 Mb/s	HT-MCS 2	VHT-MCS 2
3	11 Mb/s	18 Mb/s	HT-MCS 3	VHT-MCS 3
4	Reserved	24 Mb/s	HT-MCS 4	VHT-MCS 4
5–7	Reserved	Reserved	Reserved	Reserved

The Operating Class subfield specifies the operating class of the Primary Channel of the transmitting AP (see 9.4.1.36).

The Primary Channel subfield is set to the channel number of the primary channel (see 11.15.2) if the FILS Discovery frame is transmitted as a non-HT duplicate PPDU; otherwise, the subfield is not present.

The AP Configuration Sequence Number (AP-CSN) subfield format is defined in 9.4.2.181.

The Access Network Options (ANO) subfield format is defined in Figure 9-484 (in 9.4.2.91).

The Primary Channel subfield is set to the channel number of the primary channel (see 11.15.2) if the FILS Discovery frame is transmitted as a non-HT duplicate PPDU; otherwise, the subfield is not present.

The FD RSN Information subfield is defined in Figure 9-902.

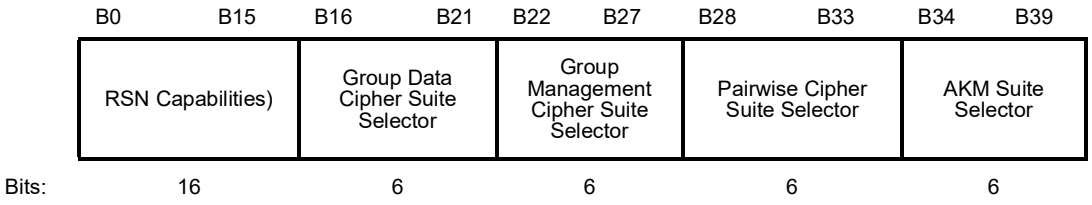

Figure 9-902—FD RSN Information subfield format

The FD RSN Information subfield contains an RSN Capabilities) subfield, as specified in Figure 9-289 (in 9.4.2.24.4).

The FD RSN Information subfield also contains three cipher suite selectors. The Group Data Cipher Suite Selector subfield contains one group data cipher suite selector. The Group Management Cipher Suite

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Selector subfield contains one group management cipher suite selector. The Pairwise Cipher Suite Selector subfield contains one pairwise cipher suite selector. Each of these subfields contains a code identifying a Cipher Suite Type as specified in Table 9-149. The definition of the cipher suite selectors is shown in Table 9-388.

Table 9-388—Cipher suite selector definitions

Cipher suite selector	Cipher suite type
0–13	Cipher suite type 0 to 13 in Table 9-149
14–61	Reserved
62	Vendor Specific
63	No cipher suite selected

The FD RSN Information subfield also contains one AKM suite selector. An AKM suite selector is a code identifying a AKM suite type as specified in Table 9-151. The definition of the AKM suite selectors is shown in Table 9-389.

Table 9-389—AKM suite selector definitions

AKM suite selector	AKM suite type
0	Use AKM from RSN IE Beacon/Probe Response frame
1	Set AKM suite to 14 of Table 9-151
2	Set AKM suite to 15 of Table 9-151
3	Set AKM suite to either 14 or 15 of Table 9-151
4	Set AKM suite to 17 of Table 9-151
5–61	Reserved
62	Vendor Specific
63	No AKM suite selected

The Channel Center Frequency Segment 1 subfield is set to the index of the channel center frequency of the frequency segment 1 for an 80+80 MHz VHT BSS, if the FILS Discovery frame is transmitted as a non-HT duplicate PPDUs at an 80+80 MHz channel bandwidth; otherwise, the subfield is not present.

The format of the Mobility Domain subfield is shown in Figure 9-903.

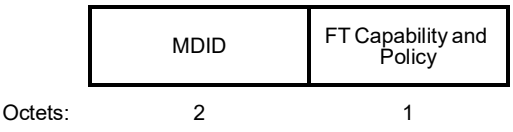

Figure 9-903—Mobility Domain subfield format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MDID field is defined in 9.4.2.46.

The FT Capability and Policy field is defined in 9.4.2.46.

The Reduced Neighbor Report element is defined in 9.4.2.170.

The FILS Indication element is defined in 9.4.2.182.

9.6.7.37 DCS Measurement Request frame format

The DCS Measurement Request frame is transmitted by a DCS requesting CDMG AP or PCP to a DCS responder CDMG AP or PCP to request all of the STAs in the DCS responder AP's infrastructure BSS or PCP's PBSS to measure a specified channel or all other channels within the supported operating class (as defined in 9.4.2.53). The format of the DCS Measurement Request frame Action field is shown in Figure 9-904.

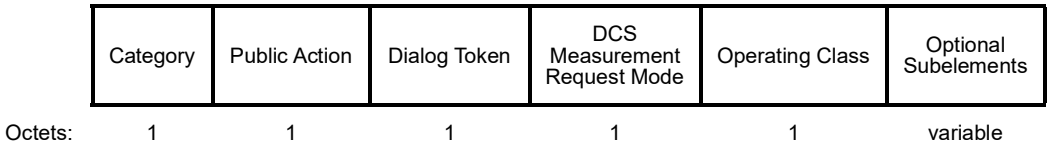

Figure 9-904—DCS Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The Measurement Request Mode field is set to 1 to indicate that the DCS requesting AP or PCP requests all STAs within the DCS responder AP's or PCP's infrastructure BSS or PBSS to measure all channels within the operating class specified in the following Operating Class field. The Measurement Request Mode field is set to 2 to indicate that the DCS requesting AP or PCP requests all STAs within the DCS responder AP's infrastructure BSS or PCP's PBSS to measure the specified channel(s) indicated within the list of optional subelements. Other values are reserved.

The Operating Class field is valid when the Measurement Request Mode field is 1. In all other cases, the Operating Class field is reserved. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Optional Subelements field is present when the Measurement Request Mode field is 2. The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The optional subelements are ordered by nondecreasing subelement ID.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Subelement ID field values for the defined optional subelements are shown in Table 9-390.

Table 9-390—Optional subelement IDs for DCS Measurement Request frame

Subelement ID	Name	Extensible
0	Reserved	
1	Channel Measurement Request	Yes
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Channel Measurement Request subelement is used to specify the channel(s) to be measured. The format of the DCS Channel Measurement Request subelement is shown in Figure 9-905.

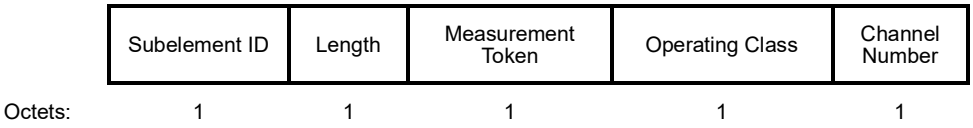

Figure 9-905—DCS Channel Measurement Request subelement format

The Subelement ID field is defined in Figure 9-390.

The Length field is defined in 9.4.3.

The Measurement Token field is set to a nonzero value that is unique among the Channel Measurement Request subelements in a particular DCS Measurement Request frame.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E (Country elements and operating classes).

The Channel Number field is set to the channel number for which the Channel Measurement Request applies (as defined in 17.3.8.4.3).

9.6.7.38 DCS Measurement Response frame format

The DCS Measurement Response frame is transmitted by a DCS responder AP or PCP to a DCS requesting AP or PCP to report the results of measuring one or more channels. The format of the DCS Measurement Response frame Action field is shown in Figure 9-906.

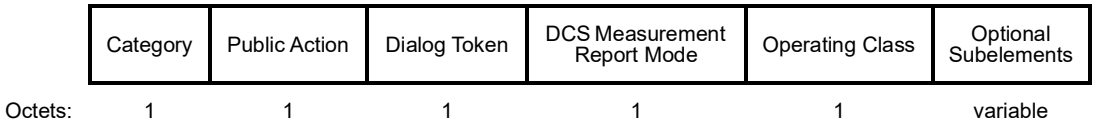

Figure 9-906—DCS Measurement Response frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is copied from the corresponding DCS Measurement Request frame.

The Measurement Report Mode field is set to 0 to indicate no clear channel to which the DCS responder AP's or PCP's BSS can move within the operating class specified in the following Operating Class field, or the DCS request has been declined by the DCS responder AP or PCP. The Measurement Report Mode field is set to 1 to indicate that all other channels within the operating class specified in the following Operating Class field are available for the DCS responder AP's or PCP's BSS. The Measurement Report Mode field is set to 2 to indicate that the clear channel for the DCS responder AP's or PCP's BSS is indicated by the Optional Subelement field in the DCS Measurement Response frame. Other values are reserved.

The Operating Class field is valid when the Measurement Report Mode field is 1. In all other cases, the Operating Class field is reserved. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Optional Subelements field is present when the Measurement Report Mode field is 2. The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 9-391.

Table 9-391—Optional subelement IDs for DCS Measurement Response frame

Subelement ID	Name	Extensible
0	Reserved	
1	Channel Measurement Report	Yes
2–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

The Channel Measurement Report subelement is used to report the number of available channel to which the DCS responder AP's or PCP's BSS can move. The DCS Channel Measurement Report subelement format is as shown in Figure 9-907.

Figure 9-907—DCS Channel Measurement Report subelement format

The Subelement ID field is defined in Table 9-391.

The Length field is defined in 9.4.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Measurement Token field is copied from the corresponding Channel Measurement Request subelement in the received DCS Measurement Request frame.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The Channel Number field is set to the channel number to which the DCS responder AP's or PCP's BSS can move (as defined in 17.3.8.4.3).

9.6.7.39 DCS Request frame format

The DCS Request frame is transmitted by a DCS requesting AP or PCP to a DCS responder AP or PCP to request the DCS responder AP's or PCP's BSS to move to an available channel indicated in the DCS Measurement Response frame. The format of the DCS Request frame Action field is shown in Figure 9-908.

	Category	Public Action	Dialog Token	Request Type	Operating Class	New Channel Number
Octets:	1	1	1	1	1	1

Figure 9-908—DCS Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field value is copied from the corresponding DCS Measurement Response frame.

The Request Type field value is set to 0 to indicate that the requesting AP or PCP requests the responder AP or PCP to tear down the DCS procedure or the DCS request is refused by the responder AP or PCP; then the following Operation Class field and New Channel Number field are reserved. The Request Type field value is set to 1 to indicate that the DCS requesting AP or PCP to request the DCS responder AP's or PCP's BSS to move to an available channel indicated by the following Operating Class field and New Channel Number field. Other values are reserved.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E. This field is valid when the Request Type field is set to 1; otherwise, it is reserved.

The New Channel Number field is set to the channel number to which the DCS requesting AP or PCP request the DCS responder AP's or PCP's BSS to move (as defined in 17.3.8.4.3). This field is valid when the Request Type field is set to 1; otherwise, it is reserved.

9.6.7.40 DCS Response frame format

The DCS Response frame is transmitted by a DCS responder AP or PCP to a DCS requesting AP or PCP to confirm that the DCS responder AP's or PCP's BSS is moving to the channel specified in the DCS request frame. The format of the DCS Response frame Action field is shown in Figure 9-909.

	Category	Public Action	Dialog Token	Responder Type	Operating Class	New Channel Number	Channel Switch Count
Octets:	1	1	1	1		1	1

Figure 9-909—DCS Response frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is copied from the corresponding DCS Request frame.

The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the DCS procedure applies. Valid values of the Operating Class field are shown in Annex E.

The New Channel Number field is set to the channel number copied from the corresponding received DCS Request frame.

The Channel Switch Count field either is set to the number of TBTTs until the DCS responder AP or PCP sending the Channel Switch Announcement frame or element within its BSS switches to the new channel or is set to 0. It is set to 1 to indicate that the switch occurs immediately before the next TBTT. It is set to 0 to indicate that the switch occurs at any time after the frame containing the element is transmitted.

9.6.7.41 Extended Notification Period Request frame format

The format of the Extended Notification Period Request frame Action field is defined in Table 9-392.

Table 9-392—Extended Notification Period Request frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	NP/BHI Duration

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel. The length of this field is 2 octets.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.7.42 Extended Notification Period Response frame format

The format of the Extended Notification Period Response frame Action field is defined in Table 9-393.

Table 9-393—Extended Notification Period Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	Dynamic Bandwidth Control

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is copied from the corresponding Extended Notification Period Response frame.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9.

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.220. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.7.43 Extended Channel Splitting Request frame format

The format of the Extended Channel Splitting Request frame Action field is defined in Table 9-394.

Table 9-394—Extended Channel Splitting Request frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	NP/BHI Duration

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel. The length of this field is 2 octets.

9.6.7.44 Extended Channel Splitting Response frame format

The format of the Extended Channel Splitting Response frame Action field is defined in Table 9-395.

Table 9-395—Extended Channel Splitting Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token
3	Status Code
4	Channel Switch Announcement
5	Beacon Interval
6	Dynamic Bandwidth Control

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is copied from the corresponding Extended Channel Splitting Response frame.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9.

The Channel Switch Announcement element is defined in 9.4.2.18. This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Beacon Interval field specifies the beacon interval length on a 2.16 GHz channel set by the STA operating on one of the 1.08 GHz channel after channel splitting and is defined in 9.4.1.3. This field is present if the Status Code field indicates successful; otherwise, it is not present.

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.220. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.7.45 Group Addressed GAS Request frame format

The Group Addressed GAS Request frame is transmitted by a requesting STA to request information from another STA. The format of the Group Addressed GAS Request frame Action field is defined in Table 9-396.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-396—Group Addressed GAS Request frame Action field format

0	Category
1	Public Action
2	Dialog Token
3	Advertisement Protocol element
4	Query Request Length
5	Query Request
6	Multi-band (optional)
7	GAS Extension

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The Advertisement Protocol element is defined in 9.4.2.92. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Request Length field format is provided in Figure 9-877. The Query Request Length field is set to the total number of octets in the Query Request field.

The Query Request field format is provided in Figure 9-878. The Query Request field is a generic container whose value is formatted in accordance with the protocol identified in the Advertisement Protocol element.

When present in a Group Addressed GAS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the Group Addressed GAS Request frame applies.

The GAS Extension element indicates parameters that the AP or PCP may use to transmit a response back to the requesting STA.

9.6.7.46 Group Addressed GAS Response frame format

The Group Addressed GAS Response frame is transmitted in response to a GAS Initial Request frame or Group Addressed GAS Request frame. The format of the Group Addressed GAS Response frame Action field is defined in Table 9-397.

Table 9-397—Group Addressed GAS Response frame Action field format

Order	Information
0	Category
1	Public Action
2	Dialog Token

Table 9-397—Group Addressed GAS Response frame Action field format *(continued)*

Order	Information
3	Status Code
4	Advertisement Protocol element
5	Query Response Length
6	Query Response
7	Multi-band (optional)
8	GAS Extension

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.7.1.

The Dialog Token field is copied from the corresponding GAS Initial Request frame or Group Addressed GAS Request frame.

The Status Code values are defined in 9.4.1.9.

The Advertisement Protocol element is defined in 9.4.2.92. The Advertisement Protocol element includes exactly one advertisement protocol ID.

The Query Response Length field format is provided in Figure 9-880. The value of the Query Response Length field is set to the total number of octets in the Query Response field.

The Query Response field format is provided in Figure 9-881. The Query Response field is a generic container whose value is formatted in accordance with the protocol specified in the Advertisement Protocol element.

When present in a Group Addressed GAS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Response frame applies.

When present in a Group Addressed GAS Response frame, the GAS Extension element indicates parameters to which STA and which Query Request of the STA the response is responding.

9.6.7.47 On-channel Tunnel Request frame format

The On-channel Tunnel Request frame allows nonrobust STA-STA communications of the same information that is conveyed in the robust On-channel Tunnel Request frame (see 9.6.20.7).

The format of the robust and nonrobust On-channel Tunnel Request frame is the same and defined in 9.6.20.7. The Category field value differentiates whether an On-channel Tunnel Request frame is robust or not.

9.6.8 FT Action frame details

9.6.8.1 General

Four Action frame formats are defined to support fast BSS transitions over the DS, which are initiated through the currently associated AP. The FT Action frames are sent over the air between the STA and the current AP. The Action frame is used as a transport mechanism for data that are destined for the target AP. An FT Action field, in the octet immediately after the Category field, differentiates the FT Action frame formats. The FT Action field values associated with each FT Action frame format are defined in Table 9-398.

Table 9-398—FT Action field values

FT Action field value	Description
0	Reserved
1	FT Request frames
2	FT Response frames
3	FT Confirm frames
4	FT Ack frames
5–255	Reserved

9.6.8.2 FT Request frame

The FT Request frame is sent by the STA to its associated AP to initiate an over-the-DS fast BSS transition.

Figure 9-910 shows the format of the FT Request frame Action field.

	Category	FT Action	STA Address	Target AP Address	FT Request frame body
Octets:	1	1	6	6	variable

Figure 9-910—FT Request frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.8.1.

The STA Address field is set to the fast BSS transition originator's (FTO's) MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The FT Request frame body contains the information shown in Table 9-399.

The usage of these elements is defined in 13.8.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-399—FT Request frame body

Order	Information	Notes
1	RSN	A RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.

9.6.8.3 FT Response frame

The FT Response frame is transmitted by the currently associated AP as a response to the STA's FT Request frame. Figure 9-911 shows the format of the FT Response frame Action field.

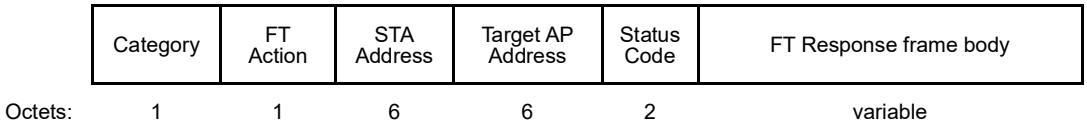

Figure 9-911—FT Response frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.8.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The Status Code field is a value from the options listed in 9.4.1.9.

If the Status Code field is SUCCESS, then the FT Response frame body contains the information shown in Table 9-400.

Table 9-400—FT Response frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.

The usage of these elements is defined in 13.8.3.

9.6.8.4 FT Confirm frame

The FT Confirm frame in an RSN is confirmation to the target AP of receipt of the ANonce and indicates the liveness of the PTKSA. The FT Confirm frame is optionally used by the FTO to request resources. Figure 9-912 shows the FT Confirm frame Action field format.

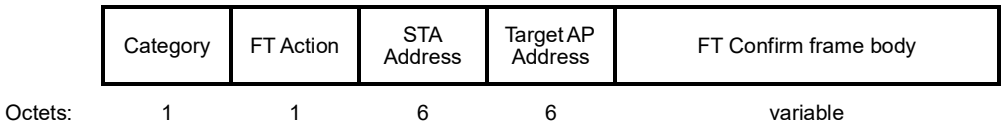

Figure 9-912—FT Confirm frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.8.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The FT Confirm frame body contains the information shown in Table 9-401.

Table 9-401—FT Confirm frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.
4	RIC	The RIC Request field is present if resources are being requested.

The usage of these elements is defined in 13.8.4.

9.6.8.5 FT Ack frame

The FT Ack frame is transmitted by the currently associated AP as a response to the STA's FT Confirm frame. Figure 9-913 shows the FT Ack frame Action field format.

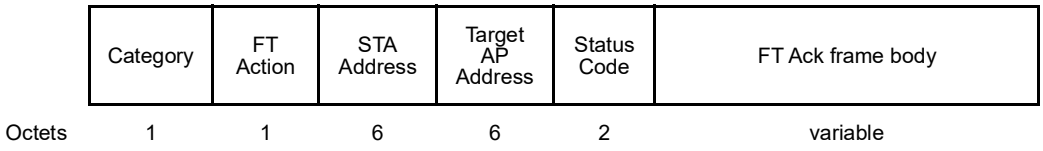

Figure 9-913—FT Ack frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.8.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The Status Code field is a value from the options listed in 9.4.1.9.

If the Status Code field is SUCCESS, then the FT Ack frame body contains the information shown in Table 9-402.

Table 9-402—FT Ack frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.
4	Timeout Interval (reassociation deadline)	A TIE containing the reassociation deadline interval is present if resources were requested in the FT Confirm frame and dot11RSNAActivated is false.
5	RIC	The RIC Response field is present if resources were requested in the FT Confirm frame.

The usage of these elements is defined in 13.8.5.

9.6.9 SA Query Action frame details

9.6.9.1 General

Two Action frame formats are defined for the SA Query procedure. An SA Query Action field, in the field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 9-403.

NOTE—The SA query functionality defined in this standard is used to prevent the Association Lockout problem (defined in 11.3).

Table 9-403—SA Query Action field values

SA Query Action field value	Description
0	SA Query Request
1	SA Query Response

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.9.2 SA Query Request frame

The SA Query Request frame is used to request an SA Query Response from the receiving STA. The format of the Action field of the SA Query Request frame is shown in Figure 9-914.

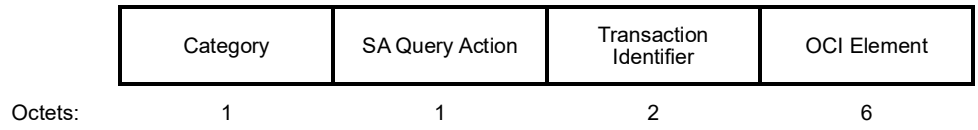

Figure 9-914—SA Query Request frame Action field format

The Category field is defined in 9.4.1.11.

The SA Query Action field is defined in 9.6.9.1.

The Transaction Identifier field is a 16-bit non-negative counter value set by the STA sending the SA Query Request frame to identify any outstanding request/response transaction.

The OCI Element field includes the OCI element (see 9.4.2.236) and is included if dot11RSNAOperatingChannelValidationActivated is true.

9.6.9.3 SA Query Response frame

The SA Query Response frame is used to respond to an SA Query Request frame from another STA. The format of the Action field of the SA Query Response frame is shown in Figure 9-915.

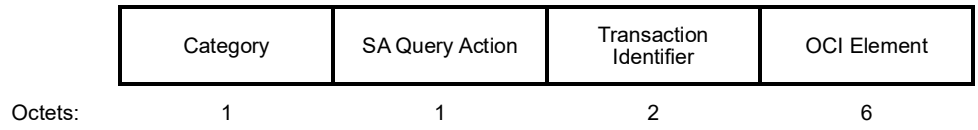

Figure 9-915—SA Query Response frame Action field format

The Category field is defined in 9.4.1.11.

The SA Query Action field is defined in 9.6.9.1.

The Transaction Identifier field is set to the same value as the Transaction Identifier field in the corresponding SA Query Request frame.

The OCI Element field includes the OCI element (see 9.4.2.236) and is included if dot11RSNAOperatingChannelValidationActivated is true.

9.6.10 Protected Dual of Public Action frames

The Protected Dual of Public Action frame is defined to allow robust STA-STA communications of the same information that is conveyed in Action frames that are not robust (see 9.4.1.11). A Public Action field, in the octet immediately after the Category field, differentiates the Protected Dual of Public Action frame formats. The defined Protected Dual of Public Action frames are listed in Table 9-404.

The Protected Dual of Public Action frames have the same format as the corresponding nonprotected Public Action frame.

Table 9-404—Public Action field values defined for Protected Dual of Public Action frames

Public Action field value	Description	Defined in
0	Reserved	
1	Protected DSE Enablement	9.6.7.4
2	Protected DSE Deenablement	9.6.7.5
3	Reserved	
4	Protected Extended Channel Switch Announcement	9.6.7.7
5	Protected Measurement Request	9.6.7.8
6	Protected Measurement Report	9.6.7.9
7	Reserved	
8	Protected DSE Power Constraint	9.6.7.10
9	Protected Vendor Specific	9.6.7.11
10	Protected GAS Initial Request	9.6.7.12
11	Protected GAS Initial Response	9.6.7.13
12	Protected GAS Comeback Request	9.6.7.14
13	Protected GAS Comeback Response	9.6.7.15
14–15	Reserved	
16	QAB Request	9.6.7.34
17	QAB Response	9.6.7.35
18	Protected QMF Policy	9.6.7.18
19	Protected QMF Policy Change	9.6.7.19
20	Protected QLoad Request	9.6.7.20
21	Protected QLoad Report	9.6.7.21
22	Protected HCCA TXOP Advertisement	9.6.7.22
23	Protected HCCA TXOP Response	9.6.7.23
24	Reserved	
25	Protected Channel Availability Query	9.6.7.25
26	Protected Channel Schedule Management	9.6.7.26
27	Protected Contact Verification Signal	9.6.7.27
28	Protected GDD Enablement Request	9.6.7.28
29	Protected GDD Enablement Response	9.6.7.29
30	Protected Network Channel Control	9.6.7.30
31	Protected White Space Map Announcement	9.6.7.31
32–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

9.6.11 HT Action frame details

9.6.11.1 HT Action field

Several Action frame formats are defined to support HT features. An HT Action field, in the octet immediately after the Category field, differentiates the HT Action frame formats. The HT Action field values associated with each frame format within the HT category are defined in Table 9-405. The frame formats are defined in 9.6.11.2 to 9.6.11.8.

Table 9-405—HT Action field values

HT Action field value	Meaning	Time priority
0	Notify Channel Width	No
1	SM Power Save	No
2	PSMP	Yes
3	Reserved	—
4	CSI	Yes
5	Noncompressed Beamforming	Yes
6	Compressed Beamforming	Yes
7	ASEL Indices Feedback	Yes
8–255	Reserved	—

9.6.11.2 Notify Channel Width frame format

A STA sends the Notify Channel Width frame to another STA if it wants to change the channel width of frames that the other STA sends to it. See definition in 11.15.2.

The format of the Notify Channel Width frame Action field is defined in Table 9-406.

Table 9-406—Notify Channel Width frame Action field format

Order	Information
1	Category
2	HT Action
3	Channel Width (see 9.4.1.21)

This frame can be sent by both non-AP STA and AP.

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.11.3 SM Power Save frame format

The SM Power Save frame is of category HT. The SM Power Save frame is used to manage SM power-saving state transitions as defined in 11.2.6.

The Action field of the SM Power Save frame is defined in Table 9-407.

Table 9-407—SM Power Save frame Action field format

Order	Information
1	Category
2	HT Action
3	SM Power Control (see 9.4.1.23)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

9.6.11.4 PSMP frame format

PSMP is obsolete. Support for this mechanism might be removed in a later revision of the standard.

The DA field of this frame is a group address. (See 10.30.2.8.)

The PSMP Parameter Set field and PSMP STA Info fields define zero or more PSMP-DTT and PSMP-UTT time allocations that follow immediately after the PSMP frame.

The Action field of this frame is defined in Table 9-408. The PSMP Parameter Set field is followed by zero or more PSMP STA Info fields.

Table 9-408—PSMP frame Action field format

Order	Information
1	Category
2	HT Action
3	PSMP Parameter Set (see 9.4.1.24)
4	PSMP STA Info (see 9.4.1.25) Repeated N_STA times (N_STA is a subfield of the PSMP Parameter Set field)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

The PSMP STA Info fields within a PSMP frame are ordered by STA_INFO Type as follows: group addressed (STA_INFO Type=1) and then individually addressed (STA_INFO Type=2).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.11.5 CSI frame format

The CSI frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-409.

Table 9-409—CSI frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 9.4.1.26)
4	CSI Report (see 9.4.1.27)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

In a CSI frame, the fields of the MIMO Control field (see 9.4.1.26) are used as described in Table 9-55. The Codebook Information subfield is reserved in this frame.

9.6.11.6 Noncompressed Beamforming frame format

The Noncompressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-410.

Table 9-410—Noncompressed Beamforming frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 9.4.1.26)
4	Noncompressed Beamforming Report (see 9.4.1.28)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

In a Noncompressed Beamforming frame, the fields of the MIMO Control field (see 9.4.1.26) are used as described in Table 9-55. The Codebook Information subfield is reserved in this frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.11.7 Compressed Beamforming frame format

The Compressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-411.

Table 9-411—Compressed Beamforming frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 9.4.1.26)
4	Compressed Beamforming Report (see 9.4.1.29)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

In a Compressed Beamforming frame, the fields of the MIMO Control field (see 9.4.1.26) are used as described in Table 9-55. The Coefficient Size subfield is reserved in this frame.

9.6.11.8 Antenna Selection Indices Feedback frame format

The Antenna Selection Indices Feedback frame is an Action or Action No Ack frame of category HT. The format of its Action field is defined in Table 9-412.

Table 9-412—Antenna Selection Indices Feedback frame Action field format

Order	Information
1	Category
2	HT Action
3	Antenna Selection Indices (see 9.4.1.30)

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.11.1.

9.6.12 TDLS Action field formats

9.6.12.1 General

Several Action field formats are defined to support TDLS. A TDLS Action field, in the octet immediately after the Category field, differentiates the TDLS Action field formats. The TDLS Action field values associated with each Action field format within the TDLS category are defined in Table 9-413.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-413—TDLS Action field values

Action field value	Meaning
0	TDLS Setup Request
1	TDLS Setup Response
2	TDLS Setup Confirm
3	TDLS Teardown
4	TDLS Peer Traffic Indication
5	TDLS Channel Switch Request
6	TDLS Channel Switch Response
7	TDLS Peer PSM Request
8	TDLS Peer PSM Response
9	TDLS Peer Traffic Response
10	TDLS Discovery Request
11–255	Reserved

References to one of the TDLS Action field values as a frame, e.g., "TDLS Setup Request frame," denote a Data frame carrying a TDLS Action field and any Vendor Specific elements tunneled as described in 11.20.1.

9.6.12.2 TDLS Setup Request Action field format

The Action field of a TDLS Setup Request Action field contains the information shown in Table 9-414.

Table 9-414—Information for TDLS Setup Request Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The Dialog Token field contains a unique nonzero value for the conversation between the STAs involved in this request. The dialog token is specified in 9.4.1.12.
4	Capability	The Capability field indicates the capabilities of the STA. The Capability field is defined in 9.4.1.4.
5	Supported Rates and BSS Membership Selectors	The Supported Rates and BSS Membership Selectors element indicates the rates that are supported by the STA. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3.
6	Country	The Country element is present when dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true. The Country element is defined in 9.4.2.8.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-414—Information for TDLS Setup Request Action field *(continued)*

Order	Information	Notes
7	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present whenever there are more than eight supported rates, and it is optionally present otherwise. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.12.
8	Supported Channels	The Supported Channels element is present if the TDLS Channel Switching subfield is equal to 1. The Supported Channels element is defined in 9.4.2.17.
9	RSNE	The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1). The RSNE is defined in 9.4.2.24.
10	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 9.4.2.26.
11	QoS Capability	The QoS Capability element is present when dot11QosOptionImplemented is true and not present otherwise. The QoS Capability element is defined in 9.4.2.34.
12	FTE	The FTE is present if security is required on the TDLS direct link (see 12.7.8.1). The FTE is defined in 9.4.2.47.
13	Timeout Interval (TPK key lifetime)	The Timeout Interval element contains the TPK key lifetime and is present if security is required on the TDLS direct link (see 12.7.8.1). The Timeout Interval element is defined in 9.4.2.48.
14	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1.
15	HT Capabilities	The HT Capabilities element is defined in 9.4.2.55. The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
16	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is defined in 9.4.2.59. The 20/40 BSS Coexistence element is optionally present.
17	Link Identifier	The Link Identifier element is specified in 9.4.2.61.
18	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
19	AID	The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented or dot11S1GOptionImplemented is true.
20	VHT Capabilities	The VHT Capabilities element is present if dot11VHTOptionImplemented is true.
21	S1G Capabilities	S1G Capabilities element is optionally present if dot11S1GOptionImplemented is true.
22	EL Operation	EL Operation element is present if dot11S1GELOperationActivated is true.

The TDLS Setup Request Action field is encapsulated in a Data frame and transmitted to the recipient STA through the AP to request the setup of a TDLS direct link. See 11.20.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.12.3 TDLS Setup Response Action field format

The Action field of a TDLS Setup Response Action field contains the information shown in Table 9-415.

Table 9-415—Information for TDLS Setup Response Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Status Code	The Status Code is defined in 9.4.1.9.
4	Dialog Token	The dialog token is copied from the corresponding TDLS Setup Request. The dialog token is specified in 9.4.1.12.
5	Capability	The Capability field indicates the capabilities of the STA and is present when the Status Code is SUCCESS and is not present otherwise. The Capability field is defined in 9.4.1.4.
6	Supported Rates and BSS Membership Selectors	The Supported Rates and BSS Membership Selectors element indicates the rates that are supported by the STA and is present when the Status Code is SUCCESS and is not present otherwise.The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3.
7	Country	The Country element is present when Status Code is SUCCESS and either dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true and is not present otherwise. The Country element is defined in 9.4.2.8.
8	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present when there are more than 8 supported rates and Status Code is SUCCESS. It is optionally present when there are less than 8 supported rates and Status Code is SUCCESS. Otherwise it is not present. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.12.
9	Supported Channels	The Supported Channels element is defined in 9.4.2.17. It is present if the TDLS Channel Switching subfield is equal to 1 and the Status Code is SUCCESS, and not present otherwise.
10	RSNE	The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1) and the Status Code is SUCCESS, and not present otherwise. The RSNE is defined in 9.4.2.24.
11	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero and the Status Code is SUCCESS, and not present otherwise. The Extended Capabilities element is defined in 9.4.2.26.
12	QoS Capability	The QoS Capability element is present when dot11QosOptionImplemented is true and the Status Code is SUCCESS and not present otherwise. The QoS Capability element is defined in 9.4.2.34.
13	FTE	The FTE is present if security is required on the TDLS direct link (see 12.7.8.1) and the Status Code is SUCCESS, and not present otherwise. The FTE is defined in 9.4.2.47.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-415—Information for TDLS Setup Response Action field *(continued)*

Order	Information	Notes
14	Timeout Interval (TPK key lifetime)	The Timeout Interval element, containing the TPK key lifetime, is present if security is required on the TDLS direct link (see 12.7.8.1) and the Status Code is SUCCESS, and not present otherwise. The Timeout Interval element is defined in 9.4.2.48.
15	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS Channel Switching subfield is equal to 1 and the Status Code is SUCCESS and not present otherwise.
16	HT Capabilities	The HT Capabilities element is present if dot11HighThroughputOptionImplemented is true and the Status Code is SUCCESS and is not present otherwise. The HT Capabilities element is defined in 9.4.2.55.
17	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present if the Status Code is SUCCESS and not present otherwise. The 20/40 BSS Coexistence element is defined in 9.4.2.59.
18	Link Identifier	The Link Identifier element is present if the Status Code is SUCCESS and not present otherwise. The Link Identifier is specified in 9.4.2.61.
19	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true and the Status Code is SUCCESS and not present otherwise.
20	AID	The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented or dot11S1GOptionImplemented is true and the Status Code is SUCCESS and not present otherwise.
21	VHT Capabilities	The VHT Capabilities element is present if dot11VHTOptionImplemented is true and the Status Code is SUCCESS and not present otherwise.
22	Operating Mode Notification	The Operating Mode Notification element is optionally present if the TDLS Setup Request frame contained an Extended Capabilities element with the Operating Mode Notification field is equal to 1.
23	S1G Capabilities	S1G Capabilities element is optionally present if dot11S1GOptionImplemented is true.
24	EL Operation	EL Operation element is present if dot11S1GELOperationActivated is true.

The TDLS Setup Response Action field is encapsulated in a Data frame and transmitted to the TDLS initiator STA through the AP in response to a TDLS Setup Request Action field. See 11.20.

9.6.12.4 TDLS Setup Confirm Action field format

The Action field of a TDLS Setup Confirm Action field contains the information shown in Table 9-416.

The TDLS Setup Confirm Action field is encapsulated in a Data frame and transmitted to the TDLS responder STA through the AP in response to a TDLS Setup Response Action field. See 11.20.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-416—Information for TDLS Setup Confirm Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Status Code	The Status Code is defined in 9.4.1.9.
4	Dialog Token	The dialog token is copied from the corresponding TDLS Setup Response. The dialog token is specified in 9.4.1.12.
5	RSNE	The RSNE is present if security is required on the TDLS direct link (see 12.7.8.1) and the Status Code is SUCCESS, and not present otherwise. The RSNE is defined in 9.4.2.24.
6	EDCA Parameter Set	The EDCA parameter set is present if QoS is supported on the TLDS direct link (see 12.7.8.1) . The EDCA Parameter Set element is specified in 9.4.2.28. It is present for Status Code SUCCESS.
7	FTE	The FTE is defined in 9.4.2.47. The FTE is present if security is required on the TDLS direct link (see 12.7.8.1) and the Status Code is SUCCESS, and not present otherwise.
8	Timeout Interval (TPK Key Lifetime)	The Timeout Interval element is defined in 9.4.2.48. The Timeout Interval, containing the TPK Key Lifetime, is present if security is required on the direct link and the Status Code is SUCCESS, and not present otherwise.
9	HT Operation	The HT Operation element is present if dot11HighThroughputOptionImplemented is true, the TDLS Setup Response frame contained an HT Capabilities element, the Status Code is SUCCESS. The HT Operation element is defined in 9.4.2.56.
10	Link Identifier	The Link Identifier is specified in 9.4.2.61. It is present if the Status Code is SUCCESS.
11	VHT Operation	VHT Operation element (optional). The VHT Operation element is present if dot11VHTOptionImplemented is true, the TDLS Setup Response frame contained a VHT Capabilities element, the status code is SUCCESS, and the TDLS direct link is not established in the 2.4 GHz band. The VHT Operation element is defined in 9.4.2.158.
12	Operating Mode Notification	The Operating Mode Notification element is optionally present if the TDLS Setup Request frame contained an Extended Capabilities element with the Operating Mode Notification field is equal to 1.
13	S1G Operation	The S1G Operation element is present if dot11S1GOptionImplemented is true and the status code is 0 (Successful). The S1G Operation element is defined in 9.4.2.212.

9.6.12.5 TDLS Teardown Action field format

The Action field of a TDLS Teardown Action field contains the information shown in Table 9-417.

Table 9-417—Information for TDLS Teardown Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Reason Code	The Reason Code is defined in 9.4.1.7.
4	FTE	The FTE is present if a TPK handshake was successful for this session. The FTE is defined in 9.4.2.47.
5	Link Identifier	The Link Identifier is specified in 9.4.2.61.

The TDLS Teardown Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly or through the AP to tear down a TDLS direct link. See 11.20.

9.6.12.6 TDLS Peer Traffic Indication Action field format

The Action field of a TDLS Peer Traffic Indication Action field contains the information shown in Table 9-418.

Table 9-418—Information for TDLS Peer Traffic Indication Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The dialog token is specified in 9.4.1.12.
4	Link Identifier	The Link Identifier is specified in 9.4.2.61.
5	PTI Control	The PTI Control element is optionally present. It is defined in 9.4.2.64.
6	TPU Buffer Status	The TPU Buffer Status element is defined in 9.4.2.65.

The TDLS Peer Traffic Indication Action field indicates the state of the power save buffer at the STA supporting TPU that is buffering data for a TDLS peer STA in power save mode.

The TPU Buffer Status element indicates the status of the AC buffers at the TPU buffer STA.

The PTI Control element is optionally included in the TDLS Peer Traffic Indication Action field (see 11.2.3.13) to identify the latest MPDU transmitted to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication Action field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TDLS Peer Traffic Indication Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA through the AP. See 11.2.3.13.

9.6.12.7 TDLS Channel Switch Request Action field format

The Action field of the TDLS Channel Switch Request Action field contains the information shown in Table 9-419.

Table 9-419—Information for TDLS Channel Switch Request Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Target Channel	1-octet field that specifies the channel number of the target channel. See 9.4.1.35.
4	Operating Class	1-octet field that specifies the operating class for the target channel. The Operating Channel field is defined in 9.4.1.36.
5	Secondary Channel Offset	The secondary channel offset is present if a switch to a 40 MHz direct link is indicated and is absent otherwise. See 9.4.2.19.
6	Link Identifier	The Link Identifier element is specified in 9.4.2.61.
7	Channel Switch Timing	The Channel Switch Timing element is specified in 9.4.2.63.
8	Wide Bandwidth Channel Switch	Wide Bandwidth Channel Switch element (optional). The Wide Bandwidth Channel Switch element is included when a switch to an 80 MHz, 160 MHz, or 80+80 MHz direct link is indicated. See 9.4.2.160.
9	Country	Country element (optional). The Country element is included to change operating classes when a switch to a direct link is indicated. The Country element indicates the same country as the BSS and includes zero Subband Triplet fields.
10	Transmit Power Envelope	Transmit Power Envelope element (zero or more). Each Transmit Power Envelope element that is present includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the maximum transmit powers for the direct link for the indicated bandwidths with an indicated unit interpretation after a switch to a direct link (see 11.20.6.5.1).

The TDLS Channel Switch Request Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA to request for the TDLS direct link to be switched to another channel. See 11.20.

9.6.12.8 TDLS Channel Switch Response Action field format

The Action field of the TDLS Channel Switch Response Action field contains the information shown in Table 9-420.

The TDLS Channel Switch Response Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA in response to a TDLS Channel Switch Request Action field. See 11.20.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-420—Information for TDLS Channel Switch Response Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Status Code	The Status Code is defined in 9.4.1.9.
5	Link Identifier	The Link Identifier element is specified in 9.4.2.61. It is present if the Status Code is SUCCESS.
6	Channel Switch Timing	The Channel Switch Timing element is specified in 9.4.2.63.

9.6.12.9 TDLS Peer PSM Request Action field format

The TDLS Peer PSM Request Action field contains the information shown in Table 9-421.

Table 9-421—Information for TDLS Peer PSM Request Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The Dialog Token field contains a value that is unique among TDLS Peer PSM Request Action fields for which a corresponding TDLS Peer PSM Response Action field has not been received. The dialog token is specified in 9.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 9.4.2.61.
5	Wakeup Schedule	The Wakeup Schedule element is specified in 9.4.2.62.

The TDLS Peer PSM Request Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA, directly or through the AP, to set up or change a periodic wakeup schedule on the TDLS direct link. See 11.2.3.12.

9.6.12.10 TDLS Peer PSM Response Action field format

The TDLS Peer PSM Response Action field contains the information shown in Table 9-422.

Table 9-422—Information for TDLS Peer PSM Response Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The dialog token is set to the value contained in the corresponding TDLS Peer PSM Request Action field. The dialog token is specified in 9.4.1.12.

Table 9-422—Information for TDLS Peer PSM Response Action field *(continued)*

Order	Information	Notes
4	Status Code	The Status Code is specified in 9.4.1.9.
5	Link Identifier	The Link Identifier element is specified in 9.4.2.61. It is present if the Status Code is SUCCESS.
6	Wakeup Schedule	The Wakeup Schedule element is present is present if the status code is set to TDLS_REJECTED_ALTERNATIVE_PROVIDED and is not present otherwise. The Wakeup Schedule element is specified in 9.4.2.62.

The TDLS Peer PSM Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly in response to a TDLS Peer PSM Request Action field. See 11.2.3.12.

9.6.12.11 TDLS Peer Traffic Response Action field format

The Action field of a TDLS Peer Traffic Response Action field contains the information shown in Table 9-423.

Table 9-423—Information for TDLS Peer Traffic Response Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The dialog token is specified in 9.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 9.4.2.61.

The TDLS Peer Traffic Response Action field indicates the receipt of the corresponding TDLS Peer Traffic Indication Action field.

The Dialog Token field is set to the nonzero value of the corresponding TDLS Peer Traffic Indication Action field.

The Link Identifier field is set to identify the TDLS direct link in relation to which the TDLS Peer Traffic Response Action field is transmitted.

The TDLS Peer Traffic Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly. See 11.2.3.13.

9.6.12.12 TDLS Discovery Request Action field format

The TDLS Discovery Request Action field contains the information shown in Table 9-424.

The TDLS Discovery Request Action field is encapsulated in a Data frame and transmitted to a TDLS peer STA through the AP, to request TDLS STAs in the same BSS to respond with a TDLS Discovery Response frame. See 11.20.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-424—Information for TDLS Discovery Request Action field

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	TDLS Action	The TDLS Action field is defined in 9.6.12.1.
3	Dialog Token	The Dialog Token field can be used to match TDLS Discovery Response frames to the corresponding TDLS Discovery Request frame. The dialog token is specified in 9.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 9.4.2.61.
5	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.

9.6.13 WNM Action details

9.6.13.1 WNM Action fields

Several Action frame formats are defined for wireless network management (WNM) purposes. A WNM Action field, in the field immediately after the Category field, differentiates the formats. The WNM Action field values associated with each frame format are defined in Table 9-425.

Table 9-425—WNM Action field values

WNM Action field value	Description
0	Event Request
1	Event Report
2	Diagnostic Request
3	Diagnostic Report
4	Location Configuration Request
5	Location Configuration Response
6	BSS Transition Management Query
7	BSS Transition Management Request
8	BSS Transition Management Response
9	FMS Request
10	FMS Response
11	Collocated Interference Request
12	Collocated Interference Report
13	TFS Request
14	TFS Response
15	TFS Notify
16	WNM Sleep Mode Request

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-425—WNM Action field values *(continued)*

WNM Action field value	Description
17	WNM Sleep Mode Response
18	TIM Broadcast Request
19	TIM Broadcast Response
20	QoS Traffic Capability Update
21	Channel Usage Request
22	Channel Usage Response
23	DMS Request
24	DMS Response
25	Timing Measurement Request
26	WNM Notification Request
27	WNM Notification Response
28–255	Reserved

9.6.13.2 Event Request frame format

The Event Request frame is transmitted to request another STA to report one or more events. The format of the Event Request frame Action field is shown in Figure 9-916.

	Category	WNM Action	Dialog Token	Event Request Elements	Destination URI Element (optional)
Octets:	1	1	1	variable	variable

Figure 9-916—Event Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value chosen by the STA sending the event request to identify the request/report transaction.

The Event Request Elements field contains one or more of the Event Request elements described in 9.4.2.66.

The Destination URI element field contains zero or one Destination URI elements described in 9.4.2.89.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.13.3 Event Report frame format

The Event Report frame is transmitted in response to an Event Request frame, or autonomously. The format of the Event Report frame Action field is shown in Figure 9-917.

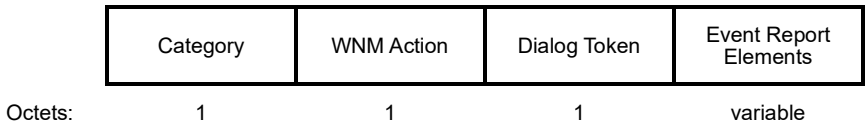

Figure 9-917—Event Report frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the nonzero value of the corresponding Event Request frame. If the Event Report frame is being transmitted other than in response to an Event Request frame, then the dialog token is 0.

The Event Report Elements field contains one or more of the Event Report elements described in 9.4.2.67.

9.6.13.4 Diagnostic Request frame format

The Diagnostic Request frame is transmitted requesting the receiving STA to execute a diagnostic test. The format of the Diagnostic Request frame Action field is shown in Figure 9-918.

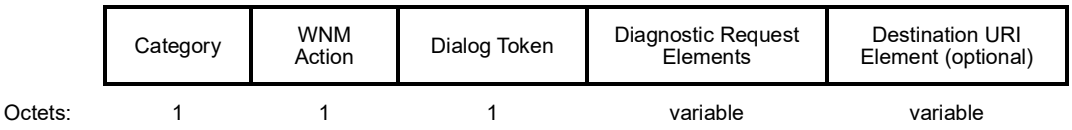

Figure 9-918—Diagnostic Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value chosen by the STA sending the Diagnostic Request frame to identify the request/report transaction.

The Diagnostic Request Elements field contains one or more of the Diagnostic Request elements described in 9.4.2.68. The number and length of the Diagnostic Request elements in a Diagnostic Request frame is limited by the maximum MMPDU size (see 9.3.3.1).

The Destination URI element field contains zero or one Destination URI elements described in 9.4.2.89.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.13.5 Diagnostic Report frame format

The Diagnostic Report frame is transmitted by a STA in response to a Diagnostic Request frame. The format of the Diagnostic Report frame Action field is shown in Figure 9-919.

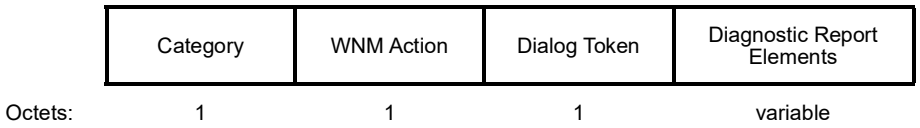

Figure 9-919—Diagnostic Report frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the nonzero value in any corresponding Diagnostic Request frame.

The Diagnostic Report Elements field contains one or more of the Diagnostic Report elements described in 9.4.2.69. The number and length of the Diagnostic Report elements in a Diagnostic Report frame is limited by the maximum MMPDU size (see 9.3.3.1).

9.6.13.6 Location Configuration Request frame format

The Location Configuration Request frame is transmitted to configure another STA to send a Location Track Notification frame on a set of channels periodically for the purposes of determining location of the STA. The format of the Location Configuration Request frame Action field is shown in Figure 9-920.

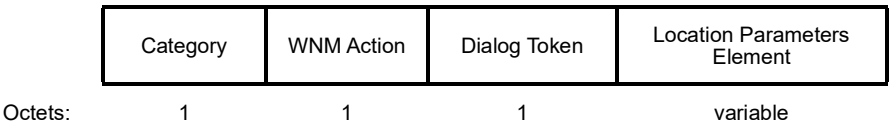

Figure 9-920—Location Configuration Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value that is unique among the Location Configuration Request frames sent to each destination MAC address for which a corresponding Location Configuration Response frame has not been received.

The Location Parameters Element field contains the location parameters subelements, described in 9.4.2.70. Table 9-426 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Request frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-426—Location Parameters Element field for Location Configuration Request frame

Allowed subelements	Subelement ID	Notes
Location Indication Parameters	1	The Location Indication Parameters subelement is included in the Location Configuration Request frame.
Location Indication Channels	2	The Location Indication Channels subelement is included in the Location Configuration Request frame.
Location Indication Broadcast Data Rate	6	The Location Indication Broadcast Data Rate subelement is included in the Location Configuration Request frame.
Location Indication Options	8	The Location Indication Options subelement is optionally included in the Location Configuration Request frame.
Vendor Specific Information	221	Zero or more Vendor Specific subelements are included in the Location Configuration Request frame.

9.6.13.7 Location Configuration Response frame format

The Location Configuration Response frame is transmitted in response to a Location Configuration Request frame. The format of the Location Configuration Response frame Action field is shown in Figure 9-921.

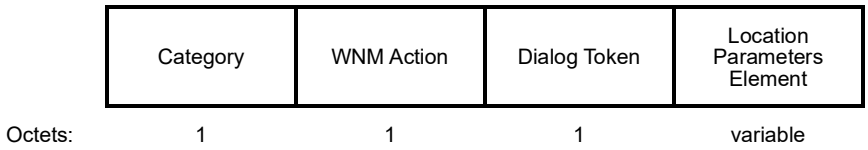

Figure 9-921—Location Configuration Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the nonzero value received in the Location Configuration Request frame to identify the request/response transaction.

The Location Parameters Element field contains the location parameters subelements, described in 9.4.2.70. Table 9-427 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Response frame.

Table 9-427—Location Parameters Element field for Location Configuration Response frame

Allowed subelements	Subelement ID	Notes
Location Indication Parameters	1	The Location Indication Parameters subelement is optionally included in the Location Configuration Response frame.
Location Indication Channels	2	The Location Indication Channels subelement is optionally included in the Location Configuration Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-427—Location Parameters Element field for Location Configuration Response frame *(continued)*

Allowed subelements	Subelement ID	Notes
Location Indication Broadcast Data Rate	6	The Location Indication Broadcast Data Rate subelement is optionally included in the Location Configuration Response frame.
Location Indication Options	8	The Location Indication Options subelement is optionally included in the Location Configuration Response frame.
Location Status	3	The Location Status subelement is included in the Location Configuration Response frame. If all configuration of the subelements contained in a Location Configuration Request frame was successful, then a single Location Status subelement is included in the Location Configuration Response frame. For each subelement contained in the Location Configuration Request frame that is not successful a Location Status subelement is included in the Location Configuration Response frame that indicates the subelement ID and the unsuccessful status code for that subelement ID.
Vendor Specific Information	221	Zero or more Vendor Specific subelements are included in the Location Configuration Response frame.

9.6.13.8 BSS Transition Management Query frame format

The BSS Transition Management Query frame is transmitted to request or provide information on BSS transition candidate APs. The format of the BSS Transition Management Query frame Action field is shown in Figure 9-922.

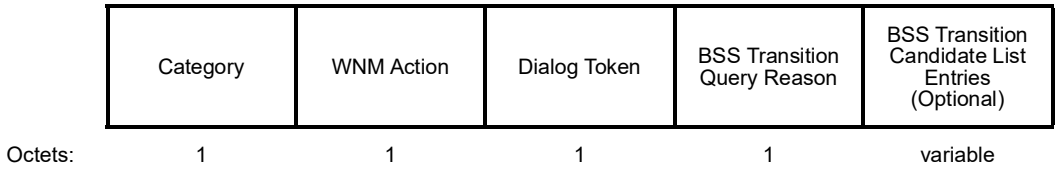

Figure 9-922—BSS Transition Management Query frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value chosen by the STA sending the BSS Transition Management Query frame to identify the query/request/response transaction.

The BSS Transition Query Reason field contains the reason code for a BSS transition management query as defined in Table 9-198.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements, as described in 9.4.2.36. The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 11.21.7.2. The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Query frame is limited by the maximum MMPDU size (see 9.3.3.1).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.13.9 BSS Transition Management Request frame format

The BSS Transition Management Request frame is transmitted by an AP in response to a BSS Transition Management Query frame, or autonomously. The format of the BSS Transition Management Request frame Action field is shown in Figure 9-923.

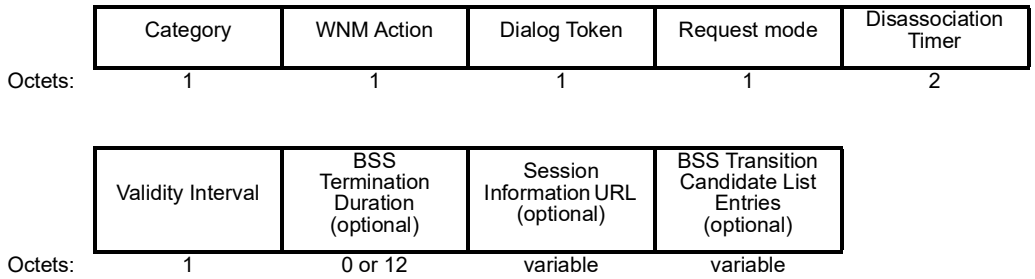

Figure 9-923—BSS Transition Management Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the nonzero value received in the BSS Transition Management Query frame if the BSS Transition Management Request frame is being transmitted in response to a BSS Transition Management Query frame. If the BSS Transition Management Request frame is being transmitted other than in response to a BSS Transition Management Query frame, then the Dialog Token field is a nonzero value chosen by the AP sending the BSS Transition Management Request frame to identify the request/response transaction.

The Request mode field is defined in Figure 9-924.

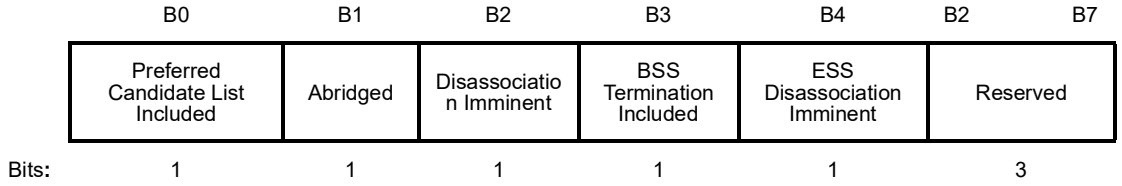

Figure 9-924—Request Mode field format

— The Preferred Candidate List Included (bit 0) field indicates whether the BSS transition candidate list included in this frame is a preferred candidate list or a list of known BSS transition candidates. The Preferred Candidate List Included bit set to 0 indicates that the receiving STA can ignore the BSS Transition Candidate List Entries field (see 11.21.7.3). The Preferred Candidate List Included bit set to 1 indicates that the sender expects the receiving STA to process this frame.

— The Abridged (bit 1) field indicates to the recipient of the frame the intended treatment of all BSSIDs not listed in the BSS Transition Candidate List Entries field. The AP sets the Abridged bit in the Request Mode field to 1 when a preference value of 0 is assigned to all BSSIDs that do NOT appear in the BSS Transition Candidate List. The AP sets the Abridged bit in the Request Mode field to 0 when the AP has no recommendation for or against any BSSID not present in the BSS Transition Candidate List Entries field.

— The Disassociation Imminent (bit 2) field indicates whether the STA will be disassociated from the current AP. The value 1 in the Disassociation Imminent bit in the Request Mode field indicates that

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

the STA is to be disassociated from the current AP, while the value 0 indicates that disassociation from the AP is not imminent.

— The BSS Termination Included (bit 3) field indicates that the BSS Termination Duration field is included, the BSS is shutting down and the STA will be disassociated. The AP sets the BSS Termination Included bit in the Request mode field to 1 to indicate that the BSS is shutting down. The BSS Termination Included bit is 0 if no BSS Termination Duration information is included in the BSS Transition Management Request frame.

— The ESS Disassociation Imminent (bit 4) field indicates that the Session Information URL field is included, and that the STA will be disassociated from the ESS. The value 1 in the ESS Disassociation Imminent bit in the Request Mode field indicates that the STA is to be disassociated from the ESS, while the value 0 indicates that disassociation from the ESS is not imminent. When the ESS Disassociation Imminent bit value is 1, a Session Information URL field is included in the BSS Transition Management Request frame.

The Disassociation Timer indicates the time after which the AP issues a Disassociation frame to this STA. The Disassociation Timer field contains the number of beacon transmission times (TBTTs) until the AP sends a Disassociation frame to this STA. Setting the field to 0 indicates that the AP has not determined when it will send a Disassociation frame to this STA. If the Disassociation Imminent field is 0, the Disassociation Timer field is reserved. The format of the Disassociation Timer field is shown in Figure 9-925.

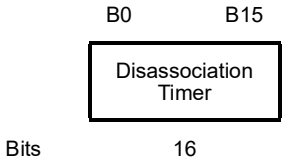

Figure 9-925—Disassociation Timer field format

The Validity Interval field is the number of beacon transmission times (TBTTs) until the BSS transition candidate list is no longer valid. A value of 0 is reserved.

The BSS Termination Duration field contains the BSS Termination Duration subelement (see 9.4.2.36) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field.

The format of the optional Session Information URL field is shown in Figure 9-926. This field is present when the ESS Disassociation Imminent field is 1.

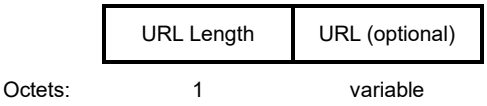

Figure 9-926—Session Information URL field format

The URL Length field is the value of the length of the URL field. The URL Length field is 0 when the URL field is not present.

The URL field is a variable length field formatted in accordance with IETF RFC 3986.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 9.4.2.36. If the STA has no information in response to the BSS Transition Management Query frame or in an unsolicited BSS Transition Management Request frame, the Neighbor Report elements are omitted and

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

the Preferred Candidate List Included bit is 0. The length of the BSS Transition Candidate List Entries in a BSS Transition Management Request frame is limited by the maximum MMPDU size (see 9.3.3.1).

9.6.13.10 BSS Transition Management Response frame format

The BSS Transition Management Response frame is optionally transmitted by a STA in response to a BSS Transition Management Request frame. The format of the BSS Transition Management Response frame Action field is shown in Figure 9-927.

	Category	WNM Action	Dialog Token	BTM Status Code	BSS Termination Delay	Target BSSID (Optional)	BSS Transition Candidate List Entries (Optional)
Octets:	1	1	1	1	1	0 or 6	variable

Figure 9-927—BSS Transition Management Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the value in the corresponding BSS Transition Management Request frame. The BSS Transition Management Response frame is transmitted in response to a BSS Transition Management Request frame.

The BTM Status Code field contains the status code in response to a BSS Transition Management Request frame as defined in Table 9-428. If the STA will transition to another BSS, then the status code is 0 (i.e., Accept). If the STA intends to retain the association with the current BSS, the status code is one of the "Reject" status codes.

Table 9-428—BTM status code definitions

Status code	Status code description
0	Accept
1	Reject—Unspecified reject reason.
2	Reject—Insufficient Beacon or Probe Response frames received from all candidates.
3	Reject—Insufficient available capacity from all candidates.
4	Reject—BSS termination undesired.
5	Reject—BSS termination delay requested.
6	Reject—STA BSS Transition Candidate List provided.
7	Reject—No suitable BSS transition candidates.
8	Reject—Leaving ESS.
9–255	Reserved

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The BSS Termination Delay field is the number of minutes that the responding STA requests the BSS to delay termination. This field is reserved if the Status code field value is not set to 5.

The Target BSSID field is the BSSID of the BSS that the non-AP STA transitions to. This field is present if the Status code subfield contains 0, and not present otherwise.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 9.4.2.36. The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 11.21.7.4. The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Response frame is limited by the maximum MMPDU size (see 9.3.3.1).

9.6.13.11 FMS Request frame format

The FMS Request frame is sent by a non-AP STA to the AP to request the specified FMS and to propose delivery intervals for a set of group addressed streams. The FMS Request frame is also sent by a non-AP STA to request a modification to a previous FMS Request. The format of the Action field of the FMS Request frame is shown in Figure 9-928.

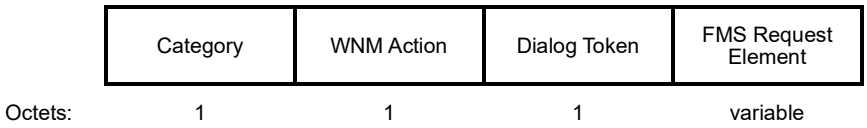

Figure 9-928—FMS Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value that is unique among the FMS Request frame sent to each destination MAC address for which a corresponding FMS Report frame has not been received.

The FMS Request Element field indicates the group addressed traffic streams that are requested by the non-AP STA. The FMS Request Element field contains one FMS Request element described in 9.4.2.75.

9.6.13.12 FMS Response frame format

The FMS Response frame is sent by an AP in response to an FMS Request frame, or sent by the AP to the STA to instruct the non-AP STA to change the delivery interval or data rate. The format of the Action field of the FMS Response frame is shown in Figure 9-929.

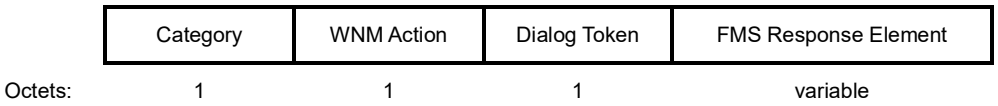

Figure 9-929—FMS Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is the nonzero value received in the FMS Request frame to identify the request/response transaction. If an FMS Response frame is being transmitted other than in response to an FMS Request frame, then the Dialog Token field is 0.

The FMS Response Element indicates the group addressed traffic streams that the AP supports and the corresponding delivery intervals. The FMS Response Element field contains one FMS Response elements, described in 9.4.2.76.

9.6.13.13 Collocated Interference Request frame format

The Collocated Interference Request frame is transmitted to request collocated interference reports, sent using Collocated Interference Report frames. The format of the Collocated Interference Request frame Action field is shown in Figure 9-930.

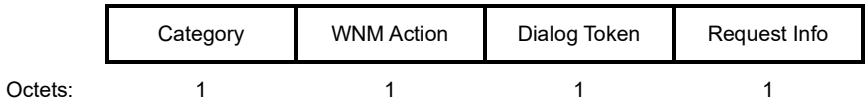

Figure 9-930—Collocated Interference Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is any nonzero value to identify the request/response transaction.

The Request Info field is shown in Figure 9-931.

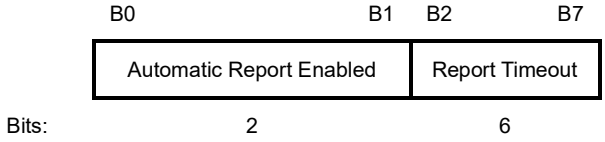

Figure 9-931—Request Info field format

The Automatic Report Enabled subfield contains an unsigned integer value.

The Automatic Report Enabled subfield set to 0 indicates that the requesting STA cancels the previous requests so that the receiving STA stops sending collocated interference reports.

The Automatic Report Enabled subfield set to 1 indicates that the requesting STA requests the receiving STA to send a collocated interference report when the STA knows of a change in the collocated interference, subject to meeting the Report Timeout requirement.

The Automatic Report Enabled subfield set to 2 indicates that the requesting STA requests the receiving STA to send a collocated interference report periodically using the period included in the Report Period field in the Collocated Interference Report element; see 9.4.2.84.

The Automatic Report Enabled subfield set to 3 indicates that the requesting STA requests the receiving STA to send collocated interference reports periodically using the period included in the Report Period field in the Collocated Interference Report element; see 9.4.2.84, or send a collocated interference report when the STA knows of a change in the collocated interference, subject to meeting the Report Timeout requirement.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Report Timeout field contains a value in units of 200 TUs and indicates the minimum duration between two consecutive Collocated Interference Report frames from the reporting STA. When the Automatic Report Enabled subfield is 0, the Report Timeout field is reserved.

9.6.13.14 Collocated Interference Report frame format

The Collocated Interference Report frame is transmitted in response to Collocated Interference Request frame. The format of the Collocated Interference Report frame Action field is shown in Figure 9-932.

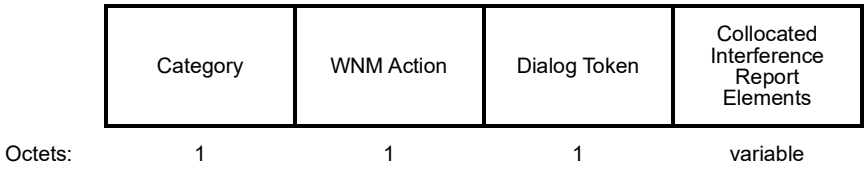

Figure 9-932—Collocated Interference Report frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the nonzero value received in the corresponding Collocated Interference Request frame to identify the request/response transaction.

The Collocated Interference Report Elements field contains one or more Collocated Interference Report elements to indicate the characteristics of the reported collocated interferences, as defined in 9.4.2.84.

9.6.13.15 TFS Request frame format

The TFS Request frame is sent by a non-AP STA to the AP to request the specified traffic filtering. The format of the TFS Request frame Action field is defined in Figure 9-933.

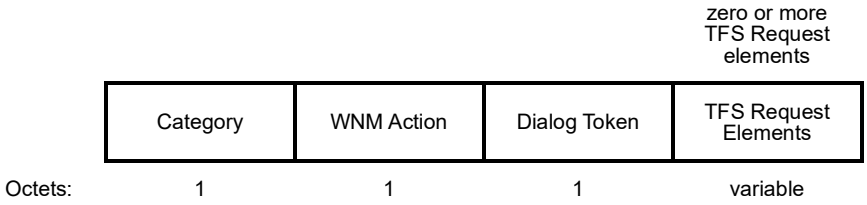

Figure 9-933—TFS Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a value chosen by the STA sending the TFS Request frame to identify the request/response transaction.

The TFS Request Elements field contains one or more TFS Request elements to specify one or more traffic filter sets that are requested by the non-AP STA, as defined in 9.4.2.79, or zero TFS Request elements to cancel all of the existing traffic filter sets (see 11.21.12.2).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.13.16 TFS Response frame format

The TFS Response frame is sent by an AP in response to a TFS Request frame. The format of the TFS Response frame Action field is defined in Figure 9-934.

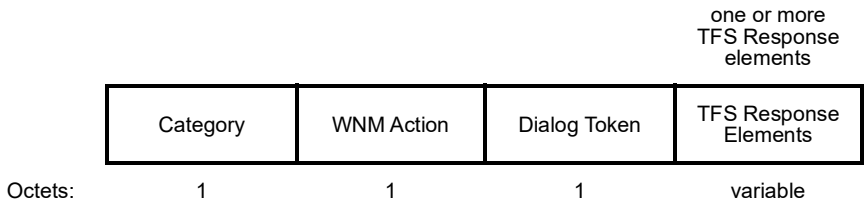

Figure 9-934—TFS Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the value in the corresponding TFS Request frame.

The TFS Response Elements field contains one or more TFS Response elements to indicate the status of the filtering parameters that the AP is requested to support, as defined in 9.4.2.80. The number of TFS Response elements in a TFS Response frame is the same as the number of the TFS Request elements in the TFS Request frame with the same dialog token, where the TFS Response elements appear in the same order as the corresponding TFS Request elements in the TFS Request frame with the same dialog token.

9.6.13.17 TFS Notify frame format

The TFS Notify frame is sent by an AP to a STA when a frame matching a traffic filter is encountered. The format of the TFS Notify frame Action field is defined in Figure 9-935.

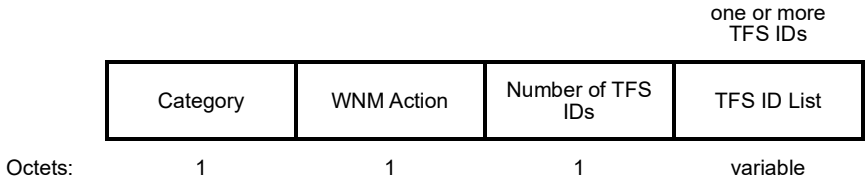

Figure 9-935—TFS Notify frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID field indicates the traffic filter set containing the matched TCLAS element.

9.6.13.18 TFS Notify Response frame format

A TFS Notify Response frame is transmitted by a non-AP STA to an AP to request the AP to resume generation of the TFS Notify frame when a frame matches any traffic filter set identified by the TFS ID(s) included in the TFS Notify Response frame. The format of the TFS Notify Response frame Action field is shown in Figure 9-936.

	Category	WNM Action	Number of TFS IDs	TFS ID List
Octets:	1	1	1	variable

Figure 9-936—TFS Notify Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID List field indicates the identifiers of the traffic filter sets.

9.6.13.19 WNM Sleep Mode Request frame format

The WNM Sleep Mode Request frame is sent by a non-AP STA to the AP to enter the WNM sleep mode. The format of the WNM Sleep Mode Request frame Action field is defined in Figure 9-937.

	Category	WNM Action	Dialog Token	WNM Sleep Mode Element	TFS Request Elements (one or more TFS Request elements)	OCI Element (optional)
Octets:	1	1	1	6	variable	0 or 6

Figure 9-937—WNM Sleep Mode Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value chosen by the non-AP STA sending the WNM Sleep Mode Request frame to identify the request/response transaction.

The WNM Sleep Mode Element field contains a WNM Sleep Mode element that is requested by a non-AP STA, as described in 9.4.2.81.

The TFS Request Elements field contains one or more TFS Request elements to specify the traffic filters that are requested by a non-AP STA, as defined in 9.4.2.79.

The OCI Element field is optionally present, and contains an OCI element as defined in 9.4.2.236.

9.6.13.20 WNM Sleep Mode Response frame format

The WNM Sleep Mode Response frame is sent by an AP in response to a WNM Sleep Mode Request frame or is sent without solicitation by an AP to a non-AP STA upon the AP's deletion of all traffic filter sets established according to the traffic filtering agreement between the AP and the non-AP STA. The format of the WNM Sleep Mode Response frame Action field is defined in Figure 9-938.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

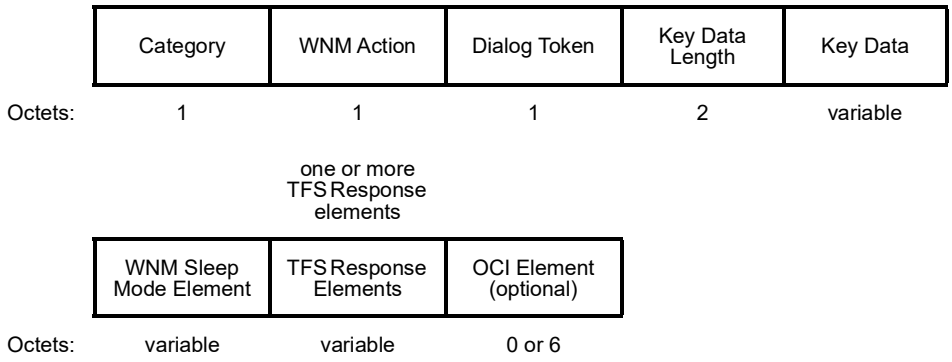

Figure 9-938—WNM Sleep Mode Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

When the WNM Sleep Mode Response frame is transmitted as a response to a WNM Sleep Mode Request frame, the Dialog Token field is the value in the corresponding WNM Sleep Mode Request frame. When the WNM Sleep Mode Response frame is transmitted as an unsolicited response, the Dialog Token field is set to 0.

The Key Data Length field is the length of the Key Data field. If the management frame protection is not used, this field is 0.

The Key Data field contains zero or more subelements that provide the current GTK, IGTK and BIGTK to the STA. The format of these subelements is shown in Figure 9-939, Figure 9-940, and Figure 9-940. The subelement IDs for these subelements are defined in Table 9-429. When management frame protection is not used, the Key Data field is not present.

Table 9-429—Optional subelement IDs for WNM Sleep Mode parameters

Value	Contents of subelement
0	GTK
1	IGTK
2	BIGTK
3–255	Reserved

The GTK subelement contains the GTK as shown in Figure 9-939.

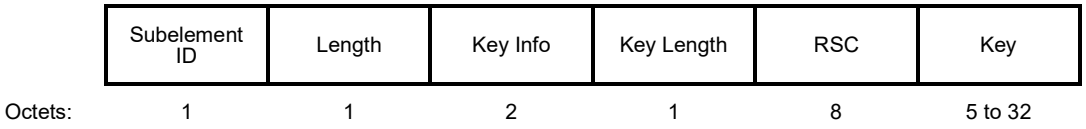

Figure 9-939—WNM Sleep Mode GTK subelement format

The Length field is defined in 9.4.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Key Info field is defined in Figure 9-360.

The Key Length field is the length of the Key field in octets.

The RSC field contains the current receive sequence counter (RSC) for the GTK being installed, to allow a STA to identify replayed MPDUs. If the RSC is less than 8 octets in length, it is stored in the first octets and the remaining octets are set to 0. The least significant octet of the RSC is in the first octet of the RSC field. The RSC for TKIP is the TKIP sequence counter (TSC); for CCMP and GCMP it is the packet number (PN); see Table 12-8.

The Key field is the GTK being distributed.

The IGTK subelement contains the IGTK as shown in Figure 9-940.

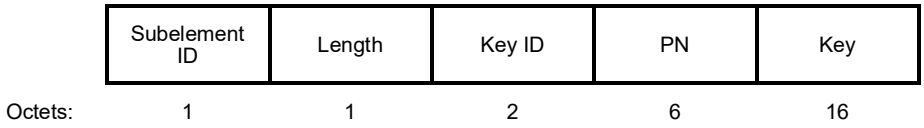

Figure 9-940—WNM Sleep Mode IGTK subelement format

The Length field is defined in 9.4.3.

The Key ID field indicates the value of the BIP key identifier.

The PN field contains the current RSC number for the IGTK being installed, to allow a STA to identify replayed protected group addressed robust Management frames. The RSC for an IGTK is the IGTK packet number (IPN).

The Key field is the IGTK being distributed.

The BIGTK subelement contains the BIGTK as shown in Figure 9-941.

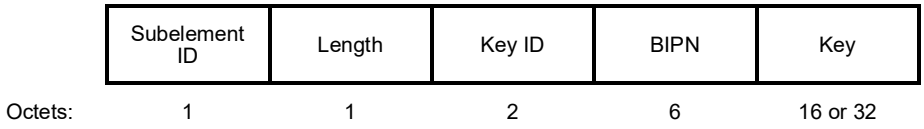

Figure 9-941—WNM Sleep Mode BIGTK subelement format

The Subelement ID field is defined in 9.6.13.20.

The Length field is defined in 9.4.3.

The Key ID field indicates the value of the BIGTK identifier.

The BIPN field contains the current RSC for the BIGTK being installed, to allow a STA to identify replayed Beacon frames. The RSC for a BIGTK is the BIGTK packet number (BIPN).

The Key field is the BIGTK being distributed.

NOTE 1—There might be multiple GTK, multiple IGTK, and multiple BIGTK subelements if a group rekeying is in process when the non-AP STA wakes up from WNM sleep mode.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE 2—Management frame protection is used to provide confidentiality, replay, and integrity protection for GTK/IGTK/BIGTK update in WNM Sleep Mode Response frames.

The WNM Sleep Mode Element field contains a WNM Sleep Mode element, as described in 9.4.2.81.

The TFS Response Elements field contains one or more TFS Response elements to specify the traffic filters, as defined in 9.4.2.80.

The OCI Element field is optionally present, and contains an OCI element as defined in 9.4.2.236.

9.6.13.21 TIM Broadcast Request frame format

The format of the TIM Broadcast Request frame Action field is shown in Figure 9-942.

	Category	WNM Action	Dialog Token	TIM Broadcast Request Element
Octets:	1	1	1	3

Figure 9-942—TIM Broadcast Request frame Action fieldformat

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value chosen by the STA sending the TIM Broadcast Request frame to identify the request/response transaction.

The TIM Broadcast Request Element field contains a TIM Broadcast Request Element as specified in 9.4.2.82.

9.6.13.22 TIM Broadcast Response frame format

The format of the TIM Broadcast Response frame Action field is shown in Figure 9-943.

	Category	WNM Action	Dialog Token	TIM Broadcast Response Element
Octets:	1	1	1	3 or 12

Figure 9-943—TIM Broadcast Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the nonzero value of the corresponding TIM Broadcast Request frame. If the TIM Broadcast Response frame is being transmitted other than in response to a TIM Broadcast Request frame, then the dialog token is 0.

The TIM Broadcast Response Element field contains a TIM Broadcast Response Element as specified in 9.4.2.83.

9.6.13.23 QoS Traffic Capability Update frame format

The QoS Traffic Capability Update frame is sent by a non-AP STA to the AP to update QoS Traffic Capability information. The format of the Action field of the QoS Traffic Capability Update frame is shown in Figure 9-944.

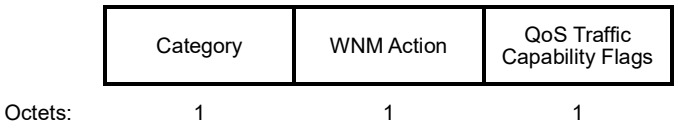

Figure 9-944—QoS Traffic Capability Update frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The QoS Traffic Capability Flags field is defined in Table 9-430. The QoS Traffic Capability Flags field comprises 1 octet, with the bits 4–6 serving as QoS Traffic Capability Flags. Each of the bits 4–6 serves as a flag for one of the three user priorities, UP 4–6. The field is 1 to indicate the expectation of generating traffic belonging to the corresponding user priority (UP). The field is 0 to indicate that such expectation does not exist. The use of the QoS Traffic Capability Update frame is described in 11.21.10.

Table 9-430—QoS Traffic Capability Flags definition

Bit	Description
0–3	Reserved
4	UP 4 Traffic
5	UP 5 Traffic
6	UP 6 Traffic
7	Reserved

9.6.13.24 Channel Usage Request frame format

The Channel Usage Request frame is sent by a non-AP STA to the AP to request the specified Channel Usage information. The format of the Channel Usage Request frame Action field is defined in Figure 9-945.

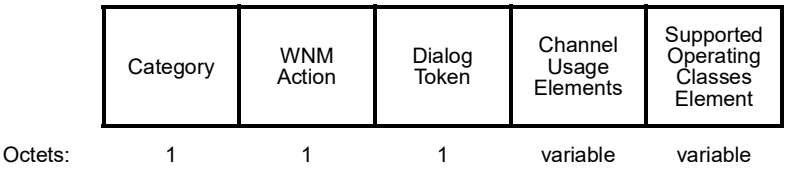

Figure 9-945—Channel Usage Request frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value chosen by the non-AP STA sending the Channel Usage Request frame to identify the request/response transaction.

The Channel Usage Element field includes one or more Channel Usage elements described in 9.4.2.85 to identify the request Usage Mode.

The Supported Operating Classes Element field contains a Supported Operating Classes element to indicate the supported operating classes for the requested network type, consistent with the Country element advertised by the AP. The Supported Operating Classes is described in 9.4.2.53.

9.6.13.25 Channel Usage Response frame format

The Channel Usage Response frame is sent by an AP in response to a Channel Usage Request frame, or autonomously. The format of the Channel Usage Response frame Action field is shown in Figure 9-946.

	Category	WNM Action	Dialog Token	Channel Usage Elements	Country String	Power Constraint Element (optional)	EDCA Parameter Set Element (optional)	Transmit Power Envelope element (optional)
Octets:	1	1	1	variable	3	0 or 3	0 or 20	variable

Figure 9-946—Channel Usage Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the nonzero value received in the Channel Usage Request frame if the Channel Usage Response frame is being transmitted in response to a Channel Usage Request frame. The Dialog Token field is 0 if the Channel Usage Response frame is being transmitted other than in response to a Channel Usage Request frame.

The Channel Usage Element field includes zero or more Channel Usage elements described in 9.4.2.85.

The Country String field is the value contained in the dot11CountryString attribute.

The Power Constraint Element field includes zero or one Power Constraint elements described in 9.4.2.13. The use of the Power Constraint element included in the Power Constraint Element field is described in 11.21.15.

The EDCA Parameter Set Element field includes zero or one EDCA Parameter Set elements described in 9.4.2.28. The use of the EDCA Parameter Set element included in the EDCA Parameter Set Element field is described in 11.21.15.

The Transmit Power Envelope element field is defined in 9.4.2.161.

9.6.13.26 DMS Request frame format

The DMS Request frame is sent by a non-AP STA to the AP to define information about a DMS request to the AP. The format of the DMS Request frame Action field is defined in Figure 9-947.

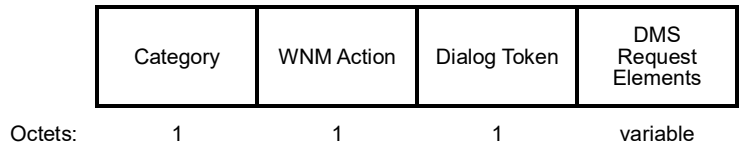

Figure 9-947—DMS Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is a nonzero value chosen by the non-AP STA sending the DMS Request frame to identify the request/response transaction.

The DMS Request Elements field contains one or more DMS Request elements as specified in 9.4.2.87.

9.6.13.27 DMS Response frame format

The DMS Response frame is sent by an AP or a mesh STA in response to a DMS Request frame, or autonomously to terminate a requested DMS stream, or to advertise the current parameters for one or more GCR streams. The format of the DMS Response frame Action field is shown in Figure 9-948.

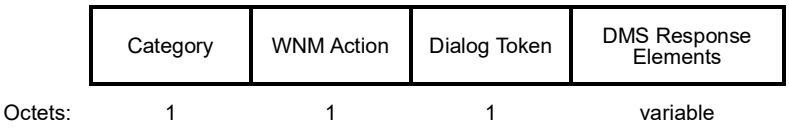

Figure 9-948—DMS Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is the nonzero value received in the DMS Request frame if the DMS Response frame is being transmitted in response to a DMS Request frame. The Dialog Token field is 0 if the DMS Response frame is being transmitted autonomously, and not in response to a DMS Request frame.

The DMS Response Elements field contains one or more DMS Response elements as specified in 9.4.2.88.

Copyright © 2021 IEEE. All rights reserved.

9.6.13.28 Timing Measurement Request frame format

The format of the Timing Measurement Request frame Action field is shown in Figure 9-949.

	Category	WNM Action	Trigger
Octets:	1	1	1

Figure 9-949—Timing Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Trigger field set to the value 1 indicates that the sending STA requests a timing measurement procedure at the receiving STA as defined in 11.21.5. The Trigger field set to the value 0 indicates that the sending STA requests that the receiving STA stop sending Timing Measurement frames. Trigger field values 2–255 are reserved.

9.6.13.29 WNM Notification Request frame format

The format of the WNM Notification Request frame Action field is shown in Figure 9-950.

	Category	WNM Action	Dialog Token	Type	Optional Subelements
Octets:	1	1	1	1	variable

Figure 9-950—WNM Notification Request frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the WNM notification request to identify the request/response transaction.

The Type field indicates the type of WNM notification, as defined in Table 9-431.

Table 9-431—WNM notification type

Value	Description
0	Firmware Update Notification
1	Reserved
2	Beacon Protection Failure
3–220	Reserved
221	Vendor Specific
222–255	Reserved

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-432.

Table 9-432—Optional subelement IDs for WNM Notification Request

Subelement ID	Name	Extensible
0	AP Descriptor	No
1	Firmware Version—Current	No
2	Firmware Version—New	No
3–220	Reserved	
221	Vendor Specific	Vendor defined
222–255	Reserved	

When the Type field is 0, the AP Descriptor, Firmware Version—Current, and Firmware Version—New optional subelements are included in the WNM Notification Request frame. The AP descriptor field format is defined in Figure 9-417. The Firmware Version—Current subelement contains the current firmware version, in the Firmware Version subelement format defined in Figure 9-423. The Firmware Version—New subelement contains the new firmware version, in the Firmware Version subelement format defined in Figure 9-423.

When the Type field is 2, the AP Descriptor, Firmware Version—Current, and Firmware Version—New optional subelements are not included in the WNM Notification Request frame.

9.6.13.30 WNM Notification Response frame format

The format of the WNM Notification Response frame Action field is shown in Figure 9-951.

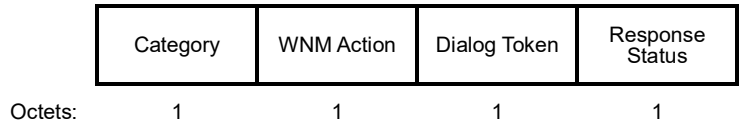

Figure 9-951—WNM Notification Response frame Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.13.1.

The Dialog Token field is set to the nonzero value of the corresponding WNM Notification Request frame.

The Response Status field indicates the Response Status value, as defined in Table 9-433.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-433—WNM Notification Response Status

Value	Description
0	Notification Acknowledged
1–255	Reserved

9.6.14 Unprotected WNM Action details

9.6.14.1 Unprotected WNM Action fields

Unprotected WNM Action frames are not encapsulated using mechanisms defined for robust Management frames. An Unprotected WNM Action field, in the field immediately after the Category field, differentiates the formats. The Unprotected WNM Action field values associated with each frame format is defined in Table 9-434.

Table 9-434—Unprotected WNM Action field values

Action field value	Description
0	TIM
1	Timing Measurement
2–255	Reserved

9.6.14.2 TIM frame format

The format of the TIM frame Action field is shown in Figure 9-952.

	Category	Unprotected WNM Action	Check Beacon	Timestamp	TIM Element
Octets:	1	1	1	8	4–256

Figure 9-952—TIM frame Action field format

The Category field is defined in 9.4.1.11.

The Unprotected WNM Action field is defined in 9.6.14.1.

The Check Beacon field is defined as an unsigned integer initialized to 0, that increments when a critical update to the Beacon frame has occurred; see 11.2.3.15.

The Timestamp field is defined in 9.4.1.10. The field contains a TSF timestamp when the TIM Broadcast Response frame contained a Status field set to “Accept, timestamp present in TIM frames” or “Overridden, timestamp present in TIM frames.” The field is reserved otherwise.

The TIM Element field contains a TIM element as specified in 9.4.2.5. The bit corresponding to buffered group addressed frames is reserved for all BSSIDs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.14.3 Timing Measurement frame format

The Timing Measurement frame is used to support the timing measurement procedure described in 11.21.5. The format of the Timing Measurement frame Action field is shown in Figure 9-953.

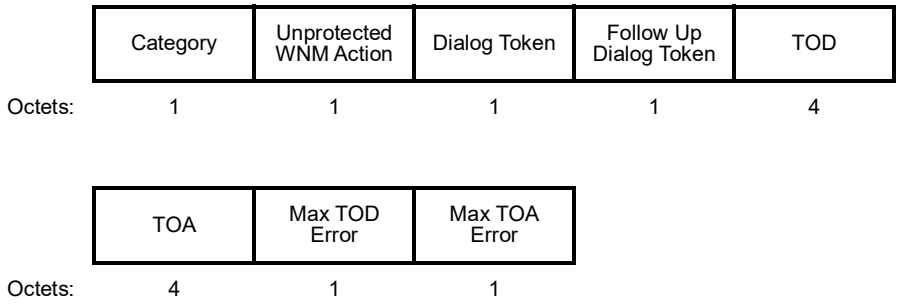

Figure 9-953—Timing Measurement frame Action field format

The Category field is defined in 9.4.1.11.

The Unprotected WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value chosen by the sending STA to identify the Timing Measurement frame as the first of a pair, with the second or follow-up Timing Measurement frame to be sent later. The Dialog Token field is set to 0 to indicate that the Timing Measurement frame will not be followed by a subsequent follow-up Timing Measurement frame.

The Follow Up Dialog Token field is the nonzero value of the Dialog Token field of the previously transmitted Timing Measurement frame to indicate that it is the follow up Timing Measurement frame and that the TOD, TOA, Max TOD Error and Max TOA Error fields contain the values of the timestamps captured with the first Timing Measurement frame of the pair. The Follow Up Dialog Token field is 0 to indicate that the Timing Measurement frame is not a follow up to a previously transmitted Timing Measurement frame. The value 0 in this field also indicates that the TOD, TOA, Max TOD Error, and Max TOA Error fields are reserved. See 11.21.5.

The TOD, TOA, Max TOD Error, and Max TOA Error fields are expressed in units of 10 ns.

The TOD field contains a timestamp that represents the time at which the start of the preamble of the previously transmitted Timing Measurement frame appeared at the transmit antenna connector.

The TOA field contains a timestamp that represents the time at which the start of the preamble of the Ack frame to the previously transmitted Timing Measurement frame arrived at the receive antenna connector.

NOTE—The values specified in the TOD and TOA fields are described in 6.3.55.

The Max TOD Error field contains an upper bound for the error in the value specified in the TOD field. For instance, a 2 in the Max TOD Error field indicates that the TOD field has a maximum error of ± 20 ns.

The Max TOA Error field contains an upper bound for the error in the value specified in the TOA field. For instance, a 2 in the Max TOA Error field indicates that the TOA field has a maximum error of ± 20 ns.

Setting the Max TOD Error or the Max TOA Error field to 0 indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. Setting either field to 255 indicates that the upper bound on the error is greater than or equal to 2.55 μs.

9.6.15 Self-protected Action frame details

9.6.15.1 Self-protected Action fields

The Self-protected Action frame is defined to allow robust STA-STA communications of the Action frames that are not robust (see 9.4.1.11). The protocols that use these Action frames are responsible for deciding whether to protect these frames and supporting protection mechanisms for these frames as needed.

Self-protected Action frames have a different nature than Public Action frames and robust Action frames. Robust Action frames assume the existence of a completely established security association. Self-protected Action frames typically exist to manage the creation and deletion of security associations, regardless of whether they are completely established.

Public Action frames are defined as public for all STAs, including those that are not in the BSS and MBSS. Self-protected Action frames, however, are used for relationship creation and maintenance between two specific STAs. Their public nature is incidental.

A Self-protected Action field, in the field immediately after the Category field, differentiates the formats. The defined Self-protected Action frames are listed in Table 9-435.

Table 9-435—Self-protected Action field values

Self-protected Action field value	Description
0	Reserved
1	Mesh Peering Open
2	Mesh Peering Confirm
3	Mesh Peering Close
4	Mesh Group Key Inform
5	Mesh Group Key Acknowledge
6–255	Reserved

The Mesh Peering Open frame, the Mesh Peering Confirm frame, and the Mesh Peering Close frame are referred to as *mesh peering Management frames*.

9.6.15.2 Mesh Peering Open frame format

9.6.15.2.1 Mesh Peering Open frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Open frames.

When the Mesh Peering Open frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

9.6.15.2.2 Mesh Peering Open frame details

The Mesh Peering Open frame is used to open a mesh peering using the procedures defined in 14.3.6 and in 14.5.5. The format of the Mesh Peering Open frame Action field is shown in Table 9-436.

Copyright © 2021 IEEE. All rights reserved.

Table 9-436—Mesh Peering Open frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	Capability	
4	Supported Rates and BSS Membership Selectors	
5	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates and is optionally present otherwise.
6	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true.
7	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false.
8	RSN	The RSNE is present if dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true; otherwise not present.
9	Mesh ID	
10	Mesh Configuration	
11	Mesh Peering Management	The Mesh Peering Management element is set as described in 9.4.2.97.
12	ERP Information	The ERP element is present if ERP mesh STA detects non-ERP STAs in its vicinity and is optionally present otherwise.
13	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true, or for a mesh STA if dot11OperatingClassesImplemented is true and the STA is capable of operation in more than one operating class.
14	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
15	HT Operation	The HT Operation element is included when dot11HighThroughputOptionImplemented is true.
16	20/40 BSS Coexistence element	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
17	Extended Capabilities element	The Extended Capabilities element is present if any of the fields in this element are nonzero.
18	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
19	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
20	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true.
21	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.15.1.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Open frame. The information following the MIC element through to the end of the Mesh Peering Open frame body is encrypted and authenticated (see 14.5).

The OCI element appears prior to the MIC element in the Mesh Peering Open frame, and as part of the input AAD is authenticated by the MIC element (see 14.5).

9.6.15.3 Mesh Peering Confirm frame format

9.6.15.3.1 Mesh Peering Confirm frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Confirm frames.

When the Mesh Peering Confirm frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

9.6.15.3.2 Mesh Peering Confirm frame details

The Mesh Peering Confirm frame is used to confirm a mesh peering using the procedures defined in 14.3.7 and 14.5.5. The format of the Mesh Peering Confirm frame Action field is shown in Table 9-437.

Table 9-437—Mesh Peering Confirm frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	Capability	
4	AID	
5	Supported Rates and BSS Membership Selectors	
6	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates and is optionally present otherwise.
7	RSN	The RSNE is present only when dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true.
8	Mesh ID	
9	Mesh Configuration	The Mesh Configuration element is present when dot11MeshActivated is true.
10	Mesh Peering Management	The Mesh Peering Management element is set as described in 9.4.2.101.

Table 9-437—Mesh Peering Confirm frame Action field format *(continued)*

Order	Information	Notes
11	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
12	HT Operation	The HT Operation element is included when dot11HighThroughputOptionImplemented is true.
13	20/40 BSS Coexistence element	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
14	Extended Capabilities element	The Extended Capabilities element is present if any of the fields in this element are nonzero.
15	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
16	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true.
17	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.15.1.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Confirm frame. The information following the MIC element through to the end of the Mesh Peering Confirm frame body is encrypted and authenticated (see 14.5).

The OCI element appears prior to the MIC element in the Mesh Peering Open frame, and as part of the input AAD is authenticated by the MIC element (see 14.5).

9.6.15.4 Mesh Peering Close frame format

9.6.15.4.1 Mesh Peering Close frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Close frames.

When the Mesh Peering Close frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

9.6.15.4.2 Mesh Peering Close frame details

The Mesh Peering Close frame is used to close a mesh peering using the procedures defined in 14.3.8 and in 14.5.5. The format of the Mesh Peering Close frame Action field is shown in Table 9-438.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-438—Mesh Peering Close frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	Mesh ID	
4	Mesh Peering Management	

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.15.1.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Close frame. The information following the MIC element through to the end of the Mesh Peering Close frame body is encrypted and authenticated (see 14.5).

9.6.15.5 Mesh Group Key Inform frame format

9.6.15.5.1 Mesh Group Key Inform frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 14.6) that uses Mesh Group Key Inform frames.

9.6.15.5.2 Mesh Group Key Inform frame details

The Mesh Group Key Inform frame is used to update a mesh GTK (MGTK) with a peer. The format of the Mesh Group Key Inform frame Action field is shown in Table 9-439.

Table 9-439—Mesh Group Key Inform frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	MIC element	
4	Authenticated Mesh Peering Exchange	

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.15.1.

The MIC element is set as defined in 9.4.2.118.

The Authenticated Mesh Peering Exchange element is set according to 14.6. The information following the MIC element through to the end of the Mesh Group Key Inform frame body is encrypted and authenticated (see 14.6.2).

9.6.15.6 Mesh Group Key Acknowledge frame format

9.6.15.6.1 Mesh Group Key Acknowledge frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 14.6) that uses Mesh Group Key Acknowledge frames.

9.6.15.6.2 Mesh Group Key Acknowledge frame details

The Mesh Group Key Acknowledge frame is used to acknowledge receipt and processing of a Mesh Group Key Inform frame. The format of the Mesh Group Key Acknowledge frame Action field is shown in Table 9-440.

Table 9-440—Mesh Group Key Acknowledge frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	MIC element	
4	Authenticated Mesh Peering Exchange	

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.15.1.

The MIC element is set as defined in 9.4.2.118.

The Authenticated Mesh Peering Exchange element is set according to 14.6. The information following the MIC element through to the end of the Mesh Group Key Acknowledge frame body is encrypted and authenticated (see 14.6.2).

9.6.16 Mesh Action frame details

9.6.16.1 Mesh Action fields

Several Mesh Action frame formats are defined for mesh BSS operation. A Mesh Action field, in the field immediately after the Category field, differentiates the formats. The Mesh Action field values associated with each frame format are defined in Table 9-441.

Table 9-441—Mesh Action field values

Mesh Action field value	Description
0	Mesh Link Metric Report
1	HWMP Mesh Path Selection
2	Gate Announcement

Table 9-441—Mesh Action field values *(continued)*

Mesh Action field value	Description
3	Congestion Control Notification
4	MCCA Setup Request
5	MCCA Setup Reply
6	MCCA Advertisement Request
7	MCCA Advertisement
8	MCCA Teardown
9	TBTT Adjustment Request
10	TBTT Adjustment Response
11–255	Reserved

9.6.16.2 Mesh Link Metric Report frame format

The Mesh Link Metric Report frame is transmitted by a mesh STA to a neighbor peer mesh STA to report metric information on the link between the two mesh STAs. It is also transmitted by a mesh STA to a neighbor peer mesh STA to request metric information on the link between the two mesh STAs from the recipient. This frame is transmitted using an individually addressed frame. The format of the Mesh Link Metric Report frame Action field is shown in Table 9-442.

Table 9-442—Mesh Link Metric Report frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Mesh Link Metric Report element	

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The Mesh Link Metric Report element is set as described in 9.4.2.99.

9.6.16.3 HWMP Mesh Path Selection frame format

The HWMP Mesh Path Selection frame is transmitted by a mesh STA to establish, update or delete paths to other mesh STAs using the HWMP defined in 14.10. This frame is transmitted in an individually or group addressed frame depending on the contained elements and as defined in 14.10.7. The format of the HWMP Mesh Path Selection frame Action field is shown in Table 9-443.

The HWMP Mesh Path Selection frame contains one or more of the elements indicated in Table 9-443. Usage of the HWMP Mesh Path Selection frame is described in 14.10.7.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-443—HWMP Mesh Path Selection frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	PREQ element	A PREQ element is optionally present
4	PREP element	A PREP element is optionally present
5	PERR element	A PERR element is optionally present
6	RANN element	A RANN element is optionally present

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The PREQ element is set as described in 9.4.2.112. It is present in an HWMP Mesh Path Selection frame as described in 14.10.9.

The PREP element is set as described in 9.4.2.113.

The PERR element is set as described in 9.4.2.114.

The RANN element is set as described in 9.4.2.111.

9.6.16.4 Gate Announcement frame format

The Gate Announcement frame is transmitted by a mesh gate to announce its presence in the MBSS. This frame is transmitted using group addresses. The format of the Gate Announcement frame Action field is shown in Table 9-444.

Table 9-444—Gate Announcement frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	GANN element	

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The GANN element is set as described in 9.4.2.110.

9.6.16.5 Congestion Control Notification frame format

A mesh STA uses the Congestion Control Notification frame to indicate its congestion status to its neighbor peer mesh STA(s). This frame is transmitted using individual addresses or group addresses. The format of the Congestion Control Notification frame Action field is shown in Table 9-445.

Table 9-445—Congestion Control Notification frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Congestion Notification element	One or more Congestion Notification elements (9.4.2.100) are present. Repeated *N* times (*N* is the number of Congestion Notification elements contained in the frame).

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The Congestion Notification element is set as described in 9.4.2.100.

9.6.16.6 MCCA Setup Request frame format

The MCCA Setup Request frame is used to set up an MCCAOP reservation. A mesh STA (with dot11MCCAActivated equal to true) transmits the MCCA Setup Request frame to one or more neighbor mesh STAs (with dot11MCCAActivated equal to true too). This frame is transmitted using individual addresses or group addresses. The format of the MCCA Setup Request frame Action field is shown in Table 9-446.

Table 9-446—MCCA Setup Request frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Setup Request element	

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The MCCAOP Setup Request element is described in 9.4.2.105.

Copyright © 2021 IEEE. All rights reserved.

9.6.16.7 MCCA Setup Reply frame format

The MCCA Setup Reply frame is used to reply to an MCCA Setup Request frame. It is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true. This frame is transmitted using individual addresses. The format of the MCCA Setup Reply frame Action field is shown in Table 9-447.

Table 9-447—MCCA Setup Reply frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Setup Reply element	

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The MCCAOP Setup Reply element is described in 9.4.2.106.

9.6.16.8 MCCA Advertisement Request frame format

The MCCA Advertisement Request frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true in order to request MCCAOP advertisements from the neighbor peer mesh STA. This frame is transmitted using individual addresses. The format of the MCCA Advertisement Request frame Action field is shown in Table 9-448.

Table 9-448—MCCA Advertisement Request frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Advertisement Overview element	An MCCAOP Advertisement Overview element is optionally present.

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The MCCAOP Advertisement Overview element is described in 9.4.2.107.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.16.9 MCCA Advertisement frame format

The MCCA Advertisement frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Advertisement frame Action field is shown in Table 9-449.

Table 9-449—MCCA Advertisement frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Advertisement Overview element	An MCCAOP Advertisement Overview element is optionally present.
4	MCCAOP Advertisement elements	If an MCCAOP Advertisement Overview element is present, zero or more MCCAOP Advertisement elements are present. If an MCCAOP Advertisement Overview element is not present, one or more MCCAOP Advertisement elements are present.

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The MCCAOP Advertisement Overview element is described in 9.4.2.107.

The MCCAOP Advertisement element is described in 9.4.2.108.

9.6.16.10 MCCA Teardown frame format

The MCCA Teardown frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Teardown frame Action field is shown in Table 9-450.

Table 9-450—MCCA Teardown frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Teardown element	

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The MCCAOP Teardown element is described in 9.4.2.109.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.16.11 TBTT Adjustment Request frame format

The TBTT Adjustment Request frame is used to request a particular neighbor peer mesh STA to adjust its TBTT. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Request frame Action field is shown in Table 9-451.

Table 9-451—TBTT Adjustment Request frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Beacon Timing element	Repeated *N_Info* times (*N_Info* is a number of beacon timing information tuples as described in 14.13.4.2.5).

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The Beacon Timing element is set as described in 9.4.2.104. When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

9.6.16.12 TBTT Adjustment Response frame format

The TBTT Adjustment Response frame is used to respond to a TBTT adjustment request. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Response frame Action field is shown in Table 9-452.

Table 9-452—TBTT Adjustment Response frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Status Code	
4	Beacon Timing element (optional)	Repeated *N_Info* times (*N_Info* is a number of beacon timing information tuples as described in 14.13.4.2.5).

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.16.1.

The Status Code field is set as described in 14.13.4.4.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Beacon Timing element is set as defined in 9.4.2.104. It is present only if the Status Code is set to CANNOT_FIND_ALTERNATIVE_TBTT (i.e., when the request is not successful due to the neighbor constraint). When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

9.6.17 Multihop Action frame details

9.6.17.1 Multihop Action fields

Several Multihop Action frame formats are defined for mesh BSS operation. A Multihop Action field, in the field immediately after the Category field, differentiates the formats. The Multihop Action field values associated with each frame format are defined in Table 9-453. The Mesh Control field is present immediately after the Multihop Action field in all Multihop Action frames.

Table 9-453—Multihop Action field values

Multihop Action field value	Description
0	Proxy Update
1	Proxy Update Confirmation
2–255	Reserved

9.6.17.2 Proxy Update frame format

The Proxy Update frame is used to inform the recipient about new, updated, or deleted proxy information. This frame is transmitted using individual addresses. The format of the Proxy Update frame Action field is shown in Table 9-454.

Table 9-454—Proxy Update frame Action field format

Order	Information	Notes
1	Category	
2	Multihop Action	
3	Mesh Control	
4	PXU element	Repeated *N* times (*N* is the number of PXU elements contained in the frame).

The Category field is defined in 9.4.1.11.

The Multihop Action field is defined in 9.6.17.1.

The Mesh Control field is set as defined in 9.2.4.7.3.

The PXU element is described in 9.4.2.115. The Proxy Update frame allows the inclusion of multiple PXU elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.17.3 Proxy Update Confirmation frame format

The Proxy Update Confirmation frame is transmitted by a mesh STA in response to a Proxy Update frame. This frame is used to inform that the corresponding PXU element has been properly received and is transmitted using individual addresses. The format of the Proxy Update Confirmation frame Action field is shown in Table 9-455.

Table 9-455—Proxy Update Confirmation frame Action field format

Order	Information	Notes
1	Category	
2	Multihop Action	
3	Mesh Control	
4	PXUC element	Repeated *N* times (*N* is the number of PXUC elements contained in the frame).

The Category field is defined in 9.4.1.11.

The Multihop Action field is defined in 9.6.17.1.

The Mesh Control field is set as defined in 9.2.4.7.3.

The PXUC element is described in 9.4.2.116. The Proxy Update Confirmation frame allows the inclusion of one or more PXUC elements.

9.6.18 Robust AV Streaming Action frame details

9.6.18.1 General

Several Action frame formats are defined to support robust AV streaming. The Robust Action field values associated with each frame format within the robust AV streaming category are defined in Table 9-456. The frame formats are defined in 9.6.18.2 to 9.6.18.7.

Table 9-456—Robust AV streaming Robust Action field values

Robust Action field value	Meaning
0	SCS Request
1	SCS Response
2	Group Membership Request
3	Group Membership Response
4	MSCS Request
5	MSCS Response
6–255	Reserved

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.18.2 SCS Request frame format

SCS Request frames are used to request the creation, modification, or deletion of a stream classification using the procedures defined in 11.25.2.

The Action field of the SCS Request frame contains the information shown in Figure 9-954.

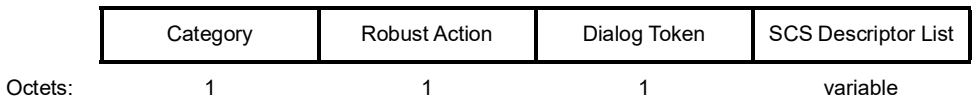

Figure 9-954—SCS Request frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

The SCS Descriptor List field contains one or more SCS Descriptor elements, as defined in 9.4.2.121.

9.6.18.3 SCS Response frame format

The SCS Response frame is sent in response to an SCS Request frame using the procedures defined in 11.25.2. The Action field of an SCS Response frame contains the information shown in Figure 9-955.

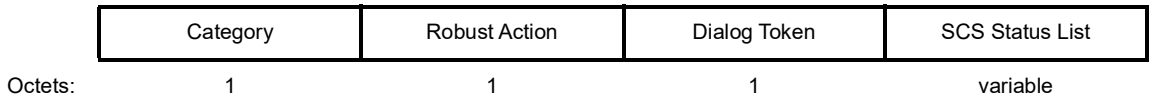

Figure 9-955—SCS Response frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is set to the nonzero value of the corresponding SCS Request frame. If the SCS Report frame is being transmitted for a reason other than in response to an SCS Request frame, then the Dialog Token field is set to 0.

The SCS Status List field contains one or more SCS Status duples. The format of the SCS Status duple is defined in Figure 9-956.

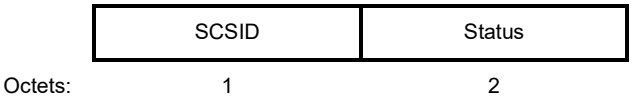

Figure 9-956—SCS Status duple format

The SCSID field is set to the value of the SCSID field in the SCS Descriptor element received in the SCS Request frame.

The Status field indicates the status of the requested SCSID, as indicated in Table 9-50.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.18.4 Group Membership Request frame format

The Group Membership Request frame is sent to a STA to request the contents of its dot11GroupAddressesTable. The Action field of a Group Membership Request frame contains the information shown in Figure 9-957.

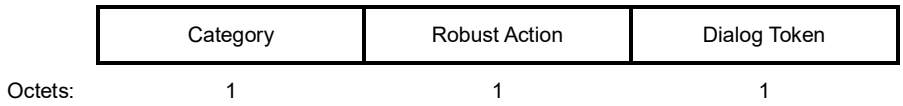

Figure 9-957—Group Membership Request frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

Usage of the Group Membership Request frame is described in 11.21.16.3.2.

9.6.18.5 Group Membership Response frame format

The Group Membership Response frame is sent in response to a Group Membership Request frame or upon a change in the dot11GroupAddressesTable object, using the procedures defined in 11.21.16.3.2. The Action field of a Group Membership Response frame contains the information shown in Figure 9-958.

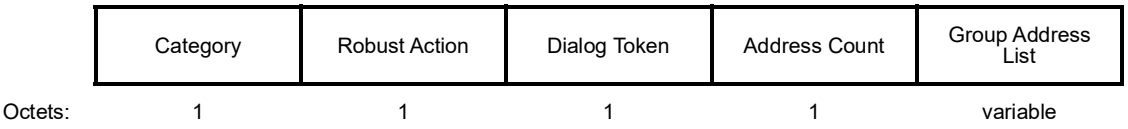

Figure 9-958—Group Membership Response frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is set to the nonzero value of the corresponding Group Membership Request frame. If the Group Membership Report frame is being transmitted for a reason other than in response to a Group Membership Request frame, the Dialog Token field is set to 0.

The Address Count field specifies the number of MAC addresses that are in the Group Address List field.

The Group Address List field contains zero or more MAC addresses to indicate the set of group addressed MAC addresses for which the STA receives frames. Each MAC address is 6 octets in length, as described in 9.2.4.3.2.

9.6.18.6 MSCS Request frame format

MSCS Request frames are used to request the creation, modification, or deletion of mirrored stream classification using the procedures defined in 11.25.3.

The Action field of the MSCS Request frame contains the information shown in Figure 9-959.

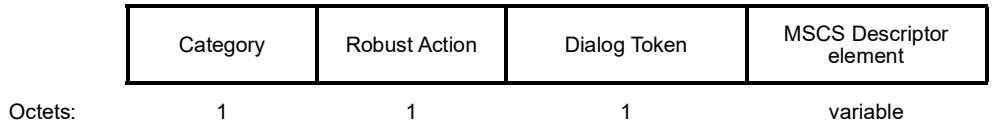

Figure 9-959—MSCS Request frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.28.5.

The MSCS Descriptor element is defined in 9.4.2.243.

9.6.18.7 MSCS Response frame format

The MSCS Response frame is sent in response to an MSCS Request frame using the procedures defined in 11.25.3. The Action field of an MSCS Response frame contains the information shown in Figure 9-960.

Figure 9-960—MSCS Response frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.18.1

The Dialog Token field is set to the nonzero value of the corresponding MSCS Request frame. If the MSCS Report frame is being transmitted for a reason other than in response to an MSCS Request frame, then the Dialog Token field is set to 0.

The Status field indicates the status of the request, as indicated in Table 9-50.

The MSCS Descriptor element is defined in 9.4.2.243. When the Status field is SUCCESS the element is not present; otherwise it is optionally present as described in 11.25.3.

9.6.19 DMG Action frame details

9.6.19.1 DMG Action field

Several Action frame formats are defined to support DMG features. A DMG Action field, in the octet immediately after the Category field, differentiates the DMG Action frame formats. The DMG Action field values associated with each frame format within the DMG category are defined in Table 9-457.

Table 9-457—DMG Action field values

DMG Action field value	Meaning
0	Power Save Configuration Request
1	Power Save Configuration Response
2	Information Request
3	Information Response
4	Handover Request
5	Handover Response
6	Reserved
7	Reserved
8	Relay Search Request
9	Relay Search Response
10	Multi-Relay Channel Measurement Request
11	Multi-Relay Channel Measurement Report
12	RLS Request
13	RLS Response
14	RLS Announcement
15	RLS Teardown
16	Relay Ack Request
17	Relay Ack Response
18	TPA Request
19	TPA Response
20	TPA Report
21	ROC Request
22	ROC Response

9.6.19.2 Power Save Configuration Request frame format

The format of the Power Save Configuration Request (PSC-REQ) frame Action field is shown in Table 9-458.

Table 9-458—Power Save Configuration Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	DMG Power Management
5	DMG Wakeup Schedule element (optional)

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The length of the DMG Power Management (DPM) field is 1 octet. Setting the DPM field to 0 indicates a transition from power save mode to active mode. Setting the DPM field to 1 indicates a transition from active mode to power save mode. All other values are reserved.

The DMG Wakeup Schedule element is defined in 9.4.2.130 (11.2.7.2).

9.6.19.3 Power Save Configuration Response frame format

The format of the Power Save Configuration Response (PSC-RSP) frame Action field is shown in Table 9-459.

Table 9-459—Power Save Configuration Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Status Code
5	DMG Wakeup Schedule element (optional)
6	Antenna Sector ID Pattern element (optional)

The Category field is defined in 9.4.1.11.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to the value of the Dialog Token field in the corresponding PSC-REQ frame.

The Status Code field is defined in 9.4.1.9.

The DMG Wakeup Schedule element is defined in 9.4.2.130.

The Antenna Sector ID Pattern element is defined in 9.4.2.156.

9.6.19.4 Information Request frame format

The format of an Information Request frame Action field is shown in Table 9-460.

Table 9-460—Information Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Subject Address
4	Request element
5	Zero or more DMG Capabilities elements
6	Zero or more provided elements
7	Zero or more Extended Request elements
8	Zero or more Vendor Specific Request elements

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Subject Address field contains the MAC address of the STA whose information is being requested. If this frame is sent to the PCP and the Subject Address field is the broadcast address, then the STA is requesting information regarding all associated STAs.

The Request element field is described in 9.4.2.9.

The DMG Capabilities element carries information about the transmitter STA and other STAs known to the transmitter STA. The format of this element is defined in 9.4.2.127.

Each provided element is an element as specified in 9.4.2, that the transmitter of this frame is providing to the destination of the frame.

The Extended Request element is described in 9.4.2.10.

The Vendor Specific Request element is described in 9.4.2.218.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.19.5 Information Response frame format

The format of an Information Response frame Action field is shown in Table 9-461.

This frame is individually addressed to a STA in response to an Information Request frame or it is sent unsolicited and individually addressed to a STA or broadcast to all STAs in the PBSS/infrastructure BSS. If this frame is sent as a broadcast, then this frame is an Action No Ack frame.

Table 9-461—Information Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Subject Address
4	One or more DMG Capabilities elements
5	Zero or more requested elements
6	Zero or more provided elements

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Subject Address field contains the MAC address of the STA whose information is being provided. If this field is set to the broadcast address, then the STA is providing information regarding all associated STAs.

The DMG Capabilities element carries information about the transmitter STA and other STAs known to the transmitter STA. The DMG Capabilities element is described in 9.4.2.127.

The requested elements are those returned in response to an Information Request frame, as described in 11.28.1.

The provided elements are elements, as described in 9.4.2, that the transmitter of this frame provides to the destination of the frame, either in addition to the requested elements, or in an unsolicited Information Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.19.6 Handover Request frame format

The format of the Handover Request frame Action field is shown in Table 9-462.

Table 9-462—Handover Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Handover Reason
4	Handover Remaining BI

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Handover Reason field is 1 octet in length and indicates the reason that the current PCP intends to do the PCP handover. The Handover Reason field is set to 0 to indicate the PCP is leaving the PBSS, it is set to 1 to indicate low power in the PCP, is set to 2 to indicate that a more qualified PCP handover capable STA is available, and is set to 3 to indicate that the PCP handover capable STA wishes to become a PCP. The other values are reserved.

The Handover Remaining BI field is 1 octet in length and indicates the number of beacon intervals, excluding the beacon interval in which this frame is transmitted, remaining until the handover takes effect.

9.6.19.7 Handover Response frame format

The format of the Handover Response frame Action field is shown in Table 9-463.

Table 9-463—Handover Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Handover Result
4	Handover Reject Reason

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Handover Result field is 1 octet in length and indicates whether the STA accepted the handover request. Setting this field to 0 indicates that the STA accepts the handover request. Setting this field to 1 indicates that the STA does not accept the handover request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the Handover Result field is set to 0, the Handover Reject Reason field is reserved and set to 0. If the Handover Result field is set to 1, the Handover Reject Reason field indicates the reason the STA rejected the handover request and can be one of the following: 0 for low power, 1 for handover in progress with another STA, 2 for invalid value for Handover Remaining BI field, and 3 for unspecified reason. The length of Handover Reject Reason field is 1 octet.

9.6.19.8 Relay Search Request frame format

The Relay Search Request frame is transmitted by a non-AP and non-PCP STA to the AP or PCP to request a list of RDSs in the BSS. The format of the Relay Search Request frame Action field is shown in Table 9-464.

Table 9-464—Relay Search Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Destination REDS AID

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the Relay Search Request frame to identify the request/response transaction.

The Destination REDS AID field is set to the AID of the target destination REDS. The structure of the field is defined in 9.4.1.8.

9.6.19.9 Relay Search Response frame format

The Relay Search Response frame is sent by an AP or PCP in response to a Relay Search Request frame. The format of a Relay Search Response frame Action field is shown in Table 9-465.

Table 9-465—Relay Search Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Status Code
5	Number of Relay Capable STAs
6	Zero or more Relay Capable STA Info fields

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to the value in the corresponding Relay Search Request frame that generated this response.

The Status Code field is defined in 9.4.1.9.

The Number of Relay Capable STAs field is 1 octet in length and indicates the number of STAs in the BSS that are relay capable. This field is set to 0 if the Status Code does not indicate success.

The Relay Capable STA Info field is defined in 9.4.1.44. This information is included only if the status code indicates successful. The number of Relay Capable STA Info fields that appear in the frame is indicated by the value of the Number of Relay Capable STAs field.

9.6.19.10 Multi-relay Channel Measurement Request frame format

The Multi-Relay Channel Measurement Request frame is transmitted by a STA initiating relay operation to the recipient STA in order to obtain Channel Measurements between the recipient STA and the other STA participating in the relay operation. The format of the Multi-Relay Channel Measurement Request frame Action field is shown in Table 9-466.

Table 9-466—Multi-relay Channel Measurement Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the Multi-Relay Channel Measurement Request frame to identify the request/report transaction.

9.6.19.11 Multi-relay Channel Measurement Report frame format

The Multi-Relay Channel Measurement Report frame is sent in response to a Multi-Relay Channel Measurement Request. The format of the Multi-Relay Channel Measurement Report frame Action field is shown in Table 9-467.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-467—Multi-relay Channel Measurement Report frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Number of Channel Measurement Info
5	One or more Channel Measurement Info fields

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to the value in any corresponding Multi-Relay Channel Measurement Request frame. If the Multi-Relay Channel Measurement Report frame is not being transmitted in response to a Multi-Relay Channel Measurement Request frame, then the dialog token is set to 0.

The Number of Channel Measurement Info field is 1 octet in length and indicates the number of Channel Measurements Info fields included in the frame.

The format of the Channel Measurement Info field is defined in Figure 9-961. The number of Channel Measurement Info fields included in the frame is indicated by the Number of Channel Measurement Info field. More than one Multiple Channel Measurement Info field is included if the reporting STA measures the channel for multiple RDSs.

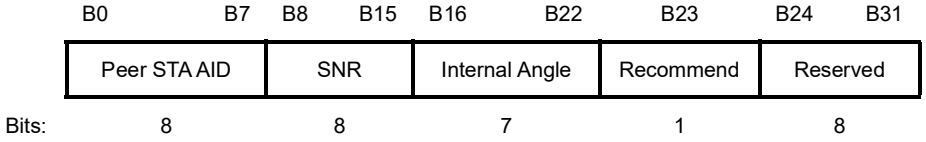

Figure 9-961—Channel Measurement Info field format

The Peer STA AID subfield contains the AID of the STA toward which the reporting STA measures link.

The SNR subfield indicates the SNR measured in the link toward the STA corresponding to Peer STA AID. This subfield is encoded as 8-bit 2s complement value of 4x(SNR-19), where SNR is measured in dB. This covers from –13 dB to 50.75 dB in 0.25 dB steps.

The Internal Angle subfield indicates the angle between directions toward the other STAs involved in the relay operation. This covers from 0° to 180° in 2° steps. This subfield uses the degree of the direction from the sector that the feedbacks indicates has highest quality during TXSS if SLS phase of BF is performed and RXSS is not included.

The Recommend subfield indicates whether the responding STA recommends relay operation based on the channel measurement with the Peer STA. This subfield is set to 1 when the relay operation is recommended and otherwise is set to 0.

9.6.19.12 RLS Request frame format

The RLS Request frame is used to set up a relay link. The format of the RLS Request frame Action field is shown in Table 9-468.

Table 9-468—RLS Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Destination AID
5	Relay AID
6	Source AID
7	Destination Capability Information
8	Relay Capability Information
9	Source Capability Information
10	Relay Transfer Parameter Set

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the RLS Request frame to identify the request/response transaction.

The Destination AID field value is the AID of the target destination formatted per 9.4.1.8.

The Relay AID field value is the AID of the selected RDS formatted per 9.4.1.8.

The Source AID field value is the AID of the initiating STA formatted per 9.4.1.8.

The Destination Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the target destination REDS as defined in 9.4.2.147.

The Relay Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the selected RDS as defined in 9.4.2.147.

The Source Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the originator of the request as defined in 9.4.2.147.

The Relay Transfer Parameter Set element is defined in 9.4.2.148.

9.6.19.13 RLS Response frame format

The RLS Response frame is sent in response to an RLS Request frame. The format of an RLS Response frame Action field is shown in Table 9-469.

Table 9-469—RLS Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Destination Status Code
5	Relay Status Code (optional)

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to the value in any corresponding RLS Request frame.

The Destination Status Code field is included when the destination REDS transmits an RLS Response frame as a result of RLS Request. It is defined in 9.4.1.9.

The Relay Status Code field is included when the relay REDS transmits an RLS Response frame as a result of RLS Request. It is defined in 9.4.1.9.

9.6.19.14 RLS Announcement frame format

The RLS Announcement frame is sent to announce the successful RLS. The format of an RLS Announcement frame Action field is shown in Table 9-470.

Table 9-470—RLS Announcement frame Action field format

Order	Information
1	Category
2	DMG Action
3	Status Code
4	Destination AID
5	Relay AID
6	Source AID

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Status Code field is defined in 9.4.1.9.

The Destination AID field value is the AID of the target destination formatted per 9.4.1.8.

The Relay AID field value is the AID of the RDS formatted per 9.4.1.8.

The Source AID field value is the AID of the initiating STA formatted per 9.4.1.8.

9.6.19.15 RLS Teardown frame format

The RLS Teardown frame is sent to terminate a relay operation. The format of the RLS Teardown frame Action field is shown in Table 9-471.

Table 9-471—RLS Teardown frame Action field format

Order	Information
1	Category
2	DMG Action
3	Destination AID
4	Relay AID
5	Source AID
6	Reason Code

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Destination AID field value is the AID of the destination REDS formatted per 9.4.1.8.

The Relay AID field value is the AID of the RDS formatted per 9.4.1.8.

The Source AID field value is the AID of the source REDS formatted per 9.4.1.8.

The Reason Code field is defined in 9.4.1.7.

9.6.19.16 Relay Ack Request frame format

The Relay Ack Request frame is sent by a source REDS to an RDS participating in a relay operation in order to determine whether all frames forwarded through the RDS were received by the destination REDS also participating in the relay operation. This frame is used only when the RDS is operated in HD-DF mode and relay operation is link switching. The format of the Relay Ack Request frame Action field is shown in Table 9-472.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-472—Relay Ack Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	BAR Control
4	BlockAck Starting Sequence Control

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The BAR Control field and BlockAck Starting Sequence Control fields are defined in 9.3.1.7.

9.6.19.17 Relay Ack Response frame format

The Relay Ack Response frame is sent by an RDS to a source REDS participating in a relay operation in order to report the frames received by the destination REDS also participating in the relay operation. This frame is used only when the RDS is operated in HD-DF mode and relay operation is link switching. The format of the Relay Ack Response frame Action field is shown in Table 9-473.

Table 9-473—Relay Ack Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	BA Control
4	BlockAck Starting Sequence Control
5	BlockAck Bitmap

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The BA Control field is defined in 9.3.1.8.

The BlockAck Starting Sequence Control field is defined in 9.3.1.8 and is set to the corresponding value within the immediately previously received Relay Ack Request frame.

The BlockAck Bitmap field is defined in 9.3.1.8.

9.6.19.18 TPA Request frame format

The TPA Request frame is sent by a destination REDS participating in operation based on link cooperation to both the RDS and source REDS that belong to the same group as the destination REDS in order for them

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

to send back their own TPA Response frames at the separately predefined times. Also, a source REDS sends a TPA Request frame to the RDS that is selected by the source REDS in order for the RDS to feedback its own TPA Response frame at the predefined time.

The format of the TPA Request frame Action field is shown in Table 9-474.

Table 9-474—TPA Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Timing Offset
5	Sampling Frequency Offset

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the TPA Request frame to identify the request/response transaction.

The Timing Offset field is 2 octets in length and indicates the amount of time, in nanoseconds, that the STA identified in the RA of the frame is required to change the timing offset of its transmissions so that they arrive at the expected time at the transmitting STA.

The Sampling Frequency Offset field is 2 octets in length and indicates the amount by which to change the sampling frequency offset of the burst transmission so that bursts arrive at the destination DMG STA with no sampling frequency offset. The unit is 0.01 ppm.

9.6.19.19 TPA Response frame format

The TPA Response frame is sent by an RDS or a source REDS participating in relay operation in response to a TPA Request frame from a destination REDS or a source REDS. The RDS or the source REDS that receives a TPA Request frame responds to the destination REDS or the source REDS, as appropriate, with a TPA Response frame at a predetermined time from the end of the TPA Request frame (see 11.34). The format of the TPA Response frame Action field is shown in Table 9-475.

Table 9-475—TPA Response frame Action field format

Order	Information
1	Category

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to the value of the Dialog Token field of the TPA Request frame that generated this response.

9.6.19.20 TPA Report frame format

The TPA Report frame is sent to announce whether a TPA procedure is successful. The format of the TPA Report frame Action field is shown in Table 9-476.

Table 9-476—TPA Report frame Action field format

Order	Information
1	Category
2	DMG Action
3	Status code

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Status Code field indicates the result of the current TPA procedure and is defined in 9.4.1.9.

9.6.19.21 ROC Request frame format

The ROC Request frame is sent by the source REDS participating in a relay operation in order to request a change in the current relay operation type. The format of the ROC Request frame Action field is shown in Table 9-477.

Table 9-477—ROC Request frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Relay Operation Type

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the ROC Request frame to identify the request/response transaction.

Copyright © 2021 IEEE. All rights reserved.

The format of the Relay Operation Type field is defined in Figure 9-962.

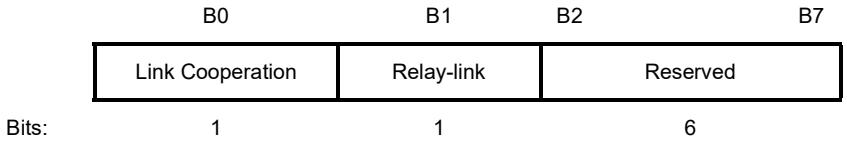

Figure 9-962—Relay Operation Type field format

The Link Cooperation subfield is set to 0 to request the operation to be changed to link switching and is set to 1 to request the operation to be changed to link cooperation.

The Relay-link subfield is set to 0 to indicate that the link switching operation starts at the direct link between the source REDS and destination REDS and set to 1 to indicate that the link switching operation starts with the RDS. If the Link Cooperation subfield is set to 1, the Relay-link subfield is reserved.

9.6.19.22 ROC Response frame format

The ROC Response frame is sent by the RDS or the destination DMG STA participating in a relay operation in response to a ROC Request frame from the source DMG STA. The format of the ROC Response frame Action field is shown in Table 9-478.

Table 9-478—ROC Response frame Action field format

Order	Information
1	Category
2	DMG Action
3	Dialog Token
4	Status Code

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.19.1.

The Dialog Token field is set to the value received in the corresponding ROC Request frame that generated this response.

The Status Code field is defined in 9.4.1.9.

9.6.20 FST Action frame details

9.6.20.1 FST Action field

The FST Action field values are defined in Table 9-479.

Table 9-479—FST Action field values

FST Action field value	Meaning
0	FST Setup Request
1	FST Setup Response
2	FST Teardown
3	FST Ack Request
4	FST Ack Response
5	On-channel Tunnel Request

9.6.20.2 FST Setup Request frame format

The FST Setup Request frame allows an initiating STA to announce to a peer STA whether the initiating STA intends to enable FST for the session between the initiating STA and the peer STA (11.31). The format of the FST Setup Request frame Action field is shown in Table 9-480.

Table 9-480—FST Setup Request frame Action field format

Order	Information
1	Category
2	FST Action
3	Dialog Token
4	LLT
5	Session Transition
6	Multi-band (optional)
7	DMG Wakeup Schedule (optional)
8	Awake Window (optional)
9	Switching Stream (optional)
10	Zero or more additional elements are present, as defined in 11.31.1. Each of these elements is not present more than once in the frame.

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The Dialog Token field is set to a nonzero value chosen by the STA.

The Link loss timeout (LLT) field is 32 bits and indicates the compressed maximum duration counted from the last time an MPDU was received by the initiating STA from the peer STA until the initiating STA decides to initiate FST. The use of this field is described in 11.31.

The Session Transition field contains the Session Transition element as defined in 9.4.2.145.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Multi-band field contains the Multi-Band element as defined in 9.4.2.138. The regulatory information contained in the Multi-band element is applicable to all of the fields and elements contained in the frame.

The DMG Wakeup Schedule element is defined in 9.4.2.130.

The Awake Window element is defined in 9.4.2.137.

The Switching Stream element is defined in 9.4.2.144.

9.6.20.3 FST Setup Response frame format

The FST Setup Response frame is transmitted in response to an FST Setup Request frame. The format of the frame Action field is shown in Table 9-481.

Table 9-481—FST Setup Response frame Action field format

Order	Information
1	Category
2	FST Action
3	Dialog Token
4	Status Code
5	Session Transition
6	Multi-band (optional)
7	DMG Wakeup Schedule (optional)
8	Awake Window (optional)
9	Switching Stream (optional)
10	Timeout Interval (optional)
11	Zero or more additional elements are present, as defined in 11.31.1. Each of these elements is not present more than once in the frame.

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The Dialog Token field value is copied from the corresponding received FST Setup Request frame.

The Status Code field is defined in 9.4.1.9.

The Session Transition field contains the Session Transition element as defined in 9.4.2.145.

The Multi-band element is defined in 9.4.2.138.

The DMG Wakeup Schedule element is defined in 9.4.2.130.

The Awake Window element is defined in 9.4.2.137

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Switching Stream element is defined in 9.4.2.144.

The Timeout Interval element is defined in 9.4.2.48.

9.6.20.4 FST Teardown frame format

The FST Teardown frame is transmitted to delete an established FST session between STAs. The format of the frame Action field is shown in Table 9-482.

Table 9-482—FST Teardown frame Action field format

Order	Information
1	Category
2	FST Action
3	FSTS ID

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The FSTS ID field contains the identification of the FST session established between the STAs identified by the TA and RA fields of this frame. The format of the FSTS ID field is as specified 9.4.2.145.

9.6.20.5 FST Ack Request frame format

The FST Ack Request frame is transmitted in the frequency band an FST session is transferred to and confirms the FST. The format of the frame Action field is shown in Table 9-483.

Table 9-483—FST Ack Request frame Action field format

Order	Information
1	Category
2	FST Action
3	Dialog Token
4	FSTS ID

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the FST Ack request to identify the request/report transaction.

The FSTS ID field contains the identification of the FST session established between the STAs identified by the TA and RA fields of this frame. The format of the FSTS ID field is as specified in 9.4.2.145.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.20.6 FST Ack Response frame format

The FST Ack Response frame is transmitted in response to an FST Ack Request frame. The format of the frame Action field is shown in Table 9-484.

Table 9-484—FST Ack Response frame Action field format

Order	Information
1	Category
2	FST Action
3	Dialog Token
4	FSTS ID

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

The Dialog Token field is set to the value in any corresponding FST Ack Request frame. If the FST Ack Response frame is not being transmitted in response to an FST Ack Request frame, then the dialog token is set to 0.

The FSTS ID field contains the identification of the FST session established between the STAs identified in the TA and RA fields of this frame. The format of the FSTS ID field is as specified in 9.4.2.145.

9.6.20.7 On-channel Tunnel Request frame format

The On-channel Tunnel Request frame allows a STA of a multi-band device to encapsulate an MMPDU for transmission to an MLME of a peer STA within the same multi-band device (11.31), which can be used to perform multi-band association and multi-band authentication.

The format of the On-channel Tunnel Request frame Action field is shown in Table 9-485.

Table 9-485—On-channel Tunnel Request frame Action field format

Order	Information
1	Category
2	FST Action
3	OCT MMPDU Descriptor
4	Multi-band
5	OCT Source

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.20.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The OCT MMPDU Descriptor field is defined in Figure 9-963.

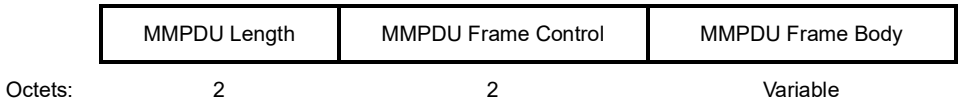

Figure 9-963—Definition of the OCT MMPDU Descriptor field

The MMPDU Length subfield contains the length in octets of the MMPDU Frame Body subfield.

The MMPDU Frame Control subfield carries the content of the Frame Control field of an MMPDU that would be constructed if the MMPDU for the corresponding management frame type were transmitted over the air.

The MMPDU Frame Body subfield carries the content of the Frame Body field of an MPDU carrying the MMPDU that would be constructed if the MMPDU for the corresponding management frame type were transmitted unencrypted over the air (i.e., all of the octets after the MAC header and up to, but not including, the FCS).

The Multi-band field contains the Multi-band element (see 9.4.2.138) of the peer MLME to which the OCT MMPDU is destined to. The values of the Band ID, Channel Number and BSSID fields contained in this element are used to deliver the OCT MMPDU to the correct MLME within the peer STA.

The OCT Source field contains an OCT Source element that identifies the MLME that is the source of an OCT MMPDU.

9.6.21 Unprotected DMG Action frame details

9.6.21.1 Unprotected DMG Action field

Unprotected DMG Action frames are not encapsulated using mechanisms defined for robust Management frames. An Unprotected DMG Action field, in the field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 9-486.

Table 9-486—Unprotected DMG Action field values

Unprotected DMG Action field value	Meaning
0	Announce
1	BRP

9.6.21.2 Announce frame format

The Announce frame is an Action or an Action No Ack frame of category Unprotected DMG. The format of an Announce frame Action field is shown in Table 9-487.

Announce frames can be transmitted during the ATI of a beacon interval and can perform functions including of a DMG Beacon frame, but since this frame does not have to be transmitted as a sector sweep to a STA, it can provide much more spectrally efficient access than using a DMG Beacon frame.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-487—Announce frame Action field format

Order	Information	Notes
1	Category	The Category field is defined in 9.4.1.11.
2	Unprotected DMG Action	The Unprotected DMG Action field is defined in 9.6.21.1.
3	Timestamp	The Timestamp field is defined in 9.4.1.10.
4	Beacon Interval	The Beacon Interval field is defined in 9.4.1.3 and specifies the duration of the beacon interval of the BSS.
5	SSID	The SSID element is defined in 9.4.2.2. The SSID element is optionally present. If present, the SSID element specifies the SSID of the BSS.
6	Extended Schedule	The Extended Schedule element is defined in 9.4.2.131. The Extended Schedule element is optionally present. If present, the Extended Schedule element specifies the schedule of the BSS.
7	DMG Capabilities	The DMG Capabilities element is defined in 9.4.2.127. The DMG Capabilities element is optionally present. If present, the DMG Capabilities element specifies capabilities of the transmitting STA.
8	RSN	The RSNE is defined in 9.4.2.24. The RSNE is optionally present. If present, the RSNE indicates that security is required in the BSS.
9	Multiple BSSID	The Multiple BSSID element is defined in 9.4.2.45. The Multiple BSSID element is optionally present. If present, the Multiple BSSID element signals all the BSSIDs in use by the BSS.
10	DMG Operation	The DMG Operation element is defined in 9.4.2.128. The DMG Operation element is optionally present. If present, the DMG Operation element specifies the operational parameters of the BSS.
11	Next DMG ATI	The Next DMG ATI element is defined in 9.4.2.135. The Next DMG ATI element is optionally present. If present, the Next DMG ATI element specifies the start time of the next ATI at a subsequent beacon interval.
12	Multi-band	The Multi-band element is defined in 9.4.2.138. The Multi-band element is optionally present.
13	Awake Window	The Awake Window element is defined in 9.4.2.137. The Awake Window element is optionally present.
14	DMG BSS Parameter Change	The DMG BSS Parameter Change element is defined in 9.4.2.126. The DMG BSS Parameter Change element is optionally present.
15	BeamLink Maintenance	The BeamLink Maintenance element is defined in 9.4.2.151. The BeamLink Maintenance element is optionally present.
16	Multiple MAC Sublayers	The Multiple MAC Sublayers element is defined in 9.4.2.152. The Multiple MAC Sublayers element is optionally present.
17	ECAPC Policy	The ECAPC Policy element is defined in 9.4.2.154. The ECAPC Policy element is optionally present.
18	Cluster Report	The Cluster Report element is defined in 9.4.2.146. The Cluster Report element is optionally present.
19	Next PCP List	The Next PCP List element is defined in 9.4.2.140. The Next PCP List element is optionally present.

Table 9-487—Announce frame Action field format *(continued)*

Order	Information	Notes
20	PCP Handover	The PCP Handover element is defined in 9.4.2.141. The PCP Handover element is optionally present.
21	STA Availability	The STA Availability element is defined in 9.4.2.132. The STA Availability element is optionally present.
22	UPSIM	The UPSIM element is defined in 9.4.2.166. The UPSIM element is optionally present.
23	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is defined in 9.4.2.52. The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.
24	Cluster Probe	The Cluster Probe element is defined in 9.4.2.223. The Cluster Probe element is optionally present.
25	Extended Cluster Report	The Extended Cluster Report element is defined in 9.4.2.224. The Extended Cluster Report element is optionally present.
26	Cluster Switch Announcement	The Cluster Switch Announcement element is defined in 9.4.2.225. The Cluster Switch Announcement element is optionally present.
27	CDMG Extended Schedule	The Extended Schedule element is optionally present if dot11OpportunisticTransmissionsImplemented is true; otherwise not present.
28	Service Hash	The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true; otherwise not present.
29	Service Hint	The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true; otherwise not present.

9.6.21.3 BRP frame format

The BRP frame is an Action No Ack frame. The format of a BRP frame Action field is shown in Table 9-488.

Table 9-488—BRP frame Action field format

Order	Information
1	Category
2	Unprotected DMG Action
3	Dialog Token
4	BRP Request field
5	DMG Beam Refinement element
6	Zero or more Channel Measurement Feedback elements
7	Enhanced Beam Tracking element
8	SSW Report element

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The Unprotected DMG Action field is defined in 9.6.21.1.

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The BRP Request field is defined in 9.5.4.

The DMG Beam Refinement element is defined in 9.4.2.129.

The Channel Measurement Feedback element is defined in 9.4.2.136.

The BRP frame contains more than one Channel Measurement Feedback element if the measurement information exceeds 255 octets. The content of each Channel Measurement Feedback element that follows the first one in a single BRP frame is a continuation of the content in the previous element. The Channel Measurement, Tap Delay, and Sector ID Order subfields can be split between several elements. Each Channel Measurement Feedback element that is not the last Channel Measurement Feedback element in the frame is 257 octets long. Channel measurement information for a single channel measurement is always contained within a single BRP frame.

NOTE—The length of a BRP frame can limit the choice of channel measurement parameters such as the number of measurements and the number of taps.

The Enhanced Beam Tracking element is defined in 9.4.2.226.

The SSW Report element is defined in 9.4.2.222.

9.6.22 VHT Action frame details

9.6.22.1 VHT Action field

Several Action frame formats are defined to support VHT functionality and S1G functionality. A VHT Action field, in the octet immediately after the Category field, differentiates the VHT Action frame formats. The VHT Action field values associated with each frame format within the VHT category are defined in Table 9-489.

Table 9-489—VHT Action field values

Value	Meaning	Time priority
0	VHT Compressed Beamforming	Yes
1	Group ID Management	No
2	Operating Mode Notification	No
3–255	Reserved	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.22.2 VHT Compressed Beamforming frame format

The VHT Compressed Beamforming frame is an Action No Ack frame of category VHT. The Action field of a VHT Compressed Beamforming frame contains the information shown in Table 9-490.

Table 9-490—VHT Compressed Beamforming frame Action field format

Order	Information
1	Category
2	VHT Action
3	VHT MIMO Control (see 9.4.1.48)
4	VHT Compressed Beamforming Report (see 9.4.1.49)
5	MU Exclusive Beamforming Report (see 9.4.1.51)

The Category field is defined in 9.4.1.11.

The VHT Action field is defined in 9.6.22.1.

The VHT MIMO Control field is always present in the frame. The presence and contents of the VHT Compressed Beamforming Report field and the MU Exclusive Beamforming Report field are dependent on the values of the Feedback Type, Remaining Feedback Segments, and First Feedback Segment subfields of the VHT MIMO Control field (see 9.4.1.48, 9.4.1.49, 9.4.1.51, and 10.36.5).

No Vendor Specific elements are present in a VHT Compressed Beamforming frame.

When carried in an S1G PPDU, a VHT Compressed Beamforming frame is referred to as an S1G Compressed Beamforming frame, and a VHT MIMO Control field is referred to as an S1G MIMO Control field.

When carried in an S1G PPDU, a VHT NDP Announcement frame is referred to as an S1G NDP Announcement frame.

9.6.22.3 Group ID Management frame format

The Group ID Management frame is transmitted by the AP to assign or change the user position of a STA for one or more group IDs. The Action field of a Group ID Management frame contains the information shown in Table 9-491.

Table 9-491—Group ID Management frame Action field format

Order	Information
1	Category
2	VHT Action
3	Membership Status Array (see 9.4.1.54)
4	User Position Array (see 9.4.1.55)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is defined in 9.4.1.11.

The VHT Action field is defined in 9.6.22.1.

9.6.22.4 Operating Mode Notification frame format

The Operating Mode Notification frame is used to notify STAs that the transmitting STA is changing one or more of its operating channel width, the maximum number of spatial streams it can receive, and its LDPC receive preference.

The Action field of the Operating Mode Notification frame contains the information shown in Table 9-492.

Table 9-492—Operating Mode Notification frame Action field format

Order	Information
1	Category
2	VHT Action
3	Operating Mode (see 9.4.1.53)

The Category field is defined in 9.4.1.11.

The VHT Action field is defined in 9.6.22.1.

9.6.23 FILS Action frame details

9.6.23.1 General

The FILS Action frame is used for FILS operation after the non-AP STA has associated with the AP. The defined FILS Action frames are listed in Table 9-493.

Table 9-493—FILS Action frame values

Action field value	Description
0	FILS Container frame
1–255	Reserved

9.6.23.2 FILS Container frame

The FILS Container frame is used to exchange FILS IP Address Assignment elements (see 9.4.2.184). The format of the Action field of the FILS Container frame is shown in Figure 9-964.

	Category	FILS Action	FILS IP Address Assignment Elements
Octets:	1	1	variable

Figure 9-964—FILS Container frame Action field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Category field is set to the value for FILS defined in Table 9-51.

The FILS Action field is set to the value given in Table 9-493 for FILS Container frame.

The FILS IP Address Assignment Elements field contains one or more FILS IP Address Assignment elements as defined in 9.4.2.184.

9.6.24 Unprotected S1G Action frame details

9.6.24.1 Unprotected S1G Action field

Several Action frame formats are defined to support S1G functionality. An Unprotected S1G Action field, in the octet immediately after the Category field, differentiates the Unprotected S1G Action frame formats. The Unprotected S1G Action field values associated with each frame format within the Unprotected S1G category are defined in Table 9-494.

Table 9-494—Unprotected S1G Action field values

Value	Meaning	Time Priority
0	AID Switch Request	No
1	AID Switch Response	No
2	Sync Control	No
3	STA Information Announcement	No
4	EDCA Parameter Set	No
5	EL Operation	No
6	TWT Setup	No
7	TWT Teardown	No
8	Sectorized Group ID List	No
9	Sector ID Feedback	No
10	Reserved	
11	TWT Information	No
12–255	Reserved	

9.6.24.2 AID Switch Request frame format

A STA that is changing its device characteristic as defined in 9.4.2.193 uses the AID Switch Request frame to request the frame's recipient to change its AID or to request a group AID from an AP. The Action field of the AID Switch Request frame contains the information shown in Table 9-495.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-495—AID Switch Request frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Dialog Token
4	AID Request (see 9.4.2.193)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Dialog Token field is a value chosen by the non-AP STA sending the AID Switch Request frame to identify the request/response transaction.

The AID Request field contains an AID Request element as specified in 9.4.2.193.

9.6.24.3 AID Switch Response frame format

The AID Switch Response frame is sent by an AP in response to an AID Switch Request frame, or sent by an AP to a non-AP STA to instruct the STA to change its AID or wakeup interval and it is sent by an AP to assign a group AID to a requesting STA. The Action field of the AID Switch Response frame contains the information shown in Table 9-496.

Table 9-496—AID Switch Response frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Dialog Token
4	AID Response (see 9.4.2.194)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Dialog Token field is the value in the corresponding AID Switch Request frame. If the AID Switch Response frame is not being transmitted in response to an AID Switch Request frame, then the Dialog token is set to 0.

The AID Response field contains an AID Response element as specified in 9.4.2.194.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.24.4 Sync Control frame format

The Sync Control frame is transmitted by a non-AP STA to a UL-Sync capable AP to enable or disable sync frame transmission for uplink traffic (see 10.49). The Action field of a Sync Control frame contains the information shown in Table 9-497.

Table 9-497—Sync Control frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Sync Control (see 9.4.1.58)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Sync Control field is defined in 9.4.1.58.

9.6.24.5 STA Information Announcement frame format

The STA Information Announcement frame is either used by a non-AP STA to inform the peer STAs of the updated AID when a STA's AID is changed or used by a relay STA to inform the AP of a newly associated STA's AID or the updated AID when a STA's AID is changed. The Action field of the STA Information Announcement frame contains the information shown in Table 9-498.

Table 9-498—STA Information Announcement frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	AID Announcement (9.4.2.208)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The AID Announcement field contains an AID Announcement element as specified in 9.4.2.208.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.24.6 EDCA Parameter Set frame format

The EDCA Parameter Set frame is used to update the EDCA Parameter Set at the recipient STA, as defined in 10.2.3.2). The Action field of the EDCA Parameter Set frame contains the information shown in Table 9-499.

Table 9-499—EDCA Parameter Set frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	EDCA Parameter Set (9.4.2.28)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The EDCA Parameter Set field contains an EDCA Parameter Set element as specified in 9.4.2.28.

9.6.24.7 EL Operation frame format

The EL Operation frame is used to carry the EL Operation element (9.4.2.210). The Action field of the EL Operation frame contains the information shown in Table 9-500

Table 9-500—EL Operation Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	EL Operation (9.4.2.210)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The EL Operation field contains an EL Operation element as specified in 9.4.2.210.

9.6.24.8 TWT Setup frame format

The TWT Setup frame is sent by a STA to request the setup of a TWT SP and it is sent by a responding STA to indicate the status of a requested TWT SP. The Action field of the TWT Setup frame contains the information shown in Table 9-501.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-501—TWT Setup frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Dialog Token
4	TWT (9.4.2.199)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

In a TWT Setup frame with a TWT Request field that is equal to 1, the Dialog Token field is set to a value chosen by the transmitting STA to identify the request/response transaction. In a TWT Setup frame with a TWT Request field equal to 0, the Dialog Token field is set to the value copied from the corresponding received TWT Setup frame with a TWT Request field equal to 1.

9.6.24.9 TWT Teardown frame format

The TWT Teardown frame is sent by a STA to request the teardown of a TWT agreement and is transmitted by either STA of an existing TWT agreement. The Action field of the TWT Teardown frame contains the information shown in Table 9-502.

Table 9-502—TWT Teardown frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	TWT Flow

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The TWT Flow field contains the TWT Flow Identifier field and 5 reserved bits as shown in Figure 9-965:

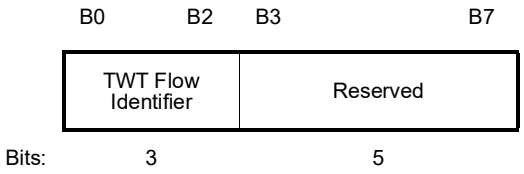

Figure 9-965—TWT Flow field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TWT Flow Identifier field is defined in 9.4.2.199. In a TWT Teardown frame, the TWT Flow Identifier field is set to the value of the TWT Flow Identifier field of the TWT element in the frame that successfully concluded the setup of the TWT that is the subject of the teardown request.

9.6.24.10 Sectorized Group ID List frame format

The Sectorized Group ID List frame is an Action or Action No Ack frame of category Unprotected S1G Action. The frame is used to allocate/change sectorized group IDs to a STA. The format of its Action field is defined in Table 9-503.

Table 9-503—Sectorized Group ID List frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Sectorized Group ID List (9.4.2.211)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

The Sectorized Group ID List field contains a Sectorized Group ID List as specified in 9.4.2.211.

9.6.24.11 Sector ID Feedback frame format

The Sector ID Feedback frame is an Action or Action No Ack frame of category Unprotected S1G. The format of its Action field is defined in Table 9-504.

Table 9-504—Sector ID Feedback frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	Sector ID Index

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Sector ID index field is shown in Figure 9-966.

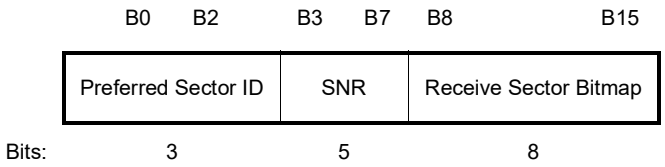

Figure 9-966—Sector ID Index format

The Preferred Sector ID field indicates the sector selected by the STA. The method in which a STA selects the Sector ID is out of the scope of this standard.

The SNR field indicates the received SNR at the preferred Sector, 0 to 30 represents SNR values from –3 to 27 dB, respectively. If the SNR value is less than –3 dB, set to 0. If the SNR value is greater than 27 dB, set to 30. 31 indicates no feedback.

The Receive Sector Bitmap field indicates a bit map. A bit position equal to 0 within the bit map indicates that the STA does not receive the AP signal in the corresponding Sector ID. A bit position equal to 1 within the bit map indicates that the STA does receive the AP signal in the corresponding Sector ID. The position of the bit map (0 to 7) corresponding to the sector ID (see Figure 9-967).

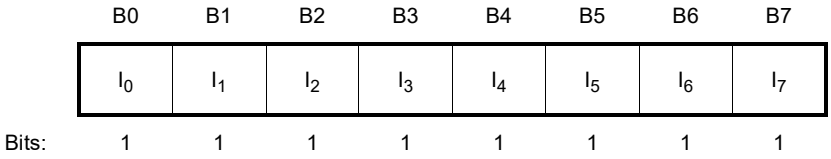

Figure 9-967—Receive Sector Bitmap format

9.6.24.12 TWT Information frame format

The TWT Information frame is sent by a STA to request or deliver information about a TWT agreement and is transmitted by either STA of an existing TWT agreement. The Action field of the TWT Information frame contains the information shown in Table 9-505.

Table 9-505—TWT Information frame Action field format

Order	Information
1	Category
2	Unprotected S1G Action
3	TWT Information (9.4.1.60)

The Category field is defined in 9.4.1.11.

The Unprotected S1G Action field is defined in 9.6.24.1.

9.6.25 S1G Action frame details

9.6.25.1 S1G Action field

The S1G Action field values are specified in Table 9-506.

Table 9-506—S1G Action field values

S1G Action field value	Description
0	Reachable Address Update
1	Relay Activation Request
2	Relay Activation Response
3	Header Compression Update
4	Protected TWT Setup
5	Protected TWT Teardown
6	Protected TWT Information
7–255	Reserved

9.6.25.2 Reachable Address Update frame format

The Reachable Address Update frame is used to update the addresses that can be reached through a relay STA. The format of the Reachable Address Update frame Action field is shown in Table 9-507.

Table 9-507—Reachable Address Update frame Action field format

Order	Information
1	Category
2	S1G Action
3	Reachable Address

The Category field is defined in 9.4.1.11.

The S1G Action field is defined in 9.6.25.1.

The Reachable Address element (as specified by 9.4.2.205) contains the addresses whose reachability through the S1G relay STA is being updated.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.25.3 Relay Activation Request frame format

The Relay Activation Request frame is used by the STA or AP to Request start or terminate a relay function. The format of the Relay Activation Request frame Action field is shown in Table 9-508.

Table 9-508—Relay Activation Request frame Action field format

Order	Information
1	Category
2	S1G Action
3	Relay Activation

The Category field is defined in 9.4.1.11.

The S1G Action field is defined in 9.6.25.1.

The Relay Activation Mode subfield of the S1G Relay Activation element (as specified by 9.4.2.206) included in the Relay Activation Request frame is set to 1.

9.6.25.4 Relay Activation Response frame format

The Relay Activation Response frame is used by the STA or AP to confirm or reject the start or the termination of the relay function. The format of the Relay Activation Response frame Action field is shown in Table 9-509.

Table 9-509—Relay Activation Response frame Action field format

Order	Information
1	Category
2	S1G Action
3	Relay Activation

The Category field is defined in 9.4.1.11.

The S1G Action field is defined in 9.6.25.1.

The Relay Activation Mode subfield of the S1G Relay Activation element (as specified by 9.4.2.206) included in the Relay Activation Response frame is set to 0.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.25.5 Header Compression frame format

The Header Compression frame is used to update information at the recipient STA, as defined in 10.58. The Header Compression frame Action field contains the information shown in Table 9-510.

Table 9-510—Header Compression frame Action field format

Order	Information
1	Category
2	S1G Action
3	Dialog Token
4	Header Compression (see 9.4.2.213)

The Category field is defined in 9.4.1.11.

The S1G Action field is defined in 9.6.25.1.

The Dialog Token field is a value chosen by the STA sending the Header Compression frame to identify the request/response transaction.

The Header Compression field contains a Header Compression element as specified in 9.4.2.213.

9.6.25.6 Protected TWT Setup frame format

The Protected TWT Setup frame allows robust STA-STA communication of the same information that is conveyed in the TWT Setup frame that is not robust (see 9.6.24.1).

The Action field of the Protected TWT Setup frame has the same format as the Action field of the unprotected TWT Setup frame (see 9.6.24.8), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.7 Protected TWT Teardown frame format

The Protected TWT Teardown frame allows robust STA-STA communication of the same information that is conveyed in the TWT Teardown frame that is not robust (see 9.6.24.1).

The Action field of the Protected TWT Teardown frame has the same format as the Action field of the unprotected TWT Teardown frame (see 9.6.24.9), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.25.8 Protected TWT Information frame format

The Protected TWT Information frame allows robust STA-STA communication of the same information that is conveyed in the TWT Information frame that is not robust (see 9.6.24.1).

The Action field of the Protected TWT Information frame has the same format as the Action field of the unprotected TWT Information frame (see 9.6.24.12), except that the Order 2 item is the S1G Action field, which is defined in 9.6.25.1, instead of the Unprotected S1G Action field.

9.6.26 Flow Control Action frame details

9.6.26.1 Flow Control Action field

The Flow Control Action field values are specified in Table 9-511.

Table 9-511—Flow Control Action field format

Flow Control Action field value	Description	Time priority
0	Flow suspension	Yes when transmitted as an Action no Ack frame
1	Flow resumption	Yes when transmitted as an Action no Ack frame
2–255	Reserved	

9.6.26.2 Flow Suspension frame format

The Flow Suspension frame is an Action or an Action No Ack frame of category Flow Control Action used by a STA to suspend incoming transmissions for an amount of time indicated in the Suspend Duration field. The format of the Flow Suspension frame Action field is shown in Table 9-512.

Table 9-512—Flow Suspension frame Action field format

Order	Information
1	Category
2	Flow Control Action
3	Suspend Duration

The Category field is defined in 9.4.1.11.

The Flow Control Action field is defined in 9.6.26.1.

The Suspend Duration field is 2 octets and denotes the amount of time, in microseconds, during which the intended recipient STAs are not allowed to transmit Data frames to the STA identified by the TA field of the Flow Suspension frame.

9.6.26.3 Flow Resumption frame format

The Flow Resumption frame is an Action or an Action No Ack frame of category Flow Control Action used by the STA identified by the TA field of the frame to cancel any outstanding flow suspension time the STA had previously invoked through the transmission of a Flow Suspension, BAT, TACK, STACK, or NDP Ack frame as described in 10.61. The format of the Flow Resumption frame Action field is shown in Table 9-513.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-513—Flow Resumption frame Action field format

Order	Information
1	Category
2	Flow Control Action

The Category field is defined in 9.4.1.11.

The Flow Control Action field is defined in 9.6.26.1.

9.6.27 Control Response MCS Negotiation frame details

9.6.27.1 Control Response MCS Negotiation Action field

The Control Response MCS Negotiation Action field values are specified in Table 9-514.

Table 9-514—Control Response MCS Negotiation Action field values

MCS Negotiation Action field value	Description
0	Control Response MCS Negotiation Request
1	Control Response MCS Negotiation Response
2–255	Reserved

9.6.27.2 Control Response MCS Negotiation Request frame format

The Control Response MCS Negotiation Request frame is used by a STA to negotiate with its peer STA the requested MCS for transmitting control response frame as defined in 10.6.6.5.3. The format of the Action field of the Control Response MCS Negotiation Request frame is shown Table 9-515.

Table 9-515—Control Response Negotiation Request frame Action field format

Order	Information
1	Category
2	Control Response MCS Negotiation Action
3	MCS Difference

The Category field is defined in 9.4.1.11.

The Control Response MCS Negotiation Action field is defined in 9.6.27.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MCS Difference field is 1 octet and is set to an unsigned value that represents the MCS difference between the index of the primary MCS and the index of the MCS that is preferred for use by the STA to transmit control response frame as described in 10.6.6.5.6.

9.6.27.3 Control Response MCS Negotiation Response frame format

The Control Response MCS Negotiation Response frame is used to indicate a response to a Control Response MCS Negotiation Request frame, which is either Accept or Reject, and the MCS Difference proposed by the Requesting STA. The format of the Action field of the Control Response MCS Negotiation Response frame is shown in Table 9-516.

Table 9-516—Control Response MCS Negotiation Response frame Action field format

Order	Information
1	Category
2	Control Response MCS Negotiation Action
3	Command

The Category field is defined in 9.4.1.11.

The Control Response MCS Negotiation Action field is defined in 9.6.27.1.

The Command field is 1 octet and is set to a value from the Table 9-517 to represent accepting or rejecting the proposed MCS Difference by the Control Response MCS Negotiation Request frame as described in 10.6.6.5.6.

Table 9-517—Command values

Values	Description
0	Reject
1	Accept
2–255	Reserved

9.6.28 CDMG Action frame details

9.6.28.1 CDMG Action field

Several Action frame formats are defined to support CDMG features. A CDMG Action field, in the octet immediately after the Category field, differentiates the CDMG Action frame formats. The CDMG Action field values associated with each frame format within the CDMG category are defined in Table 9-518.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-518—CDMG Action field values

CDMG Action field value	Meaning
0	Notification Period Request frame
1	Notification Period Response frame
2	Channel Splitting Request frame
3	Channel Splitting Response frame
4	CDMG Allocation Request frame
5	CDMG Allocation Response frame

9.6.28.2 Notification Period Request frame format

The format of the Notification Period Request frame Action field is shown in Figure 9-968.

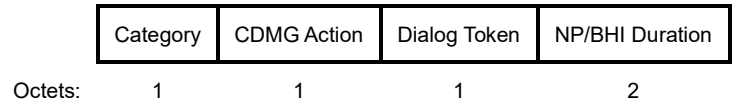

Figure 9-968—Notification Period Request frame Action field format

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel.

9.6.28.3 Notification Period Response frame format

The format of the Notification Period Response frame Action field is shown in Table 9-519.

Table 9-519—Notification Period Response frame Action field format

Order	Information
0	Category
1	CDMG Action
2	Dialog Token
3	Status Code
4	Dynamic Bandwidth Control

The Category field is defined in 9.4.1.11.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The CDMG Action field is defined in 9.6.28.1.

The Dialog Token field is copied from the corresponding Notification Period Request frame.

The Status Code field indicates the result of the notification period allocation request and is defined in 9.4.1.9.

The Dynamic Bandwidth Control element is defined in 9.4.2.220. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.28.4 Channel Splitting Request frame format

The format of the Channel Splitting Request frame Action field is shown in Figure 9-969.

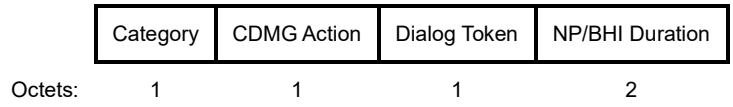

Figure 9-969—Channel Splitting Request frame Action field format

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The NP/BHI Duration field is set to the length of the NP/BHI duration requested by the STA intending to establish its BSS on a free 1.08 GHz channel to the peer STA operating on the adjacent 1.08 GHz channel.

9.6.28.5 Channel Splitting Response frame format

The format of the Channel Splitting Response frame Action field is shown in Table 9-520.

Table 9-520—Channel Splitting Response frame Action field format

Order	Information
0	Category
1	CDMG Action
2	Dialog Token
3	Status Code
4	Channel Switch Announcement
5	Beacon Interval
6	Dynamic Bandwidth Control

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is copied from the corresponding Channel Splitting Request frame.

The Status Code field indicates the result of the channel splitting request and is defined in 9.4.1.11.

The Channel Switch Announcement element is defined in 9.4.2.18. This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Beacon Interval field specifies the beacon interval length on a 2.16 GHz channel set by the STA operating on one of the 1.08 GHz channel after channel splitting and is defined in 9.4.1.3. This element is present if the Status Code field indicates successful; otherwise, it is not present.

The Dynamic Bandwidth Control element specifies the information of the STA operating on a 1.08 GHz channel after channel splitting and is defined in 9.4.2.220. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.28.6 CDMG Allocation Request frame format

The format of the CDMG Allocation Request frame Action field is shown in Figure 9-970.

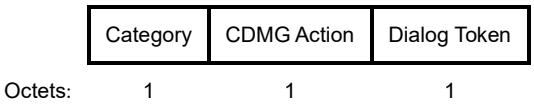

Figure 9-970—CDMG Allocation Request frame Action field format

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.28.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

9.6.28.7 CDMG Allocation Response frame format

The format of the CDMG Allocation Response frame Action field is shown in Table 9-521.

Table 9-521—CDMG Allocation Response frame Action field format

Order	Information
0	Category
1	CDMG Action
2	Dialog Token
3	Status Code
4	Extended Schedule

The Category field is defined in 9.4.1.11.

The CDMG Action field is defined in 9.6.29.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Dialog Token field is copied from the corresponding CDMG Allocation Request frame.

The Status Code field indicates the result of the Allocation request and is defined in 9.4.1.9.

The Extended Schedule element indicates all the available time that can be allocated to the DMG STAs on a 2.16 GHz channel by the STA operating on the adjacent 1.08 GHz channel of the STA sending this response and is defined in 9.4.2.131. This element is present if the Status Code field indicates successful; otherwise, it is not present.

9.6.29 CMMG Action frame details

9.6.29.1 CMMG Action field

Several Action frame formats are defined to support CMMG functionality. A CMMG Action field, in the octet immediately after the Category field, differentiates the CMMG Action frame formats. The CMMG Action field values associated with each frame format within the CMMG category are defined in Table 9-522.

Table 9-522—CMMG Action field values

Value	Meaning	Time priority
0	CMMG CSI	Yes
1	CMMG Compressed Beamforming	Yes
2	CMMG Operating Mode Notification	Yes
3–255	Reserved	

9.6.29.2 CMMG Compressed Beamforming frame format

The CMMG Compressed Beamforming frame is an Action or an Action No Ack frame of category CMMG. The format of its Action field is defined in Table 9-523.

Table 9-523—CMMG Compressed Beamforming frame Action field format

Order	Information
1	Category
2	CMMG Action
3	CMMG MIMO Control (see 9.4.1.61)
4	CMMG Compressed Beamforming Report (see 9.4.1.62)

The Category field is defined in 9.4.1.11.

The CMMG Action field is defined in 9.6.29.1.

The CMMG MIMO Control field (see 9.4.1.61) are used as described in Table 9-85.

The CMMG Compressed Beamforming Report field is defined in 9.4.1.62.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.29.3 CMMG Operating Mode Notification frame format

The CMMG Operating Mode Notification frame is used to notify STAs that the transmitting STA is changing its operating channel width, the maximum number of spatial streams it can receive, or both.

In the context of CMMG STAs, references to an Operating Mode Notification frame or element should be understood as referring to a CMMG Operating Mode Notification frame or element, respectively.

The Action field of the CMMG Operating Mode Notification frame contains the information shown in Table 9-524.

Table 9-524—CMMG Operating Mode Notification frame Action field format

Order	Information
1	Category
2	CMMG Action
3	CMMG Operating Mode (see 9.4.1.63)

The Category field is defined in 9.4.1.11.

The CMMG Action field is defined in 9.6.29.1.

The CMMG Operating Mode field is defined in 9.4.1.63.

9.6.30 GLK Action frame details

9.6.30.1 GLK Action field

A GLK Action field, in the octet immediately after the Category field, differentiates the GLK Action frame formats. The GLK Action field values associated with each frame format within the GLK category are defined in Table 9-525.

Table 9-525—GLK Action field values

Value	Meaning	Time priority
0	GLK Groupcast Mode Change Notification	No
1–255	Reserved	—

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.6.30.2 GLK Groupcast Mode Change Notification

The GLK Groupcast Mode Change Notification frame is used to indicate a change to the GLK groupcast transmission policy. See Table 9-526.

Table 9-526—GLK Groupcast Mode Change Notification frame format

Order	Information
1	Category
2	GLK Action
3	GLK-GCR Parameter Set

The Category field is defined in 9.4.1.11. The GLK Action field is defined in 9.6.30.1. The GLK-GCR Parameter Set element is defined in 9.4.2.234.

9.7 Aggregate MPDU (A-MPDU)

9.7.1 A-MPDU format

An A-MPDU consists of a sequence of one or more A-MPDU subframes and a variable amount of EOF padding as shown in Figure 9-971.

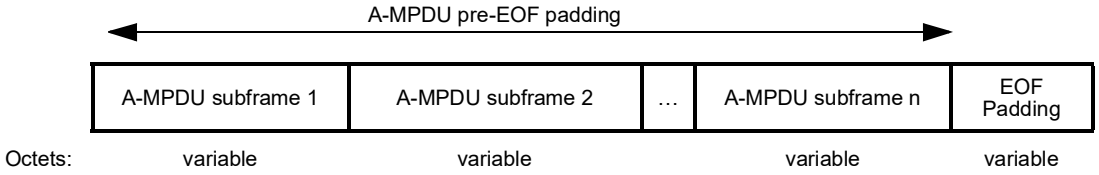

Figure 9-971—A-MPDU format

The structure of the A-MPDU subframe is shown in Figure 9-973. Each A-MPDU subframe consists of an MPDU delimiter optionally followed by an MPDU. Each nonfinal A-MPDU subframe in an A-MPDU has padding octets appended to make the subframe a multiple of 4 octets in length. The content of these octets is unspecified.

In an HT or DMG PPDU, the final A-MPDU subframe is not padded. In a VHT or S1G PPDU, padding is added as described below.

The EOF Padding field is shown in Figure 9-972. This is present only in a VHT or S1G PPDU.

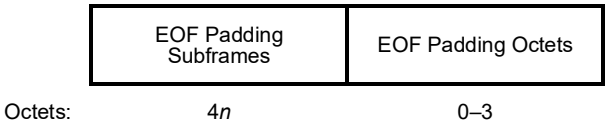

Figure 9-972—EOF Padding field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The EOF Padding Subframes subfield contains zero or more EOF padding subframes. An EOF padding subframe is an A-MPDU subframe with 0 in the MPDU Length field and 1 in the EOF field.

In a VHT or S1G PPDU, the following padding is present, as determined by the rules in 10.12.6:

— 0–3 octets in the Padding subfield of the final A-MPDU subframe (see Figure 9-973) before any EOF padding subframes. The content of these octets is unspecified.
— Zero or more EOF padding subframes in the EOF Padding Subframes subfield.
— 0–3 octets in the EOF Padding Octets subfield. The content of these octets is unspecified.

An A-MPDU pre-EOF padding refers to the contents of the A-MPDU up to, but not including, the EOF Padding field.

NOTE 1—A-MPDU pre-EOF padding includes any A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF field inserted in order to meet the minimum MPDU start spacing requirement.

The maximum length of an A-MPDU in an HT PPDU is 65 535 octets. The maximum length of an A-MPDU in a DMG PPDU is 262 143 octets. The maximum length of an A-MPDU pre-EOF padding in a VHT PPDU is 1 048 575 octets. The length of an A-MPDU addressed to a particular STA can be further constrained as described in 10.12.2.

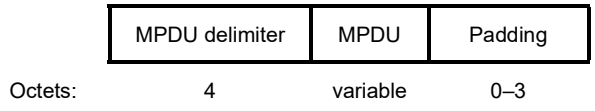

Figure 9-973—A-MPDU subframe format

The structure of the MPDU delimiter when transmitted by a non-DMG STA is defined in Figure 9-974. The structure of the MPDU Delimiter field when transmitted by a DMG STA is shown in Figure 9-975.

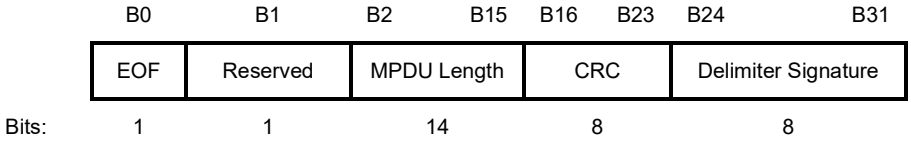

Figure 9-974—MPDU delimiter (non-DMG)

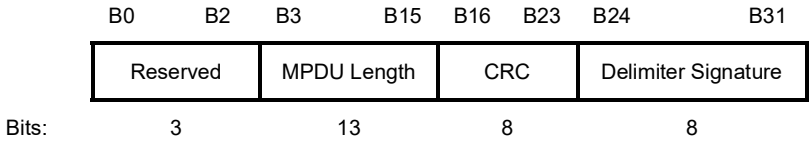

Figure 9-975—MPDU delimiter (DMG)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The fields of the MPDU delimiter when transmitted by a non-DMG STA are defined in Table 9-527. The fields of the MPDU delimiter when transmitted by a DMG STA are defined in Table 9-528.

Table 9-527—MPDU delimiter fields (non-DMG)

Field	Size (bits)	Description
EOF	1	End of frame indication. Set to 1 in an A-MPDU subframe that has 0 in the MPDU Length field and that is used to pad the A-MPDU in a VHT PPDU as described in 10.12.6. Set to 1 in the MPDU delimiter of an S-MPDU as described in 10.12.7. Set to 0 otherwise.
Reserved	1	
MPDU Length	14	Length of the MPDU in octets. Set to 0 if no MPDU is present. An A-MPDU subframe with 0 in the MPDU Length field is used as defined in 10.12.3 to meet the minimum MPDU start spacing requirement and also to pad the A-MPDU to fill the available octets in a VHT PPDU as defined in 10.12.6.
CRC	8	8-bit CRC of the preceding 16 bits (see 9.7.2).
Delimiter Signature	8	Pattern that can be used to detect an MPDU delimiter when scanning for an MPDU delimiter. The unique pattern is 0x4E (see NOTE).
NOTE—The ASCII value of the character 'N' was chosen as the unique pattern for the value in the Delimiter Signature field.		

Table 9-528—MPDU delimiter fields (DMG)

MPDU Delimiter field	Size (bits)	Description
Reserved	3	
MPDU Length	13	Length of MPDU in octets
CRC	8	8-bit CRC on preceding 16 bits (see 9.7.2).
Delimiter Signature	8	Pattern that can be used to detect an MPDU delimiter when scanning for a delimiter. The unique pattern is 0x4E.

The format of the MPDU Length field when transmitted by a non-DMG STA is shown in Figure 9-976. The MPDU Length Low subfield contains the 12 low order bits of the MPDU length. In a VHT PPDU, the MPDU Length High subfield contains the two high order bits of the MPDU length. In an HT PPDU, the MPDU Length High subfield is reserved.

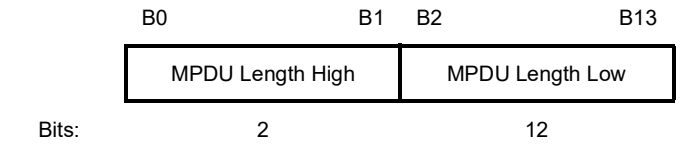

Figure 9-976—MPDU Length field format (non-DMG)

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MPDU length value is derived from the MPDU Length field subfields as follows:

$$L_{MPDU} = \begin{cases} L_{low} + L_{high} \times 4096, & \text{VHT PPDU} \\ L_{low}, & \text{HT PPDU} \\ L, & \text{DMG PPDU} \end{cases} \quad (9\text{-}5)$$

where

L_{low} is the value of the MPDU Length Low subfield
L_{high} is the value of the MPDU Length High subfield
L is the value of the MPDU Length field

NOTE 2—The format of the MPDU Length field maintains a common encoding structure for both VHT and HT PPDUs. For HT PPDUs, only the MPDU Length Low subfield is used, while for VHT PPDUs, both subfields are used.

The purpose of the MPDU delimiter is to locate the MPDUs within the A-MPDU so that the structure of the A-MPDU can usually be recovered when one or more MPDU delimiters are received with errors. See O.2 for a description of a deaggregation algorithm.

9.7.2 MPDU delimiter CRC field

The MPDU delimiter CRC field is an 8-bit CRC value. It is used as a check sequence to protect the fields that precede it in the MPDU delimiter. The CRC field is the 1s complement of the remainder generated by the modulo 2 division of the protected bits by the polynomial $x^8 + x^2 + x^1 + 1$, where the shift-register state is preset to all 1s.

NOTE—The order of transmission of bits within the CRC field is defined in 9.2.2.

Figure 9-977 illustrates the CRC calculation for the MPDU delimiter.

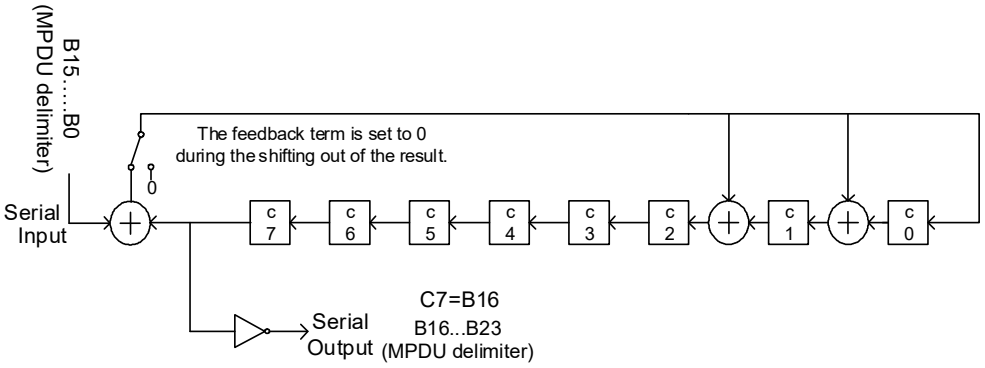

Figure 9-977—MPDU delimiter CRC calculation

9.7.3 A-MPDU contents

In a non-DMG PPDU, an A-MPDU is a sequence of A-MPDU subframes carried in a single PPDU with one of the following combinations of RXVECTOR or TXVECTOR parameter values:

— The FORMAT parameter set to VHT
— The FORMAT parameter set to HT_MF or HT_GF and the AGGREGATION parameter set to 1
— The FORMAT parameter set to S1G, S1G_DUP_1M, or S1G_DUP_2M and the AGGREGATION parameter set to 1

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In a DMG PPDU, an A-MPDU is a sequence of MPDUs carried in a single PPDU with the TXVECTOR/ RXVECTOR AGGREGATION parameter set to 1.

All of the MPDUs within an A-MPDU are addressed to the same RA. All QoS Data frames within an A-MPDU that have a TID for which an HT-immediate block ack agreement exists have the same value for the Ack Policy Indicator subfield of the QoS Control field.

All protected MPDUs within an A-MPDU have the same Key ID.

The Duration/ID fields in the MAC headers of all MPDUs in an A-MPDU carry the same value. The Duration/ID fields in the MAC headers of MPDUs in A-MPDUs carried in the same VHT MU PPDU all carry the same value.

NOTE 1—The reference point for the Duration/ID field is the end of the PPDU carrying the MPDU. Setting the Duration/ID field to the same value in the case of A-MPDU aggregation means that each MPDU consistently specifies the same NAV setting.

An A-MPDU is transmitted in one of the contexts specified in Table 9-529 as defined by the description in the Definition of context column, independently of whether the A-MPDU is contained in a VHT MU PPDU or an SU PPDU. Ordering of MPDUs within an A-MPDU is not constrained, except where noted in these tables. See 10.12.1.

A VHT MU PPDU or S1G MU PPDU does not carry more than one A-MPDU that contains one or more MPDUs soliciting an immediate response.

NOTE 2—The TIDs present in a data enabled A-MPDU context are also constrained by the channel access rules (for a TXOP holder; see 10.23.2 and 10.23.3) and the RD response rules (for an RD responder, see 10.29.4). This is not shown in these tables.

NOTE 3—If a STA supports A-MSDUs of 7935 octets (indicated by the Maximum A-MSDU Length field in the HT Capabilities element), A-MSDUs transmitted by that TA within an A-MPDU carried in a PPDU with FORMAT HT_MF or HT_GF or within an MPDU carried in a non-HT PPDU are constrained so that the length of the QoS Data frame carrying the A-MSDU is no more than 4095 octets. The 4095-octet MPDU length limit does not apply to A-MPDUs carried in VHT or DMG PPDUs. The use of A-MSDU within A-MPDU might be further constrained as described in 9.4.1.13 through the operation of the A-MSDU Supported field.

Table 9-529—A-MPDU contexts

Name of Context	Definition of Context	Table defining permitted contents
Data Enabled Immediate Response	The A-MPDU is transmitted outside a PSMP sequence by a TXOP holder or an RD responder including potential immediate responses.	Table 9-530
Data Enabled No Immediate Response	The A-MPDU is transmitted outside a PSMP sequence by a TXOP holder that does not include or solicit an immediate response. See NOTE.	Table 9-531
PSMP	The A-MPDU is transmitted within a PSMP sequence.	Table 9-532

Table 9-529—A-MPDU contexts *(continued)*

Name of Context	Definition of Context	Table defining permitted contents
Control Response	The A-MPDU is transmitted by a STA that is neither a TXOP holder nor an RD responder that also needs to transmit one of the following immediate response frames: Ack frame BlockAck frame with a TID for which an HT-immediate block ack agreement exists	Table 9-533
S-MPDU context	The A-MPDU is transmitted within a VHT PPDU and contains an S-MPDU.	Table 9-534
NOTE—This context includes cases when no response is generated.		

Table 9-530—A-MPDU contents in the data enabled immediate response context

MPDU Description	Conditions	
Ack	If the preceding PPDU contains an MPDU that requires an Ack frame response, a single Ack frame at the start of the A-MPDU.	Of these, in a non-DMG STA: at most one MPDU is present. Of these, in a DMG STA: at most one Ack frame is present, and zero or more HT-immediate BlockAck frames are present.
HT-immediate BlockAck	In a non-DMG STA: if the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, at most one BlockAck frame for this TID, in which case it occurs at the start of the A-MPDU. In a DMG STA: if the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, one or more copies of the same BlockAck for this TID.	
Action No Ack	Action No Ack frames.	
Data frames sent under an HT-immediate block ack agreement	QoS Data frames with the same TID, which corresponds to an HT-immediate block ack agreement. See NOTE.	Of these, at most one of the following is present in a non-DMG BSS: — One or more QoS Data frames with Implicit BAR ack policy — A BlockAckReq frame Of these, at most one of the following is present in a DMG BSS: — One or more QoS Data frames with Implicit BAR ack policy — QoS Null frame with the No Ack ack policy — A BlockAckReq frame with an optional QoS Null frame with No Ack ack policy
QoS Null frames with the No Ack ack policy	In a DMG BSS, QoS Null frames with the No Ack ack policy.	
Immediate BlockAckReq	At most one BlockAckReq frame with a TID that corresponds to an HT-immediate block ack agreement. This is the last MPDU in the A-MPDU. It is not present if any QoS Data frames for that TID are present.	
NOTE—These MPDUs all have the same ack policy, which is either Implicit BAR or Block Ack.

Table 9-531—A-MPDU contents in the data enabled no immediate response context

MPDU Description	Conditions
Data without a block ack agreement	QoS Data frames with a TID that does not correspond to a block ack agreement. These have No Ack ack policy and the A-MSDU Present subfield equal to 0.
Action No Ack	Action No Ack frames.

Table 9-532—A-MPDU contents in the PSMP context

MPDU Description	Conditions	
Acknowledgment for PSMP data	At most one Multi-TID BlockAck frame. Acknowledgment in response to data received with the PSMP Ack ack policy and/or a Multi-TID BlockAckReq frame in the previous PSMP-UTT or PSMP-DTT.	
HT-immediate Data	QoS Data frames with the PSMP Ack or Block Ack ack policy and with a TID that corresponds to an HT-immediate block ack agreement.	An A-MPDU containing MPDUs with a block ack agreement does not also contain MPDUs without a block ack agreement.
Data without a block ack agreement	QoS Data frames with a TID that does not correspond to a block ack agreement. These have No Ack ack policy and the A-MSDU Present subfield is equal to 0.	
Action No Ack	Action No Ack frames.	
Multi-TID BlockAckReq	At most one Multi-TID BlockAckReq frame with the BAR Ack Policy subfield equal to No Acknowledgment.	

Table 9-533—A-MPDU contents in the control response context

MPDU	Conditions	
Ack	Ack frame transmitted in response to an MPDU that requires an Ack frame.	One of these is present at the start of the A-MPDU; these are not present other than at the start of the A-MPDU.
BlockAck	BlockAck frame with a TID that corresponds to an HT-immediate block ack agreement.	
Action No Ack	BRP +HTC frames. Action No Ack +HTC frames containing an explicit feedback response. Action No Ack frames that are Flow Suspension frames or Flow Resumption frames.	

Table 9-534—A-MPDU contents in the S-MPDUcontext

MPDU	Conditions
Any MPDU	An S-MPDU.

9.8 MAC frame format for PV1 frames

9.8.1 Basic components

Each PV1 frame consists of the following basic components:

a) A PV1 MAC header, which comprises frame control, address, optional sequence control information;
b) A variable-length frame body, which contains information specific to the frame type;
c) An FCS, which contains a 32-bit CRC based on ITU-T Recommendation V.42 [B55] (see 9.2.4.8).

9.8.2 General PV1 frame format

Figure 9-978 depicts the general PV1 MAC frame format. The first three fields (Frame Control, A1 and A2) and the last field FCS are always present in PV1 frames. The Sequence Control, A3, A4 and Frame body fields are optionally present. Each field is defined in 9.8.3.

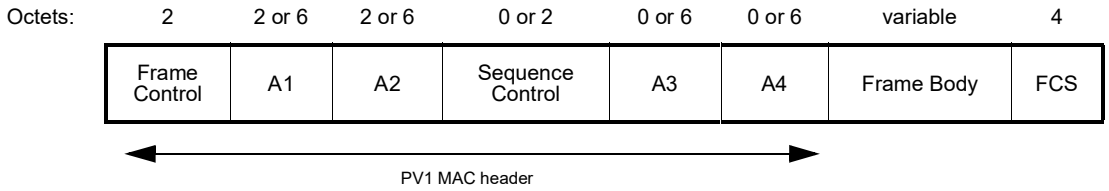

Figure 9-978—PV1 frame format)

NOTE—In Figure 9-978, the total number of octets in the A1 and A2 fields is either 8 or 12.

The Frame Body field is of variable size, constrained as defined in 9.2.4.7.1.

9.8.3 PV1 frame fields

9.8.3.1 Frame Control field

The Frame Control field of the PV1 MAC header for PV1 frames except the PV1 Probe Request frame, PV1 Resource Allocation frame, and PV1 Control frames, is defined in Figure 9-979.

The Frame Control field of the PV1 MAC header for the PV1 Probe Response frame, PV1 Resource Allocation frame and PV1 Control frames is defined in 9.8.5.3, 9.8.5.4, and 9.8.4, respectively.

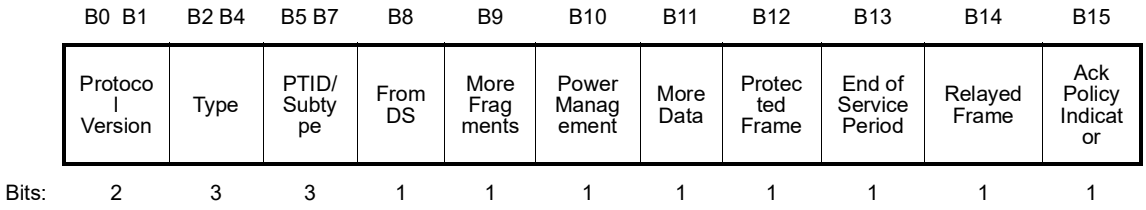

Figure 9-979—Frame Control field format

The Protocol Version subfield is defined in 9.2.4.1.2. For PV1 frames the Protocol Version subfield is 1.

The Type subfield identifies the type of the frame, as defined in Table 9-535.

Table 9-535—PV1 frame types

Type Value	Type	Description
0	QoS Data	Either the A1 field or the A2 field is an SID (defined in 9.8.3.2), as determined by the From DS subfield in the Frame Control field.
1	Management	Both A1 and A2 fields contain MAC addresses for PV1 Probe Response frames, or Either the A1 field or the A2 field is an SID (defined in 9.8.3.2), as determined by the From DS subfield in the Frame Control field.
2	Control	The A1 field is an SID and the A2 field is either an SID or contains a MAC address.
3	QoS Data	Both A1 and A2 fields contain MAC addresses.
4–6	Reserved	
7	Reserved for extension	

PV1 frames with Type subfield value equal to 0 define a PV1 QoS Data frame where either A1 or A2 field is an SID as indicated in Table 9-536 and the other A1 or A2 field contains a MAC address. PV1 frames with Type subfield value equal to 1 define a PV1 Management frame where either A1 or A2 field is an SID as indicated in Table 9-536 and the other A1 or A2 field contains a MAC address. PV1 frames with Type subfield value equal to 2 define PV1 Control frames. PV1 frames with Type subfield value equal to 3 define a PV1 QoS Data frame where both A1 and A2 fields contain MAC addresses. All other values of the Type subfield are reserved.

The PTID/Subtype subfield, depending on the type of the PV1 frame, indicates:

— The 3 LSBs of the TID as defined in 9.2.4.5.2 for PV1 QoS Data frames (Type field equal to 0 and 3) transmitted by a QoS STA.
— The Subtype for PV1 Control frames (Type subfield equal to 2) as described in 9.8.4.
— The Subtype for PV1 Management frames (Type subfield equal to 1) as described in 9.8.5.

The From DS subfield, if present, defines the addressing of PV1 frames with values of the Type field less than 2, as defined in Table 9-536.

Table 9-536—From DS values in PV1 frames

From DS field	Meaning	Use
0	A1 contains the MAC address of the receiver A2 is an SID, which contains the AID of the transmitter — A2 contains the MAC address of the transmitter for PV1 QoS Data frames with Type subfield equal to 3 A3 (if present) contains the MAC address of the destination A4 (if present) contains the MAC address of the source	For frames transmitted by a non-AP STA to an AP For frames transmitted from a non-AP STA to non-AP STA (direct link)
1	A1 is an SID, which contains the AID of the receiver — A1 contains the MAC address of the receiver for PV1 QoS Data frames with Type subfield equal to 3 A2 is the MAC address of the transmitter A3 (if present) contains the MAC address of the destination A4 (if present) contains the MAC address of the source	AP to non-AP STA

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The More Fragments subfield is described in 9.2.4.1.5.

The Power Management subfield is described in 9.2.4.1.7.

The EOSP subfield is described in 9.2.4.5.3.

The Protected Frame subfield is described in 9.2.4.1.9.

The More Data subfield is described in 9.2.4.1.8.

The Relayed Frame subfield indicates that the current TXOP is shared with the relay STA using the TXOP sharing procedures for relays described in 10.54.5.

The Ack Policy Indicator subfield identifies the ack policy that is followed upon the delivery of the MPDU, as defined in Table 9-537.

Table 9-537—Ack Policy Indicator subfield in the Frame Control field for PV1 frames

Ack policy	Ack Policy Indicator subfield	Other conditions	Meaning
Normal Ack	0	MPDU is a non-A-MPDU frame	Where the frame contains a fragment and both the originator and the addressed recipient support fragment BA: The addressed recipient returns an NDP BlockAck or BAT frame after a SIFS, according to the procedures defined in 10.3.2.12 and 10.47.2. Otherwise: The addressed recipient returns an Ack, TACK or STACK frame after a short interframe space (SIFS) period, according to the procedures defined in 10.3.2.11 and 10.47.2.
Implicit BAR	0	MPDU is not a non-A-MPDU frame	The addressed recipient returns a BlockAck or BAT frame, either individually or as part of an A-MPDU starting a SIFS after the PPDU carrying the frame, according to the procedures defined in 10.3.2.11 and 10.47.2.
No Ack	1	MPDU is a non-A-MPDU frame	The addressed recipient takes no action upon receipt of the frame. More details are provided in 10.26. This ack policy is used in all individually addressed frames in which the sender does not require acknowledgment. It is also used in all group addressed frames. It is not used for PV1 Data frames with a TID for which a block ack agreement exists.
Block Ack	1	MPDU is not a non-A-MPDU frame	The addressed recipient takes no action upon the receipt of the frame except for recording the state. The recipient can expect a BlockAckReq frame in the future to which it responds using the procedure described in 10.25.

9.8.3.2 Address fields

There are up to four address fields in the PV1 MAC frame format. These fields are used to indicate the recipient of the frame (A1), the transmitter of the frame (A2), and optionally the MAC address of the source and/or the MAC address of the destination of the frame (A3 and/or A4).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The recipient of the frame (A1) or the transmitter of the frame (A2) can be identified by the AID subfield located in the Short ID (SID) field depending on the value of the From DS subfield of the Frame Control field as described in 9.8.3.1. A group of receiving non-AP STAs of the frame can be identified by the AID subfield with a group AID value, as described in 10.55, located in the Short ID (SID) field. The length of the SID field is 2 octets and is shown in Figure 9-980.

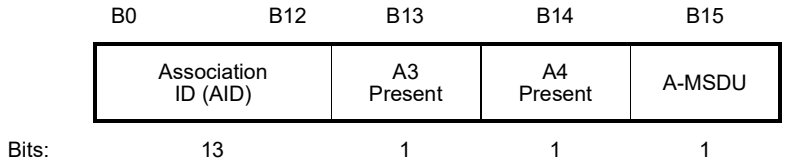

Figure 9-980—SID field format

The AID subfield contains an AID as specified in Table 9-536 in PV1 frames of Type 0, 1, and 2.

The A3 Present subfield is 1 if the A3 is present in the PV1 MAC header, otherwise it is 0.

The A4 Present subfield is 1 if the A4 is present in the PV1 MAC header, otherwise it is 0.

The A-MSDU subfield is 1 if the MPDU contains a Dynamic A-MSDU as described in 9.3.2.2.4.

NOTE—PV1 frames without an SID field do not contain A3 and A4 fields and do not carry A-MSDUs.

The A3 field is present if A3 is not equal to the address identified by A1 and an A3 is not stored at the receiver, or when A3 is not equal to an A3 stored at the receiver (as described in 10.58). When the A3 field is not present, A3 is either stored at the recipient of the frame or, if an A3 is not stored at the recipient of the frame then A3 is equal to the address identified by A1.

The A4 field is present if A4 is not equal to the address identified by A2 and an A4 is not stored at the receiver, or when A4 is not equal to an A4 stored at the receiver (as described in 10.58). When the A4 field is not present, A4 is either stored at the recipient of the frame or, if an A4 is not stored at the recipient of the frame then A4 is equal to the address identified by A2.

9.8.3.3 Sequence Control field

The Sequence Control field is present in all PV1 Data frames and PV1 Management frames other than PV1 Probe Response frames, and is described in 9.2.4.4. The Sequence Control field is not present in PV1 Control frames and in PV1 Probe Response frames.

9.8.3.4 Frame Body field

The Frame Body field is a variable-length field and is described in 9.2.4.7.

9.8.3.5 Overhead for encryption

The overhead for encryption is described in Clause 12.

9.8.3.6 FCS field

The FCS field is described in 9.2.4.8.

9.8.4 PV1 Control frames

9.8.4.1 General

The subfields within the Frame Control field of PV1 Control frames are set as shown in Figure 9-981.

	B0 B1	B2 B4	B5 B7	B8 B10	B11	B12	B13	B14	B15
	Protocol Version (1)	Type (Control)	PTID/ Subtype	Bandwidth Indication	Dynamic Indication	Power Management	More Data	Flow Control	Next TWT Info Present
Bits:	2	3	3	3	1	1	1	1	1

Figure 9-981—Frame Control field subfield values within PV1 Control frames

Table 9-538 defines the different PV1 Control frame subtypes.

Table 9-538—PV1 Control frame subtypes

PTID/Subtype value b8 b7 b6	Subtype description
000	STACK
001	BAT
010–111	Reserved

The Bandwidth Indication subfield and the Dynamic Indication subfield are described in 9.2.4.1.11.

The Next TWT Info Present subfield is set to 1 if the Next TWT Info field is present in PV1 Control frames. Otherwise, it is set to 0.

The More Data subfield is described in 9.2.4.1.8.

The Flow Control subfield is used for flow suspension signaling as described in 10.61.

9.8.4.2 STACK frame format

The frame format of the short TWT acknowledgment (STACK) frame is defined in Figure 9-982. The A1 field is an SID field that contains the AID of the intended recipient of the frame in the AID subfield when the intended recipient is not an AP and the value 0 when the intended recipient is an AP. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

The A2 field is an SID field that contains the bit sequence Scrambler Initialization[0:6] || FCS[23:31] obtained from the scrambler initialization value in the Service field (as defined in 23.3.9.2), prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

	Frame Control	A1	A2	Tetrapartial Timestamp/ Next TWT Info/ Suspend Duration	FCS
Octets:	2	2	2	4	4

Figure 9-982—STACK frame format

If the Next TWT Info Present subfield in the Frame Control field is equal to 0, the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains the value of the 4 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Tetrapartial Timestamp field appears at the transmit antenna connector.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0, then the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains the value of the 4 least significant octets of the TSF timer for the next TWT logically ANDed with the value 0xFFFFFFF8 and then added to the value of the TWT flow identifier that corresponds to that next TWT value.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0 and the 29 MSBs of the Next TWT Info subfield is equal to all 0s, the transmitter does not currently have a next TWT value available for transmission for the TWT indicated by the TWT flow identifier corresponding to the value of the 3 LSBs of the Next TWT Info field.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 1, then the Tetrapartial Timestamp/Next TWT Info/Suspend Duration field contains a flow suspension duration, in microseconds, during which the intended recipient TWT STAs are not allowed to transmit Data frames to the STA identified by the RA field of the frame that elicited the STACK frame.

9.8.4.3 BAT frame format

The frame format of the Block Acknowledgment TWT (BAT) frame is defined in Figure 9-983:

	Frame Control	A1	A2	Beacon Sequence	Pentapartial Timestamp	Next TWT Info /Suspend Duration	Starting Sequence Control	BAT Bitmap	FCS
Octets:	2	2	6	1	5	6	2	4	4

Figure 9-983—BAT frame format

The A1 field is an SID field that contains the AID of the intended recipient of the frame in the AID subfield when the intended recipient is not an AP and the value 0 when the intended recipient is an AP. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

The A2 field contains the MAC address of the transmitter sending the frame.

The Beacon Sequence field contains the value of the Change Sequence field from the most recently transmitted Beacon frame.

The Pentapartial Timestamp field contains the value of the 5 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Pentapartial Timestamp field appears at the transmit antenna connector.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0, then the Next TWT Info/Suspend Duration field contains a next TWT value for the intended recipient of the frame corresponding to the value of the 6 least significant octets of the TSF timer for the next TWT logically ANDed with the value 0xFFFFFFFFFFF8 and then added to the value of the TWT flow identifier that corresponds to that next TWT value.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 0 and the 45 MSBs of the Next TWT Info/Suspend Duration subfield is equal to all 0s, the transmitter does not currently have a next TWT value available for transmission for the TWT indicated by the TWT flow identifier corresponding to the value of the 3 LSBs of the Next TWT Info/Suspend Duration field.

If the Next TWT Info Present subfield in the Frame Control field is equal to 1 and the Flow Control subfield of the Frame Control field is equal to 1, then the Next TWT Info/Suspend Duration field contains a flow suspension duration, in microseconds, during which the intended recipient TWT STAs are not allowed to transmit Data frames to the STA identified by the A2 field of the BAT frame.

If the Next TWT Info Present subfield in the Frame Control field is equal to 0, then the Next TWT Info/Suspend Duration field is reserved.

The Starting Sequence Control field contains the sequence number of the first MSDU and the TID for which this BAT frame is sent and is defined in Figure 9-984:

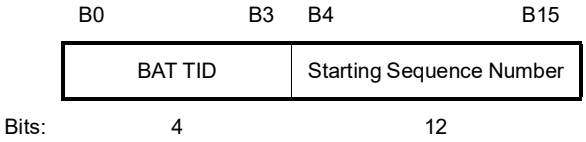

Figure 9-984—Starting Sequence Control field format

The BAT Bitmap field is used to indicate the received status of up to 32 MSDUs and A-MSDUs. Each bit that is equal to 1 in the BAT Bitmap field acknowledges the reception of a single MSDU or A-MSDU in sequentially increasing sequence number order, with the first bit of the BAT Bitmap field corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the BAT frame.

9.8.5 PV1 Management frames

9.8.5.1 Format of PV1 Management frames

The format of a PV1 Management frame is defined in Figure 9-985.

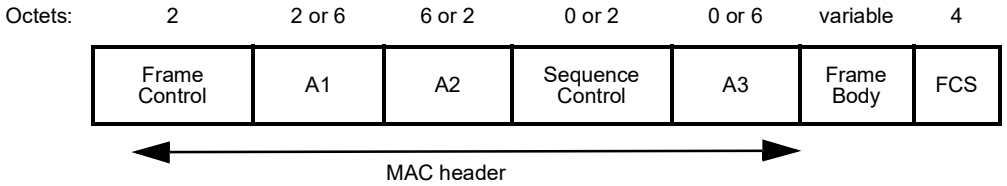

Figure 9-985—PV1 Management frame format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Frame Control, A1, and A2 fields are present in all PV1 Management frame subtypes.

The address fields A1 and A2 contain the receiver and transmitter addresses either of which can be an SID field as described in 9.8.3.2.

The Sequence Control field is described in 9.2.4.4 and is present in PV1 Management frames of subtype Action and Action No Ack.

The address field A3 (if present, as described in 9.8.3.2) is set to the BSSID.

The frame body consists of the fields followed by the elements defined for each PV1 Management frame subtype. All fields and elements are mandatory unless stated otherwise and appear in the specified, relative order. STAs that encounter an element ID they do not recognize in the frame body of a received PV1 Management frame ignore that element and continue to parse the remainder of the PV1 Management frame body (if any) for additional elements with recognizable element IDs. See 10.28.7.

Table 9-539 defines the different PV1 Management frame subtypes.

Table 9-539—PV1 Management frame subtypes

PTID/Subtype value b8 b7 b6	Subtype description
000	Action
001	Action No Ack
010	PV1 Probe Response
011	Resource Allocation
100–111	Reserved

PV1 Management frames are Management frames.

9.8.5.2 Action and Action No Ack frames

The frame body of a PV1 Management frame of subtype Action is described in 9.3.3.13 and the format of the Action field formats allowed is described in 9.6.

The frame body of a PV1 Management frame of subtype Action No Ack is described in 9.3.3.14 and the format of the Action field formats allowed is described in 9.6.

9.8.5.3 PV1 Probe Response frame format

The format of the PV1 Probe Response frame is shown in Figure 9-986.

	Frame Control	A1	A2	Timestamp	Change Sequence	Next TBTT (optional)	Compressed SSID (optional)	Access Network Options (optional)	Optional Elements	FCS
Octets:	2	6	6	4	1	0 or 3	0 or 4	0 or 1	variable	4

Figure 9-986—PV1 Probe Response frame format

The A1 field contains the MAC address of the intended recipient of the frame.

The A2 field contains the MAC address of the transmitter sending the frame.

The Timestamp field contains the value of the 4 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Timestamp field appears at the transmit antenna connector.

The Change Sequence field is defined as an unsigned integer, initialized to 0, that increments when a critical update to the Beacon frame has occurred (see 10.46.2).

The Next TBTT field is present if the Next TBTT Present subfield in the Frame Control field is 1 and indicates the most significant 3 octets of the 4 least significant octets of the next TBTT. Otherwise, it is not present.

Either a Compressed SSID field or an SSID element is included in the PV1 Probe Response frame.

The Compressed SSID field is present if the Full SSID Present subfield in the Frame Control field is 0 and it contains a 32-bit CRC calculated over the SSID contained in the Probe Response or S1G Beacon frame (calculation is performed as defined in 9.2.4.8 where the SSID is the calculation fields). An SSID element is not present if the Full SSID Present subfield in the Frame Control field is 0.

An SSID element as defined in 9.4.2.2 is present in the Optional Elements field of the PV1 Probe Response frame if the Full SSID Present subfield in the Frame Control field is 1. The Compressed SSID field is not present if the Full SSID Present subfield in the Frame Control field is 1.

The Access Network Options field is present if the ANO Present subfield in the Frame Control field is 1 and is defined in 9.4.2.91. Otherwise, it is not present.

The Optional Elements field contains optional elements requested to be included in the PV1 Probe Response frame such as S1G Beacon Compatibility element. If the S1G Beacon Compatibility element is requested to be included, the PV1 Probe Response frame includes it as the first optional element.

The Frame Control field of the PV1 Probe Response frame is shown in Figure 9-987.

The Next TBTT present subfield is set to 1 if the Next TBTT field is included in the PV1 Probe Response frame and otherwise set to 0.

The Full SSID Present field indicates whether a Full SSID or a Compressed SSID is included in the PV1 Probe Response frame. Setting the field to 1 indicates that an SSID element is included and the Compressed

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

SSID field is not included in the PV1 Probe Response frame. Setting the field to 0 indicates that the Compressed SSID field is included and the SSID element is not included in the PV1 Probe Response frame.

	B0 B1	B2 B4	B5 B7	B8	B9	B10	B11 B13	B14	B15
	Protocol Version	Type	PTID/ Subtype	Next TBTT Present	Full SSID Present	ANO Present	BSS BW	Security	1 MHz Primary Channel Location
Bits:	2	3	3	1	1	1	3	1	1

Figure 9-987—Frame Control field of PV1 Probe Response frame format

The ANO Present subfield equals 1 if the Access Network Options field is present; otherwise, it equals 0.

The BSS BW subfield indicates the minimum and the maximum operating bandwidths of the BSS and is defined in Table 9-8.

The Security subfield equals 1 if the transmitting STA is an RSNA STA.

The 1 MHz Primary Channel Location subfield indicates the location of the 1 MHz primary channel. If it is equal to 0, it indicates that the 1 MHz primary channel is located at lower side of 2 MHz primary channel. If it is equal to 1, it indicates that the 1 MHz primary channel is located at upper side of 2 MHz primary channel.

9.8.5.4 Resource Allocation frame format

The Resource Allocation (RA) frame is broadcasted to all non-AP STAs that belong to the RAW group identified by the RAW Group field of a previously transmitted RPS element with the RAW Type subfield indicating a generic RAW and the RAW Type Options subfield indicating an RA frame (see 9.4.2.191). The RA frame signals the presence of downlink buffered data for paged STAs and their assigned RAW slots for both uplink and downlink service periods. The Resource Allocation frame has two kinds of format depending on the slot assignment mode indicated in the Frame Control field. The Resource Allocation frame formats are shown in Figure 9-988 and Figure 9-989.

	Frame Control	A1	BSSID	RAW Group	RAW Duration	Slot Assignment 1	...	Slot Assignment N	FCS
Octets:	2	2	6	3	2	3 or 4		3 or 4	4

Figure 9-988—Resource Allocation frame format when Slot Assignment Mode field is 0

	Frame Control	A1	BSSID	RAW Group	RAW Duration	Slot Assignment Indication	FCS
Octets:	2	2	6	3	2	variable	4

Figure 9-989—Resource Allocation frame format when Slot Assignment Mode field is 1

The Slot Assignment Indication field formats are shown in Figure 9-990, Figure 9-991, and Figure 9-992.

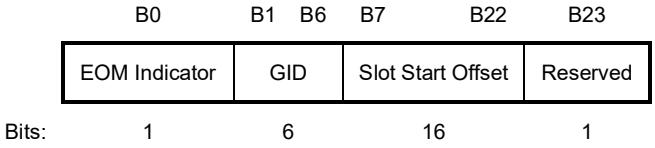

Figure 9-990—Slot Assignment Indication field for MU group when Slot Assignment Mode field is 0 and the Group Indicator field is 1

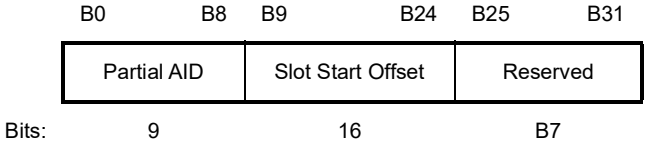

Figure 9-991—Slot Assignment Indication field for a STA when Slot Assignment Mode is 0 and the Group Indicator field is 0

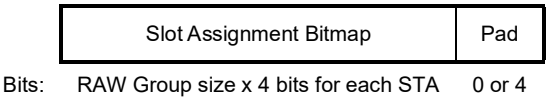

Figure 9-992—Slot Assignment Indication field when Slot Assignment Mode field is 1

The Frame Control field of the Resource Allocation frame is shown in Figure 9-993.

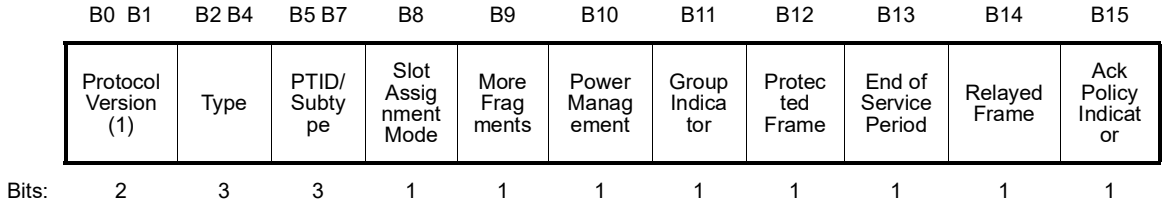

Figure 9-993—Frame Control field format for Resource Allocation frame

The subfields of the Frame Control field, except for the Slot Assignment Mode and the Group Indicator subfields, are defined in 9.8.3.1. The Slot Assignment Mode and the Group Indicator subfields are defined as follows:

- The Slot Assignment Mode subfield indicates the format of the Resource Allocation frame:
  - If the Slot Assignment Mode subfield is equal to 0, the Resource Allocation frame format is as shown in Figure 9-988.
  - If the Slot Assignment Mode subfield is equal to 1, the Resource Allocation frame format is as shown in Figure 9-989.
- The Group Indicator subfield indicates whether any subfield of MU group is included or no subfield of MU group exists in the Slot Assignment field if Slot Assignment mode field is equal to 0. Otherwise, it is reserved.

The A1 field is an SID field that contains the value 0 in the AID subfield. A3 Present, A4 Present, and A-MSDU subfields (B13, B14, and B15) of the SID field are reserved.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The BSSID field indicates the address of the AP transmitting the Resource Allocation frame.

The RAW Group field indicates the STA AIDs that are assigned the RAW as defined in 9.4.2.191. The AIDs in this RAW Group are identical to the AIDs in the RAW Group subfield with the value in the RAW Type subfield set to 0 and the value in the RAW Type Options subfield set to 1 in the RAW Control subfield within the RPS element. STAs that wake up and receive the Resource Allocation frame use this field to determine whether their AIDs are included within the RAW Group.

The RAW Duration field is an unsigned integer expressed in TUs that indicates the duration of the current RAW where the Resource Allocation frame is broadcasted. The field is either set to the value of the RAW duration deduced from the value in the RAW Slot Definition subfield (9.4.2.191) or is modified from the value indicated in the RAW Slot Definition subfield of the RPS element (9.4.2.191).

The Slot Assignment field indicates a partial AID for a STA or a GID for STAs in the corresponding MU Group and their corresponding slot(s) of medium access within the current RAW. Since MU MIMO is used for DL traffic, the first bit, as called end of multi-user (EOM) Indicator, for the MU group block indicates whether the following subfields are used for the last MU group when this bit is 1 or more MU groups exist after subfields for this MU group when the bit is 0. This field is of length 3 octets for each MU Group and 4 octets for each STA and the length is determined based on the value in the EOM subfield.

If Slot Assignment Mode field is 0 and the Group Indicator field is 1, the Slot Assignment field is used for either MU group of STAs or an assigned STA as shown in Figure 9-990 and Figure 9-991. If Slot Assignment Mode field is 0 and the Group Indicator field is 0, the Slot Assignment field is not used for MU group of STAs. The Slot Assignment field for MU group of STAs is located first at the beginning of the Slot Assignment fields, if exists.

The Partial AID subfield indicates a partial AID for an assigned STA.

The Slot Start Offset subfield indicates the start time of a RAW slot, in TU, for a STA's or MU MIMO group of STAs' medium access, relative to the RAW Start Time field as defined in 9.4.2.191 and is of length 2 octets.

The RA frame contains Slot Assignment Indication field to indicate to each of the STAs in the RAW group the number of UL/DL slot allocations within the current RAW.

The Slot Assignment Bitmap subfield indicates the number of RAW slots allocated for all STAs in the RAW group in ascending order with each 4 bits corresponding to one STA. The decimal number represented by the 4 bits indicates the number of allocation units for a STA. For example, setting this subfield to 0 indicates no allocation for a STA. Setting this subfield to 1 indicates one RAW slot for a STA. All RAW slots have equal duration, in TUs, which is calculated by dividing the value of the RAW Duration field with the number of RAW slots allocated to all STAs in the RAW group. The first RAW slot starts at the end of the Resource Allocation frame while the start times of the remaining RAW slots are equal to the end times of their immediately preceding RAW slots as indicated in the Slot Assignment Bitmap subfield.

The Slot Assignment Bitmap subfield has a length in bits, SAB_{length}, which is determined as:

$$SAB_{\text{length}} = (\text{RAW End AID} - \text{RAW Start AID} + 1) \times 4$$

where
RAW End AID and RAW Start AID for the RAW group are defined in 9.4.2.191

The Pad subfield contains 0 or 4 bits of 0s to make the total number of bits in the Slot Assignment Indication field equal to an integer number of octets.

10. MAC sublayer functional description

10.1 Introduction

The MAC functional description is presented in this clause. The architecture of the MAC sublayer, including the distributed coordination function (DCF), the hybrid coordination function (HCF), the mesh coordination function (MCF), and their coexistence in an IEEE 802.11 LAN are introduced in 10.2. These functions are expanded on in 10.3, 10.23, and 10.24. Fragmentation and defragmentation are defined in 10.4 and 10.5. Multirate support is addressed in 10.6. A number of additional restrictions to limit the cases in which MSDUs are reordered or discarded are described in 10.7. Operation across regulatory domains is defined in 10.22. The block ack mechanism is described in 10.25. The No Ack mechanism is described in 10.26. The protection mechanism is described in 10.27. Rules for processing MAC frames are described in 10.28.

10.2 MAC architecture

10.2.1 General

The MAC architecture is shown in Figure 10-1, Figure 10-2, and Figure 10-3.

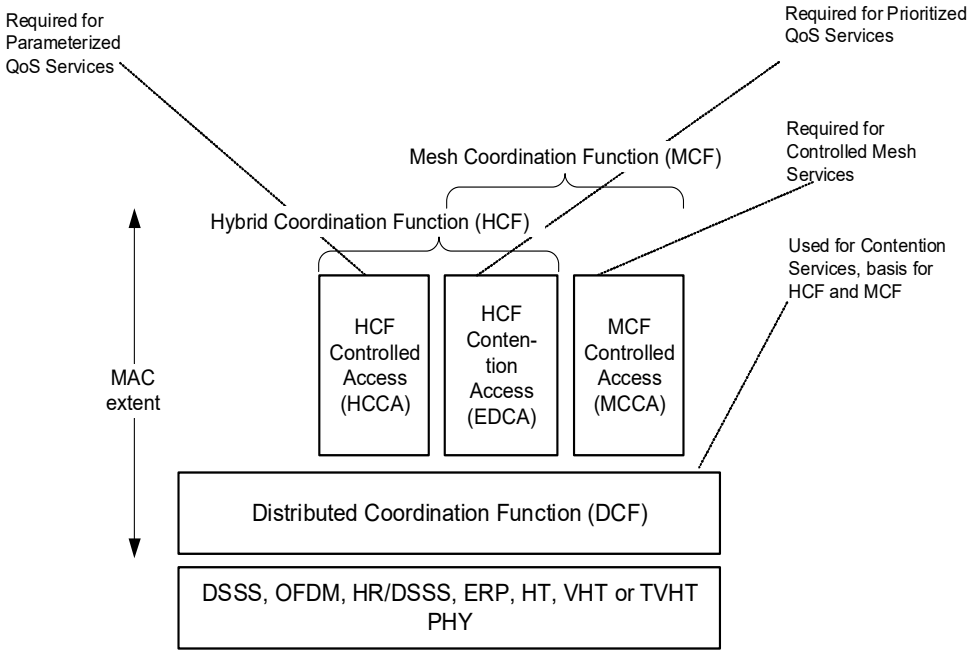

Figure 10-1—Non-DMG non-CMMG non-S1G STA MAC architecture

In a non-DMG non-CMMG non-S1G STA:

— The MAC provides the HCF and MCF service using the services of the DCF. The MAC also provides direct access to the DCF service.

— The HCF is present in QoS STAs and absent otherwise.

— The MCF is present in mesh STAs and absent otherwise.

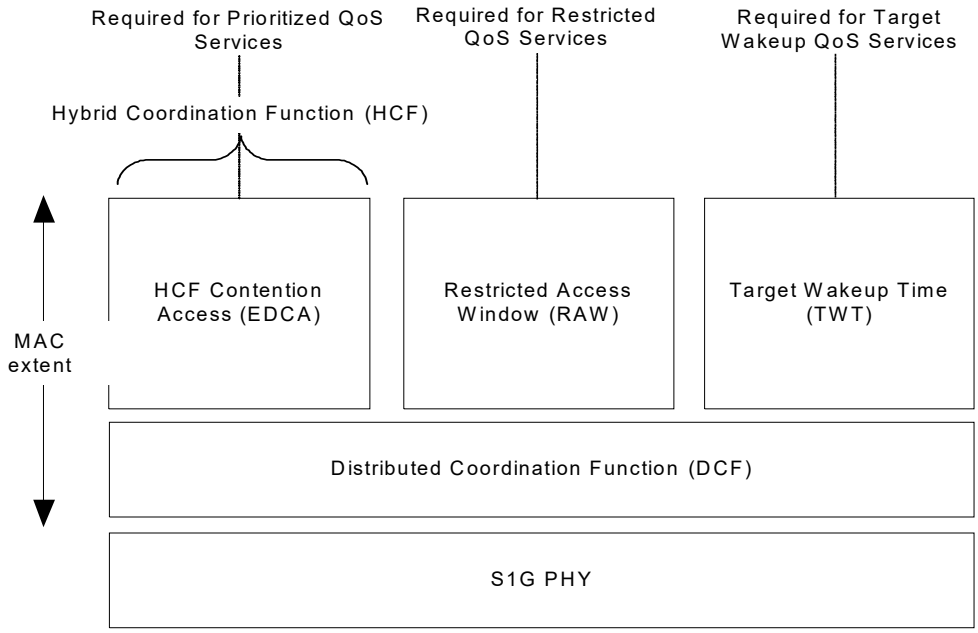

Figure 10-2—S1G STA MAC architecture

In an S1G STA:

— The MAC provides EDCA service using the services of the DCF.
— The RAW is optionally present.
— The TWT is optionally present.

In a DMG STA:

— The MAC provides services using the DMG channel access mechanisms.

In a CMMG STA:

— The MAC provides services using the CMMG channel access mechanisms.

In either a DMG or CMMG STA:

— Specific rules apply for access during scheduled periods, which include the association beamforming training (A-BFT) period, announcement transmission interval (ATI), contention based access period (CBAP), and service period (SP).
— The DCF is used during contention based access periods.
— Dynamic allocation (10.39.7) is built on service period and contention based access period.

The MAC maintains information in local variables called *MAC variables*. MAC variables that hold state information are also called *state variables*.

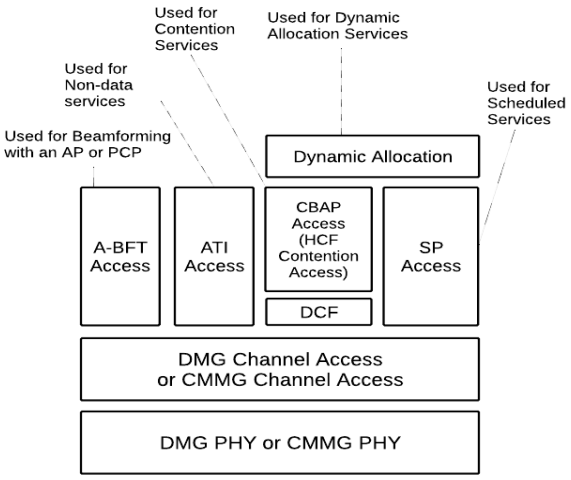

Figure 10-3—DMG STA and CMMG STA architecture

10.2.2 DCF

The fundamental access method of the MAC used by non-DMG STAs is a DCF known as *carrier sense multiple access with collision avoidance* (CSMA/CA). The DCF shall be implemented in all STAs.

For a STA to transmit, it shall sense the medium to determine if another STA is transmitting. If the medium is not determined to be busy (see 10.3.2.1), the transmission may proceed. The CSMA/CA distributed algorithm mandates that a gap of a minimum specified duration exists between frame exchange sequences. A transmitting STA shall verify that the medium is idle for this required duration before attempting to transmit. If the medium is determined to be busy, a non-DMG STA shall defer until the end of the current transmission, and a DMG STA may defer until the end of the current transmission. After deferral, or prior to attempting to transmit again immediately after a successful transmission, the STA shall initialize a backoff counter to a random backoff count [see Equation (10-1)] and shall decrement the backoff counter once per interval of aSlotTime (a backoff slot) while the medium is idle. A refinement of the method may be used under various circumstances to further minimize collisions—here the transmitting and receiving STA exchange short Control frames (RTS and CTS frames for non-DMG STAs, and RTS and DMG CTS frames for DMG STAs) after determining that the medium is idle and after any deferrals or backoffs, prior to data transmission. The details of CSMA/CA, deferrals, and backoffs are described in 10.3. RTS/CTS and RTS/DMG CTS exchanges are also presented in 10.3.

10.2.3 Hybrid coordination function (HCF)

10.2.3.1 General

The QoS facility includes an additional coordination function called *HCF* that is usable only in QoS network configurations. The HCF shall be implemented in all QoS STAs except mesh STAs. Instead, mesh STAs implement the MCF. The HCF combines functions from the DCF with some enhanced, QoS-specific mechanisms and frame subtypes to allow a uniform set of frame exchange sequences to be used for QoS data transfers . The HCF uses both a contention based channel access method, called the *enhanced distributed channel access (EDCA)* mechanism for contention based transfer and a controlled channel access, referred to as the *HCF controlled channel access (HCCA)* mechanism, for contention free transfer.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A STA may obtain a TXOP using one or both of the channel access mechanisms specified in 10.23. If a TXOP is obtained using the contention based channel access, it is defined as *EDCA TXOP*. If a TXOP is obtained using the controlled channel access, it is defined as *HCCA TXOP*. If an HCCA TXOP is obtained due to a QoS (+)CF-Poll frame from the HC, the TXOP is defined as a *polled TXOP*.

Time priority Management frames are transmitted outside of the normal MAC queuing process as per individually described transmission rules. Time priority Management frames are defined to be those that have a value of Yes in the Time priority column in Table 9-405, Table 9-489, Table 9-494, and Table 9-511. No other frames are time priority Management frames.

10.2.3.2 HCF contention based channel access (EDCA)

The EDCA mechanism provides differentiated, distributed access to the WM for STAs using eight different UPs. The EDCA mechanism defines four access categories (ACs) that provide support for the delivery of traffic with UPs at the STAs. Six transmit queues are defined when dot11AlternateEDCAActivated is true, and four transmit queues otherwise. The transmit queue and AC are derived from the UPs as shown in Table 10-1.

Table 10-1—UP-to-AC mappings

Priority	UP (Same as IEEE 802.1D user priority)	IEEE 802.1D designation	AC	Transmit queue (dot11Alternate-EDCAActivated false or not present)	Transmit queue (dot11Alternate EDCAActivated true)	Designation
Lowest	1	BK	AC_BK	BK	BK	Background
	2	—	AC_BK	BK	BK	Background
	0	BE	AC_BE	BE	BE	Best Effort
	3	EE	AC_BE	BE	BE	Best Effort
	4	CL	AC_VI	VI	A_VI	Video (alternate)
	5	VI	AC_VI	VI	VI	Video (primary)
	6	VO	AC_VO	VO	VO	Voice (primary)
Highest	7	NC	AC_VO	VO	A_VO	Voice (alternate)

NOTE—The Designation column is an indication of general usage and guidance. Actual uses of each UP are implementation specific.

NOTE 1—A DMG or S1G STA that implements a single AC (see 10.23.2.1) has all of its UP values in Table 10-1 mapped to AC_BE.

For each AC an enhanced variant of the DCF, called an *enhanced distributed channel access function (EDCAF)*, contends for TXOPs using a set of EDCA parameters. When communicating Data frames outside the context of a BSS (dot11OCBActivated is true), the EDCA parameters are the corresponding default values or are as set by the SME in dot11EDCATable (except for TXOP limits, which shall be set to 0 for each AC). For a non-AP STA communicating within a non-mesh QoS BSS, the EDCA parameters used are from the EDCA Parameter Set element or (for a non-AP STA prior to associating with an AP of an infrastructure BSS, a mesh STA, or a STA that operates OCB) from the default values for the parameters. The parameters used by the EDCAF to control its operation are defined by dot11QAPEDCATable at the AP and by dot11EDCATable at the non-AP STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The following rules apply for HCF contention based channel access:

a) The minimum specified idle duration is not the constant value (DIFS) defined for DCF, but is a distinct value. This value is specified in table dot11QAPEDCATableAIFSN for an AP and in table dot11EDCATableAIFSN for a non-AP STA; see 10.23.2. The minimum idle duration is assigned either by a management entity or by an AP.

b) The contention window limits aCWmin and aCWmax, from which the random backoff is computed, are not fixed per PHY, as with DCF, but are variable (contained in tables dot11QAPEDCATableCWmin and dot11QAPEDCATableCWmax for an AP and in tables dot11EDCATableCWmin and dot11EDCATableCWmax for a non-AP STA) and assigned by a management entity or by an AP.

c) Collisions between contending EDCAFs in a STA are resolved within the STA, so that the Data frames from the higher priority AC receive the TXOP and the Data frames from the lower priority colliding AC(s) behave as if there were an external collision on the WM except that the Retry subfield in the MAC headers of MPDUs at the head of the lower priority ACs is not affected.

d) During an EDCA TXOP won by an EDCAF a STA may initiate multiple frame exchange sequences to transmit MMPDUs and/or MSDUs within the same AC. The duration of this EDCA TXOP is bounded, for an AC, by the value dot11QAPEDCATableTXOPLimit for an AP and by dot11EDCATableTXOPLimit for a non-AP STA. A value of 0 for this duration means that the EDCA TXOP is limited as defined by the rule for TXOP limit of 0 found in 10.23.2.9.

The QoS AP shall announce the EDCA parameters in selected Beacon frames and in all Probe Response and (Re)Association Response frames by the inclusion of the EDCA Parameter Set element using the information from the MIB entries in dot11EDCATable. If no such element has been received (e.g., prior to association in an infrastructure BSS), a non-AP QoS STA shall use the default values for the parameters. The EDCA Parameter Set element shall be included in all Beacon frames occurring within two delivery traffic indication map (DTIM) periods following a change in announced EDCA parameters, which provides all STAs an opportunity to receive the updated EDCA parameters; it may optionally be included in more Beacon frames. If any associated STAs are in WNM sleep mode or using FMS, these fields should be included by the AP for as many DTIM periods as needed to exceed the longest interval any STA is expected to not receive Beacon frames.

A QoS STA, on receiving an updated EDCA Parameter Set element, should update the dot11EDCATable as soon as practical in the implementation and shall update the dot11EDCATable within an interval of time equal to one beacon interval. QoS STAs update the dot11EDCATable and store the EDCA Parameter Set update count value in the QoS Info field. An S1G STA shall update its dot11EDCATable if its STA type is indicated by the STA Type subfield contained in the received EDCA Parameter Set element (see 10.61). An AP may change the EDCA access parameters by changing the EDCA Parameter Set element in the Beacon frame, Probe Response frame, and (Re)Association Response frame. However, the AP should change them only rarely. A QoS STA shall use the EDCA Parameter Set Update Count Value subfield in the QoS Capability element of all Beacon frames to determine whether the STA is using the current EDCA Parameter Values. If the EDCA Parameter Set update count value in the QoS Capability element is different from the value that has been stored, the QoS STA shall query the updated EDCA parameter values by sending a Probe Request frame to the AP.

The S1G AP shall set the STA Type subfield of EDCA Parameter Set elements it transmits as follows:

— 1 if it indicates support for sensor STAs but no support for non-sensor STAs
— 2 if it indicates support for non-sensor STAs but no support for sensor STAs

The S1G AP may set the STA Type subfield of EDCA Parameter Set elements to any value that is less than 3 if it indicates support for both sensor STAs and non-sensor STAs as described in 10.61.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

An S1G AP may assign to an S1G STA EDCA parameters different from the ones in dot11EDCATable, by sending to the STA an EDCA Parameter Set frame with an EDCA Parameter Set element with the Override field equal to 1. An S1G STA receiving an EDCA Parameter Set element with the Override field equal to 1 shall update its MIB values of the EDCA parameters based on the values indicated by the EDCA Parameter Set element.

An S1G STA that receives an EDCA Parameter Set frame with an EDCA Parameter Set element with the Override field equal to 1 shall disregard any EDCA Parameter Set elements with the Override field equal to 0 received afterward during the current association until it receives the EDCA Parameter Set element with the Override field equal to 1 carried in an EDCA Parameter Set frame.

In the Beacon frame the EDCA Parameter Set Update Count subfield is initially set by the AP to 0 and is incremented every time any of the announced EDCA parameters change.

An AP or PCP may use a different set of EDCA parameter values than it advertises to the STAs in its BSS.

A QoS STA that transmits a Management frame determines access category used for medium access in transmission of the Management frame as follows:

- If dot11QMFActivated is false or not present and
  - If the Management frame is individually addressed to a non-QoS STA, category AC_BE should be selected.

    NOTE 2—Category AC_BE might not be selected when no prior Data frames have been transmitted to the non-QoS STA.
  - If category AC_BE was not selected by the previous step, category AC_VO shall be selected.

    NOTE 3—Selection of AC_VO above is independent of whether the STA is associated with a BSS, or whether there is a QoS facility in the BSS.
- If dot11QMFActivated is true, the STA determines the access category as described in 11.24.

BlockAckReq and BlockAck frames shall be sent using the same access category for medium access as the corresponding QoS Data frames.

A non-S1G STA shall send PS-Poll frames using the access category AC_BE. This reduces the likelihood of collisions following a Beacon frame.

If an S1G STA receives an EDCA Parameter Set element from its associated AP and its STA type is indicated in the STA Type subfield in the received EDCA Parameter Set element, an S1G STA shall transmit PS-Poll frames, PS-Poll+BDT frames and NDP PS-Poll frames using the access category indicated in the PS-Poll ACI subfield. Otherwise, an S1G STA shall transmit PS-Poll frames, PS-Poll+BDT frames and NDP PS-Poll frames either using access category AC_VO when the S1G STA is a non-sensor STA or using access category AC_BE when the S1G STA is a sensor STA (see 10.61).

When the first frame in a frame exchange sequence intended to carry a QoS Data, QoS Null or Management frame is an RTS or CTS frame, the RTS or CTS frame shall be transmitted using the access category of the corresponding QoS Data or QoS Null frame or the access category used for medium access of the Management frame.

Control Wrapper frames shall be sent using the access category that would apply to the carried Control frame.

A beamformer may send a VHT NDP Announcement frame or Beamforming Report Poll frame using any access category and without being restricted by admission control procedures.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

PS-Poll frames and Management frames are exempted from any and all restrictions on transmissions arising from admission control procedures.

The operation rules of HCF contention based channel access are defined in 10.23.2.

The alternate video (A_VI) and alternate voice (A_VO) transmit queues share the same EDCAF as VI and VO transmit queues, respectively, as shown in Figure 10-24. When dot11AlternateEDCAActivated is true, a scheduling function above the VO EDCAF selects from the primary or alternate transmit queue an MSDU, an A-MSDU, an MMPDU, or set of MSDUs to be the next to be passed to the VO EDCAF (as shown in Figure 10-24) so that the MSDU(s), A-MSDU(s), or MMPDU(s) from the queue with the higher UP are selected with a higher probability than from the queue with the lower UP. When dot11AlternateEDCAActivated is true, a scheduling function above the VI EDCAF selects from the primary or alternate transmit queue an MSDU, an A-MSDU, an MMPDU, or set of MSDUs to be the next to be passed to the VI EDCAF so that the MSDU(s), A-MSDU(s), or MMPDU(s) from the queue with the higher UP are selected with a higher probability than from the queue with the lower UP. The default algorithm to select an MSDU, A-MSDU, or MMPDU from either the A_VI or VI queue and to select an MSDU, A-MSDU, or MMPDU from either the A_VO or VO queue is as follows:

— For each EDCAF, an MSDU, A-MSDU, or MMPDU is selected for transmission using the transmission selection procedures defined in 8.6.8 of IEEE Std 802.1Q using two queues, the primary and alternate.
— For a given AC, the order in which frames are selected for transmission shall maintain the requirements specified in 10.7 of this standard.

Alternative prioritization algorithms that meet the requirements of 10.7 may be used.

All MSDUs, A-MSDUs, and MMPDUs passed to the VO EDCAF are transmitted according to AC_VO EDCAF parameters and rules. All MSDUs, A-MSDUs, and MMPDUs passed to the VI EDCAF are transmitted according to AC_VI EDCAF parameters and rules.

10.2.3.3 HCF controlled channel access (HCCA)

The HCCA mechanism uses a QoS-aware centralized coordinator, called a *hybrid coordinator (HC)*. The HC is collocated with the AP of the BSS and uses the HC's higher priority of access to the WM to initiate frame exchange sequences and to allocate TXOPs to itself and other STAs in order to provide limited-duration CAPs for contention free transfer of QoS data.

The HC traffic delivery and TXOP allocation may be scheduled to meet the QoS requirements of a particular TC or TS. TXOP allocations and contention free transfers of QoS traffic might be based on the HC's BSS-wide knowledge of the amounts of pending traffic belonging to different TS and/or TCs and are subject to BSS-specific QoS policies.

Implementers are cautioned that QoS STAs are not required to interpret data subtypes that include QoS +CF-Ack in frames not addressed to themselves unless they set the Q-Ack subfield in the QoS Capability element to 1.

The HCF protects the transmissions during each CAP using the virtual CS mechanism.

A STA may initiate multiple frame exchange sequences during a polled TXOP of sufficient duration to perform more than one such sequence.

The operation rules of the HCCA are defined in 10.23.3.

10.2.4 Mesh coordination function (MCF)

The mesh facility includes an additional coordination function called *MCF* that is usable only in an MBSS. A mesh STA shall implement the MCF only. MCF has both a contention based channel access and contention free channel access mechanism. The contention based mechanism is EDCA and the contention free mechanism is called the *MCF controlled channel access (MCCA)*. MCF uses the default values for the PTKSA, and GTKSA Replay Counters. The operation rules of the EDCA are defined in 10.23.2. The operation rules of the MCCA are defined in 10.24.3.

10.2.5 Combined use of DCF and HCF

The DCF and the hybrid coordination function are defined so they may operate within the same BSS. The HCF access methods (controlled and contention based) operate sequentially. Sequential operation allows the polled and contention based access methods to alternate, within intervals as short as the time to transmit a frame exchange sequence, under rules defined in 10.23.

10.2.6 Fragmentation/defragmentation overview

The process of partitioning an MSDU or an MMPDU into smaller MAC-level frames, MPDUs, is called *fragmentation*. Fragmentation creates MPDUs smaller than the original MSDU or MMPDU length to increase reliability, by increasing the probability of successful transmission as defined in 10.2.2 of the MSDU or MMPDU when channel characteristics limit reception reliability for longer frames. A STA may use fragmentation to use the medium efficiently in consideration of the duration available in granted TXOPs, as long as the rules in 10.4 are followed. Fragmentation is accomplished at each immediate transmitter. The process of recombining MPDUs into a single MSDU or MMPDU is defined as *defragmentation*. Defragmentation is accomplished at each immediate recipient.

An MSDU transmitted under an HT-immediate block ack agreement shall not be fragmented even if its length exceeds dot11FragmentationThreshold. An MSDU or MMPDU transmitted within an A-MPDU that does not contain an S-MPDU (see 10.12.8) shall not be fragmented even if its length exceeds dot11FragmentationThreshold. MSDUs or MMPDUs carried in a group addressed MPDU shall not be fragmented even if their length exceeds dot11FragmentationThreshold.

NOTE 1—A fragmented MSDU or MMPDU transmitted by an HT STA to another HT STA can be acknowledged only using immediate acknowledgment (i.e., transmission of an Ack frame after a SIFS).

NOTE 2—As specified in 10.11, A-MSDUs are never fragmented.

NOTE 3—A fragmented MSDU or MMPDU transmitted by an S1G STA to another S1G STA can be acknowledged either using immediate acknowledgment (i.e., transmission of an (NDP) Ack frame after a SIFS) or using fragment BA described in 10.3.2.12.

Except as described below, when an individually addressed MSDU is received from the LLC or an individually addressed MMPDU is received from the MLME that would result in an MPDU of length greater than dot11FragmentationThreshold, the MSDU or MMPDU shall be fragmented. An exception applies when an MSDU is transmitted using an HT-immediate block ack agreement or when the MSDU or MMPDU is carried in an A-MPDU that does not contain an S-MPDU, in which case the MSDU or MMPDU is transmitted without fragmentation. Each fragment is a frame no longer than dot11FragmentationThreshold, if security encapsulation is not invoked for the MPDU. If security encapsulation is active for the MPDU, then the fragments shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold. It is possible that any fragment may be a frame smaller than dot11FragmentationThreshold. An illustration of fragmentation is shown in Figure 10-4.

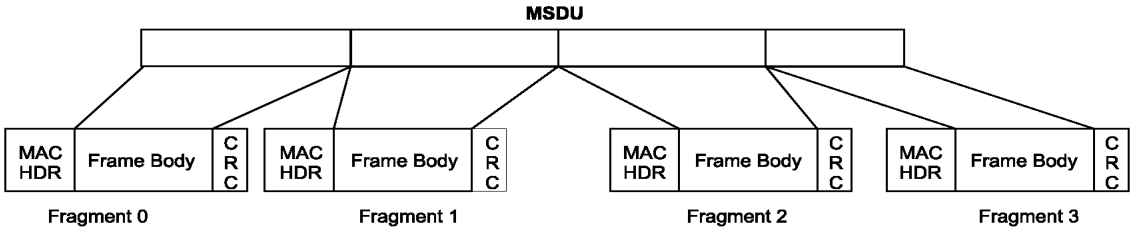

Figure 10-4—Fragmentation

The MPDUs resulting from the fragmentation of an MSDU or MMPDU are sent as independent transmissions, each of which is separately acknowledged. This permits transmission retries to occur per fragment, rather than per MSDU or MMPDU. The fragments of a single MSDU or MMPDU are either

— Sent as individual frames using the DCF, or

— Sent as a burst in an EDCA or HCCA TXOP, subject to TXOP limits and medium occupancy limits for the attached PHY.

A QoS Data frame with a TID matching a block ack agreement may be transmitted in a non-A-MPDU with Normal Ack ack policy.
