Abstract: Technical corrections and clarifications to IEEE Std 802.11 for wireless local area networks (WLANs) as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions are specified in this revision. Amendments 1 to 5 published in 2016 and 2018 have also been incorporated into this revision.

Keywords: 2.4 GHz, 256-QAM, 3650 MHz, 4.9 GHz, 5 GHz, 5.9 GHz, 60 GHz, advanced encryption standard, AES, audio, beamforming, carrier sense multiple access/collision avoidance, CCMP, channel switching, clustering, contention based access period, Counter mode with Cipher-block chaining Message authentication code Protocol, confidentiality, CSMA/CA, DFS, direct link, directional multi-gigabit, dynamic allocation of service period, dynamic extension of service period, dynamic frequency selection, dynamic truncation of service period, E911, EDCA, emergency alert system, emergency services, fast session transfer, forwarding, GCMP, generic advertisement service, high throughput, IEEE 802.11™, international roaming, interworking, interworking with external networks, LAN, local area network, MAC, management, measurement, medium access control, media-independent handover, medium access controller, mesh, MIS, millimeter-wave, MIMO, MIMO-OFDM, multi-band operation, multi-hop, multi-user MIMO, multiple input multiple output, network advertisement, network discovery, network management, network selection, noncontiguous frequency segments, OCB, path-selection, personal basic service set, PHY, physical layer, power saving, QoS, quality of service, quality-of-service management frame, radio, radio frequency, RF, radio resource, radio management, relay operation, spatial sharing, SSPN, subscriber service provider, television white spaces, TPC, transmit power control, video, wireless access in vehicular environments, wireless LAN, wireless local area network, WLAN, wireless network management, zero-knowledge proof

Important Notices and Disclaimers Concerning IEEE Standards Documents

IEEE Standards documents are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page (https://standards.ieee.org/ipr/disclaimers.html), appear in all standards and may be found under the heading "Important Notices and Disclaimers Concerning IEEE Standards Documents."

Notice and Disclaimer of Liability Concerning the Use of IEEE Standards Documents

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE SA) Standards Board. IEEE develops its standards through an accredited consensus development process, which brings together volunteers representing varied viewpoints and interests to achieve the final product. IEEE Standards are documents developed by volunteers with scientific, academic, and industry-based expertise in technical working groups. Volunteers are not necessarily members of IEEE or IEEE SA, and participate without compensation from IEEE. While IEEE administers the process and establishes rules to promote fairness in the consensus development process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

IEEE makes no warranties or representations concerning its standards, and expressly disclaims all warranties, express or implied, concerning this standard, including but not limited to the warranties of merchantability, fitness for a particular purpose and non-infringement. In addition, IEEE does not warrant or represent that the use of the material contained in its standards is free from patent infringement. IEEE Standards documents are supplied "AS IS" and "WITH ALL FAULTS."

Use of an IEEE standard is wholly voluntary. The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity, nor is IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any IEEE Standards document, should rely upon his or her own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

IN NO EVENT SHALL IEEE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: THE NEED TO PROCURE SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

Translations

The IEEE consensus development process involves the review of documents in English only. In the event that an IEEE standard is translated, only the English version published by IEEE is the approved IEEE standard.

Official statements

A statement, written or oral, that is not processed in accordance with the IEEE SA Standards Board Operations Manual shall not be considered or inferred to be the official position of IEEE or any of its committees and shall not be considered to be, nor be relied upon as, a formal position of IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that the presenter's views should be considered the personal views of that individual rather than the formal position of IEEE, IEEE SA, the Standards Committee, or the Working Group.

Comments on standards

Comments for revision of IEEE Standards documents are welcome from any interested party, regardless of membership affiliation with IEEE or IEEE SA. However, **IEEE does not provide interpretations, consulting information, or advice pertaining to IEEE Standards documents**.

Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since IEEE standards represent a consensus of concerned interests, it is important that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, IEEE and the members of its Societies and Standards Coordinating Committees are not able to provide an instant response to comments, or questions except in those cases where the matter has previously been addressed. For the same reason, IEEE does not respond to interpretation requests. Any person who would like to participate in evaluating comments or in revisions to an IEEE standard is welcome to join the relevant IEEE working group. You can indicate interest in a working group using the Interests tab in the Manage Profile & Interests area of the IEEE SA myProject system. An IEEE Account is needed to access the application.

Comments on standards should be submitted using the Contact Us form.

Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE Standards document does not constitute compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Data privacy

Users of IEEE Standards documents should evaluate the standards for considerations of data privacy and data ownership in the context of assessing and using the standards in compliance with applicable laws and regulations.

Copyrights

IEEE draft and approved standards are copyrighted by IEEE under US and international copyright laws. They are made available by IEEE and are adopted for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making these documents available for use and adoption by public authorities and private users, IEEE does not waive any rights in copyright to the documents.

Photocopies

Subject to payment of the appropriate licensing fees, IEEE will grant users a limited, non-exclusive license to photocopy portions of any individual standard for company or organizational internal use or individual, non-commercial use only. To arrange for payment of licensing fees, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400; https://www.copyright.com/. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Updating of IEEE Standards documents

Users of IEEE Standards documents should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect.

Every IEEE standard is subjected to review at least every 10 years. When a document is more than 10 years old and has not undergone a revision process, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE standard.

In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit IEEE Xplore or contact IEEE. For more information about the IEEE SA or IEEE's standards development process, visit the IEEE SA Website.

Errata

Errata, if any, for all IEEE standards can be accessed on the IEEE SA Website. Search for standard number and year of approval to access the web page of the published standard. Errata links are located under the Additional Resources Details section. Errata are also available in IEEE Xplore. Users are encouraged to periodically check for errata.

Patents

IEEE Standards are developed in compliance with the IEEE SA Patent Policy.

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE SA Website at https://standards.ieee.org/about/sasb/patcom/patents.html. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

IMPORTANT NOTICE

IEEE Standards do not guarantee or ensure safety, security, health, or environmental protection, or ensure against interference with or from other devices or networks. IEEE Standards development activities consider research and information presented to the standards development group in developing any safety recommendations. Other information about safety practices, changes in technology or technology implementation, or impact by peripheral systems also may be pertinent to safety considerations during implementation of the standard. Implementers and users of IEEE Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, and interference protection practices and all applicable laws and regulations.

Participants

At the time this revision was sent to sponsor ballot, the IEEE 802.11 Working Group (WG) had the following officers:

Dorothy V. Stanley, *Chair*
Jon W. Rosdahl, *1st Vice Chair*
Robert Stacey, *2nd Vice Chair*
Stephen McCann, *Secretary*

The officers of the WG Task Group md and the members of the WG ballot group for this revision are as follows:

Dorothy V. Stanley, *Chair*
Mark Hamilton, *Vice Chair*
Michael Montemurro, *Vice Chair*
Jon W. Rosdahl, *Secretary*
Emily H. Qi, *Technical Editor*
Edward Au, *Technical Sub-editor*

Introduction

This introduction is not part of IEEE Std 802.11-2020, IEEE Standard for Information Technology—Telecommunications and Information Exchange between Systems—Local and Metropolitan Area Networks—Specific Requirements—Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications.

This revision gives users, in one document, the IEEE 802.11 standard for wireless local area networks (WLANs) with all of the amendments that have been published to date.

Incorporating published amendments

The original standard was published in 1997, revised in 1999 with MIB changes, and reaffirmed in 2003.

A revision was published in 2007, which incorporated into the 1999 edition the following amendments:

- IEEE Std 802.11a™-1999: High-speed Physical Layer in the 5 GHz Band (Amendment 1)
- IEEE Std 802.11b™-1999: Higher-Speed Physical Layer Extension in the 2.4 GHz Band (Amendment 2)
- IEEE Std 802.11b-1999/Corrigendum 1-2001: Higher-speed Physical Layer (PHY) extension in the 2.4 GHz band (Corrigendum 1 to Amendment 2)
- IEEE Std 802.11d™-2001: Specification for operation in additional regulatory domains (Amendment 3)
- IEEE Std 802.11g™-2003: Further Higher Data Rate Extension in the 2.4 GHz Band (Amendment 4)
- IEEE Std 802.11h™-2003: Spectrum and Transmit Power Management Extensions in the 5 GHz band in Europe (Amendment 5)
- IEEE Std 802.11i™-2004: Medium Access Control (MAC) Security Enhancements (Amendment 6)
- IEEE Std 802.11j™-2004: 4.9 GHz–5 GHz Operation in Japan (Amendment 7)
- IEEE Std 802.11e™-2005: Medium Access Control (MAC) Quality of Service Enhancements (Amendment 8)

A revision was published in 2012, which incorporated into the 2007 revision the following amendments:

- IEEE Std 802.11k™-2008: Radio Resource Measurement of Wireless LANs (Amendment 1)
- IEEE Std 802.11r™-2008: Fast Basic Service Set (BSS) Transition (Amendment 2)
- IEEE Std 802.11y™-2008: 3650–3700 MHz Operation in USA (Amendment 3)
- IEEE Std 802.11w™-2009: Protected Management Frames (Amendment 4)
- IEEE Std 802.11n™-2009: Enhancements for Higher Throughput (Amendment 5)
- IEEE Std 802.11p™-2010: Wireless Access in Vehicular Environments (Amendment 6)
- IEEE Std 802.11z™-2010: Extensions to Direct-Link Setup (DLS) (Amendment 7)
- IEEE Std 802.11v™-2011: Wireless Network Management (Amendment 8)
- IEEE Std 802.11u™-2011: Interworking with External Networks (Amendment 9)
- IEEE Std 802.11s™-2011: Mesh Networking (Amendment 10)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A revision was published in 2016, which incorporated into the 2012 revision the following amendments:

- IEEE Std 802.11ae™-2012: Prioritization of Management Frames (Amendment 1)
- IEEE Std 802.11aa™-2012: MAC Enhancements for Robust Audio Video Streaming (Amendment 2)
- IEEE Std 802.11ad™-2012: Enhancements for Very High Throughput in the 60 GHz Band (Amendment 3)
- IEEE Std 802.11ac™-2013: Enhancements for Very High Throughput for Operation in Bands below 6 GHz (Amendment 4)
- IEEE Std 802.11af™-2013: Television White Spaces (TVWS) Operation (Amendment 5)

This revision is based on IEEE Std 802.11-2016, into which the following amendments have been incorporated:

- IEEE Std 802.11ai™-2016 (second printing): Fast Initial Link Setup (Amendment 1)
- IEEE Std 802.11ah™-2016: Sub 1 GHz License Exempt Operation (Amendment 2)
- IEEE Std 802.11aj™-2018: Enhancements for Very High Throughput to Support Chinese Millimeter Wave Frequency Bands (60 GHz and 45 GHz) (Amendment 3)
- IEEE Std 802.11ak™-2018: Enhancements for Transit Links Within Bridged Networks (Amendment 4)
- IEEE Std 802.11aq™-2018: Preassociation Discovery (Amendment 5)

Technical corrections, clarifications, and enhancements

In addition, this revision specifies technical corrections and clarifications to IEEE Std 802.11 as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions. In addition, this revision removes some features previously marked as obsolete and adds new indications of other obsolete features.

Generally, features that are marked deprecated or obsolete are not maintained; there might be technical errors in the material describing these features.

Renumbering of clauses and annexes

The numbering of certain clauses and annexes has been modified since IEEE Std 802.11-2007.

The evolution of this numbering is shown in Figure 1.

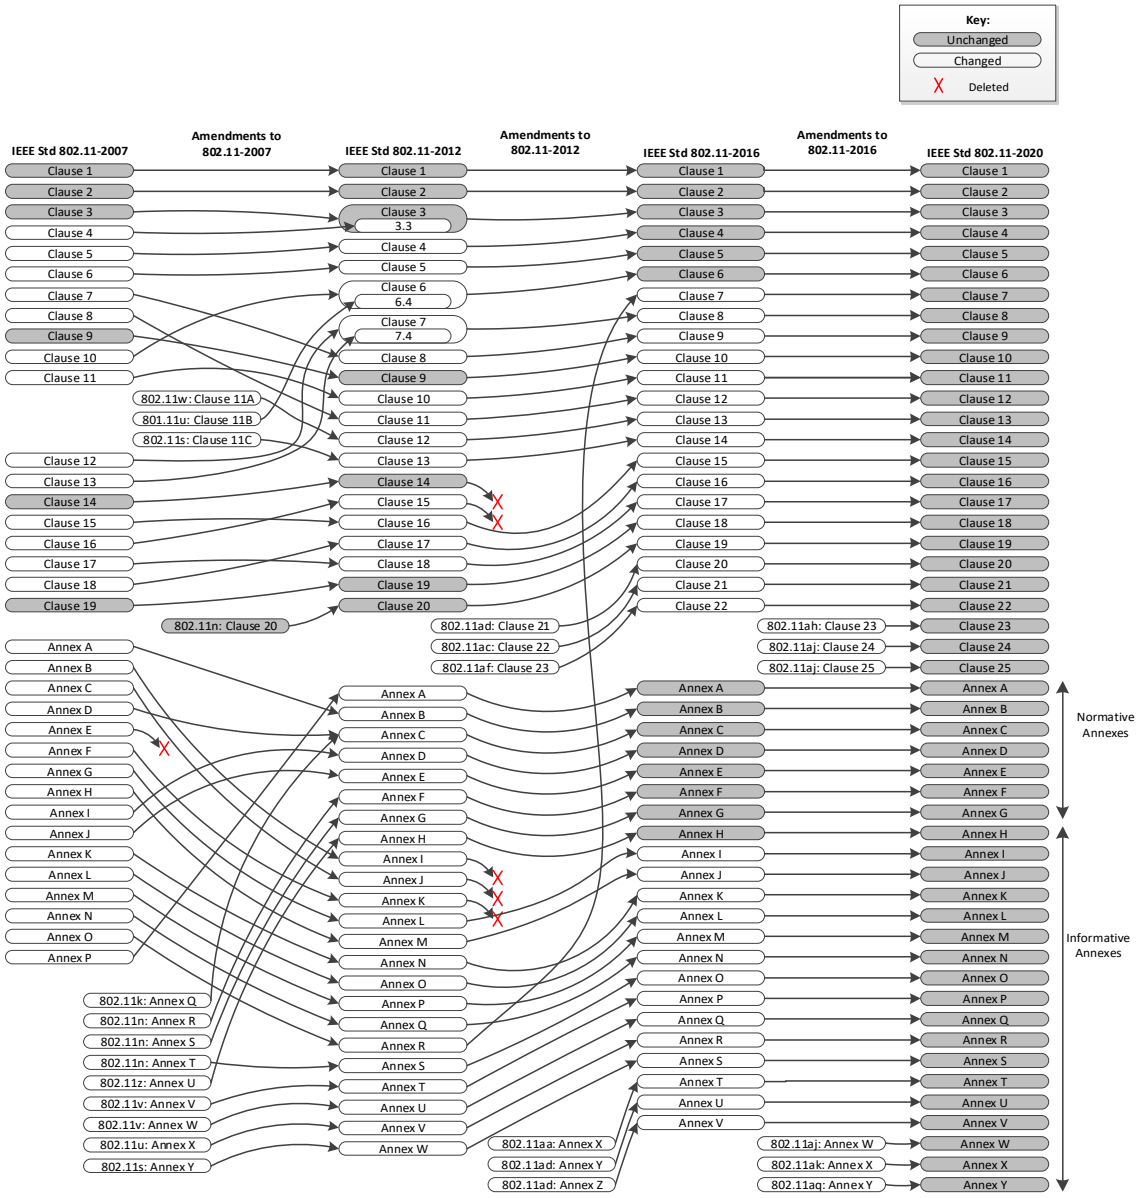

Figure 1—The evolution of numbering in IEEE Std 802.11

Contents

1. Overview ... 149

1.1 Scope ... 149
1.2 Purpose ... 149
1.3 Supplementary information on purpose ... 149
1.4 Word usage ... 150
1.5 Terminology for mathematical, logical, and bit operations ... 151

2. Normative references ... 154

3. Definitions, acronyms, and abbreviations ... 158

3.1 Definitions ... 158
3.2 Definitions specific to IEEE Std 802.11 ... 173
3.3 Definitions specific to IEEE 802.11 operation in some regulatory domains ... 205
3.4 Acronyms and abbreviations ... 205
3.5 Abbreviations and acronyms in some regulatory domains ... 218

4. General description ... 219

4.1 General description of the architecture ... 219
4.2 How wireless local area networks (WLANs) are different ... 219
4.2.1 Introduction ... 219
4.2.2 Wireless station (STA) ... 219
4.2.3 Media impact on design and performance ... 219
4.2.4 The impact of handling mobile STAs ... 220
4.2.5 Interaction with other IEEE 802® layers ... 220
4.2.6 Interaction with non-IEEE-802 protocols ... 220
4.3 Components of the IEEE 802.11 architecture ... 220
4.3.1 General ... 220
4.3.2 Independent BSS (IBSS) ... 221
4.3.3 Personal BSS (PBSS) ... 221
4.3.4 STA membership in a BSS is dynamic ... 221
4.3.5 Distribution system (DS) concepts ... 222
4.3.5.1 Overview ... 222
4.3.5.2 Extended service set (ESS): the large coverage network ... 223
4.3.6 Area concepts ... 224
4.3.7 Integration with non-IEEE-802.11 LANs ... 225
4.3.8 Robust security network association (RSNA) ... 226
4.3.9 Centralized coordination service set (CCSS) and extended centralized AP or PCP clustering (ECAPC) ... 226
4.3.10 QoS BSS ... 228
4.3.11 Wireless LAN radio measurements ... 229
4.3.11.1 General ... 229
4.3.11.2 Beacon ... 230
4.3.11.3 Measurement pilot ... 230
4.3.11.4 Frame ... 230
4.3.11.5 Channel load ... 230
4.3.11.6 Noise histogram ... 231
4.3.11.7 STA statistics ... 231
4.3.11.8 Location ... 231
4.3.11.9 Measurement pause ... 231

4.3.11.10 Neighbor report 231
4.3.11.11 Link measurement 231
4.3.11.12 Transmit stream/category measurement 231
4.3.12 Operation in licensed frequency bands 232
4.3.12.1 General 232
4.3.12.2 Dynamic STA enablement (DSE) in licensed bands 232
4.3.12.3 Contention based protocol (CBP) in nonexclusively licensed bands . 232
4.3.12.4 Using DSE STA identification to resolve interference 232
4.3.12.5 Further coexistence enhancements in nonexclusively licensed bands 232
4.3.13 High-throughput (HT) STA 232
4.3.14 Sub 1 GHz (S1G) STA 233
4.3.14.1 Overview 233
4.3.14.2 S1G relay 234
4.3.15 Very high throughput (VHT) STA 234
4.3.16 Television very high throughput (TVHT) STA 235
4.3.17 STA transmission of Data frames outside the context of a BSS 237
4.3.18 Tunneled direct-link setup 237
4.3.19 Wireless network management 237
4.3.19.1 Overview 237
4.3.19.2 BSS max idle period management 238
4.3.19.3 BSS transition management 238
4.3.19.4 Channel usage 238
4.3.19.5 Collocated interference reporting 239
4.3.19.6 Diagnostic reporting 239
4.3.19.7 Directed multicast service (DMS) 239
4.3.19.8 Event reporting 239
4.3.19.9 Flexible multicast service (FMS) 239
4.3.19.10 Location services 239
4.3.19.11 Multicast Diagnostic report 239
4.3.19.12 Multiple BSSID capability 240
4.3.19.13 Proxy ARP 240
4.3.19.14 QoS traffic capability 240
4.3.19.15 SSID list 240
4.3.19.16 Triggered STA statistics 240
4.3.19.17 TIM broadcast 240
4.3.19.18 Timing measurement 240
4.3.19.19 Fine timing measurement 240
4.3.19.20 Traffic filtering service 241
4.3.19.21 U-APSD coexistence 241
4.3.19.22 WNM notification 241
4.3.19.23 WNM sleep mode 241
4.3.20 Subscription service provider network (SSPN) interface 241
4.3.21 Mesh BSS 242
4.3.21.1 General 242
4.3.21.2 Overview of the mesh BSS 242
4.3.21.3 Mesh STA 243
4.3.21.4 IEEE 802.11 components and mesh BSS 243
4.3.21.5 Introduction to mesh functions 245
4.3.22 DMG STA 248
4.3.23 DMG relay 249
4.3.24 Robust audio video (AV) streaming 249
4.3.24.1 Introduction 249
4.3.24.2 Groupcast with retries (GCR) 249
4.3.24.3 Stream classification service (SCS) 250

4.3.24.4 Mirrored stream classification service (MSCS) ... 250
4.3.24.5 Overlapping BSS (OBSS) management ... 250
4.3.24.6 Interworking with IEEE 802.1Q Stream Reservation Protocol (SRP) 250
4.3.24.7 Intra-access category prioritization ... 250
4.3.25 Operation under geolocation database (GDB) control ... 251
4.3.26 CDMG STA ... 252
4.3.27 CMMG STA ... 253
4.3.28 General link (GLK) ... 254
4.3.28.1 General ... 254
4.3.28.2 Selective reception of group addressed frames ... 254
4.3.28.3 GLK Service Sets ... 255
4.3.29 Ethertype protocol discrimination (EPD) ... 259
4.4 Logical service interfaces ... 260
4.4.1 General ... 260
4.4.2 SS ... 260
4.4.3 PBSS control point service (PCPS) ... 261
4.4.4 DSS ... 261
4.5 Overview of the services ... 262
4.5.1 General ... 262
4.5.2 Distribution of MSDUs within a DS ... 263
4.5.2.1 Distribution ... 263
4.5.2.2 Integration ... 264
4.5.2.3 QoS traffic scheduling ... 264
4.5.3 Connectivity-related services ... 264
4.5.3.1 General ... 264
4.5.3.2 Mobility types ... 265
4.5.3.3 Association ... 265
4.5.3.4 Reassociation ... 266
4.5.3.5 Disassociation ... 266
4.5.4 Access control and data confidentiality services ... 267
4.5.4.1 General ... 267
4.5.4.2 Authentication ... 267
4.5.4.3 Deauthentication ... 268
4.5.4.4 Data confidentiality ... 269
4.5.4.5 Key management ... 270
4.5.4.6 Data origin authenticity ... 270
4.5.4.7 Replay detection ... 270
4.5.4.8 Fast BSS transition ... 270
4.5.4.9 Management frame protection ... 270
4.5.4.10 MAC privacy enhancements ... 271
4.5.5 Spectrum management services ... 271
4.5.5.1 General ... 271
4.5.5.2 TPC ... 271
4.5.5.3 DFS ... 271
4.5.6 Traffic differentiation and QoS support ... 272
4.5.6.1 General ... 272
4.5.6.2 Quality-of-service management frame support ... 272
4.5.7 Support for higher layer timer synchronization ... 272
4.5.8 Radio measurement service ... 273
4.5.9 Interworking with external networks ... 273
4.5.9.1 General ... 273
4.5.9.2 Preassociation discovery (PAD) ... 274
4.5.10 Generic advertisement service (GAS) ... 275
4.6 Multiple logical address spaces ... 276

4.7 Differences among ESS, PBSS, and IBSS LANs 276
4.8 Differences between ESS and MBSS LANs 278
4.9 Reference model 279
4.9.1 General 279
4.9.2 Interworking reference model 279
4.9.3 Reference model for supporting multiple MAC sublayers 281
4.9.4 Reference model for multi-band operation 282
4.10 IEEE Std 802.11 and IEEE Std 802.1X-2010 284
4.10.1 General 284
4.10.2 IEEE 802.11 usage of IEEE Std 802.1X-2010 284
4.10.3 Infrastructure functional model overview 284
4.10.3.1 General 284
4.10.3.2 AKM operations with AS 284
4.10.3.3 AKM operations with a password or PSK 287
4.10.3.4 Alternate operations with PSK 288
4.10.3.5 Disassociation 288
4.10.3.6 AKM operations using FILS authentication 288
4.10.4 IBSS functional model description 289
4.10.4.1 General 289
4.10.4.2 Key usage 289
4.10.4.3 Sample IBSS 4-way handshakes 290
4.10.4.4 IBSS IEEE 802.1X example 291
4.10.5 PBSS functional model description 292
4.10.6 Authenticator-to-AS protocol 293
4.10.7 PMKSA caching 293
4.10.8 Protection of group addressed robust Management frames 294

5. MAC service definition 295

5.1 Overview of MAC services 295
5.1.1 Data service 295
5.1.1.1 General 295
5.1.1.2 Determination of UP 295
5.1.1.3 Interpretation of priority parameter in MAC service primitives 295
5.1.1.4 Interpretation of service class parameter in MAC service primitives in a STA 296
5.1.2 Security services 297
5.1.3 MSDU ordering 297
5.1.4 MSDU format 298
5.1.5 MAC data service architecture 299
5.1.5.1 General 299
5.1.5.2 Non-GLK non-AP STA role 302
5.1.5.3 Non-GLK AP role 302
5.1.5.4 Non-GLK mesh STA role 303
5.1.5.5 Mesh gate role 303
5.1.5.6 S1G relay 303
5.1.5.7 GLK STA role 305
5.1.5.8 GLK AP role 305
5.1.5.9 GLK mesh STA role 305
5.2 MAC data service specification 307
5.2.1 General 307
5.2.2 GLK MAC data service specification 307
5.2.3 MA-UNITDATA.request 307
5.2.3.1 Function 307

5.2.3.2 Semantics of the service primitive 307
5.2.3.3 When generated 308
5.2.3.4 Effect of receipt 308
5.2.4 MA-UNITDATA.indication 310
5.2.4.1 Function 310
5.2.4.2 Semantics of the service primitive 310
5.2.4.3 When generated 311
5.2.4.4 Effect of receipt 311
5.2.5 MA-UNITDATA-STATUS.indication 313
5.2.5.1 Function 313
5.2.5.2 Semantics of the service primitive 313
5.2.5.3 When generated 314
5.2.5.4 Effect of receipt 314

6. Layer management 315

6.1 Overview of management model 315
6.2 Generic management primitives 316
6.3 MLME SAP interface 316
6.3.1 Introduction 316
6.3.2 Power management 317
6.3.2.1 Introduction 317
6.3.2.2 MLME-POWERMGT.request 317
6.3.2.3 MLME-POWERMGT.confirm 318
6.3.3 Scan 318
6.3.3.1 Introduction 318
6.3.3.2 MLME-SCAN.request 318
6.3.3.3 MLME-SCAN.confirm 322
6.3.3.4 MLME-SCAN-STOP.request 337
6.3.4 Synchronization 337
6.3.4.1 Introduction 337
6.3.4.2 MLME-JOIN.request 337
6.3.4.3 MLME-JOIN.confirm 340
6.3.5 Authenticate 341
6.3.5.1 Introduction 341
6.3.5.2 MLME-AUTHENTICATE.request 341
6.3.5.3 MLME-AUTHENTICATE.confirm 342
6.3.5.4 MLME-AUTHENTICATE.indication 344
6.3.5.5 MLME-AUTHENTICATE.response 345
6.3.6 Deauthenticate 347
6.3.6.1 Introduction 347
6.3.6.2 MLME-DEAUTHENTICATE.request 347
6.3.6.3 MLME-DEAUTHENTICATE.confirm 347
6.3.6.4 MLME-DEAUTHENTICATE.indication 348
6.3.7 Associate 348
6.3.7.1 Introduction 348
6.3.7.2 MLME-ASSOCIATE.request 349
6.3.7.3 MLME-ASSOCIATE.confirm 352
6.3.7.4 MLME-ASSOCIATE.indication 358
6.3.7.5 MLME-ASSOCIATE.response 363
6.3.8 Reassociate 367
6.3.8.1 Introduction 367
6.3.8.2 MLME-REASSOCIATE.request 367
6.3.8.3 MLME-REASSOCIATE.confirm 371

6.3.8.4 MLME-REASSOCIATE.indication 377
6.3.8.5 MLME-REASSOCIATE.response 383
6.3.9 Disassociate 388
6.3.9.1 MLME-DISASSOCIATE.request 388
6.3.9.2 MLME-DISASSOCIATE.confirm 388
6.3.9.3 MLME-DISASSOCIATE.indication 389
6.3.10 Reset 389
6.3.10.1 Introduction 389
6.3.10.2 MLME-RESET.request 389
6.3.11 Start 390
6.3.11.1 Introduction 390
6.3.11.2 MLME-START.request 390
6.3.11.3 MLME-START.confirm 396
6.3.12 Stop 397
6.3.12.1 General 397
6.3.12.2 MLME-STOP.request 397
6.3.13 Protocol layer model for spectrum management and radio measurement 398
6.3.14 Measurement request 401
6.3.14.1 Introduction 401
6.3.14.2 MLME-MREQUEST.request 401
6.3.14.3 MLME-MREQUEST.indication 402
6.3.15 Channel measurement 403
6.3.15.1 Introduction 403
6.3.15.2 MLME-MEASURE.request 403
6.3.15.3 MLME-MEASURE.confirm 403
6.3.16 Measurement report 404
6.3.16.1 Introduction 404
6.3.16.2 MLME-MREPORT.request 404
6.3.16.3 MLME-MREPORT.indication 405
6.3.17 Channel switch 406
6.3.17.1 MLME-CHANNELSWITCH.request 406
6.3.17.2 MLME-CHANNELSWITCH.confirm 407
6.3.17.3 MLME-CHANNELSWITCH.indication 408
6.3.17.4 MLME-CHANNELSWITCH.response 409
6.3.18 TPC request 410
6.3.18.1 Introduction 410
6.3.18.2 MLME-TPCADAPT.request 410
6.3.18.3 MLME-TPCADAPT.confirm 411
6.3.19 SetKeys 412
6.3.19.1 MLME-SETKEYS.request 412
6.3.20 DeleteKeys 413
6.3.20.1 MLME-DELETEKEYS.request 413
6.3.21 MIC (michael) failure event 414
6.3.21.1 MLME-MICHAELMICFAILURE.indication 414
6.3.22 EAPOL 415
6.3.22.1 MLME-EAPOL.request 415
6.3.22.2 MLME-EAPOL.confirm 416
6.3.23 SetProtection 416
6.3.23.1 MLME-SETPROTECTION.request 416
6.3.24 MLME-PROTECTEDFRAMEDROPPED 417
6.3.24.1 MLME-PROTECTEDFRAMEDROPPED.indication 417
6.3.25 TS management interface 418
6.3.25.1 General 418
6.3.25.2 MLME-ADDTS.request 419

10.1 Introduction ... 1631
10.2 MAC architecture ... 1631
10.2.1 General ... 1631
10.2.2 DCF ... 1633
10.2.3 Hybrid coordination function (HCF) ... 1633
10.2.3.1 General ... 1633
10.2.3.2 HCF contention based channel access (EDCA) ... 1634
10.2.3.3 HCF controlled channel access (HCCA) ... 1637
10.2.4 Mesh coordination function (MCF) ... 1638
10.2.5 Combined use of DCF and HCF ... 1638
10.2.6 Fragmentation/defragmentation overview ... 1638
10.2.7 MAC data service ... 1639
10.3 DCF ... 1640
10.3.1 General ... 1640
10.3.2 Procedures common to the DCF and EDCAF ... 1642
10.3.2.1 CS mechanism ... 1642
10.3.2.2 MAC-level acknowledgments ... 1643
10.3.2.3 IFS ... 1643
10.3.2.4 Setting and resetting the NAV ... 1648
10.3.2.5 Setting and resetting the RID ... 1650
10.3.2.6 RTS/CTS with fragmentation ... 1653
10.3.2.7 VHT and S1G RTS procedure ... 1654
10.3.2.8 CMMG RTS procedure ... 1655
10.3.2.9 CTS and DMG CTS procedure ... 1655
10.3.2.10 Dual CTS protection ... 1657
10.3.2.11 Acknowledgment procedure ... 1660
10.3.2.12 Fragment BA procedure ... 1663
10.3.2.13 MU acknowledgment procedure ... 1664
10.3.2.14 Duplicate detection and recovery ... 1665
10.3.2.15 NAV distribution ... 1669
10.3.2.16 Operation of aSlotTime ... 1670
10.3.2.17 Response Indication procedure ... 1670
10.3.3 Random backoff procedure ... 1672
10.3.4 DCF access procedure ... 1673
10.3.4.1 Introduction ... 1673
10.3.4.2 Basic access ... 1673
10.3.4.3 Backoff procedure for DCF ... 1674
10.3.4.4 Recovery procedures and retransmit limits ... 1677
10.3.4.5 Control of the channel ... 1678
10.3.5 Individually addressed MPDU transfer procedure ... 1679
10.3.6 Group addressed MPDU transfer procedure ... 1679
10.3.7 DCF timing relations ... 1680
10.3.8 Signal extension ... 1683
10.3.9 Determination of PLME aCWmin characteristics ... 1684
10.4 MSDU and MMPDU fragmentation ... 1684
10.5 MSDU and MMPDU defragmentation ... 1685
10.6 Multirate support ... 1686
10.6.1 Overview ... 1686
10.6.2 Basic HT-MCS Set field ... 1687
10.6.3 Basic STBC MCS ... 1687
10.6.4 Basic rate set, basic HT-MCS set, and basic VHT-MCS and NSS set for mesh STA ... 1687
10.6.5 Rate selection for Data and Management frames ... 1688
10.6.5.1 Rate selection for non-STBC Beacon and non-STBC PSMP frames 1688

10.6.5.2 Rate selection for STBC group addressed Data and Management frames ... 1688
10.6.5.3 Rate selection for other group addressed Data and Management frames ... 1688
10.6.5.4 Rate selection for polling frames ... 1689
10.6.5.5 Rate selection for +CF-Ack frames ... 1689
10.6.5.6 Rate selection for Data frames sent within an FMS stream ... 1689
10.6.5.7 Rate selection for other individually addressed Data and Management frames ... 1689
10.6.6 Rate selection for Control frames ... 1691
10.6.6.1 General rules for rate selection for Control frames ... 1691
10.6.6.2 Rate selection for Control frames that initiate a TXOP ... 1692
10.6.6.3 Rate selection for CF-End frames ... 1692
10.6.6.4 Rate selection for Control frames that are not control response frames ... 1693
10.6.6.5 Rate selection for control response frames ... 1694
10.6.6.6 Channel Width selection for Control frames ... 1699
10.6.6.7 Control frame TXVECTOR parameter restrictions ... 1701
10.6.7 Multirate support for DMG STAs ... 1701
10.6.7.1 Usage of DMG Control modulation class ... 1701
10.6.7.2 Rate selection rules for Control frames transmitted by DMG STAs 1702
10.6.7.3 Rate selection for group addressed Data and Management frames transmitted by DMG STAs ... 1702
10.6.7.4 Rate selection for individually addressed Data and Management frames transmitted by DMG STAs ... 1703
10.6.7.5 Rate selection for BRP PPDUs ... 1703
10.6.8 Multirate support for CMMG STAs ... 1704
10.6.8.1 Usage of CMMG Control modulation class ... 1704
10.6.8.2 Rate selection rules for Control frames transmitted by CMMG STAs ... 1704
10.6.8.3 Rate selection for group addressed Data and Management frames transmitted by CMMG STAs ... 1705
10.6.8.4 Rate selection for individually addressed Data and Management frames transmitted by CMMG STAs ... 1705
10.6.8.5 Rate selection for BRP PPDUs for CMMG STAs ... 1706
10.6.9 Multiple BSSID Rate Selection ... 1706
10.6.10 Modulation classes ... 1706
10.6.11 Non-HT basic rate calculation ... 1708
10.6.12 Channel Width in non-HT and non-HT duplicate PPDUs ... 1708
10.6.13 Rate selection constraints for VHT STAs ... 1709
10.6.13.1 Rx Supported VHT-MCS and NSS Set ... 1709
10.6.13.2 Tx Supported VHT-MCS and NSS Set ... 1710
10.6.13.3 Additional rate selection constraints for VHT PPDUs ... 1711
10.6.14 Rate selection constraints for S1G STAs ... 1711
10.6.14.1 RX Supported S1G-MCS and NSS Set ... 1711
10.6.14.2 TX Supported S1G-MCS and NSS Set ... 1712
10.6.14.3 Additional rate selection constraints for S1G PPDUs ... 1712
10.6.15 Rate selection constraints for CMMG STAs ... 1713
10.6.15.1 Rx supported CMMG-MCS and NSS set ... 1713
10.6.15.2 Tx supported CMMG-MCS and NSS set ... 1713
10.7 MSDU transmission restrictions ... 1713
10.8 HT Control field operation ... 1714
10.9 Control Wrapper operation ... 1715
10.10 MSDU processing ... 1715

10.11 A-MSDU operation ... 1715
10.12 A-MPDU operation ... 1719
10.12.1 A-MPDU contents ... 1719
10.12.2 A-MPDU length limit rules ... 1719
10.12.3 Minimum MPDU Start Spacing field ... 1720
10.12.4 A-MPDU aggregation of group addressed Data frames ... 1721
10.12.5 Transport of A-MPDU by the PHY data service ... 1722
10.12.6 A-MPDU padding for VHT PPDU or S1G PPDU ... 1722
10.12.7 Setting the EOF field of the MPDU delimiter ... 1723
10.12.8 Transport of S-MPDUs ... 1724
10.13 PPDU duration constraint ... 1724
10.14 DMG A-PPDU operation ... 1724
10.15 Low-density parity check code (LDPC) operation ... 1725
10.16 STBC operation ... 1725
10.17 Short GI operation ... 1726
10.18 Greenfield operation ... 1729
10.19 Group ID and partial AID in VHT and CMMG PPDUs ... 1729
10.20 S1G dynamic AID assignment operation ... 1731
10.21 Group ID, partial AID, Uplink Indication, and COLOR in S1G PPDUs ... 1733
10.22 Operation across regulatory domains ... 1735
10.22.1 General ... 1735
10.22.2 Operation upon entering a regulatory domain ... 1735
10.22.3 Operation with operating classes ... 1736
10.22.4 Operation with the Transmit Power Envelope element ... 1736
10.22.5 Operation with coverage classes ... 1737
10.23 HCF ... 1737
10.23.1 General ... 1737
10.23.2 HCF contention based channel access (EDCA) ... 1738
10.23.2.1 Reference model ... 1738
10.23.2.2 EDCA backoff procedure ... 1739
10.23.2.3 EDCA TXOPs ... 1741
10.23.2.4 Obtaining an EDCA TXOP ... 1741
10.23.2.5 EDCA channel access in a VHT or TVHT BSS ... 1743
10.23.2.6 EDCA channel access in an S1G BSS ... 1745
10.23.2.7 Sharing an EDCA TXOP ... 1746
10.23.2.8 Multiple frame transmission in an EDCA TXOP ... 1747
10.23.2.9 TXOP limits ... 1750
10.23.2.10 Truncation of TXOP ... 1751
10.23.2.11 Termination of TXOP ... 1753
10.23.2.12 Retransmit procedures ... 1754
10.23.2.13 EDCA channel access in a CMMG BSS ... 1756
10.23.3 HCF controlled channel access (HCCA) ... 1756
10.23.3.1 General ... 1756
10.23.3.2 HCCA procedure ... 1757
10.23.3.3 HCCA TXOP structure and timing ... 1759
10.23.3.4 NAV operation of a TXOP under HCCA ... 1760
10.23.3.5 HCCA transfer rules ... 1761
10.23.4 Admission control at the HC ... 1763
10.23.4.1 General ... 1763
10.23.4.2 Contention based admission control procedures ... 1763
10.23.4.3 Controlled-access admission control ... 1765
10.23.5 Restricted access window (RAW) operation ... 1767

10.23.5.5 EDCA backoff procedure in generic RAW or triggering frame RAW ... 1772
10.23.5.6 EDCA backoff procedure in RAWs other than generic or triggering frame RAW ... 1772
10.23.5.7 RAW Operation with Resource Allocation frame ... 1773
10.23.5.8 Periodic RAW (PRAW) operation ... 1773
10.24 Mesh coordination function (MCF) ... 1774
10.24.1 General ... 1774
10.24.2 MCF contention based channel access ... 1775
10.24.3 MCF controlled channel access (MCCA) ... 1775
10.24.3.1 General ... 1775
10.24.3.2 MCCA activation ... 1775
10.24.3.3 MCCAOP reservations ... 1776
10.24.3.4 Neighborhood MCCAOP periods at a mesh STA ... 1777
10.24.3.5 MCCA access fraction (MAF) ... 1777
10.24.3.6 MCCAOP setup procedure ... 1778
10.24.3.7 MCCAOP advertisement ... 1779
10.24.3.8 MCCAOP teardown ... 1783
10.24.3.9 Access during MCCAOPs ... 1784
10.24.3.10 Interaction with time synchronization ... 1786
10.25 Block acknowledgment (block ack) ... 1786
10.25.1 Introduction ... 1786
10.25.2 Setup and modification of the block ack parameters ... 1787
10.25.3 Data and acknowledgment transfer using immediate block ack policy ... 1789
10.25.4 Teardown of the block ack mechanism ... 1789
10.25.5 Selection of BlockAck and BlockAckReq variants ... 1789
10.25.6 HT-immediate block ack extensions ... 1791
10.25.6.1 Introduction to HT-immediate block ack extensions ... 1791
10.25.6.2 HT-immediate block ack architecture ... 1791
10.25.6.3 Scoreboard context control during full-state operation ... 1792
10.25.6.4 Scoreboard context control during partial-state operation ... 1793
10.25.6.5 Generation and transmission of BlockAck frames by an HT STA, DMG STA, or S1G STA ... 1794
10.25.6.6 Receive reordering buffer control operation ... 1795
10.25.6.7 Originator's behavior ... 1797
10.25.6.8 Maintaining block ack state at the originator ... 1798
10.25.6.9 Originator's support of recipient's partial state ... 1799
10.25.7 Protected block ack agreement ... 1799
10.25.8 GCR and GLK-GCR block ack ... 1800
10.25.8.1 Introduction ... 1800
10.25.8.2 Scoreboard context control during GCR block ack ... 1800
10.25.8.3 Scoreboard context control during GLK-GCR block ack ... 1801
10.25.8.4 GCR block ack BlockAckReq and BlockAck frame exchanges ... 1802
10.25.9 DMG block ack with flow control ... 1804
10.25.9.1 General ... 1804
10.25.9.2 DMG block ack architecture with flow control ... 1804
10.25.9.3 Scoreboard context control with flow control ... 1805
10.25.9.4 Receive Reordering Buffer with flow control operation ... 1805
10.25.9.5 Generation and transmission of BlockAck frame by a STA with flow control ... 1807
10.25.9.6 Originator's behavior with flow control support ... 1808
10.26 No Acknowledgment (No Ack) ... 1808

12.2 Framework 2439
12.2.1 Classes of security algorithm 2439
12.2.2 Security methods 2439
12.2.3 RSNA STA capabilities 2439
12.2.4 RSNA establishment 2440
12.2.5 RSNA assumptions and constraints 2442
12.2.6 Requirements for the Protected Frame field 2443
12.2.7 Requirements for management frame protection 2443
12.2.8 Emergency service establishment in an RSN 2443
12.2.9 Requirements for Operating Channel Validation 2443
12.2.10 Requirements for support of MAC privacy enhancements 2444
12.3 Pre-RSNA security methods 2445
12.3.1 Status of Pre-RSNA security methods 2445
12.3.2 Wired equivalent privacy (WEP) 2445
12.3.2.1 WEP overview 2445
12.3.2.2 WEP MPDU format 2446
12.3.2.3 WEP state 2446
12.3.2.4 WEP procedures 2447
12.3.3 Pre-RSNA authentication 2448
12.3.3.1 Overview 2448
12.3.3.2 Open System authentication 2449
12.3.3.3 Shared Key authentication 2449
12.4 Authentication using a password 2453
12.4.1 SAE overview 2453
12.4.2 Assumptions on SAE 2453
12.4.3 Representation of a password 2454
12.4.4 Finite cyclic groups 2454
12.4.4.1 General 2454
12.4.4.2 Elliptic curve cryptography (ECC) groups 2455
12.4.4.3 Finite field cryptography (FFC) groups 2460
12.4.5 SAE protocol 2462
12.4.5.1 Message exchanges 2462
12.4.5.2 PWE and secret generation 2463
12.4.5.3 Construction of an SAE Commit message 2463
12.4.5.4 Processing of a peer's SAE Commit message 2464
12.4.5.5 Construction of an SAE Confirm message 2465
12.4.5.6 Processing of a peer's SAE Confirm message 2465
12.4.6 Anti-clogging tokens 2465
12.4.7 Framing of SAE 2466
12.4.7.1 General 2466
12.4.7.2 Data type conversion 2466
12.4.7.3 Authentication transaction sequence number for SAE 2467
12.4.7.4 Encoding and decoding of SAE Commit messages 2467
12.4.7.5 Encoding and decoding of SAE Confirm messages 2468
12.4.7.6 Status codes 2468
12.4.8 SAE finite state machine 2468
12.4.8.1 General 2468

14.13.1 TSF for MBSSs 2730
14.13.2 Extensible synchronization framework 2730
14.13.2.1 General 2730
14.13.2.2 Neighbor offset synchronization method 2731
14.13.3 Beaconing 2733
14.13.3.1 Beacon generation in MBSSs 2733
14.13.3.2 Beacon reception for mesh STA 2733
14.13.4 Mesh beacon collision avoidance (MBCA) 2734
14.13.4.1 Overview 2734
14.13.4.2 Beacon timing advertisement 2734
14.13.4.3 TBTT selection 2737
14.13.4.4 TBTT adjustment 2738
14.13.4.5 Frame transmission across reported TBTT 2739
14.13.4.6 Delayed beacon transmissions 2740
14.14 Power save in a mesh BSS 2740
14.14.1 General 2740
14.14.2 Mesh power management modes 2740
14.14.2.1 General 2740
14.14.2.2 Peer-specific mesh power management modes 2741
14.14.2.3 Nonpeer mesh power management modes 2742
14.14.3 Mesh power management mode indications and transitions 2742
14.14.3.1 General 2742
14.14.3.2 Transition to a higher activity level 2743
14.14.3.3 Transition to a lower activity level 2743
14.14.4 TIM transmissions in an MBSS 2743
14.14.5 TIM types 2743
14.14.6 Mesh awake window 2744
14.14.7 Power save support 2744
14.14.8 Operation in peer-specific and nonpeer mesh power management modes 2745
14.14.8.1 General 2745
14.14.8.2 Operation in active mode 2745
14.14.8.3 Operation in deep sleep mode for nonpeer mesh STAs 2745
14.14.8.4 Operation in light sleep mode for a mesh peering 2746
14.14.8.5 Operation in deep sleep mode for a mesh peering 2746
14.14.8.6 Conditions for doze state 2746
14.14.9 Mesh peer service periods 2746
14.14.9.1 General 2746
14.14.9.2 Initiation of a mesh peer service period 2747
14.14.9.3 Operation during a mesh peer service period 2748
14.14.9.4 Termination of a mesh peer service period 2748
14.14.10 MCCA use by power saving mesh STA 2748

15. DSSS PHY specification for the 2.4 GHz band designated for ISM applications 2749

15.1 Overview 2749
15.1.1 General 2749
15.1.2 Scope of DSSS PHY services 2749
15.1.3 DSSS PHY functions 2749
15.1.3.1 General 2749
15.1.3.2 PLME 2749
15.1.4 Service specification method and notation 2749
15.2 DSSS PHY specific service parameter list 2750
15.2.1 Introduction 2750
15.2.2 TXVECTOR parameters 2750
15.2.2.1 General 2750
15.2.2.2 TXVECTOR LENGTH 2750
15.2.2.3 TXVECTOR DATARATE 2750
15.2.2.4 TXVECTOR SERVICE 2750
15.2.2.5 TXVECTOR TXPWR_LEVEL_INDEX 2751
15.2.2.6 TXVECTOR TIME_OF_DEPARTURE_REQUESTED 2751
15.2.2.7 TXVECTOR TX_ANTENNA 2751
15.2.3 RXVECTOR parameters 2751
15.2.3.1 General 2751
15.2.3.2 RXVECTOR LENGTH 2751
15.2.3.3 RXVECTOR RSSI 2751
15.2.3.4 RXVECTOR SIGNAL 2752
15.2.3.5 RXVECTOR SERVICE 2752
15.2.3.6 PHY-RXEND.indication parameter RCPI 2752
15.2.3.7 RXVECTOR SQ 2752
15.2.3.8 RXVECTOR RX_ANTENNA 2752
15.2.4 TXSTATUS parameters 2752
15.2.4.1 General 2752
15.2.4.2 TXSTATUS TIME_OF_DEPARTURE 2753
15.2.4.3 TXSTATUS TIME_OF_DEPARTURE_ClockRate 2753
15.3 DSSS PHY 2753
15.3.1 Overview 2753
15.3.2 PPDU format 2753
15.3.3 PHY field definitions 2754
15.3.3.1 General 2754
15.3.3.2 PHY SYNC field 2754
15.3.3.3 PHY SFD 2754
15.3.3.4 PHY SIGNAL field 2754
15.3.3.5 PHY SERVICE field 2754
15.3.3.6 PHY LENGTH field 2754
15.3.3.7 PHY CRC field 2755
15.3.4 PHY/DSSS PHY data scrambler and descrambler 2756
15.3.5 PHY data modulation and modulation rate change 2757
15.3.6 Transmit PHY 2757
15.3.7 Receive PHY 2759
15.4 DSSS PLME 2762
15.4.1 PLME SAP sublayer management primitives 2762
15.4.2 DSSS PHY MIB 2763
15.4.3 DSSS PHY 2763
15.4.4 PHY operating specifications, general 2764
15.4.4.1 General 2764
15.4.4.2 Operating frequency range 2764

Annex F (normative) HT LDPC matrix definitions ... 4130

Annex G (normative) Frame exchange sequences ... 4133
G.1 General ... 4133
G.2 Basic sequences ... 4135
G.3 EDCA and HCCA sequences ... 4135
G.4 HT, VHT, and S1G sequences ... 4138

Annex H (normative) Usage of Ethertype 89-0d ... 4148

Annex I (informative) Examples of encoding a frame for OFDM PHYs and DMG PHYs ... 4149
I.1 Example 1—BCC encoding ... 4149
I.1.1 Introduction ... 4149
I.1.2 The message for the BCC example ... 4150
I.1.3 Generation of the preamble ... 4151
I.1.4 Generation of the SIGNAL field ... 4156
I.1.5 Generating the DATA bits for the BCC example ... 4160
I.1.6 Generating the first DATA symbol for the BCC example ... 4164
I.1.7 Generating the additional DATA symbols ... 4170
I.1.8 The entire packet for the BCC example ... 4170
I.2 Generating encoded DATA bits—LDPC example 1 ... 4178
I.2.1 General ... 4178
I.2.2 The message for LDPC example 1 ... 4178
I.2.3 Prepending the SERVICE field for LDPC example 1 ... 4180
I.2.4 Scrambling LDPC example 1 ... 4181
I.2.5 Inserting shortening bits for LDPC example 1 ... 4182
I.2.6 Encoding data for LDPC example 1 ... 4185
I.2.7 Removing shortening bits and puncturing for LDPC example 1 ... 4187
I.3 Generating encoded DATA bits—LDPC example 2 ... 4189
I.3.1 General ... 4189
I.3.2 The message for LDPC example 2 ... 4190
I.3.3 Prepending the SERVICE field for LDPC example 2 ... 4191
I.3.4 Scrambling LDPC example 2 ... 4193
I.3.5 Inserting the shortening bits for LDPC example 2 ... 4195
I.3.6 Encoding the data for LDPC example 2 ... 4197
I.3.7 Removing shortening bits and repetition for LDPC example 2 ... 4200
I.4 DMG example data vectors ... 4204
I.5 DMG Example 1—DMG control mode encoding ... 4205
I.5.1 DMG control mode preamble ... 4205
I.5.2 Control mode header ... 4205
I.5.3 DMG control mode payload ... 4208
I.6 DMG Example 2—DMG SC mode encoding ... 4209
I.6.1 DMG SC mode preamble ... 4209
I.6.2 DMG SC mode header ... 4209
I.6.3 DMG SC mode payload ... 4212
I.7 DMG Example 3—DMG low-power SC mode encoding ... 4217
I.7.1 DMG low-power SC mode preamble ... 4217
I.7.2 DMG low-power SC mode header ... 4217
I.7.3 DMG low-power SC mode MCS 26 payload ... 4217
I.7.4 DMG low-power SC mode MCS 30 payload ... 4219

R.5.4 Description of the Expedited Bandwidth Request element ... 4342
R.5.5 Access to emergency services in an RSN ... 4342
R.6 Peer information ... 4343
R.7 Calculating Estimated Throughput ... 4344

Annex S (informative) Mesh BSS operation ... 4347
S.1 Clarification of mesh Data frame format ... 4347
S.2 Operational considerations for interworking ... 4347
S.3 Power save parameters selection ... 4347
S.3.1 General ... 4347
S.3.2 Selecting the mesh power management mode based on traffic load ... 4348
S.3.3 Scanning of mesh BSSs ... 4348
S.3.4 Default parameters ... 4349
S.3.5 MSDU forwarding in an MBSS containing mesh STAs in light or deep sleep mode ... 4349
S.3.6 Synchronization maintenance of mesh STAs in deep sleep mode ... 4349
S.4 SIV key wrapping test vector ... 4350
S.5 Airtime link metric usage example ... 4351
S.6 Link metric report example ... 4351
S.7 Generation of proactive PREP elements in the proactive PREQ mechanism of HWMP ... 4352
S.7.1 General ... 4352
S.7.2 Additions to forwarding information ... 4352
S.7.3 Actions when sending Data frames as source mesh STA ... 4352
S.7.4 Actions on receipt of a proactive PREQ element ... 4353
S.7.5 Generation of proactive PREP elements ... 4353
S.8 Generation of PREQ elements in proactive RANN mechanism of HWMP ... 4353
S.8.1 General ... 4353
S.8.2 Additions to forwarding information ... 4353
S.8.3 Actions when sending Data frames as source mesh STA ... 4354
S.8.4 Actions on receipt of proactive RANN element ... 4354
S.8.5 Actions on receipt of a PREP element ... 4354

Annex T (informative) Overlapping BSS (OBSS) management ... 4355
T.1 Introduction ... 4355
T.2 QLoad Report element ... 4355
T.2.1 General ... 4355
T.2.2 Calculating medium time ... 4356
T.2.3 Calculation of potential traffic self ... 4356
T.2.4 Calculation of allocated traffic self ... 4358
T.2.5 Calculation of allocated traffic shared ... 4359
T.2.6 Calculation of EDCA Access Factor ... 4359
T.2.7 EDCA Overhead Factor ... 4360
T.2.8 Calculation of HCCA Access Factor ... 4360
T.3 Channel selection using QLoad report ... 4361
T.3.1 General ... 4361
T.3.2 AP with admission control mandatory ... 4361
T.3.3 AP with an HC ... 4361
T.3.4 Channel selection procedures ... 4362
T.4 Sharing in an OBSS situation ... 4363
T.4.1 General ... 4363
T.4.2 Sharing schemes ... 4364
T.5 Mitigating consequences of OBSS sharing in presence of noncollaborating devices ... 4366

IEEE Standard for Information Technology—
Telecommunications and Information Exchange between Systems
Local and Metropolitan Area Networks—
Specific Requirements

Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications

1. Overview

1.1 Scope

The scope of this standard is to define one medium access control (MAC) and several physical layer (PHY) specifications for wireless connectivity for fixed, portable, and moving stations (STAs) within a local area.

1.2 Purpose

The purpose of this standard is to provide wireless connectivity for fixed, portable, and moving stations within a local area. This standard also offers regulatory bodies a means of standardizing access to one or more frequency bands for the purpose of local area communication.

1.3 Supplementary information on purpose

Specifically, in the context of IEEE 802.11™-compliant devices, this standard

- Describes the functions and services required by a device to operate within independent, personal, and infrastructure networks as well as the aspects of device mobility (transition) within those networks.
- Describes the functions and services that allow a device to communicate directly with another such device outside of an independent or infrastructure network.
- Defines the MAC procedures to support the MAC service data unit (MSDU) delivery services.
- Defines several PHY signaling techniques and interface functions that are controlled by the MAC.
- Permits the operation of a device within a wireless local area network (WLAN) that coexists with multiple overlapping IEEE 802.11 WLANs.
- Describes the requirements and procedures to provide data confidentiality of user information and MAC management information being transferred over the wireless medium (WM) and authentication of devices.
- Defines mechanisms for dynamic frequency selection (DFS) and transmit power control (TPC) that may be used to satisfy regulatory requirements for operation in any band.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

- Defines the MAC procedures to support local area network (LAN) applications with quality-of-service (QoS) requirements, including the transport of voice, audio, and video.
- Defines mechanisms and services for wireless network management of devices that include BSS transition management, channel usage and coexistence, collocated interference reporting, diagnostic, multicast diagnostic and event reporting, flexible multicast, efficient beacon mechanisms, proxy ARP advertisement, location, timing measurement, directed multicast, extended sleep modes, traffic filtering, and management notification.
- Defines functions and procedures aiding network discovery and selection by devices, information transfer from external networks using QoS mapping, and a general mechanism for the provision of emergency services.
- Defines the MAC procedures that are necessary for wireless multi-hop communication to support wireless LAN mesh topologies.
- Defines medium access control mechanisms to support the prioritization of Management frames.
- Defines mechanisms to improve audio video (AV) streaming QoS while maintaining data and voice performance.
- Defines the PHY signaling, MAC, and beamforming procedures required for operation with directional antenna patterns.
- Defines the PHY and MAC enhancements to enable operation in the Chinese millimeter wave frequency bands (60 GHz and 45 GHz).
- Defines the mechanisms for communications over the wireless medium used as a link in an IEEE 802.1Q™ bridged network.
- Defines mechanisms to enable delivery of preassociation service discovery information to IEEE 802.11 stations (STAs).

1.4 Word usage

In this document, the word *shall* is used to indicate a mandatory requirement. The word *should* is used to indicate a recommendation. The word *may* is used to indicate a permissible action. The word *can* is used for statements of possibility and capability.

The construction "between *x* and *y*", "*x* to *y*" or "*x*-*y*" represents an inclusive range (i.e., the range includes both values *x* and *y*).

The construction "up to *y*" represents an inclusive upper bound (i.e., the range includes the value *y).*

Any action specified as relating to a SAP primitive is to be interpreted as an action on an invocation or instance of that primitive.

If <x> represents a scalar field, scalar subfield, scalar parameter or scalar MIB attribute:

- if "<x> is" is used in a context that relates to the testing or setting the value of "<x>" this usage is to be interpreted as though written "the value of <x> is"
- "<x> indicate(s)" is to be interpreted as though written "the value of <x> indicate(s)"
- "indicated by <x>" is to be interpreted as though written "indicated by the value of <x>"
- "<x> that indicate" is to be interpreted as though written "<x> whose value indicates"

If <x> represents a frame, element, subelement, structured field, structured subfield, structured parameter or structured MIB attribute:

- "<x> indicate(s)" is to be interpreted as though written "the contents of <x> indicate"
- "indicated by <x>" is to be interpreted as though written "indicated by the contents of <x>"
- "<x> that indicate" is to be interpreted as though written "<x> whose contents indicate"

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If <x> represents a SAP primitive:

— "<x> indicate(s)" is to be interpreted as though written "the (or an) invocation of <x> indicates"

— "indicated by <x">" is to be interpreted as though written "indicated by the (or an) invocation of <x>"

The construction of descriptions for uses of the SHA family of hash algorithms [HMAC-]SHA-<1,256,384>[-*n*] is used to refer to hash algorithms/HMACs where square brackets indicate optional information, and *n* is an integer indicating the length, in bits, of the output when truncating.

A construction of the form "the x element can be included in a, b and c frames" or "the x element can be present in a, b and c frames" is not to be understood as being a complete list of frames in which the element might be present.

Constructions of the form that a frame, MPDU or A-MPDU is transmitted with a certain TXVECTOR parameter, or received with a certain RXVECTOR parameter, are to be understood as referring to the TXVECTOR or RXVECTOR parameter, respectively, corresponding to the PSDU containing the frame, MPDU or A-MPDU. Similarly, constructions of the form that a PPDU is transmitted with a certain TXVECTOR parameter, or received with a certain RXVECTOR parameter, are to be understood as referring to the TXVECTOR or RXVECTOR parameter, respectively, corresponding to the PSDU contained in the PPDU.

References in this standard to a "<name> frame", where <name> corresponds to one of the Management frame subtypes, are to be understood as being to a "<name> MMPDU, where the MMPDU is carried in the frame body of one or more Management frames with the Subtype field value corresponding to <name>, plus information from the MPDU headers (the Management frame subtype and the addresses)".

References in this standard to a "<name> request", where <name> corresponds to one of the Measurement Types in Table 9-98 is equivalent to (according to context) a) "a Spectrum Measurement Request frame or Radio Measurement Request frame carrying a Measurement Request element with the Measurement Type field equal to <name>" or b) "a Measurement Request element with the measurement type field equal to <name>".

An ASCII or UTF-8 string is a sequence of ASCII or UTF-8 encoded code points, respectively, without a terminating null.

References in this standard to "<adjective> STA" correspond to a specific instance of a STA implementation that will statically support and execute the <adjective> feature or role for the lifetime of the instance. Such a STA implementation may be capable of a different configuration where <adjective> is not supported (or even a mutually exclusive state is supported instead), but the switch from support to nonsupport of <adjective> is beyond the scope of this standard. The <adjective> support is to be understood as static for the lifetime of the instance, unless explicitly discussed otherwise.

References in this standard to "FILS authentication frame" or "SAE authentication frame" are to be understood as references to an Authentication frame that contains fields and elements for FILS or SAE (respectively) operation per Table 9-41.

1.5 Terminology for mathematical, logical, and bit operations

Floor (x), also written as $\lfloor x \rfloor$, is the largest integer smaller than or equal to x. For example, Floor (2.3) is 2 and Floor (–2.3) is –3. The two parameter form, Floor (x, y), is the largest multiple of y smaller than or equal to x; this operator is not used in this standard if y is negative. For example, Floor (3.3, 2) is 2 and Floor (–3.3, 2) is –4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Ceil (x), also written as $\lceil x \rceil$ is the smallest integer larger than or equal to x. For example, Ceil (2.3) is 3 and Ceil (–2.3) is –2. The two parameter form, Ceil (x, y), is the smallest multiple of y larger than or equal to x; this operator is not used in this standard if y is negative. For example, Ceil (2.3, 2) is 4 and Ceil (–2.3, 2) is –2.

Round (x) is the integer closest to x, rounding values with a fractional part of 0.5 away from zero. For example, Round (2.3) is 2, Round (2.5) is 3, Round (–2.3) is –2 and Round (–2.5) is –3.

x mod y is the remainder when x is divided by y; this operator is not used in this standard if y is negative; the result is positive even if x is negative. For example, 5 mod 3 is 2 and –5 mod 3 is 1.

The symbol ⊕ represents bitwise exclusive OR (XOR).

log2 (x) is the logarithm of x to the base 2. For example, log2 (32) is 5.

Re (z) is the real part of complex number z. Im (z) is the imaginary part of complex number z (not including the factor i). For example, Re ($1 – 2i$) is 1 and Im ($1 – 2i$) is –2.

x && y is the short-circuiting Boolean AND.

x || y is the concatenation of x and y, except in code, where it sometimes is the short-circuiting Boolean OR (as determined by the context).

!x is the Boolean NOT.

x >> y is x logically shifted right (i.e., zeros are inserted at the most significant end) by y; this operator is not used in this standard if y is negative.

x << y is x shifted left (i.e., zeros are inserted at the least significant end) by y; this operator is not used in this standard if y is negative.

x == y is Boolean equality.

x != y Boolean inequality.

x & y, where x and y are numbers, is the bitwise AND of x and y.

x | y, where x and y are numbers, is the bitwise OR of x and y.

0x introduces a hexadecimal number. For example, 0x12 is 18 decimal.

L(S, F, N) is bits F to F+N–1 of the bit string S starting from the left, using the IEEE 802.11 bit conventions from 9.2.2.

Truncate-N(S) is bits 0 to N–1 of the bit string S starting from the left, using the IEEE 802.11 bit conventions from 9.2.2). Other bits are irretrievably deleted.

exp(x) is e to the power x, where e is the base of natural logarithms.

A[b:c] is the bit string consisting of bits b to c of A, where bit 0 of the output is the value of bit b. This operator is not used in this standard with b larger than c.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

int(*S*) is the numeric value of bit string *S*, where bit 0 of S is the least significant bit, using the IEEE 802.11 bit conventions from 9.2.2.

NOTE—The *int* operator applied to a (portion of a) MAC address implies that octet 0 of the MAC address is the least significant octet under this operator.[1]

bin[*x*, *k*] is the operator that casts decimal value *x* into *k* bits binary vector, where *x* is less than 2^k.

[1] NOTEs in text, tables, and figures of a standard are given for information only and do not contain requirements needed to implement the standard. Lettered footnotes to tables and figures, however, are normative.

3. Definitions, acronyms, and abbreviations

3.1 Definitions

For the purposes of this standard, the following terms and definitions apply. The *IEEE Standards Dictionary Online* should be referenced for terms not defined in this clause.[15]

access control: The prevention of unauthorized usage of resources.

access point (AP): An entity that contains one station (STA) and provides access to the distribution system services, via the wireless medium (WM) for associated STAs. An AP comprises a STA and a distribution system access function (DSAF).

access point (AP) reachability: An AP is reachable by a station (STA) if preauthentication messages can be exchanged between the STA and the target AP via the distribution system (DS).

NOTE—Preauthentication is defined in 12.6.10.2.

additional authentication data (AAD): Data that are not encrypted, but are cryptographically protected.

admission control: An algorithm intended to prevent the violation of parameterized service commitments made by the network to admitted flows by controlling the admittance of a new flow into a resource constrained network.

aggregate medium access control (MAC) protocol data unit (A-MPDU): A structure that contains one or more MPDUs and is transported by a physical layer (PHY) as a single PHY service data unit (PSDU).

aggregate medium access control (MAC) protocol data unit (A-MPDU) subframe: A portion of an A-MPDU that contains a delimiter and optionally contains an MPDU plus any necessary padding.

aggregate medium access control (MAC) service data unit (A-MSDU): A structure that contains one or more MSDUs and is transported within a single (unfragmented) data medium access control (MAC) protocol data unit (MPDU).

aggregate medium access control (MAC) service data unit (A-MSDU) subframe: A portion of an A-MSDU that contains a header and associated MSDU.

antenna connector: The measurement point of reference for radio frequency (RF) measurements in a station (STA). The antenna connector is the point in the STA architecture representing the input of the receiver (output of the antenna) for radio reception and the input of the antenna (output of the transmitter) for radio transmission. In systems using multiple antennas or antenna arrays, the antenna connector is a virtual point representing the aggregate output of (or input to) the multiple antennas. In systems using active antenna arrays with processing, the antenna connector is the output of the active array, which includes any processing gain of the active antenna subsystem.

antenna selection (ASEL) receiver: A station (STA) that performs receive ASEL.

antenna selection (ASEL) transmitter: A station (STA) that performs transmit ASEL.

[14] OMA publications are available from the Open Mobile Alliance (http://openmobilealliance.org/).

[15] *IEEE Standards Dictionary Online* is available at http://dictionary.ieee.org/. An IEEE account is required for access to the dictionary, and one can be created at no charge on the dictionary sign-in page.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

antenna weight vector (AWV): A vector of weights describing the excitation (amplitude and phase) for each element of an antenna array.

association: The service used to establish a mapping between an access point (AP) or personal basic service set (PBSS) control point (PCP), and a station (STA) and enable STA invocation of the distribution system services (DSSs).

authenticated encryption with associated data (AEAD): A cipher mode that performs authenticated encryption of a plaintext, with associated data that is authenticated but not encrypted.

authentication: The service used to establish the identity of one station (STA) as a member of the set of STAs authorized to associate with another STA.

Authentication Server (AS): An entity that provides an authentication service to an Authenticator. This service determines, from the credentials provided by the Supplicant, whether the Supplicant is authorized to access the services provided by the Authenticator. (IEEE Std 802.1X-2010[16])

Authenticator: An entity at one end of a point-to-point local area network (LAN) segment that facilitates authentication of the entity attached to the other end of that link. (IEEE Std 802.1X-2010)

authenticator address (AA): The medium access control (MAC) address of the IEEE 802.1X Authenticator's STA.

authorization: The act of determining whether a particular right, such as access to a resource, is granted to an entity.

NOTE—See IETF RFC 2903 [B35].

authorized: To be explicitly allowed.

average noise plus interference power indicator (ANIPI): A medium access control (MAC) indication of the average noise plus interference power measured on a channel that meets the two simultaneous conditions: 1) the station (STA) is not transmitting a frame, and 2) the station (STA) is not receiving a frame addressed to it.

azimuth: The horizontal orientation of the front surface of a station or of a radio antenna system's main lobe measured clockwise from true north.

basic service area (BSA): The area containing the members of a basic service set (BSS). It might contain members of other BSSs.

basic service set (BSS): A set of stations (STAs) that have successfully synchronized using the JOIN service primitives[17] and one STA that has used the START primitive. Alternatively, a set of STAs that have used the START primitive specifying matching mesh profiles where the match of the mesh profiles has been verified via the scanning procedure. Membership in a BSS does not imply that wireless communication with all other members of the BSS is possible.

basic service set (BSS) max idle period: A time period during which the access point (AP) does not disassociate a station (STA) due to nonreceipt of frames from that STA.

[16] Information on references can be found in Clause 2.
[17] Description of these primitives can be found in 6.3.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

basic service set (BSS) transition: Change of association by a station (STA) from one BSS to another BSS in the same extended service set (ESS).

beamformee: A station (STA) that receives a physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix.

beamformer: A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

beamforming: A spatial filtering mechanism used at a transmitter to improve the received signal power or signal-to-noise ratio (SNR) at an intended receiver. *Syn:* **beam steering**.

beamforming steering matrix: A matrix determined using knowledge of the channel between a transmitter and an intended receiver that maps from space-time streams to transmit antennas with the goal of improving the signal power or signal-to-noise ratio (SNR) at the intended receiver.

beacon integrity group temporal key (BIGTK): A random value, assigned by the access point (AP), that is used to protect Beacon frames from that AP.

big endian: The concept that, for a given multi-octet numeric representation, the most significant octet has the lowest address.

broadcast address: A unique group address that specifies all stations (STAs).

calibration initiator: A station (STA) that initiates a calibration sequence.

calibration responder: A station (STA) that transmits during a calibration sequence in response to a transmission by a calibration initiator.

candidate peer mesh station (STA): A neighbor mesh STA to which a mesh peering has not been established but meets eligibility requirements to become a peer mesh STA.

certificate authority (CA): An entity that vouches for the binding between a device's identity, its public key, and associated keying material (such as key validity period and key usage).

channel: An instance of wireless medium (WM) use for the purpose of passing physical layer (PHY) protocol data units (PDUs) between two or more stations (STAs).

channel spacing: The difference between the center frequencies of two nonoverlapping and adjacent channels of the radio transmitter.

cipher suite: A set of one or more algorithms, designed to provide data confidentiality, data authenticity or integrity, and/or replay protection.

clear channel assessment (CCA) function: The logical function in the physical layer (PHY) that determines the current state of use of the wireless medium (WM).

collocated interference: Interference that is caused by another radio or station (STA) emitting radio energy located in the same physical device as the reporting STA, where the reported characteristics of the interference are known a priori without interference detection, measurement, or characterization by the reporting STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

collocated radio: A radio capable of emitting radio-frequency energy located in the same physical device as the reporting station (STA), where the radio's type and some link characteristics are known without signal detection or measurement by the reporting STA.

configuration profile: A collection of parameters identified by a profile identifier (ID) that represent a current or available configuration of a station (STA).

contiguous transmission: A transmission that uses only one frequency segment.

coordination function: The logical function that determines when a station (STA) is permitted to transmit protocol data units (PDUs) via the wireless medium (WM).

counter mode with cipher-block chaining message authentication code (CCM): A symmetric key block cipher mode providing confidentiality using counter mode (CTR) and data origin authenticity using cipher-block chaining message authentication code (CBC-MAC).

NOTE—See IETF RFC 3610.

cryptographic encapsulation: The process of generating the cryptographic payload from the plaintext data. This comprises the cipher text as well as any associated cryptographic state required by the receiver of the data, e.g., initialization vectors (IVs), sequence numbers, message integrity codes (MICs), key identifiers.

data confidentiality: A property of information that prevents disclosure to unauthorized individuals, entities, or processes.

deauthentication service: The service that voids an existing authentication relationship.

decapsulate: To recover an unprotected frame from a protected one.

decapsulation: The process of generating plaintext data by decapsulating an encapsulated frame.

dependent station (STA): A STA that is not registered and whose operational parameters are dictated by messages it receives from an enabling STA. Once enabled by the dynamic STA enablement (DSE) process, a dependent STA's continued operation becomes contingent upon being able to receive messages from its enabling STA over the wireless medium (WM).

destination mesh station (STA): A mesh STA that is the final destination of a MAC service data unit (MSDU). This mesh STA might reside in a proxy mesh gate that might forward the MSDU to a STA outside of the mesh basic service set (MBSS). A destination mesh STA might be an end station as defined in IEEE Std 802.

direct link: A bidirectional link from one quality-of-service (QoS) station (STA) to another QoS STA operating in the same infrastructure QoS basic service set (BSS) that does not pass through a QoS access point (AP). Once a direct link has been set up, all frames between the two QoS STAs are exchanged directly.

directed frame: *See:* **individually addressed**.

directed multicast service (DMS): A service in which the access point (AP) transmits group addressed frames as individually addressed frames to the requesting non-AP station (STA).

disassociation service: The service that removes an existing association.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

distributed coordination function (DCF): A class of coordination function where the same coordination function logic is active in every station (STA) in the basic service set (BSS) whenever the network is in operation.

distribution system (DS): A system used to interconnect a set of basic service sets (BSSs) and integrated local area networks (LANs) to create an extended service set (ESS).

distribution system access function (DSAF): A function within an access point (AP) or mesh gate that uses the medium access control (MAC) service and distribution system service (DSS) to provide access between the distribution system (DS) and the wireless medium (WM). Within a general link (GLK) AP or GLK mesh station (STA), the DSAF also switches GLK traffic to the GLK convergence function and from there to the IEEE 802.1Q bridge port.

distribution system medium (DSM): The medium or set of media used by a distribution system (DS) for communications between access points (APs), mesh gates, and the portal of an extended service set (ESS).

distribution system service (DSS): The set of services provided by the distribution system (DS) that enable the medium access control (MAC) to transport MAC service tuples between stations (STAs) that are not in direct communication with each other over a single instance of the wireless medium (WM).

NOTE 1—These services include transport of MAC service tuples between the access points (APs) of basic service sets (BSSs) within an extended service set (ESS), transport of MAC service tuples between the portal and BSSs within an ESS, transport of MAC service tuples between mesh gates in the same or different mesh basic service sets (MBSSs), transport of MAC service tuples between mesh gates and APs, transport of MAC service tuples between mesh gates and a portal, and transport of MAC service tuples between STAs in the same BSS when the MAC service tuples has a group destination address or the destination is an individual address and the STA is associated with an AP.

NOTE 2—DSSs are provided between pairs of MACs not on the same instance of the WM.

dynamic frequency selection (DFS): Facilities mandated to satisfy requirements in some regulatory domains for radar detection and uniform channel spreading in the 5 GHz band. These facilities might also be used for other purposes, such as automatic frequency planning.

dynamic station (STA) enablement (DSE): The process by which an enabling STA grants permission and dictates operational procedures to STAs that are subject to its control.

effective isotropic radiated power (EIRP): The equivalent power of a transmitted signal in terms of an isotropic (omnidirectional) radiator. The EIRP equals the product of the transmitter power and the antenna gain (reduced by any coupling losses between the transmitter and antenna).

emergency alert system (EAS): A U.S. national public warning system.

enabling station (STA): A registered STA that has the authority to control when and how a dependent STA can operate. An enabling STA communicates an enabling signal to its dependents over the wireless medium (WM). An enabling STA chooses whether other dynamic STA enablement (DSE) messages are exchanged over the air, over the distribution system (DS), or by mechanisms that rely on transport via higher layers.

encapsulate: To construct a protected frame from an unprotected frame.

encapsulation: The process of generating a protected frame by encapsulating plaintext data.

extended service area (ESA): The area within which members of an extended service set (ESS) can communicate. An ESA is larger than or equal to a basic service area (BSA) and might involve several basic service sets (BSSs) in overlapping, disjointed, or both configurations.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

extended service set (ESS): A set of one or more interconnected basic service sets (BSSs) that appears as a single BSS to the logical link control (LLC) layer at any station (STA) associated with one of those BSSs.

extended service set (ESS) transition: Change of association by a station (STA) from one basic service set (BSS) in one ESS to another BSS in a different ESS.

fast basic service set (BSS) transition: Change of association by a station (STA) that is from one BSS in one extended service set (ESS) to another BSS in the same ESS and that minimizes the amount of time that the data connectivity is lost between the STA and the distribution system (DS).

fast session transfer (FST): The transfer of a session from a channel to another channel, in the same or different frequency bands. The term "session" refers to non-physical layer state information kept by a pair of stations (STAs) that communicate directly (i.e., excludes forwarding).

fixed station (STA): A STA that is physically attached to a specific location. In licensed bands, a fixed STA might be authorized to operate only at a specific location.

forwarding information: The information maintained by a mesh station (STA) that allows the mesh STA to perform its path selection and forwarding functions.

frame: A unit of data exchanged between peer protocol entities.

frame exchange sequence: A sequence of frames specified by Annex G.

frequency segment: A contiguous block of spectrum used by a transmission.

Gaussian frequency shift keying (GFSK): A modulation scheme in which the data are first filtered by a Gaussian filter in the baseband and then modulated with a simple frequency modulation.

geolocation: A location within an earth-centric frame of reference.

group: The entities in a wireless network, e.g., an access point (AP) and its associated stations (STAs), or all of the STAs in an independent basic service set (IBSS) network.

group address: A medium access control (MAC) address that has the group bit equal to 1. *Syn*: **multicast address**.

group addressed: When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with a group address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with a group address in the Address 1 field. *Syn*: **multicast**.

group master key (GMK): An auxiliary key that might be used to derive a group temporal key (GTK).

group temporal key (GTK): A random value, assigned by the group source, which is used to protect group addressed medium access control (MAC) protocol data units (MPDUs) from that source. The GTK might be derived from a group master key (GMK).

hidden station (STA): A STA whose transmissions are not detected using carrier sense (CS) by a second STA, but whose transmissions interfere with transmissions from the second STA to a third STA

homogeneous extended service set (ESS): A collection of basic service sets (BSSs), which may or may not be within the same extended service set (ESS), in which every subscription service provider network (SSPN) or other external network reachable at one BSS is reachable at all of them.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

idle power indicator (IPI): A physical layer (PHY) indication of the total channel power (noise and interference) as measured in the channel at the receiving antenna connector while the station (STA) is idle, i.e., neither transmitting nor receiving a frame.

IEEE 802.1X authentication: Extensible Authentication Protocol (EAP) authentication transported by the IEEE 802.1X protocol.

independent basic service set (IBSS): A basic service set (BSS) that forms a self-contained network, and in which no access to a distribution system (DS) is available.

independent basic service set (IBSS) station (STA): A STA that has started or joined an IBSS.

individual address: A medium access control (MAC) address in which the group bit is 0. *Syn:* **directed address**, **unicast address**.

individually addressed: When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with an individual address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with an individual address in the Address 1 field. *Syn:* **directed, unicast**.

infrastructure: An infrastructure comprises a distribution system (DS), one or more more access points(APs), zero or one portals, and zero or more mesh gates. It is also the logical location of distribution and integration service functions of an extended service set (ESS).

infrastructure authorization information: The information that specifies the access rights of the user of a non-access-point (non-AP) station (STA). This information might include the rules for routing the user traffic, a set of permissions about services that a user is allowed to access, quality-of-service (QoS) configuration information, or the accounting policy to be applied by the infrastructure.

integration service: The service that enables delivery of medium access control (MAC) service data units (MSDUs) between the distribution system (DS) and a local area network (LAN) (via a portal).

integrity group temporal key (IGTK): A random value, assigned by the broadcast/multicast source station (STA), which is used to protect group addressed medium access control (MAC) management protocol data units (MMPDUs) from that source STA.

link margin: Ratio of the received signal power to the minimum required by the station (STA). The STA might incorporate rate information and channel conditions, including interference, into its computation of link margin. The specific algorithm for computing the link margin is implementation dependent.

link metric: A criterion used to characterize the performance, quality, and eligibility of a link.

little endian: The concept that, for a given multi-octet numeric representation, the least significant octet has the lowest address.

liveness: A demonstration that the peer is actually participating in this instance of communication.

location subject local: The term used when a location request is for the location of the requesting station (STA), i.e., when the requesting STA asks, “Where am I?”

location subject remote: The term used when a location request is for the location of the reporting station (STA), i.e., when the requesting STA asks, “Where are you?”

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

location subject third party: The term used when the location request is for the location of a station (STA) other than the requesting STA or the requested STA, (i.e., when the requesting STA asks, "Where is he/she?")

master session key (MSK): Keying material that is derived between the Extensible Authentication Protocol (EAP) peer and exported by the EAP method to the Authentication Server (AS).

NOTE—In this standard, this key is at least 64 octets in length.

medium access control (MAC) frame: The unit of data exchanged between MAC entities. *Syn:* **medium access control (MAC) protocol data unit (MPDU)**.

NOTE—In contexts in which the MAC is clearly the subject, "frame" is an implicit reference to a MAC frame.

medium access control (MAC) protocol data unit (MPDU): The unit of data exchanged between two peer MAC entities using the services of the physical layer (PHY). *Syn:* **medium access control (MAC) frame**.

medium access control (MAC) service data unit (MSDU): Information that is delivered as a unit between MAC service access points (SAPs).

medium access control (MAC) service tuple: The collection of a MAC service data unit (MSDU) along with the associated source address, destination addresses, priority, drop eligibility, service class, optional set of service_access_point_identifiers, and optional indication of whether the supplied MSDU is in Ethertype protocol discrimination (EPD) or logical link control (LLC) protocol discrimination (LPD) format, which are all passed as parameters across the MAC service access point (SAP) and are all except the service_access_point_identifiers delivered across the distribution system between access points (APs), mesh gates, and the portal of an extended service set (ESS).

mesh basic service set (MBSS): A basic service set (BSS) that forms a self-contained network of mesh stations (STAs) that use the same mesh profile. An MBSS contains zero or more mesh gates, and can be formed from mesh STAs that are not in direct communication.

mesh facility: The set of enhanced functions, channel access rules, frame formats, mutual authentication methods, and managed objects used to provide data transfer among autonomously operating stations (STAs) that might not be in direct communication with each other over a single instance of the wireless medium. Communication between STAs using the mesh facility takes place using only the wireless medium. The mesh facility transports a medium access control (MAC) service data unit (MSDU) between source and destination STAs over potentially multiple hops of the wireless medium without transiting the MAC service access point (SAP) at intermediate STAs.

mesh gate: Any entity that has a mesh station (STA) function and a distribution system access function (DSAF) to provide access to a single distribution system for the mesh basic service set (MBSS).

mesh link: A link from one mesh station (STA) to a neighbor mesh STA that have a mesh peering with each other.

mesh neighborhood: The set of all neighbor mesh stations (STAs) of a particular mesh STA.

mesh path: A concatenated set of mesh links from a source mesh station (STA) to a destination mesh STA.

mesh path selection: The process of selecting a mesh path.

mesh peering: A relationship between two mesh stations (STAs) that is required for direct communication over a single instance of the wireless medium (WM). A mesh peering is established with a mesh peering protocol.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

mesh profile: A set of values of parameters that identifies the attributes of the mesh basic service set (MBSS) and that is used in a single MBSS.

NOTE—The mesh profile consists of the identifiers that are the values for the parameters: mesh identifier (ID), active path selection protocol, active path selection metric, congestion control mode, synchronization method, and authentication protocol.

mesh services: The set of services that enable the creation and operation of a mesh basic service set (MBSS).

mesh station (STA): A quality-of-service (QoS) STA that implements the mesh facility.

message integrity code (MIC): A value generated by a cryptographic function. If the input data are changed, a new value cannot be correctly computed without knowledge of the cryptographic key(s) used by the cryptographic function.

NOTE—This is traditionally called a *message authentication code* (MAC), but the acronym MAC is already reserved for another meaning in this standard.

mobile station (STA): A type of STA that uses network communications while in motion.

mobility domain: A set of basic service sets (BSSs), within the same extended service set (ESS), that support fast BSS transitions between themselves and that are identified by the set's mobility domain identifier (MDID).

mobility domain identifier (MDID): An identifier that names a mobility domain.

multicast: *See:* **group addressed**.

multicast address: *See:* **group address**.

multicast-group address: A medium access control (MAC) address associated by higher level convention with a group of logically related stations (STAs).

multi-level precedence and preemption (MLPP): A framework used with admission control for the treatment of traffic streams based on precedence, which supports the preemption of an active traffic stream by a higher precedence traffic stream when resources are limited. Preemption is the act of forcibly removing a traffic stream in progress in order to free up resources for another higher precedence traffic stream.

multiple basic service set identifier (BSSID) capability: The capability to advertise information for multiple BSSIDs using a single Beacon or Probe Response frame instead of using multiple Beacon or Probe Response frames, each corresponding to a single BSSID, and the capability to indicate buffered frames for these multiple BSSIDs using a single traffic indication map (TIM) element in a single Beacon or TIM frame.

multiple input, multiple output (MIMO): A physical layer (PHY) configuration in which both transmitter and receiver use multiple antennas.

multiple medium access control (MAC) station management entity (SME) (MM-SME): Component of station management that manages multiple cooperating stations (STAs).

multi-user multiple input, multiple output (MU-MIMO): A technique by which multiple stations (STAs), each with one or more antennas, either simultaneously transmit to a single STA or simultaneously receive from a single STA independent data streams over the same radio frequencies.

NOTE—IEEE Std 802.11 supports only downlink (DL) MU-MIMO. *See* downlink multi-user multiple input, multiple output (DL-MU-MIMO) (in 3.2).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

neighbor access point (AP): Any AP that is a potential service set transition candidate.

neighbor station (STA): A STA in the following relationship: STA A is a neighbor to STA B if STA A can both directly transmit to and receive from STA B over the wireless medium.

network access identifier (NAI): The user identity submitted by the Supplicant during IEEE 802.1X authentication.

NOTE—See IETF RFC 4282.

network access server (NAS) client: The client component of a NAS that communicates with the Authentication Server (AS).

network allocation vector (NAV): An indicator, maintained by each station (STA), of time periods when transmission onto the wireless medium (WM) is not initiated by the STA regardless of whether the STA's clear channel assessment (CCA) function senses that the WM is busy.

next-hop mesh station (STA): The next peer mesh STA on the mesh path to the destination mesh STA.

non-access-point (non-AP) station (STA): A STA that is not contained within an access point (AP).

nonce: A numerical value, used in cryptographic operations associated with a given cryptographic key, that is not to be reused with that key, including over all reinitializations of the system through all time.

noncontiguous transmission: A transmission that uses nonadjacent frequency segments.

nonoperating channel: A channel that is not the operating channel of the basic service set (BSS) of which the station (STA) is a member.

non-quality-of-service (non-QoS) access point (AP): An AP that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) basic service set (BSS): A BSS that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) station (STA): A STA that does not support the quality-of-service (QoS) facility.

operating channel: The operating channel is the channel in which beacons are transmitted.

NOTE—In IEEE Std 802.11, the serving access point (AP) of an infrastructure basic service set (BSS) or the dynamic frequency selection (DFS) owner of an independent basic service set (IBSS) transmits beacons.

operating channel width: The channel width in which the station (STA) is currently able to receive.

overlapping basic service set (OBSS): A basic service set (BSS) operating on the same channel as the station's (STA's) BSS and within (either partly or wholly) its basic service area (BSA).

over-the-air fast basic service set (BSS) transition (FT): An FT method in which the station (STA) communicates over a wireless medium (WM) link to the target access point (AP).

over-the-DS (distribution system) fast basic service set (BSS) transition (FT): An FT method in which the station (STA) communicates with the target access point (AP) via the current AP.

Copyright © 2021 IEEE. All rights reserved.

pairwise: Referring to, or an attribute of, two entities that are associated with each other, e.g., an access point (AP) and an associated station (STA), or two STAs in an independent basic service set (IBSS) network. This term is used to refer to a type of encryption key hierarchy pertaining to keys shared by only two entities.

pass-phrase: A secret text string employed to corroborate the user's identity.

password: A shared, secret, and potentially low-entropy word, phrase, code, or key used as a credential for authentication purposes.

NOTE—The method of distribution of a password to the units in the system is outside the scope of this standard.

path metric: An aggregate multi-hop criterion used to characterize the performance, quality, and eligibility of a mesh path.

peer mesh station (STA): A mesh STA to which a mesh peering has been established.

peer-to-peer link: A direct link within a quality-of-service (QoS) basic service set (BSS), a tunneled direct-link setup (TDLS) link, or a station-to-station (STA-to-STA) communication in an independent basic service set (IBSS).

peer-to-peer traffic specification (PTP TSPEC): The quality-of-service (QoS) characteristics of a data flow between non-access point (non-AP) QoS stations (STAs).

perfect forward secrecy (PFS): A property of a key agreement protocol that protects a session key derived from a set of long-term public and private keys from being compromised if one of the (long-term) private keys is compromised in the future.

per-frame encryption key: A unique encryption key constructed for each medium access control (MAC) protocol data unit (MPDU).

physical layer (PHY) frame: The unit of data exchanged between PHY entities. *Syn:* **physical layer (PHY) protocol data unit (PPDU)**.

NOTE—In contexts in which the PHY is clearly the subject, "frame" is an implicit reference to a PHY frame.

physical layer (PHY) protocol data unit (PPDU): The unit of data exchanged between two peer PHY entities to provide the PHY data service.

piggyback: The overloading of data with an acknowledgment of a previously received frame to the station (STA) to which the data is directed.

portable station (STA): A type of station (STA) that might be moved from location to location, but that uses network communications only while at a fixed location.

portal: The logical point at which the integration service is provided.

NOTE—For the purposes of this Standard, there is at most one portal in a given extended service set's (ESS's) infrastructure. In an implementation, a single logical portal function may be provided by multiple devices that provide integration services for the ESS. How such multiple devices coordinate to appear as a single logical portal is implementation dependent.

precursor mesh station (STA): A neighbor peer mesh STA on the mesh path to the destination mesh STA, that identifies the mesh STA as the next-hop mesh STA.

preshared key (PSK): A static key that is distributed to the units in the system by some out-of-band means.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

primary channel: The common channel of operation for all stations (STAs) that are members of the basic service set (BSS). For example, in a 20 MHz, 40 MHz, 80 MHz, 160 MHz or 80+80 MHz BSS the primary channel is a primary 20 MHz channel.

prioritized quality of service (QoS): The provisioning of service in which the medium access control (MAC) protocol data units (MPDUs) with higher priority are given a preferential treatment over MPDUs with a lower priority.

NOTE—Prioritized QoS is provided through the enhanced distributed channel access (EDCA) mechanism.

protection mechanism: Any procedure that attempts to update the network allocation vector (NAV) of all receiving stations (STAs) prior to the transmission of a frame that might or might not be detected as valid network activity by the physical layer (PHY) entities at those receiving STAs.

protection mechanism frame: Any frame that is sent as part of a protection mechanism procedure.

protocol instance: An execution of a particular protocol that consists of the state of the communicating parties as well as the messages exchanged.

proxy mesh gate: A mesh gate acting as an intermediary for IEEE 802 stations (STAs) outside the mesh basic service set (MBSS).

pseudorandom function (PRF): A function that hashes various inputs to derive a pseudorandom value. In order to ensure liveness of a communication in which a pseudorandom value is used, a nonce is used as one of the inputs to the function.

public safety answering point (PSAP): A physical location where emergency calls are received and routed to the appropriate emergency service dispatch center.

NOTE—See NENA 08-002 [B57].

quadrature binary phase shift keying (QBPSK): A binary phase shift keying modulation in which the binary data is mapped onto the imaginary (Q) axis.

quality-of-service (QoS) access point (AP): An AP that supports the QoS facility.

NOTE—In IEEE Std 802.11, the functions of a QoS AP are a superset of the functions of a non-QoS AP, and thus a QoS AP is able to function as a non-QoS AP to non-QoS stations (STAs).

quality-of-service (QoS) basic service set (BSS): A BSS that provides the QoS facility. An infrastructure QoS BSS contains a QoS access point (AP).

quality-of-service (QoS) facility: The set of enhanced functions, channel access rules, frame formats, frame exchange sequences and managed objects used to provide parameterized and prioritized QoS.

quality-of-service (QoS) independent basic service set (IBSS): An IBSS in which one or more of its stations (STAs) support the QoS facility.

quality-of-service (QoS) station (STA): A STA that implements the QoS facility.

NOTE—A QoS STA acts as a non-QoS STA when associated in a non-QoS basic service set (BSS).

radio frequency (RF) chain: The physical entity that is able to act as a receive chain or transmit chain, or both.

reassociation service: The service that enables an established association [between access point (AP) and station (STA)] to be transferred from one AP to another (or the same) AP.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

receive chain: The physical entity that implements any necessary signal processing to provide the received signal to the digital baseband. Such signal processing includes filtering, amplification, down-conversion, and sampling.

receive power: Mean power measured at the antenna connector.

received channel power indicator (RCPI): An indication of the total channel power (signal, noise, and interference) of a received frame measured on the channel and at the antenna connector used to receive the frame.

received power indicator (RPI): A quantized measure of the received power level as seen at the antenna connector.

registered location: The geolocation of a station (STA) registered in accordance with the requirements for the regulatory domain.

registered location query protocol (RLQP): The query protocol for registered location information that is received and transported by generic advertisement service (GAS) Public Action frames.

registered location secure server (RLSS): An entity that accesses and manages a database that organizes storage of information by geographic location and securely holds the location and some operating parameters of one or more basic service sets (BSSs).

registered station (STA): A STA for which information needs to be submitted to an appropriate regulatory or coordination authority before it is allowed to transmit.

remote request broker (RRB): The component of the station management entity (SME) of an access point (AP) that supports fast basic service set (BSS) transitions over the distribution system (DS).

roaming consortium: A group of subscription service providers (SSPs) having inter-SSP roaming agreements.

service hash: A value used for representing a service. This value is formed from a hash of the service name.

service set identifier (SSID): A string used to identify the infrastructure basic service sets (BSSs) that comprise an extended service set (ESS), or to identify a non-infrastructure BSS.

service set transition: A station (STA) movement from one basic service set (BSS) to another BSS, i.e., either a BSS transition or an extended service set (ESS) transition.

serving access point (AP): The AP to which the station (STA) is associated.

single-user multiple input, multiple output (SU-MIMO): A technique by which a station (STA) with more than one antenna either transmits to or receives from a single STA independent space-time streams over the same radio frequencies.

single-user (SU) physical layer (PHY) protocol data unit (PPDU): A PPDU with a format that is capable of carrying only a single PHY service data unit (PSDU), or no PSDU.

sounding: The use of preamble training fields to measure the channel for purposes other than demodulation of the Data portion of the physical layer (PHY) protocol data unit (PPDU) containing the training fields.

NOTE—These uses include calculation of transmit steering, calculation of recommended modulation and coding scheme (MCS), and calculation of calibration parameters.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

source mesh station (STA): A mesh STA from which a medium access control (MAC) service data unit (MSDU) enters the mesh basic service set (MBSS). A source mesh STA is either a mesh STA that is the source of an MSDU or a proxy mesh gate that receives an MSDU from a STA outside of the MBSS and forwards the MSDU on a mesh path.

space-time stream (STS): Stream of modulation symbols created by applying a combination of spatial and temporal processing to one or more spatial streams of modulation symbols.

spatial multiplexing (SM): A transmission technique in which data streams are transmitted on multiple spatial channels that are provided through the use of multiple antennas at the transmitter and the receiver.

spatial stream: One of several streams of bits or modulation symbols that might be transmitted over multiple spatial dimensions that are created by the use of multiple antennas at both ends of a communications link.

station (STA): A logical entity that is a singly addressable instance of a medium access control (MAC) and physical layer (PHY) interface to the wireless medium (WM).

NOTE—For IEEE 802.11 purposes, a station is any MAC/PHY entity providing the IEEE 802.11 MAC services. This differs from the IEEE 802 definition of 'station,' which includes bridges (or 'end stations') that are endpoints of link layer data traffic.

station service (SS): The set of services that support transport of medium access control (MAC) service data units (MSDUs) between stations (STAs) within a basic service set (BSS).

subscription service provider (SSP): An organization (operator) offering connection to network services, perhaps for a fee.

subscription service provider network (SSPN): The network controlled by a subscription service provider (SSP). The network maintains user subscription information.

Supplicant: An entity at one end of a point-to-point local area network (LAN) segment that is being authenticated by an Authenticator attached to the other end of that link. (IEEE Std 802.1X-2010)

Supplicant address (SPA): The medium access control (MAC) address of the IEEE 802.1X Supplicant's STA.

television white spaces (TVWS): The opportunistic use of allocated but not assigned spectrum—spectrum allocated for broadcast television, but with no assignment at a particular location.

time unit (TU): A measurement of time equal to 1024 μs.

traffic category (TC): A label for medium access control (MAC) service data units (MSDUs) that have a distinct user priority (UP), as viewed by higher layer entities, relative to other MSDUs provided for delivery over the same link. Traffic categories are meaningful only to MAC entities that support quality of service (QoS) within the MAC data service. These MAC entities determine the UP for MSDUs belonging to a particular traffic category using the priority value provided with those MSDUs at the MAC service access point (MAC SAP).

traffic classification (TCLAS): The specification of one of several types of matching filter to classify protocol data units (PDUs) or medium access control (MAC) service data units (MSDUs) as belonging to a particular traffic stream (TS). Depending on the type of classification, the filter is applied within the MAC sublayer management entity (MLME), above the MAC, or within the MAC itself.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

traffic filter: A set of traffic specifications defined by the use of traffic classification (TCLAS) elements that are utilized by the traffic filtering service (TFS) to identify specific allowed frames.

traffic filtering service (TFS): A service provided by an access point (AP) to a non-AP station (STA) to reduce the number of frames sent to the non-AP STA by not forwarding individually addressed frames addressed to the non-AP STA that do not match traffic filters specified by the non-AP STA.

traffic identifier (TID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities that support quality of service (QoS) within the MAC data service.

NOTE—There are 16 possible TID values; eight identify traffic categories (TCs), and the other eight identify parameterized traffic streams (TSs). The TID is assigned to an MSDU in the layers above the MAC.

traffic specification (TSPEC): The quality-of-service (QoS) characteristics of a data flow to and from a QoS station (STA).

traffic stream (TS): A set of medium access control (MAC) service data units (MSDUs) to be delivered subject to the quality-of-service (QoS) parameter values provided to the MAC in a particular traffic specification (TSPEC). TSs are meaningful only to MAC entities that support QoS within the MAC data service. These MAC entities determine the TSPEC applicable for delivery of MSDUs belonging to a particular TS using the priority parameter provided with those MSDUs at the MAC service access point (MAC SAP).

transmission opportunity (TXOP): An interval of time during which a particular quality-of-service (QoS) station (STA) has the right to initiate frame exchange sequences onto the wireless medium (WM).

NOTE—A TXOP is defined by a starting time and a maximum duration.

transmit chain: The physical entity that implements any necessary signal processing to generate the transmit signal from the digital baseband. Such signal processing includes digital to analog conversion, filtering, amplification and upconversion.

trusted third party (TTP): An entity that is relied upon to vouch for two parties in a pairwise authentication protocol.

type/length/value (TLV): A format that consists of a type, a length, and a value.

unauthorized disclosure: The process of making information available to unauthorized individuals, entities, or processes.

unauthorized resource use: The use of a resource not consistent with the defined security policy.

unicast: *See*: **individually addressed**.

unicast address: *See:* **individual address**.

uniform spreading: A regulatory requirement for a channel selection mechanism that provides uniform usage across a minimum set of channels in the regulatory domain.

unreachable destination: A destination mesh station (STA) for which the link to the next hop of the mesh path to this destination mesh STA is no longer usable.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

user priority (UP): A value associated with an medium access control (MAC) service data unit (MSDU) that indicates how the MSDU is to be handled. The UP is assigned to an MSDU in the layers above the MAC.

validated AP: An AP that has either been explicitly configured as a neighbor or learned through a mechanism such as the Beacon report.

wildcard basic service set identifier (BSSID): A BSSID value used to represent all BSSIDs.

NOTE—In IEEE Std 802.11, this is represented by all binary 1s.

wildcard service set identifier (SSID): An SSID value used to represent all SSIDs.

NOTE—In IEEE Std 802.11, this is represented by the value "null".

wireless medium (WM): The medium used to implement the transfer of protocol data units (PDUs) between peer physical layer (PHY) entities of a wireless local area network (LAN).

3.2 Definitions specific to IEEE Std 802.11

The following terms and definitions are specific to terms or references in this standard and are not appropriate for inclusion in the *IEEE Standards Dictionary Online*.

1 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 1 MHz transmit spectral mask defined in Clause 23 and that is a 1 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).

1 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 23 1 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).

2 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 2 MHz transmit spectral mask defined in Clause 23 and that is one of the following:

a) A 1 MHz sub 1 GHz (S1G) non-duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).
b) A 2 MHz S1G non-duplicate or S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).

2 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 23 2 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2) or a Clause 23 2 MHz S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).

4 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 4 MHz transmit spectral mask defined in Clause 23 and that is one of the following:

a) A 1 MHz sub 1 GHz (S1G) non-duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).
b) A 2 MHz S1G non-duplicate or S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).
c) A 4 MHz S1G non-duplicate, or S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).

4 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 23 4 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4), a Clause 23 4 MHz S1G 1 MHz duplicate

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4), or a Clause 23 4 MHz S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).

4-way handshake: A pairwise key management protocol defined by this standard. This handshake confirms mutual possession of a pairwise master key (PMK) by two parties and distributes a group temporal key (GTK).

8 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 8 MHz transmit spectral mask defined in Clause 23 and that is one of the following:

a) A 1 MHz sub 1 GHz (S1G) non-duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).
b) A 2 MHz S1G non-duplicate or S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).
c) A 4 MHz S1G non-duplicate, or S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).
d) An 8 MHz S1G non-duplicate, or S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8).

8 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 23 8 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8), a Clause 23 8 MHz S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8), or a Clause 23 8 MHz S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8).

16 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 16 MHz transmit spectral mask defined in Clause 23 and that is one of the following:

a) A 1 MHz sub 1 GHz (S1G) non-duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW1).
b) A 2 MHz S1G non-duplicate or S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW2).
c) A 4 MHz S1G non-duplicate, or S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW4).
d) An 8 MHz S1G non-duplicate, or S1G 1 MHz duplicate, or S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW8).
e) A 16 MHz S1G non-duplicate, or S1G 1 MHz duplicate, or S1G 2 MHz duplicate (TXVECTOR parameter CH_BANDWIDTH equal to CBW16).

16 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 23 16 MHz sub 1 GHz (S1G) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW16), a Clause 23 16 MHz S1G 1 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW16), or a Clause 23 16 MHz S1G 2 MHz duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW16).

20 MHz basic service set (BSS): A BSS in which there is a primary 20 MHz channel and no secondary channel.

20 MHz high-throughput (HT): A Clause 19 transmission with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF and TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20.

20 MHz mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

a) A Clause 17 PPDU transmitted using the 20 MHz transmit spectral mask defined in Clause 17.
b) A Clause 18 orthogonal frequency division multiplexing (OFDM) PPDU transmitted using the transmit spectral mask defined in Clause 18.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

c) A high-throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to CH_OFF_20 transmitted using the 20 MHz transmit spectral mask defined in Clause 19.

d) A very high throughput (VHT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20 transmitted using the 20 MHz transmit spectral mask defined in Clause 21.

e) A Clause 17 PPDU transmitted by a VHT STA using the 20 MHz transmit spectral mask defined in Clause 21.

f) An HT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to CH_OFF_20 transmitted by a VHT STA using the 20 MHz transmit spectral mask defined in Clause 21.

20 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 15 PPDU, Clause 17 PPDU (when using 20 MHz channel spacing), Clause 16 PPDU, Clause 18 orthogonal frequency division multiplexing (OFDM) PPDU, Clause 19 20 MHz high-throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20, or Clause 21 20 MHz very high throughput (VHT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20.

20/40 MHz basic service set (BSS): A BSS in which the supported channel width of the access point (AP) or dynamic frequency selection (DFS) owner (DO) station (STA) is 20 MHz and 40 MHz (Channel Width field is equal to 1) and the Secondary Channel Offset field is equal to a value of secondary channel above (SCA) or secondary channel below (SCB).

40 MHz high-throughput (HT): A Clause 19 transmission with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF and TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40.

40 MHz mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

a) A 40 MHz high-throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40) transmitted using the 40 MHz transmit spectral mask defined in Clause 19.

b) A 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40) transmitted by a non-very high throughput (non-VHT) STA using the 40 MHz transmit spectral mask defined in Clause 19.

c) A 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40) transmitted by a very high throughput (VHT) STA using the 40 MHz transmit spectral mask defined in Clause 21.

d) A 20 MHz HT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to either CH_OFF_20U or CH_OFF_20L transmitted using the 40 MHz transmit spectral mask defined in Clause 19.

e) A 20 MHz VHT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20 transmitted using the 40 MHz transmit spectral mask defined in Clause 21.

f) A 40 MHz VHT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW40 transmitted using the 40 MHz transmit spectral mask defined in Clause 21.

g) A 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40) transmitted by a VHT STA using the 40 MHz transmit spectral mask defined in Clause 21.

h) A 20 MHz non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20) transmitted using the 40 MHz transmit spectral mask defined in Clause 19.

i) A 20 MHz non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20) transmitted by a VHT STA using the 40 MHz transmit spectral mask defined in Clause 21.

40 MHz physical layer (PHY) protocol data unit (PPDU): A 40 MHz high-throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40), or a 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40 or TXVECTOR parameter

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

CH_BANDWIDTH equal to CBW40), or a 40 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40).

40-MHz-capable (40MC) high-throughput (HT) access point (AP): An HT AP that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

40-MHz-capable (40MC) high-throughput (HT) access point (AP) 2G4: An HT AP 2G4 that is also a 40MC HT AP.

40-MHz-capable (40MC) high-throughput (HT) access point (AP) 5G: An HT AP 5G that is also a 40MC HT AP.

40-MHz-capable (40MC) high-throughput (HT) station (STA): An HT STA that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

40-MHz-capable (40MC) high-throughput (HT) station (STA) 2G4: An HT STA 2G4 that is also a 40MC HT STA.

40-MHz-capable (40MC) high-throughput (HT) station (STA) 5G: An HT STA 5G that is also a 40MC HT STA.

80 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 80 MHz transmit spectral mask defined in Clause 21 and that is one of the following:

a) An 80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80).
b) An 80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80).
c) A 20 MHz non-HT, high-throughput (HT), or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20).
d) A 40 MHz non-HT duplicate, HT, or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40).

80 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 21 80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80) or a Clause 21 80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80).

80+80 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 80+80 MHz transmit spectral mask defined in Clause 21 and that is one of the following:

a) An 80+80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80).
b) An 80+80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80).

80+80 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 21 80+80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80) or a Clause 21 80+80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80).

160 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 160 MHz transmit spectral mask defined in Clause 21 and that is one of the following:

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

a) A 160 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160).
b) A 160 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160).
c) A 20 MHz non-HT, high-throughput (HT), or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20).
d) A 40 MHz non-HT duplicate, HT, or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40).
e) An 80 MHz non-HT duplicate or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80).

160 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 21 160 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160) or a Clause 21 160 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160).

access category (AC): A label for the common set of enhanced distributed channel access (EDCA) parameters that are used by a quality-of-service (QoS) station (STA) to contend for the channel in order to transmit medium access control (MAC) service data units (MSDUs) with certain priorities.

access network query protocol (ANQP): The query protocol for access network information retrieval transported by generic advertisement service (GAS) Public Action frames.

access period: A time period during a beacon interval established in a directional multi-gigabit (DMG) basic service set (BSS).

access point (AP) path: Path between two tunneled direct-link setup (TDLS) peer stations (STAs) via the AP with which the STAs are currently associated.

active mode: A power management mode in which a nonmesh station (STA) remains in the awake state, and a mesh power management mode with respect to a neighbor peer mesh STA in which a mesh station remains in the awake state and is expected to receive frames from this neighbor peer mesh STA.

advanced groupcast with retries (GCR): A set of features comprising the GCR block acknowledgment retransmission policy and the GCR service period (GCR-SP) delivery method.

advertisement protocol: Access network query protocol (ANQP) and higher layer protocols defined external to this standard that are used for network and service discovery.

advertisement server: A logical server that provides the information repository for a specific advertisement protocol. The location of the physical server that instantiates the advertisement server is outside the scope of this standard.

aggregated schedule: The aggregation of delivery and/or poll schedules by the quality-of-service (QoS) access point (AP) for a particular QoS station (STA) into a single service period (SP).

attached bridge: An IEEE 802.1Q bridge that has one or more bridge port Enhanced Internal Sublayer Service (EISS) interfaces supported by general links (GLKs) provided by a GLK access point (AP), GLK non-AP station (STA), GLK mesh STA, or GLK independent basic service set (IBSS) STA.

authentication and key management (AKM) suite: A set of one or more algorithms designed to provide authentication and key management, either individually or in combination with higher layer authentication and key management algorithms outside the scope of this standard.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

average noise power indicator (ANPI): A medium access control (MAC) indication of the average noise plus interference power measured when the channel is idle as defined by three simultaneous conditions: 1) the virtual carrier sense (CS) mechanism indicates idle channel, 2) the station (STA) is not transmitting a frame, and 3) the STA is not receiving a frame.

awake beacon interval (A-BI): In a directional multi-gigabit (DMG) basic service set (BSS) or personal basic service set (PBSS), a beacon interval of a power save mode wakeup schedule during which a station (STA) is expected to be in the awake state during several portions of the beacon interval.

bandwidth signaling transmitter address (TA): A TA that is used by a very high throughput (VHT) station (STA) to indicate the presence of additional signaling related to the bandwidth to be used in subsequent transmission in an enhanced distributed channel access (EDCA) transmission opportunity (TXOP). It is represented by the IEEE medium access control (MAC) individual address of the transmitting VHT STA but with the Individual/Group bit set to 1.

base channel: Primary channel of the basic service set (BSS) of the access point (AP) with which the tunneled direct-link setup (TDLS) peer station (STA) is associated with an access point (AP).

basic channel unit (BCU): For television very high throughput (TVHT) operation, 6 MHz, 7 MHz, or 8 MHz, depending on the regulatory domain.

basic modulation and coding scheme (MCS) set: The set of MCS values that are supported by all high-throughput (HT) stations (STAs) that are members of an HT basic service set (BSS).

basic space-time block coding (STBC) modulation and coding scheme (MCS): An MCS value and STBC encoder specification used in the transmission of STBC-encoded Control frames and STBC-encoded group addressed frames.

beacon header interval (BHI): The period of time that starts at the target beacon transmission time (TBTT) of a beacon interval of a directional multi-gigabit (DMG) basic service set (BSS) and that ends no later than the beginning of the data transfer interval (DTI) of the beacon interval.

beacon interval: The time interval between two consecutive target beacon transmission times (TBTTs).

beacon transmission interval (BTI): The time interval between the start of the first Directional Multi-gigabit (DMG) Beacon frame transmission by a DMG station (STA) in a beacon interval to the end of the last DMG Beacon frame transmission by the STA in the same beacon interval.

bufferable medium access control (MAC) management protocol data unit (MMPDU): An MMPDU that is eligible to be queued for delivery using a power saving mechanism (see Table 11-2).

bufferable unit (BU): A medium access control (MAC) service data unit (MSDU), aggregate MAC service data unit (MSDU) [quality-of-service (QoS) stations (STAs) only], or bufferable MAC management protocol data unit (MMPDU).

centralized authentication controlled (CAC) station (STA): A sub 1 GHz (S1G) non-access point (non-AP) STA with dot11S1GCentralizedAuthenticationControlActivated equal to true. A CAC STA supports a CAC access point (AP) to alleviate wireless medium contention when a large number of STAs are trying to, or are expected to, reconnect to the AP at about the same time.

centralized authentication controller (CAC) access point (AP): A sub 1 GHz (S1G) AP with dot11S1GCentralizedAuthenticationControlActivated equal to true. A CAC AP is able to alleviate wireless medium contention when a large number of stations (STAs) are trying to, or are expected to, reconnect to the AP at about the same time.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

centralized coordination service root (CCSR): An entity that provides synchronization and configuration services to synchronization access points (S-APs).

centralized coordination service set (CCSS): The collection of one centralized coordination service root (CCSR) and a set of one or more synchronization access points (S-APs) that are stationary with respect to their local environment while operating and are connected to the CCSR.

China directional multi-gigabit (CDMG): Pertaining to directional multi-gigabit (DMG) operation and where the channel is contained within the Chinese 60 GHz frequency band.

China directional multi-gigabit (CDMG) physical layer (PHY) protocol data unit (PPDU): A Clause 24 PPDU.

China directional multi-gigabit small band beacon interval (CDMG SBBI): A value, in units of time units (TUs) represents the length of a beacon interval operating on a 1.08 GHz channel.

China millimeter-wave multi-gigabit (CMMG): Pertaining to operation in a frequency band containing a channel in 42.3 GHz to 47.3 GHz or 47.2 GHz to 48.4 GHz frequency bands.

China millimeter-wave multi-gigabit (CMMG) basic service set (BSS): A BSS in which directional multi-gigabit (DMG) Beacon frames are transmitted by CMMG stations (STAs).

China millimeter-wave multi-gigabit (CMMG) beamformee: A CMMG station (STA) that receives a CMMG physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix and that supports the CMMG transmit beamforming feedback mechanism as described in 10.33.

China millimeter-wave multi-gigabit (CMMG) beamformer: A CMMG station (STA) that transmits a CMMG physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

China millimeter-wave multi-gigabit (CMMG) duplicate physical layer (PHY) protocol data unit (PPDU) format: A PPDU format that duplicates the transmission of a 540 MHz signal over two 540 MHz frequency segments.

China millimeter-wave multi-gigabit (CMMG) physical layer (PHY) protocol data unit (PPDU): A Clause 25 PPDU.

China millimeter-wave multi-gigabit (CMMG) single medium access control (MAC) protocol data unit (CMMG single MPDU): An MPDU that is the only MPDU in an aggregate MPDU (A-MPDU) carried in a CMMG physical layer (PHY) protocol data unit (PPDU) and that is carried in an A-MPDU subframe with the EOF subfield of the MPDU delimiter field equal to 1.

concealed groupcast with retries (GCR) frame: A group addressed frame that is transmitted using the aggregate medium access control (MAC) service data unit (A-MSDU) frame format with the destination address (DA) field set to the GCR concealment address.

contention based access period (CBAP): The time period in the data transfer interval (DTI) of a directional multi-gigabit (DMG) basic service set (BSS) during which enhanced distributed channel access (EDCA) is used.

controlled access phase (CAP): A time period during which the hybrid coordinator (HC) maintains control of the medium. It might span multiple consecutive HCCA transmission opportunities (TXOPs).

data physical layer (PHY) protocol data unit (PPDU): A PPDU containing at least one medium access control (MAC) service data unit (MSDU) or fragment of an MSDU.

deep sleep mode: A mesh power management mode with respect to a neighbor peer mesh STA in which a mesh station (STA) alternates between awake and doze states and is not expected to receive beacons from this neighbor peer mesh STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

delivery traffic indication map (DTIM) interval: The interval between the consecutive target beacon transmission times (TBTTs) of beacons containing a DTIM. The value, expressed in time units, is equal to the product of the value in the Beacon Interval field and the value in the DTIM Period subfield in the TIM element in Beacon frames.

delivery-enabled access category (AC): A quality-of-service (QoS) access point (AP) AC where the AP is allowed to use enhanced distributed channel access (EDCA) to deliver traffic from the AC to a QoS station (STA) in an unscheduled service period (SP) triggered by the STA.

destination directional multi-gigabit (DMG) station (STA): A DMG STA identified by the destination association identifier (AID) field contained in a Grant frame or Extended Schedule element that caused the allocation of a service period (SP) or a contention based access period (CBAP).

differentiated initial link setup (DILS): A mechanism for restricting fast initial link setup (FILS) to certain categories of stations.

direct sequence spread spectrum (DSSS) physical layer (PHY) protocol data unit (PPDU): A Clause 15 PPDU.

direct sequence spread spectrum/complementary code keying (DSSS/CCK): A Clause 15 or Clause 16 transmission.

direct sequence spread spectrum/complementary code keying (DSSS/CCK) physical layer (PHY) protocol data unit (PPDU): A Clause 15 or Clause 16 PPDU.

directional multi-gigabit (DMG): Pertaining to operation in a frequency band containing a channel with the channel starting frequency above 45 GHz.

NOTE—The channel starting frequency for IEEE 802.11 stations (STAs) is defined in Annex E.

directional multi-gigabit (DMG) antenna: A DMG antenna is a phased array, a single element antenna, or a set of switched beam antennas covered by a quasi-omni antenna pattern.

directional multi-gigabit (DMG) basic service set (BSS): A BSS in which DMG Beacon frames are transmitted by DMG stations (STAs).

directional multi-gigabit (DMG) frame: A frame transmitted or received within a DMG physical layer (PHY) protocol data unit (PPDU).

directional multi-gigabit (DMG) physical layer (PHY) protocol data unit (PPDU): A Clause 20 PPDU.

directional transmission: A transmission that does not use an omnidirectional antenna pattern or quasi-omni antenna pattern.

downlink: A unidirectional link from an access point (AP) to one or more non-AP stations (STAs) or a unidirectional link from a non-AP destination directional multi-gigabit (DMG) STA to a non-AP source DMG STA.

downlink multi-user multiple input, multiple output (DL-MU-MIMO): A technique by which an access point (AP) with more than one antenna transmits a physical layer (PHY) protocol data unit (PPDU) to multiple receiving non-AP stations (STAs) over the same radio frequencies, wherein each non-AP STA simultaneously receives one or more distinct space-time streams.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

downlink multi-user multiple input, multiple output (DL-MU-MIMO) physical layer (PHY) protocol data unit (PPDU): A PPDU using the DL-MU-MIMO technique.

doze beacon interval (D-BI): In a directional multi-gigabit (DMG) basic service set (BSS) or personal basic service set (PBSS), a beacon interval of a power save mode wakeup schedule during which a station (STA) is expected to be in the doze state for most of the portions of the beacon interval.

dynamic bandwidth operation: A feature of a very high throughput (VHT) station (STA) in which the request-to-send/clear-to-send (RTS/CTS) exchange, using non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data units (PPDUs), negotiates a potentially reduced channel width (compared to the channel width indicated by the RTS) for subsequent transmissions within the current transmission opportunity (TXOP).

dynamic frequency selection (DFS) owner: A station (STA) in an independent basic service set (IBSS) or off-channel tunneled direct link setup (TDLS) direct link that takes responsibility for selecting the next channel after radar is detected operating in a channel. Due to the nature of IBSSs, it cannot be guaranteed that there is a single DFS owner at any particular time and the protocol is robust to this situation.

EAPOL-Key confirmation key (KCK): A key used to integrity-check an EAPOL-Key frame.

EAPOL-Key encryption key (KEK): A key used to encrypt the Key Data field in an EAPOL-Key frame.

EAPOL-Key frame: A Data frame that carries all or part of an IEEE 802.1X EAPOL PDU of type EAPOL-Key.

EAPOL-Key request frame: A Data frame that carries all of part of an IEEE 802.1X EAPOL-Key protocol data unit (PDU) with the Request bit in the Key Information field in the IEEE 802.11 Key Descriptor set to 1.

EAPOL-Start frame: A Data frame that carries all or part of an IEEE 802.1X EAPOL PDU of type EAPOL-Start.

emergency services association: A robust security network association (RSNA) between an access point (AP) and a non-AP station (STA) without security credentials; the non-AP STA is granted access to emergency services using unprotected frames via this association.

energy limited (EL) station (STA): A sub 1 GHz (S1G) STA whose limited energy supply requires the STA to transmit or receive in certain intervals of time determined by an EL Operation element.

enhanced distributed channel access (EDCA): The prioritized carrier sense multiple access with collision avoidance (CSMA/CA) access mechanism used by quality-of-service (QoS) stations (STAs) in a QoS basic service set (BSS) and STAs operating outside the context of a BSS. This access mechanism is also used by the QoS access point (AP) and operates concurrently with hybrid coordination function (HCF) controlled channel access (HCCA).

enhanced distributed channel access function (EDCAF): A logical function in a quality-of-service (QoS) station (STA) that determines, using enhanced distributed channel access (EDCA), when a frame in the transmit queue with the associated access category (AC) is permitted to be transmitted via the wireless medium (WM). There is one EDCAF per AC.

extended centralized access point (AP) or personal basic service set (PBSS) control point (PCP) cluster (ECAPC): The collection of 1) a single centralized coordination service set (CCSS), 2) the set of centralized AP or PCP clusters such that each synchronization AP (S-AP) of a centralized AP or PCP cluster

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

is within the CCSS, and 3) all stations (STAs) within the basic service sets (BSSs) of the S-APs and member APs and PCPs of the centralized AP or PCP clusters.

extended channel switching (ECS): A procedure that is used to announce a pending change of operating channel, operating class, or both.

extended rate physical layer (ERP): A physical layer (PHY) compliant with Clause 18.

extended rate physical layer (ERP) physical layer (PHY) protocol data unit (PPDU): A Clause 18 PPDU that is not a Clause 16 PPDU.

extended rate physical layer (PHY) using complementary code keying (CCK) modulation (ERP-CCK): A mode of operation of a PHY operating under Clause 18 rules, where MODULATION=ERP-CCK.

extended rate physical layer (PHY) using direct sequence spread spectrum (DSSS) modulation (ERP-DSSS): A PHY operating under Clause 18 rules, where MODULATION=ERP-DSSS.

extended rate physical layer (PHY) using direct sequence spread spectrum (DSSS) or complementary code keying (CCK) modulation (ERP-DSSS/CCK): A PHY operating under Clause 18 rules, where MODULATION=ERP-CCK or MODULATION=ERP-DSSS.

extended rate physical layer (PHY) using orthogonal frequency division multiplexing (OFDM) modulation (ERP-OFDM): A mode of operation of a PHY operating under Clause 18 rules, where MODULATION=ERP-OFDM.

extended service set (ESS) link: In the context of an IEEE 802.11 medium access control (MAC) entity, a connection path through the wireless medium between a non-access-point (non-AP) station (STA) and one of the APs that is a member of the ESS.

Extensible Authentication Protocol (EAP) reauthentication protocol (EAP-RP): A protocol, using the EAP framework, that allows single round trip reauthentication with an Authentication Server after an initial EAP authentication.

NOTE—IETF RFC 6696 uses “ERP” for the abbreviation of EAP reauthentication protocol; IEEE Std 802.11 uses “EAP-RP” because “ERP” stands for “Extended Rate PHY” in IEEE Std 802.11.

fast basic service set (BSS) transition (FT) 4-way handshake: A pairwise key management protocol used during FT initial mobility domain association. This handshake confirms mutual possession of a pairwise master key, the PMK-R1, by two parties and distributes a group temporal key (GTK).

fast basic service set (BSS) transition (FT) initial mobility domain association: The first association or first reassociation procedure within a mobility domain, during which a station (STA) indicates its intention to use the FT procedures.

fast basic service set (BSS) transition (FT) originator: A station (STA) that initiates the FT protocol by sending an FT Request frame or an Authentication frame with Authentication Algorithm Number field equal to Fast BSS Transition.

fast initial link setup (FILS): A collection of mechanisms that enable IEEE Std 802.11 networks to minimize initial link setup time.

fast initial link setup (FILS) access point (AP): An access point that implements FILS and for which dot11FILSActivated is true.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

fast initial link setup (FILS) association: A type of association used in fast initial link setup.

fast initial link setup (FILS) authentication: A type of authentication used in fast initial link setup.

fast initial link setup (FILS) station (STA): A station that implements fast initial link setup (FILS) and for which dot11FILSActivated is true.

fine timing measurement (FTM) procedure: A procedure that allows a station (STA) to determine its distance from another STA.

flexible multicast service (FMS): A service that enables a non-access-point (non-AP) station (STA) to request a multicast delivery interval longer than the delivery traffic indication map (DTIM) interval for the purposes of lengthening the period of time a STA can be in a power save state.

flexible multicast service (FMS) stream: A succession of frames transmitted by the access point (AP) that correspond to a single flexible multicast stream identifier (FMSID).

flexible multicast service (FMS) stream set: A collection of FMS streams identified by the value of the FMS Token field, used during the FMS Request procedure.

flexible multicast stream identifier (FMSID): An identifier assigned by the access point (AP) to a particular group addressed stream subsequent to a successful FMS Request.

fragmentation: The process of partitioning a medium access control (MAC) service data unit (MSDU) or MAC management protocol data unit (MMPDU) into a sequence of smaller MAC protocol data units (MPDUs) prior to transmission. The process of recombining a set of fragment MPDUs into an MSDU or MMPDU is known as defragmentation. These processes are described in 5.8.1.9 of ISO/IEC 7498-1:1994.

future channel guidance: future channel guidance communicates likely future channel information so that STAs can efficiently move their activity when the absence of Beacon frames is noticed.

general link (GLK): A point-to-point connection between two instances of the IEEE 802.1D Internal Sublayer Service that uses an IEEE 802.11 wireless link between stations (STAs). A general link is suitable for use in an IEEE 802.1Q bridged network.

general link (GLK) convergence function: The convergence function defined in IEEE Std 802.1AC-2016 between an IEEE 802.11 medium access control (MAC) and an IEEE 802.1Q bridge.

general link groupcast with retries (GLK-GCR): A variant of GCR that specifies the use of GCR for general link.

general link (GLK) station (STA): A STA that implements GLK functionality.

generic advertisement service (GAS): An over-the-air transportation service that provides over-the-air transportation for frames of higher layer advertisements between stations (STAs) or between an advertisement server and a non-access-point (non-AP) STA. The protocol(s) used to relay frames between an AP, portal, and advertisement server is outside the scope of this standard. GAS supports higher layer protocols that employ a query/response mechanism.

geolocation database (GDB): A database whose operation is mandated or authorized by a regulatory authority and that organizes storage of information by geographic location.

geolocation database dependent (GDD): A modifier describing when station (STA) operation is dependent on information received from a geolocation database (GDB).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

geolocation database dependent (GDD) access point (AP): A station (STA) dependent on information received from a geolocation database (GDB) in order to initiate and maintain a network.

geolocation database dependent (GDD) dependent station (STA): A STA that is under the control of a GDD enabling STA.

geolocation database dependent (GDD) enabling station (STA): A STA that has the authority to control the operation of GDD dependent STAs after obtaining available spectrum for use at its own location.

geolocation database dependent (GDD) fixed station (STA): A STA whose geographical location information is fixed and maintained in a geolocation database (GDB) and whose operation depends on information received from that database.

geolocation database dependent (GDD) geolocated non-access point (non-AP) station (STA): A STA that is not an AP and is authorized by a geolocation database (GDB) to operate at its current location.

geolocation database dependent (GDD) non-access point (non-AP) station (STA): A STA that is not an AP but operates under the control of a GDD enabling STA.

global operating class: An operating class value that is any of the nonreserved values in Table E-4.

group addressed bufferable unit (BU): A group addressed medium access control (MAC) service data unit (MSDU) or group addressed bufferable MAC management protocol data unit (MMPDU).

group addressed quality-of-service management frame (GQMF): A group addressed Management frame that is transmitted using the quality-of-service management frame (QMF) service.

group addressed transmission service (GATS): A mechanism comprising directed multicast service (DMS) and groupcast with retries (GCR), for delivery of group addressed frames.

group key handshake: A group key management protocol defined by this standard. It is used only to issue a new group temporal key (GTK) to peers with whom the local station (STA) has already formed security associations.

group temporal key (GTK): A temporal key that is used to protect information exchanged in group addressed Data frames.

group temporal key security association (GTKSA): The context resulting from a successful group temporal key (GTK) distribution exchange via either a group key handshake, a 4-way handshake, or fast initial link setup (FILS) authentication.

groupcast with retries (GCR) active (GCR-A) delivery: A delivery method for a group addressed stream subject to a GCR agreement wherein the frames are transmitted without regard to the power state of non-access-point (non-AP) stations (STAs).

groupcast with retries (GCR) concealment address: A medium access control (MAC) address that is used to prevent group addressed frames transmitted via the GCR unsolicited retry or GCR block ack retransmission policies from being passed up the medium access control service access point (MAC SAP) of GCR-incapable stations (STAs).

groupcast with retries (GCR) frame: A group addressed frame subject to a GCR agreement between the access point (AP) and at least one station (STA) within the infrastructure basic service set (BSS) or between peer mesh STAs in a mesh BSS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

groupcast with retries (GCR) group address: A group address subject to a GCR agreement between the access point (AP) and at least one station (STA) within the basic service set (BSS) or between peer mesh STAs in a mesh BSS.

groupcast with retries (GCR) service: A means for transmission and retransmission of medium access control (MAC) service data units (MSDUs) to a destination that is a group address. The GCR service provides greater reliability by using group addressed retransmissions, concealed from GCR-incapable stations (STAs).

groupcast with retries (GCR) service period (GCR-SP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU subject to the GCR service with the delivery method equal to GCR-SP.

groupcast with retries (GCR) service period (GCR-SP) frame: A frame subject to the GCR service when the delivery method is GCR-SP.

groupcast with retries (GCR) service period (GCR-SP) medium access control (MAC) service data unit (MSDU): An MSDU subject to the GCR service with the delivery method equal to GCR-SP.

groupcast with retries (GCR) transmission opportunity (TXOP): An interval of time during which an access point (AP) or a mesh station (STA) has the right to initiate frame exchange sequences onto the wireless medium (WM) for the purpose of transmitting multiple frames that are subject to the GCR service.

high rate direct sequence spread spectrum (HR/DSSS) physical layer (PHY) protocol data unit (PPDU): A Clause 16 PPDU that is not a Clause 15 PPDU.

high-throughput (HT) basic service set (BSS): A BSS in which Beacon frames transmitted by an HT station (STA) include the HT Capabilities element.

high-throughput (HT) beamformee: An HT station (STA) that receives an HT physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix and that supports an HT transmit beamforming feedback mechanism.

high-throughput (HT) beamformer: An HT station (STA) that transmits an HT physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

high-throughput (HT) greenfield (HT-greenfield) format: A physical layer (PHY) protocol data unit (PPDU) format of the HT PHY using the HT-greenfield format preamble.

high-throughput (HT) immediate (HT-immediate) block acknowledgment (Ack): An immediate block ack mechanism that requires the use of the compressed BlockAck frame and an implicit block ack request and allows partial-state operation at the recipient. This block ack scheme is negotiated between two HT or directional multi-gigabit (DMG) stations (STAs).

high-throughput (HT) mixed (HT-mixed) format: A physical layer (PHY) protocol data unit (PPDU) format of the HT PHY using the HT-mixed format preamble.

high-throughput (HT) modulation and coding scheme (HT-MCS): A specification of the HT physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM), forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6), and number of spatial streams (NSS) and that is used in an HT PHY protocol data unit (PPDU).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

high-throughput (HT) null data PPDU (NDP) announcement: A physical layer (PHY) protocol data unit (PPDU) that contains one or more +HTC frames (i.e., frames with an HT Control field) that have the HT NDP Announcement subfield equal to 1.

high-throughput (HT) physical layer (PHY) protocol data unit (PPDU): A Clause 19 PPDU that is not a Clause 15, Clause 16, Clause 17, or Clause 18 PPDU.

high-throughput (HT) station (STA) 2G4: An HT STA that is also a STA 2G4.

high-throughput (HT) station (STA) 5G: An HT STA that is also a STA 5G.

hybrid coordination function (HCF): A coordination function that combines and enhances aspects of the contention based and contention free access methods to provide quality-of-service (QoS) stations (STAs) with prioritized and parameterized QoS access to the wireless medium (WM), while continuing to support non-QoS STAs for best-effort transfer. The HCF includes the functionality provided by both enhanced distributed channel access (EDCA) and HCF controlled channel access (HCCA).

hybrid coordination function (HCF) controlled channel access (HCCA): The channel access mechanism utilized by the hybrid coordinator (HC) to coordinate contention free media use by quality-of-service (QoS) stations (STAs) for downlink individually addressed, uplink, and direct-link transmissions.

hybrid coordinator (HC): A type of coordinator, defined as part of the quality-of-service (QoS) facility, that implements the frame exchange sequences and medium access control (MAC) service data unit (MSDU) handling rules defined by the hybrid coordination function (HCF).

IEEE 802.11 station (STA): Any station that is compliant with IEEE Std 802.11. Any reference to the term station (STA) in this standard that is not qualified by the term *IEEE 802.11* implicitly refers to an IEEE 802.11 station.

individually addressed bufferable unit (BU): An individually addressed medium access control (MAC) service data unit (MSDU), individually addressed aggregate MAC service data unit (A-MSDU) [quality-of-service (QoS) stations (STAs) only], or individually addressed bufferable MAC management protocol data unit (MMPDU).

individually addressed quality-of-service management frame (IQMF): An individually addressed Management frame that is transmitted using the quality-of-service management frame (QMF) service.

integrity check key (ICK): A key used to integrity check FILS Authentication frames.

interworking service: A service that supports use of an IEEE 802.11 network with non-IEEE-802.11 networks. Functions of the interworking service assist non-access-point (non-AP) stations (STAs) in discovering and selecting IEEE 802.11 networks, in using appropriate quality-of-service (QoS) settings for transmissions, in accessing emergency services, and in connecting to subscription service providers (SSPs).

key counter: A 256-bit (32-octet) counter that is used in the pseudorandom function (PRF) to generate initialization vectors (IVs). There is a single key counter per station (STA) that is global to that STA.

key data encapsulation (KDE): A format for data other than elements in the EAPOL-Key Data field.

key management service: A service to distribute and manage cryptographic keys within a robust security network (RSN).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

light sleep mode: A mesh power management mode with respect to a neighbor peer mesh STA in which a mesh station (STA) alternates between awake and doze states and is expected to receive beacons from this neighbor peer mesh STA.

link: In the context of an IEEE 802.11 medium access control (MAC) entity, a physical path consisting of exactly one traversal of the wireless medium (WM) that is usable to transfer MAC service data units (MSDUs) between two stations (STAs).

link setup: The process of discovering an extended service set (ESS), (secure) association and authentication, and gaining the ability to send higher layer [e.g., Internet Protocol (IP)] traffic with a valid higher layer address through an access point (AP).

location configuration information (LCI): As defined in IETF RFC 6225: includes latitude, longitude, and altitude, with uncertainty indicators for each.

medium access control (MAC) management protocol data unit (MMPDU): The unit of data exchanged between two peer MAC entities, using services of the physical layer (PHY), to implement the MAC management protocol. The MMPDU is transported in one or more Management frames. The MMPDU might include a Mesh Control field or management message integrity code element (Management MIC element), but does not include a MAC header, a frame check sequence (FCS), or any other security encapsulation overhead.

NOTE—The MMPDU occupies a position in the management plane similar to that of the MAC service data unit (MSDU) in the data plane. An MSDU or MMPDU is transmitted in one or more MAC protocol data units (MPDUs) (with the Type field set to Data or Management, respectively). An MSDU can be carried in an aggregate MAC service data unit (A-MSDU). An A-MSDU is transmitted in one MPDU. An MSDU, A-MSDU, or MMPDU can be carried (in an MPDU) in an aggregate MAC protocol data unit (A-MPDU).

mesh awake window: A period of time during which the mesh station (STA) operates in awake state after its Beacon or Probe Response frame transmission that contained the Mesh Awake Window element.

mesh coordination function (MCF): A coordination function that combines aspects of the contention based and scheduled access methods. The MCF includes the functionality provided by both enhanced distributed channel access (EDCA) and MCF controlled channel access (MCCA).

mesh coordination function (MCF) controlled channel access (MCCA): A coordination function for the mesh basic service set (MBSS).

mesh coordination function (MCF) controlled channel access opportunity (MCCAOP): A period of time scheduled for frame transmissions between mesh stations (STAs) using MCF controlled channel access (MCCA).

mesh Data frame: A Data frame that is transmitted by a mesh station (STA).

mesh peer service period: A period of time during which one or more individually addressed frames are transmitted between two peer mesh stations (STAs) with at least one of those mesh STAs operating in light sleep or deep sleep mode. A mesh peer service period is directional and might contain one or more transmission opportunities (TXOPs).

mesh peer service period owner: A mesh station (STA) that obtains transmission opportunities (TXOPs), transmits individually addressed frames to the recipient mesh STA in the mesh peer service period, and terminates the mesh peer service period.

mesh peering management: A group of protocols to facilitate mesh peering establishment and closure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

mesh power management mode: The activity level identifier of a mesh station (STA) set per mesh peering or for nonpeer neighbor STAs. A lower activity level enables a mesh STA to reduce its power consumption.

mesh power management mode tracking: Operation to observe the peering-specific mesh power management modes from the peer mesh STAs and to maintain the peering-specific mesh power management modes for each peer mesh STA.

message integrity code (MIC) key: Temporal key integrity protocol (TKIP) only: The portion of a transient key used to validate the integrity of medium access control (MAC) service data units (MSDUs) or MAC protocol data units (MPDUs).

method-specific service access point (SAP) (MS SAP): The point at which an instance of the IEEE 802.11 method-specific medium access control (MAC) service is offered.

michael: The message integrity code (MIC) for the temporal key integrity protocol (TKIP).

minimum downlink transmission time (DTT) to uplink transmission time (UTT) [DTT2UTT] spacing: The minimum time within a power save multi-poll (PSMP) sequence between the end of a station's (STA's) PSMP-DTT and the start of its PSMP-UTT.

modulation and coding scheme (MCS): A specification of the physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM, and 256-QAM), forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6), and, depending on the context, the number of space-time streams.

modulation and coding scheme 32 (MCS 32) format: A physical layer (PHY) protocol data unit (PPDU) format of the high-throughput (HT) PHY in which signals in two halves of the occupied channel width contain the same information. This HT PPDU format supports the lowest rate.

modulation and coding scheme (MCS) feedback (MFB) requester: A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) containing an HT Control field in which the MCS request (MRQ) subfield is equal to 1.

modulation and coding scheme (MCS) feedback (MFB) responder: A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) containing an HT Control field with the MFB field containing an MCS index or the value 127 in response to a PPDU containing an HT Control field in which the MCS request (MRQ) subfield is equal to 1.

multiple basic service set identifier (BSSID) set: A collection of cooperating access points (APs), such that all of the APs use a common operating class, channel, and antenna connector.

multiple medium access control (MAC) sublayers link (MMSL): A link between two stations (STAs), wherein one of the STAs is coordinated by a multiple MAC station management entity (MM-SME) that delivered a Multiple MAC Sublayers (MMS) element to the peer STA.

multiple medium access control (MAC) sublayers link (MMSL) cluster: The set of all MMSLs between a pair of stations (STAs).

multi-user (MU) beamformee: A non-access-point (non-AP) station (STA) that receives a physical layer (PHY) protocol data unit (PPDU) that was transmitted using a multi-user beamforming steering matrix and that supports the very high throughput (VHT) transmit beamforming feedback mechanism with a VHT null data PPDU (NDP) Announcement frame that includes more than one STA Info field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

multi-user (MU) beamformer: An access point (AP) that transmits a physical layer (PHY) protocol data unit (PPDU) using a multi-user beamforming steering matrix.

multi-user (MU) physical layer (PHY) protocol data unit (PPDU): A PPDU that carries one or more PHY service data units (PSDUs) for one or more stations (STAs) using the downlink multi-user multiple input, multiple output (DL-MU-MIMO) technique.

no acknowledgment/no retry (No-Ack/No-Retry): A retransmission policy for group addressed frames in which each frame is transmitted once and without acknowledgment.

non-40-MHz-capable (non-40MC) high-throughput (HT) station (STA): A STA that is not a 40-MHz-capable (40MC) HT STA.

nonaggregate medium access control (MAC) protocol data unit (non-A-MPDU) frame: A frame that is transmitted in a Clause 15 physical layer (PHY) protocol data unit (PPDU), Clause 17 PPDU, Clause 16 PPDU, or Clause 18 orthogonal frequency division multiplexing (OFDM) PPDU; or is transmitted with the TXVECTOR AGGREGATION parameter present and equal to NOT_AGGREGATED; or is a single medium access control (MAC) protocol data unit (S-MPDU).

nonbandwidth signaling transmitter address (TA): An address in the TA field of an medium access control (MAC) protocol data unit (MPDU) in which the Individual/Group bit has the value 0.

nonbufferable medium access control (MAC) management protocol data unit (MMPDU): An MMPDU that is not a bufferable MMPDU.

nonconcealed groupcast with retries (GCR) frame: A group addressed frame that is not transmitted to the GCR concealment address.

nonextended rate physical layer (non-ERP): A physical layer (PHY) compliant with Clause 15 or Clause 16, but not with Clause 18.

nongroupcast with retries (non-GCR): A method for delivering group addressed frames without using the groupcast with retries (GCR) unsolicited retry retransmission policy, the GCR block acknowledgment retransmission policy, or the GCR service period (GCR-SP) delivery method.

nongroupcast with retries service period (non-GCR-SP): A method for the delivery of group addressed frames without the use of a groupcast with retries service period (GCR-SP).

non-high-throughput (non-HT): A modifier meaning neither high throughput (HT) nor very high throughput (VHT).

non-high-throughput (non-HT) duplicate: A transmission format of the physical layer (PHY) that duplicates a 20 MHz non-HT transmission in two or more 20 MHz channels and allows a station (STA) in a non-HT basic service set (BSS) on any one of the 20 MHz channels to receive the transmission. A non-HT duplicate format is one of the following:

a) 40 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in two adjacent 20 MHz channels.
b) 80 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in four adjacent 20 MHz channels.
c) 160 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in eight adjacent 20 MHz channels.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

d) 80+80 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in two frequency segments of four adjacent 20 MHz channels where the two frequency segments of channels are not adjacent.

non-high-throughput (non-HT) duplicate frame: A frame transmitted in a non-HT duplicate physical layer (PHY) protocol data unit (PPDU).

non-high-throughput (non-HT) duplicate in television white spaces (TVWS) band: A transmission format of the physical layer (PHY) that duplicates a single basic channel unit (BCU) non-HT transmission in two or more BCUs and allows a station (STA) in a non-HT basic service set (BSS) on any one BCU to receive the transmission. A non-HT duplicate format is one of the following:

a) TVHT_W non-HT duplicate: A PHY transmission that replicates a non-HT PHY protocol data unit (PPDU) two times in a single BCU.
b) TVHT_2W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU four times in two contiguous BCUs.
c) TVHT_4W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU eight times in four contiguous BCUs.
d) TVHT_W+W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU two times in each single BCU.
e) TVHT_2W+2W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU four times in each of two contiguous BCUs.

non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data unit (PPDU): A PPDU transmitted by a Clause 19 or Clause 21 PHY with the TXVECTOR FORMAT parameter equal to NON_HT and the CH_BANDWIDTH parameter equal to NON_HT_CBW40, CBW40, CBW80, CBW160, or CBW80+80.

non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data unit (PPDU) in television white spaces (TVWS) band: A PPDU transmitted by a Clause 22 PHY with the TXVECTOR parameter FORMAT set to NON_HT and the TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TVHT_2W, TVHT_4W, TVHT_W+W, or TVHT_2W+2W.

non-high-throughput (non-HT) physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted by a Clause 15, Clause 16, Clause 17, or Clause 18 PHY, or not using a TXVECTOR FORMAT parameter equal to HT_MF, HT_GF or VHT.

non-high-throughput (non-HT) SIGNAL field (L-SIG) transmit opportunity (TXOP) protection: A protection mechanism in which protection is established by the non-HT SIG Length and Rate fields indicating a duration that is longer than the duration of the PPDU itself.

nonpeer mesh power management mode: The activity level identifier of a mesh station (STA) toward nonpeer neighbor mesh STAs. Two nonpeer mesh power management modes are defined: active mode and deep sleep mode.

non-personal basic service set (BSS) control point (non-PCP) station (STA): A STA that is not a personal BSS control point (PCP).

nonprimary channel: In a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz basic service set (BSS), any 20 MHz channel other than the primary 20 MHz channel.

non-quality-of-service management frame (non-QMF) access point (AP): An AP that does not implement the quality-of-service management frame (QMF) service.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

non-quality-of-service management frame (non-QMF) station (STA): A STA that does not implement the quality-of-service management frame (QMF) service.

non-sensor station (STA): A sub 1 GHz (S1G) non-access point (non-AP) STA transmitting or receiving Data frames not subject to limitation of payload size. A non-sensor STA might not have the power and traffic volume limitation expected for a sensor STA.

non-space-time-block-coding (non-STBC) frame: A frame that is transmitted in a physical layer (PHY) protocol data unit (PPDU) that has the TXVECTOR STBC parameter equal to 0, or a frame that is received in a PPDU that has the RXVECTOR STBC parameter equal to 0.

non-traffic indication map (non-TIM) mode: A sub 1 GHz (S1G) non-access point (non-AP) station (STA) power save mode in which an S1G non-AP STA need not listen for traffic indication map (TIM) Beacon frames but transmits at least one PS-Poll or trigger frame to the associated access point (AP) every listen interval.

non-traffic indication map (non-TIM) station (STA): A sub 1 GHz (S1G) non-access point (non-AP) STA that has entered the non-TIM mode.

nontransmitted basic service set (BSS) identifier (BSSID): A BSSID that is not transmitted explicitly, but that can be derived from the information encoded in Probe Response, Beacon and directional multi-gigabit (DMG) Beacon frames and neighbor reports.

null data PPDU (NDP): A physical layer (PHY) protocol data unit (PPDU) that carries no Data field.

null data PPDU (NDP) 1M (NDP_1M): An NDP carrying medium access control (MAC) information (CMI) frame that is transmitted using the S1G_1M format.

null data PPDU (NDP) 2M (NDP_2M): An NDP carrying medium access control (MAC) information (CMI) frame that is transmitted using the S1G_SHORT format.

null data PPDU (NDP) carrying medium access control information (CMAC) PPDU: A physical layer (PHY) protocol data unit (PPDU) with no Data field used by the PHY to provide to the medium access control (MAC) the service of carrying MAC information in the SIGNAL field of the sub 1 GHz (S1G) PPDU.

off-channel: A channel used by a tunneled direct link setup (TDLS) station (STA) that does not overlap the channel(s) used by the access point (AP) with which the TDLS STA is associated.

operating class: An E.1 index into a set of values for radio operation in one or more regulatory domains.

operational modulation and coding scheme (MCS) set: The set of MCSs that a station (STA) is capable of receiving. The operational MCS set is typically advertised in the physical layer (PHY) capabilities element(s), e.g. HT and VHT Capabilities elements.

operational rate set: The set of data rates that a station (STA) is capable of receiving. The operational rate set is advertised in the Supported Rates and BSS Membership Selectors element and, if present, the Extended Supported Rates and BSS Membership Selectors element.

orthogonal frequency division multiplexing (OFDM) physical layer (PHY) protocol data unit (PPDU): A Clause 17 PPDU.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

outside the context of a basic service set (BSS) (OCB): A mode of operation in which a station (STA) is not a member of a BSS and does not utilize IEEE 802.11 authentication, association, or data confidentiality services.

paged association identifier (AID): An AID of a sub 1 GHz (S1G) non-access point (non-AP) station (STA) whose corresponding bit value in a transmitted traffic indication map (TIM) encoded in AID with differential encoding (ADE) mode is 1.

pairwise master key (PMK): The key derived from a key generated by an Extensible Authentication Protocol (EAP) method or obtained directly from a preshared key (PSK).

pairwise master key (PMK) R0 (PMK-R0): The key at the first level of the fast basic service set (BSS) transition (FT) key hierarchy.

pairwise master key (PMK) R0 key holder (R0KH): The component of robust security network association (RSNA) key management of the Authenticator that is authorized to derive and hold the PMK-R0, derive the PMK-R1s, and distribute the PMK-R1s to the R1KHs.

pairwise master key (PMK) R0 key holder identifier (R0KH-ID): An identifier that names the holder of the PMK-R0 in the Authenticator.

pairwise master key (PMK) R0 name (PMKR0Name): An identifier that names the PMK-R0.

pairwise master key (PMK) R1 (PMK-R1): A key at the second level of the fast basic service set (BSS) transition (FT) key hierarchy.

pairwise master key (PMK) R1 key holder (R1KH): The component of robust security network association (RSNA) key management of the Authenticator that receives a PMK-R1 from the R0KH, holds the PMK-R1, and derives the pairwise transient keys (PTKs).

pairwise master key (PMK) R1 key holder identifier (R1KH-ID): An identifier that names the holder of a PMK-R1 in the Authenticator.

pairwise master key (PMK) R1 name (PMKR1Name): An identifier that names a PMK-R1.

pairwise master key (PMK) S0 key holder (S0KH): The component of robust security network association (RSNA) key management of the Supplicant that derives and holds the PMK-R0, derives the PMK-R1s, and provides the PMK-R1s to the S1KH.

pairwise master key (PMK) S0 key holder identifier (S0KH-ID): An identifier that names the holder of the PMK-R0 in the Supplicant.

pairwise master key (PMK) S1 key holder (S1KH): The component of robust security network association (RSNA) key management in the Supplicant that receives a PMK-R1 from the S0KH, holds the PMK-R1, and derives the pairwise transient keys (PTKs).

pairwise master key (PMK) S1 key holder identifier (S1KH-ID): An identifier that names the holder of the PMK-R1 in the Supplicant.

pairwise master key security association (PMKSA): The context resulting from a successful IEEE 802.1X authentication exchange between the peer and Authentication Server (AS) or from a preshared key (PSK).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

pairwise transient key (PTK): A concatenation of session keys derived from the pairwise master key (PMK) or from the PMK-R1.

pairwise transient key (PTK) name (PTKName): An identifier that names the PTK.

pairwise transient key security association (PTKSA): The context resulting from a successful 4-way handshake between a peer and Authenticator or from a successful fast initial link setup (FILS) authentication.

parameterized quality of service (QoS): The treatment of the medium access control (MAC) protocol data units (MPDUs) depends on the parameters associated with the MPDU. Parameterized QoS is primarily provided through the hybrid coordination function (HCF) controlled channel access (HCCA) mechanism, but is also provided by the enhanced distributed channel access (EDCA) mechanism if used with a traffic specification (TSPEC) for admission control.

payload protected (PP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU that is protected with counter mode (CTR) with cipher-block chaining message authentication code (CBC-MAC) protocol (CCMP) or Galois/counter mode (GCM) protocol (GCMP) but does not include the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

peer trigger frame: A Mesh Data or quality-of-service (QoS) Null frame that initiates a mesh peer service period.

peer-specific mesh power management mode: The activity level identifier of a mesh station (STA) set per mesh peering. Three peer-specific mesh power management modes are defined: active mode, light sleep mode, and deep sleep mode.

per-frame sequence counter: For temporal key integrity protocol (TKIP), the counter that is used as the nonce in the derivation of the per-frame encryption key. For counter mode with cipher-block chaining message authentication code protocol (CCMP) or Galois/counter mode (GCM) protocol (GCMP), the per-frame initialization vector (IV).

personal basic service set (PBSS): A directional multi-gigabit (DMG) basic service set (BSS) that includes one station (STA) that is in a PBSS control point (PCP), and in which access to a distribution system (DS) is not present.

personal basic service set (PBSS) control point (PCP): An entity that contains one station (STA) and coordinates access to the wireless medium (WM) by STAs that are members of a PBSS.

personal basic service set (PBSS) control point (PCP) or access point (AP) cluster: A single directional multi-gigabit (DMG) synchronization AP or synchronization PCP, plus zero or more neighboring DMG APs or PCPs (or a mixture of both) that join as member APs and PCPs to the synchronization AP or synchronization PCP.

physical layer (PHY) header: The portion of a PHY protocol data unit (PPDU) up to and excluding the first symbol that contains part of the PHY service data unit (PSDU).

power save (PS) mode: A power management mode in which a nonmesh station (STA) alternates between awake and doze states.

power save multi-poll (PSMP): A mechanism that provides a time schedule that is used by an access point (AP) and its stations (STAs) to access the wireless medium. The mechanism is controlled using the PSMP frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

power save multi-poll (PSMP) burst: A series of one or more PSMP sequences, separated by short interframe space (SIFS).

power save multi-poll downlink transmission time (PSMP-DTT): A period of time described by a PSMP frame during which the access point (AP) transmits.

power save multi-poll (PSMP) sequence: A sequence of frames in which the first frame is a PSMP frame that is followed by transmissions in zero or more power save multi-poll downlink transmission times (PSMP-DTTs) and then by transmissions in zero or more power save multi-poll uplink transmission times (PSMP-UTTs). The schedule of the PSMP-DTTs and PSMP-UTTs is defined in the PSMP frame.

power save multi-poll (PSMP) session: The relationship between an access point (AP) and one or more stations (STAs) that exists while any traffic stream (TS) exists that uses the PSMP mechanism with the same service period.

power save multi-poll uplink transmission time (PSMP-UTT): A period of time described by a PSMP frame during which a non-access-point (non-AP) station (STA) can transmit.

power save multi-poll uplink transmission time (PSMP-UTT) spacing: The period of time between the end of one PSMP-UTT and the start of the following PSMP-UTT within the same power save multi-poll (PSMP) sequence.

power save (PS) station (STA): A station that is in power save mode.

pre-robust security network association (pre-RSNA): The type of association used by a pair of stations (STAs) if the procedure for establishing authentication or association between them did not include the 4-way handshake, was not fast initial link setup (FILS) authentication, and did not use the fast basic service set (BSS) transition (FT) protocol.

pre-robust security network association (pre-RSNA) station (STA): A STA that is not able to create robust security network associations (RSNAs).

primary 1 MHz channel: In a 2 MHz, 4 MHz, 8 MHz, or 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 1 MHz channel that is used to transmit 1 MHz physical layer (PHY) protocol data units (PPDUs).

primary 2 MHz channel: In a 4 MHz, 8 MHz, or 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 2 MHz channel that is used to transmit 2 MHz physical layer (PHY) protocol data units (PPDUs).

primary 4 MHz channel: In an 8 MHz or 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 4 MHz channel that is used to transmit 4 MHz physical layer (PHY) protocol data units (PPDUs).

primary 8 MHz channel: In a 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 8 MHz channel that is used to transmit 8 MHz physical layer (PHY) protocol data units (PPDUs).

primary 20 MHz channel: In a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz basic service set (BSS), the 20 MHz channel that is used to transmit 20 MHz physical layer (PHY) protocol data units (PPDUs). In a high-throughput (HT) or very high throughput (VHT) BSS, the primary 20 MHz channel is also the primary channel.

primary 40 MHz channel: In an 80 MHz, 160 MHz, or 80+80 MHz basic service set (BSS), the 40 MHz channel that is used to transmit 40 MHz physical layer (PHY) protocol data units (PPDUs).

primary 80 MHz channel: In a 160 MHz or 80+80 MHz basic service set (BSS), the 80 MHz channel that is used to transmit 80 MHz physical layer (PHY) protocol data units (PPDUs).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

primary access category (AC): The AC associated with the enhanced distributed channel access function (EDCAF) that gains channel access.

protected dual of public action frame: An Action frame with the category value specified in 9.4.1.11 (Table 9-51). For each Protected Dual of Public Action frame, there is a dual Action frame in a category that is specified with No in the Robust column of Table 9-51.

protected frame: A frame that has been encrypted and/or whose integrity can be verified cryptographically.

protocol version 0 (PV0) medium access control (MAC) protocol data unit (MPDU): An MPDU that has the Protocol Version field of the Frame Control field of the MPDU header equal to 0.

protocol version 1 (PV1) medium access control (MAC) protocol data unit (MPDU): An MPDU that has the Protocol Version field of the Frame Control field of the MPDU header equal to 1.

quality-of-service (QoS) frame: A frame containing the QoS Control field.

quality-of-service management frame (QMF): A Management frame that is transmitted using the QMF service.

quality-of-service management frame (QMF) access point (AP): A quality-of-service AP that implements the QMF service.

quality-of-service management frame (QMF) policy: A policy defining the access category of Management frames. QMF stations (STAs) transmit their Management frames using the access category defined by the policy.

quality-of-service management frame (QMF) service: A service in which the enhanced distributed channel access (EDCA) access category with which a Management frame is sent is determined according to a configured policy.

quality-of-service management frame (QMF) station (STA): A quality-of-service STA that implements the QMF service.

quasi-omni antenna pattern: A directional multi-gigabit (DMG) antenna operating mode with the widest beamwidth attainable.

receive sector sweep (RXSS): Reception of Sector Sweep (SSW) frames via different sectors, in which a sweep is performed between consecutive receptions.

received signal-to-noise indicator (RSNI): An indication of the signal-to-noise plus interference ratio of a received frame.

resource information container (RIC): A sequence of elements that include resource request and response parameters.

restricted access window (RAW): A medium access interval for a group of stations (STAs) during which a STA in the RAW group indicated by the RAW parameter set (RPS) element is allowed to contend for access to the medium.

reverse direction (RD) initiator: A station (STA) that is a transmit opportunity (TXOP) holder that transmits a medium access control (MAC) protocol data unit (MPDU) in which the reverse direction grant/more physical layer protocol data unit (RDG/More PPDU) subfield is equal to 1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

reverse direction (RD) responder: A station (STA) that is not the RD initiator and whose medium access control (MAC) address matches the value of the Address 1 field of a received MAC protocol data unit (MPDU) in which the RDG/More PPDU subfield is equal to 1.

robust Action frame: An Action frame with a category value specified in 9.4.1.11 (Table 9-51 with Yes in the Robust column).

robust Management frame: A Management frame that is eligible for protection.

robust security network (RSN): A security network that allows only the creation of robust security network associations (RSNAs). An RSN can be identified by the indication in the RSN element (RSNE) of Beacon frames that the group cipher suite specified is not wired equivalent privacy (WEP).

robust security network association (RSNA): The type of association used by a pair of stations (STAs) if the procedure to establish authentication or association between them includes the 4-way handshake or the fast basic service set (BSS) transition (FT) protocol, or is fast initial link setup (FILS) authentication. Note that existence of an RSNA between two STAs does not of itself provide robust security. Robust security is provided when all STAs in the network use RSNAs.

robust security network association (RSNA) key management: Key management that includes the 4-way handshake, the group key handshake, authenticated mesh peering exchange, mesh group key handshake, and the PeerKey handshake. If fast basic service set (BSS) transition (FT) is enabled, the FT 4-way handshake and FT authentication sequence are also included. If fast initial link setup (FILS) is enabled, FILS authentication is also included.

sub 1 GHz (S1G) band: Frequency band for which an S1G operating class is defined in Annex E.

scheduled service period (SP): An SP that is scheduled by a quality-of-service (QoS) access point (AP) or a personal basic service set (PBSS) control point (PCP).

secondary 1 MHz channel: In a 2 MHz sub 1 GHz (S1G) basic service set (BSS), the 1 MHz channel adjacent to the primary 1 MHz channel that with the primary 1 MHz channel forms the 2 MHz channel of the 2 MHz S1G BSS. In a 4 MHz, 8 MHz, and 16 MHz S1G BSS, the 1 MHz channel adjacent to the primary 1 MHz channel that together form the primary 2 MHz channel of the S1G BSS.

secondary 2 MHz channel: In a 4 MHz sub 1 GHz (S1G) basic service set (BSS), the 2 MHz channel adjacent to the primary 2 MHz channel that with the primary 2 MHz channel forms the 4 MHz channel of the 4 MHz S1G BSS. In an 8 MHz and 16 MHz S1G BSS, the 2 MHz channel adjacent to the primary 2 MHz channel that together form the primary 4 MHz channel of the S1G BSS.

secondary 4 MHz channel: In an 8 MHz sub 1 GHz (S1G) basic service set (BSS), the 4 MHz channel adjacent to the primary 4 MHz channel that with the primary 4 MHz channel forms the 8 MHz channel of the 8 MHz S1G BSS. In a 16 MHz S1G BSS, the 4 MHz channel adjacent to the primary 4 MHz channel that together form the primary 8 MHz channel.

secondary 8 MHz channel: In a 16 MHz sub 1 GHz (S1G) basic service set (BSS), the 8 MHz channel adjacent to the primary 8 MHz channel that with the primary 8 MHz channel forms the 16 MHz channel of the 16 MHz S1G BSS.

secondary 20 MHz channel: In a 40 MHz very high throughput (VHT) basic service set (BSS), the 20 MHz channel adjacent to the primary 20 MHz channel that together form the 40 MHz channel of the 40 MHz VHT BSS. In an 80 MHz VHT BSS, the 20 MHz channel adjacent to the primary 20 MHz channel that together form the primary 40 MHz channel of the 80 MHz VHT BSS. In a 160 MHz or 80+80 MHz VHT BSS, the 20 MHz channel adjacent to the primary 20 MHz channel that together form the primary 40 MHz

channel of the 160 MHz or 80+80 MHz VHT BSS. In a VHT BSS, the secondary 20 MHz channel is also the secondary channel.

secondary 40 MHz channel: In an 80 MHz very high throughput (VHT) basic service set (BSS), the 40 MHz channel adjacent to the primary 40 MHz channel that together form the 80 MHz channel of the 80 MHz VHT BSS. In a 160 MHz or 80+80 MHz VHT BSS, the 40 MHz channel adjacent to the primary 40 MHz channel that together form the primary 80 MHz channel.

secondary 80 MHz channel: In a 160 MHz or 80+80 MHz very high throughput (VHT) basic service set (BSS), the 80 MHz channel not including the primary 20 MHz channel, that together with the primary 80 MHz channel form the 160 MHz or 80+80 MHz channel of the 160 MHz or 80+80 MHz VHT BSS.

secondary access category (AC): An AC that is not associated with the enhanced distributed channel access function (EDCAF) that gains channel access.

NOTE—Traffic associated with a secondary AC can be included in a multi-user (MU) physical layer (PHY) protocol data unit (MU PPDU) that includes traffic associated with the primary AC. There could be multiple secondary ACs at a given time. A single medium access control protocol data unit (S-MPDU) is a special form of MPDU that is carried in an A-MPDU.

secondary channel: A channel associated with a primary channel used to create a channel wider than the primary channel. In a 40 MHz, 80 MHz, 160 MHz or 80+80 MHz basic service set (BSS) the secondary channel is a secondary 20 MHz channel.

sector: A transmit or receive antenna pattern corresponding to a sector identifier (ID).

security network: A basic service set (BSS) in which the station (STA) starting the BSS provides information about the security capabilities and configuration of the BSS by including the robust security network element (RSNE) in Beacon frames.

self-protected action frame: An Action frame that is not eligible for protection by the robust management frame service. The protection on each Self-protected Action frame is provided by the protocol that uses the frame.

sensor station (STA): A sub 1 GHz (S1G) non-access point (non-AP) STA that has certain traffic and device characteristics (e.g., limited payload size, limited traffic volume, battery operated device) and is allowed to associate with an access point (AP) that transmits an S1G Beacon, a Probe Response, or a PV1 Probe Response frame containing the S1G Capabilities element with the STA Type Support subfield indicating a sensor basic service set (BSS) or a mixed BSS.

service information client (SIC): A logical entity that initiates station (STA) service discovery.

service information registry (SIR): A logical entity that contains caches of information about services that are available via the basic service set (BSS).

service interval (SI): The interval between the starts of two successive scheduled service periods (SPs).

service period (SP): A period of time during which one or more downlink individually addressed frames are transmitted to a quality-of-service (QoS) station (STA) and/or one or more transmission opportunities (TXOPs) are granted to the same STA. SPs are either scheduled or unscheduled.

NOTE—A non-access-point (non-AP) STA can have at most one nongroupcast with retries SP (non-GCR-SP) active at any time.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

session key: A key that is generated for a single session, to be used, e.g., for encryption and integrity protection, such as a temporal key (TK), group temporal key (GTK), EAPOL-Key encryption key (KEK) or EAPOL-Key confirmation key (KCK).

NOTE—A session key is not necessarily a temporal key.

shared bands: Radio frequency bands in which dissimilar services are permitted.

short beacon interval: The interval between the consecutive target short beacon transmission times (TSBTTs) of beacons containing a minimal set of elements.

signaling and payload protected (SPP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU that is protected with counter mode (CTR) with cipher-block chaining message authentication code (CBC-MAC) protocol (CCMP) or Galois/counter mode (GCM) protocol (GCMP) and that includes the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

single medium access control (MAC) protocol data unit (S-MPDU): An MPDU that is the only MPDU in an aggregate MPDU (A-MPDU) and that is carried in an A-MPDU subframe with the EOF subfield of the MPDU delimiter field equal to 1.

sounding physical layer (PHY) protocol data unit (PPDU): A PPDU that is intended by the transmitting station (STA) to enable the receiving STA to estimate the channel between the transmitting STA and the receiving STA. The Not Sounding field in the High Throughput SIGNAL field (HT-SIG) is equal to 0 in sounding PPDUs.

source directional multi-gigabit (DMG) station (STA): A DMG STA identified by the source association identifier (AID) field contained in a Grant frame or Extended Schedule element that caused the allocation of a service period (SP) or contention based access period (CBAP).

space-time block coding (STBC) beacon: A beacon that is transmitted using the basic STBC modulation and coding scheme (MCS) to enable discovery of the basic service set (BSS) by high-throughput (HT) stations (STAs) that support the HT STBC feature in order to extend the range of the BSS.

space-time block coding (STBC) delivery traffic indication map (DTIM): An STBC beacon transmission that is a DTIM Beacon frame.

space-time block coding (STBC) frame: A frame that is transmitted in a physical layer (PHY) protocol data unit (PPDU) that has a nonzero value of the TXVECTOR STBC parameter, or a frame that is received in a PPDU that has a nonzero value of the RXVECTOR STBC parameter.

spatial sharing (SPSH): Use of a frequency channel by multiple stations (STAs) that are located in the same vicinity, and whose directional transmissions might overlap in time.

staggered preamble: A physical layer (PHY) preamble in a sounding PHY protocol data unit (PPDU) that is not a null data PPDU (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

staggered sounding: The use of a sounding physical layer (PHY) protocol data unit (PPDU) that is not a null data PPDU (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

station (STA) 2G4: A STA that is operating on a channel that belongs to any operating class that has a value of 25 or 40 for the entry in the Channel spacing column and that has a value of 2.407 or 2.414 for the entry in the Channel starting frequency column of any of the tables found in E.1.

station (STA) 5G: A STA that is operating on a channel that belongs to any operating class that has a value of 20 or 40 for the entry in the Channel spacing column and that has a value of 5 for the entry in the Channel starting frequency column of any of the tables found in E.1.

sub 1 GHz 1M (S1G_1M) physical layer (PHY) protocol data unit (PPDU): A 1 MHz PPDU or 1 MHz duplicate PPDU that is transmitted with S1G_1M preamble.

sub 1 GHz long (S1G_LONG) physical layer (PHY) protocol data unit (PPDU): A Clause 23 PPDU.

sub 1 GHz modulation and coding scheme (S1G-MCS): A specification of the S1G physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM) and forward error correction (FEC) coding rate (e.g., 1/2 rep2, 1/2, 2/3, 3/4, 5/6) that is used in an S1G PHY protocol data unit (PPDU).

sub 1 GHz (S1G) physical layer (PHY) protocol data unit (PPDU): A PPDU transmitted with the TXVECTOR parameter FORMAT equal to S1G, S1G_DUP_1M, or S1G_DUP_2M. The PPDU is transmitted with the S1G_SHORT, S1G_LONG, or S1G_1M preamble.

sub 1 GHz short (S1G_SHORT) physical layer (PHY) protocol data unit (PPDU): A 2 MHz, 4 MHz, 8 MHz, 16 MHz, or 2 MHz duplicate PPDU with short preamble format.

subchannel selective transmission (SST) channel: A channel that is permitted for the subchannel selective transmission indicated by either an SST element or an RPS element.

subscription service provider (SSP) roaming: The act when a station (STA) uses an SSP's IEEE 802.11 infrastructure, with which the terminal has no direct agreement, based on a subscription and formal agreement with the STA's own SSP.

successful transmission: A transmission and the reception of its expected immediate response or a transmission for which no immediate response is expected.

sweep: A sequence of transmissions, separated by a short beamforming interframe space (SBIFS), in which the antenna configuration at the transmitter or receiver is changed between transmissions.

synchronization access point (AP) (S-AP): An AP that provides synchronization and other services to an AP cluster or personal basic service set (PBSS) control point (PCP).

synchronization personal basic service set (PBSS) control point (PCP) (S-PCP): A PCP that provides synchronization and other services to an access point (AP) cluster or PCP cluster.

synchronizing access point (AP) or personal basic service set (PBSS) control point (PCP): A China directional multi-gigabit (CDMG) AP or PCP that is operating on a 1.08 GHz channel but still transmitting its DMG Beacon frames on the relevant 2.16 GHz channel with the AP or PCP Role subfield of the Dynamic Bandwidth Control element (9.4.2.220) set to 0 and providing synchronization service to a synchronized AP or PCP on the relevant 2.16 GHz channel.

synchronized access point (AP) or personal basic service set (PBSS) control point (PCP): A CDMG AP or PCP that is operating on a 1.08 GHz channel but still transmitting its DMG Beacon frames on the relevant 2.16 GHz channel with the AP or PCP Role subfield of the Dynamic Bandwidth Control element (9.4.2.220) set to 1 and synchronizing with the synchronizing AP or PCP on the relevant 2.16 GHz channel.

synthetic receiver address (SYNRA): A constructed group address used by a general link (GLK) access point (AP) as a receiver address to forward frames to a subset of GLK non-AP stations (STAs), as required by IEEE 802.1Q bridges.

target wake time (TWT): A specific time or set of times for individual stations (STAs) to wake in order to exchange frames with other STAs.

target wake time (TWT) requester: A station (STA) that has had a requested TWT agreement accepted by another STA and that receives TWT service period (SP) start times from that STA.

target wake time (TWT) responder: A station (STA) that has accepted a TWT agreement that was requested by another STA and that assigns TWT service period (SP) start times to the requesting STA.

target wake time (TWT) service period (SP): A period of time during which a TWT station (STA) is awake to transmit and/or receive frames.

target wake time (TWT) service period (SP) start time: The value of the timing synchronization function (TSF) at the beginning of a TWT SP.

television very high throughput 2W (TVHT_2W): Two contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput 2W+2W (TVHT_2W+2W): Two noncontiguous frequency segments, each of which comprises two contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput 4W (TVHT_4W): Four contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput (TVHT) basic service set (BSS): A set of stations (STAs) that consists of a geolocation database dependent (GDD) enabling STA operating in television white spaces (TVWS) and one or more of its GDD STAs.

television very high throughput W (TVHT_W): One basic channel unit in television white spaces (TVWS).

television very high throughput W+W (TVHT_W+W): Two noncontiguous basic channel units (BCUs) in television white spaces (TVWS).

temporal encryption key: The portion of a pairwise transient key (PTK) or group temporal key (GTK) used directly or indirectly to encrypt data in medium access control (MAC) protocol data units (MPDUs).

temporal key (TK): Temporal key integrity protocol (TKIP) only: The combination of temporal encryption key and a message integrity code (MIC) key. Non-TKIP only: A temporal encryption key.

NOTE—A temporal key is a session key.

time priority Management frame: A Management frame that is transmitted using specific frame type channel access rules.

traffic indication map (TIM) broadcast: A service that enables a non-access-point (non-AP) station (STA) to request periodic transmission of a TIM frame by the AP. TIM frames have shorter duration than Beacon frames and can be transmitted at a higher physical layer (PHY) rate, which allows the STA to save additional power while periodically checking for buffered traffic in standby mode, relative to the power consumed if the station (STA) were to periodically wake up to receive a Beacon frame.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

traffic stream identifier (TSID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities for parameterized quality of service (QoS) [i.e., the traffic stream (TS) with a particular traffic specification (TSPEC)] within the MAC data service. The TSID is assigned to an MSDU in the layers above the MAC.

transition security network (TSN): A security network that allows the creation of pre-robust security network associations (pre-RSNAs) as well as RSNAs. A TSN is identified by the indication in the robust security network element (RSNE) of Beacon frames that the group cipher suite in use is wired equivalent privacy (WEP).

transmission opportunity (TXOP) holder: A quality-of-service (QoS) station (STA) that has either been granted a TXOP by the hybrid coordinator (HC) or successfully contended for a TXOP.

transmission opportunity (TXOP) responder: A station (STA) that transmits a frame in response to a frame received from a TXOP holder during a frame exchange sequence, but that does not acquire a TXOP in the process.

transmit power: The effective isotropic radiated power (EIRP) when referring to the operation of an orthogonal frequency division multiplexing (OFDM) physical layer (PHY) in a country where so regulated.

transmit sector sweep (TXSS): Transmission of multiple sector sweep (SSW) or directional multi-gigabit (DMG) Beacon frames via different sectors, in which a sweep is performed between consecutive transmissions.

transmit sector sweep (TXSS) contention based access period (CBAP): A CBAP that is available to all stations (STAs) in an extended centralized personal basic service set (PBSS) control point (PCP) or access point (AP) cluster outside which TXSSs in the data transfer interval (DTI) can be prohibited.

transmitted basic service set identifier (BSSID): The BSSID included in the medium access control (MAC) header transmitter address field of a Beacon frame when the multiple BSSID capability is supported.

trigger frame: A frame type or a frame transmission occurrence within a specific context, intended to solicit the peer entity into a responding action.

trigger-enabled access category (AC): A quality-of-service (QoS) station (STA) AC where frames of subtype QoS Data and QoS Null from the STA that map to the AC trigger an unscheduled service period (SP) if one is not in progress.

tunneled direct-link setup (TDLS): A protocol that uses a specific Ethertype encapsulation to TDLS frames through an access point (AP) to establish a TDLS direct link.

tunneled direct-link setup (TDLS) direct link: Direct link between two non-access-point (non-AP) stations (STAs) that has been established using the TDLS protocol.

tunneled direct-link setup (TDLS) initiator station (STA): A STA that transmits a TDLS Setup Request frame or a TDLS Discovery Request frame.

tunneled direct-link setup (TDLS) peer power save mode (PSM): A PSM that is based on periodically scheduled service periods (SPs), which can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct-link setup (TDLS) peer power save mode (PSM) initiator: A station (STA) that transmits a TDLS Peer PSM Request frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

tunneled direct-link setup (TDLS) peer power save mode (PSM) responder: A station (STA) that transmits a TDLS Peer PSM Response frame.

tunneled direct-link setup (TDLS) peer station (STA): A STA with which another STA has, or is in the process of establishing, a TDLS direct link.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)]: A power save mode based on unscheduled service periods that can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] buffer station (STA): A TDLS peer STA that buffers traffic for a TPU sleep STA.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] sleep station (STA): A TDLS STA that entered power save mode on a TDLS direct link and that is using TPU for the delivery of buffered traffic.

tunneled direct-link setup (TDLS) power save mode (PSM): TDLS peer PSM or peer unscheduled automatic power save delivery (U-APSD).

tunneled direct-link setup (TDLS) responder station (STA): A STA that receives or is the intended recipient of a TDLS Setup Request frame or TDLS Discovery Request frame.

TVHT_2W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

a) A Clause 22 TVHT_2W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1.

b) A Clause 22 TVHT_2W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1.

c) A Clause 22 TVHT_W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1.

d) A Clause 22 TVHT_W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1.

TVHT_2W+2W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

a) A Clause 22 TVHT_2W+2W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W+2W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1.

b) A Clause 22 TVHT_2W+2W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W+2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1.

c) A Clause 22 TVHT_2W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1.

d) A Clause 22 TVHT_2W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter

NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1.

e) A Clause 22 TVHT_W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1.

f) A Clause 22 TVHT_W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1.

TVHT_4W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

a) A Clause 22 TVHT_4W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_4W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1.

b) A Clause 22 TVHT_4W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_4W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1.

c) A Clause 22 TVHT_2W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1.

d) A Clause 22 TVHT_2W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1.

e) A Clause 22 TVHT_W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1.

f) A Clause 22 TVHT_W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1.

TVHT_MODE_1 physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_W VHT PPDU or TVHT_W NON_HT PPDU.

TVHT_MODE_2C physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_2W VHT PPDU or TVHT_2W NON_HT PPDU.

TVHT_MODE_2N physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_W+W VHT PPDU or TVHT_W+W NON_HT PPDU.

TVHT_MODE_4C physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_4W VHT PPDU or TVHT_4W NON_HT PPDU.

TVHT_MODE_4N physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_2W+2W VHT PPDU or TVHT_2W+2W NON_HT PPDU.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

TVHT_W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

a) A Clause 22 TVHT_W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_W transmit spectral mask defined in 22.3.17.1.

b) A Clause 22 TVHT_W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_W transmit spectral mask defined in 22.3.17.1.

TVHT_W+W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

a) A Clause 22 TVHT_W+W very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W+W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1.

b) A Clause 22 TVHT_W+W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W+W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1.

c) A Clause 22 TVHT_W VHT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1.

d) A Clause 22 TVHT_W NON_HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1.

unscheduled service period (SP): The period that is started when a quality-of-service (QoS) station (STA) transmits a trigger frame to the QoS access point (AP).

uplink: A unidirectional link from a non-access point (non-AP) station (STA) to an access point (AP) or a unidirectional link from a non-AP source directional multi-gigabit (DMG) STA to a non-AP destination DMG STA.

upstream network: An integrated local area network (LAN) to which an access point (AP) is connected through a portal.

very high throughput (VHT) basic service set (BSS): A BSS in which a Beacon frame transmitted by a VHT station (STA) includes the VHT Operation element.

very high throughput (VHT) beamformee: A VHT station (STA) that receives a VHT physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix and that supports the VHT transmit beamforming feedback mechanism.

very high throughput (VHT) beamformer: A VHT station (STA) that transmits a VHT physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

very high throughput (VHT) modulation and coding scheme (VHT-MCS): A specification of the VHT physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM) and forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6) and that is used in a VHT PHY protocol data unit (PPDU).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

very high throughput (VHT) multi-user (MU) physical layer (PHY) protocol data unit (PPDU): A VHT PPDU that is capable of carrying up to four PHY service data units (PSDUs) for up to four users and is transmitted using the downlink multi-user multiple input, multiple output (DL-MU-MIMO) technique.

very high throughput (VHT) physical layer (PHY) protocol data unit (PPDU): A Clause 21 PPDU that is not a Clause 17 or Clause 19 PPDU.

very high throughput (VHT) single-user (SU) physical layer (PHY) protocol data unit (PPDU): A VHT PPDU that carries one PHY service data unit (PSDU) for one user and is not transmitted using the downlink multi-user multiple input, multiple output (DL-MU-MIMO) technique.

very high throughput (VHT) single-user-only (SU-only) beamformee: A VHT beamformee that does not receive VHT multi-user (MU) physical layer (PHY) protocol data units (PPDUs).

very high throughput (VHT) single-user-only (SU-only) beamformer: A VHT beamformer that does not transmit VHT multi-user (MU) physical layer (PHY) protocol data units (PPDUs).

white space map (WSM): Information on identified available frequencies that is obtained from a geolocation database (GDB) and that is used by IEEE 802.11 stations (STAs).

wired equivalent privacy (WEP): An obsolete cryptographic data confidentiality algorithm specified by this standard.

wireless network management (WNM) sleep mode: An extended power save mode for non-access-point (non-AP) stations (STAs) whereby a non-AP STA need not listen for every delivery traffic indication map (DTIM) Beacon frame and does not perform group temporal key/integrity group temporal key/beacon integrity group temporal key (GTK/IGTK/BIGTK) updates.

3.3 Definitions specific to IEEE 802.11 operation in some regulatory domains

ISO 3166-1 defines the international two-letter designation for country names, and these designations are included [in square brackets] at the end of each definition that has clear attribution to a regulatory domain.

contact verification signal (CVS): A signal sent by a geolocation database dependent (GDD) enabling station (STA) to validate the list of available frequencies and to verify that the receiving GDD STA is within reception range of the master white space device (WSD) [US].

personal/portable station (STA): A STA that uses network communications at unspecified locations [US].

television band device (TVBD): An intentional radiator that operates on an unlicensed basis on available channels in the broadcast television frequency bands [US].

white space device (WSD): An entity that employs cognitive facilities to use white space spectrum without causing harmful interference to protected services [EU].

3.4 Acronyms and abbreviations

3GPP	3rd Generation Partnership Project
40MC	40-MHz-capable
802.x LAN	IEEE 802-based local area networks such as IEEE Std 802.3 and IEEE Std 802.11
AA	authenticator address
AAA	authentication, authorization, and accounting

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

AAD	additional authentication data
AAI	administratively assigned identifier
A-BFT	association beamforming training
A-BI	awake beacon interval
AC	access category
ACI	access category index
Ack	acknowledgment
ACM	admission control mandatory
ACU	admission control unit
ADDBA	add block acknowledgment
ADDTS	add traffic stream
ADE	AID with differential encoding
AEAD	authenticated encryption with associated data
AES	advanced encryption standard
AES-128-CMAC	advanced encryption standard (with 128-bit key) cipher-based message authentication code
AFC	automatic frequency control
AGC	automatic gain control
AID	association identifier
AIFS	arbitration interframe space
AIFSN	arbitration interframe space number
AKM	authentication and key management
AKMP	authentication and key management protocol
A-MPDU	aggregate MAC protocol data unit
AMPE	authenticated mesh peering exchange
A-MSDU	aggregate MAC service data unit
ANIPI	average noise plus interference power indicator
ANO	access network options
ANonce	authenticator nonce
ANPI	average noise power indicator
ANQP	access network query protocol
AP	access point
AP-CSN	AP configuration sequence number
APSD	automatic power save delivery
ARP	Address Resolution Protocol
AS	authentication server
ASEL	antenna selection
ASN.1	Abstract Syntax Notation One
ASRA	additional step required for access
ATI	announcement transmission interval
ATIM	announcement traffic indication message
AV	audio video
AWV	antenna weight vector
BA	block acknowledgment
BAR	block acknowledgment request
BAT	block acknowledgment TWT

BC	beam combining
BCC	binary convolutional code
BCU	basic channel unit
BDT	bidirectional TXOP
BF	beamforming
BHI	beacon header interval
BIP	broadcast/multicast integrity protocol
BIGTK	beacon integrity group temporal key
BIGTKSA	beacon integrity group temporal key security association
BIPN	BIGTK packet number
BPN	base packet number
BPSK	binary phase shift keying
BRP	beam refinement protocol
BRPIFS	beam refinement protocol interframe space
BSA	basic service area
BSS	basic service set
BSSID	basic service set identifier
BT	bit time
BTI	beacon transmission interval
BU	bufferable unit
BW	bandwidth
CA	certificate authority
CAC	centralized authentication controller (for access points) or controlled (for stations)
CAG	Common Advertisement Group
CAP	controlled access phase
CAQ	channel availability query
CBAP	contention based access period
CBC	cipher-block chaining
CBC-MAC	cipher-block chaining message authentication code
CBP	contention based protocol
CCA	clear channel assessment
CCK	complementary code keying
CCM	CTR with CBC-MAC
CCMP	CTR with CBC-MAC Protocol
CCSR	centralized coordination service root
CCSS	centralized coordination service set
CDMG	China directional multi-gigabit
CEF	channel estimation field
CF	contention free
CID	Company ID
CMMG	China millimeter-wave multi-gigabit
C-MPDU	coded MPDU
C-PSDU	coded PSDU
CRC	cyclic redundancy code
CS	carrier sense
CSD	cyclic shift diversity

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

CSI	channel state information
CSM	channel schedule management
CSMA/CA	carrier sense multiple access with collision avoidance
CTR	counter mode
CTS	clear to send
CTS1	clear to send 1
CTS2	clear to send 2
CVS	contact verification signal
CW	contention window
DA	destination address
DBC	dynamic bandwidth control
D-BI	doze beacon interval
DBPSK	differential binary phase shift keying
DCF	distributed coordination function
DCLA	dc level adjustment
DCS	dynamic channel selection
DEI	drop eligibility indicator
DELBA	delete block acknowledgment
DELTS	delete traffic stream
DFS	dynamic frequency selection
DFT	discrete Fourier transform
DIFS	distributed (coordination function) interframe space
DILS	differentiated initial link setup
DLL	data link layer
DL-MU-MIMO	downlink multi-user multiple input, multiple output(
DLTF	Data Long Training field
DMG	directional multi-gigabit
DMS	directed multicast service
DMSID	directed multicast service identifier
DN	destination network
DO	DFS owner
DQPSK	differential quadrature phase shift keying
DR	data rate
DS	distribution system
DSAF	distribution system access function
DSCP	differentiated services code point
DSE	dynamic station enablement
DSM	distribution system medium
DSS	distribution system service
DSSS	direct sequence spread spectrum
DST	daylight saving time
DTI	data transfer interval
DTIM	delivery traffic indication map
EAP	Extensible Authentication Protocol (IETF RFC 3748)
EAPOL	Extensible Authentication Protocol over LANs (IEEE Std 802.1X-2010)
EAP-RP	EAP reauthentication protocol

Copyright © 2021 IEEE. All rights reserved.

EAS	emergency alert system
EBR	expedited bandwidth request
ECAPC	extended centralized AP or PCP cluster
ECS	extended channel switching
ED	energy detection
EDCA	enhanced distributed channel access
EDCAF	enhanced distributed channel access function
EDT	eastern daylight time
EHCC	extended hyperbolic congruence code
EIFS	extended interframe space
EIRP	equivalent isotropically radiated power
EL	energy limited
ELI	extended local identifier
ELTF	Extension Long Training field
EOF	end-of-frame
EOM	end of multi-user
EOSP	end of service period
EPD	Ethertype Protocol Discrimination (IEEE Std 802)
ERP	extended rate PHY
ERP-CCK	extended rate PHY using CCK modulation
ERP-DSSS	extended rate PHY using DSSS modulation
ERP-DSSS/CCK	extended rate PHY using DSSS or CCK modulation
ERP-OFDM	extended rate PHY using OFDM modulation
ESA	extended service area
ESP	estimated service parameters
ESR	emergency services reachable
ESS	extended service set
EST	eastern standard time
EVM	error vector magnitude
FCS	frame check sequence
FD	FILS discovery
FD-AF	full-duplex amplify-and-forward
FEC	forward error correction
FER	frame error ratio
FFC	finite field cryptography
FFE	finite field element
FFT	Fast Fourier Transform
FIFO	first in first out
FILS	fast initial link setup
FMS	flexible multicast service
FMSID	flexible multicast stream identifier
FOV	field of view
FSM	finite state machine
FST	fast session transfer
FSTS	fast session transfer session
FT	fast BSS transition

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

FTAA	fast BSS transition authentication algorithm
FTE	fast BSS transition element
FTM	fine timing measurement
FTO	fast BSS transition originator
GANN	gate announcement
GAS	generic advertisement service
GATS	group addressed transmission service
GCM	Galois/counter mode
GCMP	Galois/Counter Mode Protocol
GCR	groupcast with retries
GCR-A	groupcast with retries active
GCR-SP	groupcast with retries service period
GDB	geolocation database
GDD	geolocation database dependent
GFSK	Gaussian frequency shift key or keying
GI	guard interval
GID	group identifier
GLK	general link
GLK-GCR	general link groupcast with retries
GMK	group master key
GNonce	group nonce
GP	grant period
GPRS	general packet radio service
GPS	Global Positioning System
GQMF	group addressed quality-of-service Management frame
GTK	group temporal key
GTKSA	group temporal key security association
HC	hybrid coordinator
HCC	hyperbolic congruence code
HCCA	HCF controlled channel access
HCF	hybrid coordination function
HD-DF	half-duplex decode-and-forward
HEC	header error check
HELD	HTTP-enabled location delivery
HEMM	HCCA, EDCA mixed mode
HESSID	homogeneous extended service set identifier
HIPERLAN	high-performance radio local area network
HLP	higher layer protocol
HPA	high power amplifier
HR/DSSS	high rate direct sequence spread spectrum using the long preamble and header
HR/DSSS/short	high rate direct sequence spread spectrum using the optional short preamble and header mode
HT	high-throughput
HTC	high-throughput control
HT-GF-STF	high-throughput Greenfield Short Training field
HT-SIG	high-throughput SIGNAL field

HT-STF	high-throughput Short Training field
HTTP	hyptertext transfer protocol
HTTPS	hyptertext transfer protocol secure
HWMP	hybrid wireless mesh protocol
IBSS	independent basic service set
ICK	integrity check key
ICMP	Internet Control Message Protocol
ICV	integrity check value
IDFT	inverse discrete Fourier transform
IFFT	inverse Fast Fourier Transform
IFS	interframe space
IGTK	integrity group temporal key
IGTKSA	integrity group temporal key security association
IMp	intermodulation protection
INonce	initiator nonce
IPI	idle power indicator
IPN	IGTK packet number
I/Q	in phase and quadrature
IQMF	individually addressed quality-of-service Management frame
ISM	industrial, scientific, and medical
ISS	initiator sector sweep
IUT	implementation under test
IV	initialization vector
KCK	EAPOL-Key confirmation key
KDE	key data encapsulation
KDF	key derivation function
KEK	EAPOL-Key encryption key
LAN	local area network
LBIFS	long beamforming interframe space
LCI	location configuration information
LDPC	low-density parity check
LFSR	linear feedback shift register
LGR	legendre symbol
LLC	logical link control
L-LTF	non-HT Long Training field
LME	layer management entity
LNA	low noise amplifier
LP	low power
LPD	LLC Protocol Discrimination (IEEE Std 802)
LRC	long retry count
LSB	least significant bit
L-SIG	non-HT SIGNAL field
L-STF	non-HT Short Training field
LTF	Long Training field
MAC	medium access control
MAC_I	initiator mac address

MAC_P	peer mac address
MAD	maximum away duration
MAF	MCCA access fraction
MBCA	mesh beacon collision avoidance
MBIFS	medium beamforming interframe space
MBSS	mesh basic service set
MCCA	MCF controlled channel access
MCCAOP	MCF controlled channel access opportunity
MCF	mesh coordination function
MCS	modulation and coding scheme
MDE	Mobility Domain element
MDID	mobility domain identifier
MFB	MCS feedback
MFPC	management frame protection capable
MFPR	management frame protection required
MFSI	MCS feedback sequence identifier
MGTK	mesh group temporal key
MIB	management information base
MIC	message integrity code
MID	multiple sector identifier
MIDC	multiple sector identifier capture
MIMO	multiple input, multiple output
MIS	media independent service
MLME	MAC sublayer management entity
MLPP	multi-level precedence and preemption
MME	Management MIC element
MMPDU	MAC management protocol data unit
MMS	multiple MAC sublayers
MMSL	multiple MAC sublayers link
MM-SME	multiple MAC station management entity
MPDU	MAC protocol data unit
MPM	mesh peering management
MRQ	MCS request
MSB	most significant bit
MSDU	MAC service data unit
MSGCF	MAC state generic convergence function
MSI	MRQ sequence identifier
MSK	master session key
MS SAP	method specific service access point
MTK	mesh temporal key
MU	multi-user
MU-MIMO	multi-user multiple input, multiple output
N/A	not applicable
NAI	network access identifier
NAS	network access server
NAV	network allocation vector

NCC	network channel control
NDP	null data PPDU
non-ERP	nonextended rate PHY
NSS	number of spatial streams
NTP	Network Time Protocol (IETF RFC 5905 [B46])
OBSS	overlapping basic service set
OCB	outside the context of a BSS
OCEF	OFDM channel estimation field
OCI	operating channel information
OCT	on-channel tunneling
OCVC	operating channel validation capable
OFDM	orthogonal frequency division multiplexing
OI	organization identifier
OLB	offset length bitmap
OSI	Open Systems Interconnection (ISO/IEC 7498-1:1994)
OSTF	OFDM short training field
OUI	Organizationally Unique Identifier
PAD	preassociation discovery
PAE	port access entity (IEEE Std 802.1X-2010)
PBAC	protected block ack agreement capable
PBSS	personal basic service set
PCP	PBSS control point
PCPS	PBSS control point service
PDU	protocol data unit
PER	packet error ratio
PERR	path error
PFS	perfect forward secrecy
PHB	per-hop behavior
PHY	physical layer
PHYCS	PHY carrier sense
PHYED	PHY energy detection
PICS	protocol implementation conformance statement
PIFS	priority interframe space
PLME	physical layer management entity
PLW	PSDU length word
PMK	pairwise master key
PMKID	pairwise master key identifier
PMK-R0	pairwise master key, first level
PMK-R1	pairwise master key, second level
PMKSA	pairwise master key security association
PN	packet number
PN	pseudonoise (code sequence)
PNonce	peer nonce
PP	polling period
PP A-MSDU	payload protected aggregate MAC service data unit
PPDU	PHY protocol data unit

PRAW	periodic restricted access window
PREP	path reply
PREQ	path request
PRF	pseudorandom function
PRNG	pseudorandom number generator
PS	power save (mode)
PSAP	public safety answering point
PSDU	PHY service data unit
PSF	PHY Signaling field
PSK	preshared key
PSM	power save mode
PSMP	power save multi-poll
PSMP-DTT	power save multi-poll downlink transmission time
PSMP-UTT	power save multi-poll uplink transmission time
PTI	peer traffic indication
PTK	pairwise transient key
PTKSA	pairwise transient key security association
PTP	peer-to-peer
PV0	protocol version 0
PV1	protocol version 1
PWE	password element of an ECC group
PXU	proxy update
PXUC	proxy update confirmation
QAB	quieting adjacent BSS
QACM	QMF access category mapping
QAM	quadrature amplitude modulation
QBPSK	quadrature binary phase shift keying
QMF	quality-of-service Management frame
QoS	quality of service
QPSK	quadrature phase shift keying
QSRC	QoS STA retry count
R0KH	PMK-R0 key holder in the Authenticator
R0KH-ID	PMK-R0 key holder identifier in the Authenticator
R1KH	PMK-R1 key holder in the Authenticator
R1KH-ID	PMK-R1 key holder identifier in the Authenticator
RA	receiver address or receiving station address
RADIUS	remote authentication dial-in user service (IETF RFC 2865 [B33])
RANN	root announcement
RAV	resource allocation vector
RAW	restricted access window
RCPI	received channel power indicator
RD	reverse direction
RDE	RIC Data element
RDG	reverse direction grant
RDS	relay DMG STA
REDS	relay endpoint DMG STA

RF	radio frequency
RFC	request for comments
RIC	resource information container
RID	response indication deferral
RIFS	reduced interframe space
RLAN	radio local area network
RLQP	registered location query protocol
RLS	relay link setup
RLSS	registered location secure server
ROC	relay operation type change
RPI	receive power indicator
RPS	RAW parameter set
RRB	remote request broker
RSC	receive sequence counter
RSN	robust security network
RSNA	robust security network association
RSNE	Robust Security Network element
RSNI	received signal-to-noise indicator
RSNXE	Robust Security Network Extension element
RSPI	receiver service period initiated
RSS	responder sector sweep
RSSI	receive signal strength indicator
RTS	request to send
RTT	round trip time
RX	receive or receiver
RXASSI	receive antenna selection sounding indication
RXASSR	receive antenna selection sounding request
RXSS	receive sector sweep
S0KH	PMK-R0 key holder in the Supplicant
S0KH-ID	PMK-R0 key holder identifier in the Supplicant
S1G	sub 1 GHz
S1KH	PMK-R1 key holder in the Supplicant
S1KH-ID	PMK-R1 key holder identifier in the Supplicant
SA	source address
SAE	simultaneous authentication of equals
SAI	standard assigned identifier
S-AP	synchronization access point
SAP	service access point
S-APSD	scheduled automatic power save delivery
SA Query	security association query
SBBI	small band beacon interval
SBIFS	short beamforming interframe space
SC	single carrier
SCA	secondary channel above
SCB	secondary channel below
SCEF	single carrier channel estimation field

SCN	no secondary channel
SCS	stream classification service
SCSID	stream classification service identifier
SDL	specification and description language
SDU	service data unit
SEMM	SPCA-EDCA mixed mode
SFD	start frame delimiter
SI	service interval
SIC	service information client
SID	short identifier
SIFS	short interframe space
SIR	service information registry
SLAP	structured local address plan
SLRC	station long retry count
SLS	sector-level sweep
SM	spatial multiplexing
SME	station management entity
S-MPDU	single MAC protocol data unit
SMT	station management
SN	sequence number
SNAP	Sub-Network Access Protocol
SNonce	supplicant nonce
SNR	signal-to-noise ratio
SP	service period
SPA	supplicant address
SPCA	service period channel access
S-PCP	synchronization PBSS control point
SPP A-MSDU	signaling and payload protected aggregate MAC service data unit
SPR	service period request
SPSH	spatial sharing
SQ	signal quality (PN code correlation strength)
SRC	short retry count
SS	station service
SSID	service set identifier
SSP	subscription service provider
SSPN	subscription service provider network
SSRC	station short retry count
SST	subchannel selective transmission
SSW	sector sweep
STA	station
STACK	short TWT acknowledgment
STBC	space-time block coding
STF	Short Training field
STS	space-time stream
STT	selective translation table
SU	single-user

SU-MIMO	single-user multiple input, multiple output
SYNC	synchronization
SYNRA	synthetic receiver address
TA	transmitter address or transmitting station address
TACK	TWT acknowledgment
TAI	Temps Atomique International (International Atomic Time)
TBTT	target beacon transmission time
TC	traffic category
TCLAS	traffic classification
TDDTI	time division data transfer interval
TDLS	tunneled direct-link setup
TFS	traffic filtering service
TID	traffic identifier
TIE	Timeout Interval element
TIM	traffic indication map
TK	temporal key
TKIP	temporal key integrity protocol
TLV	type/length/value
TMPTT	target measurement pilot transmission time
TOA	time of arrival
TOD	time of departure
TPA	transmission time-point adjustment
TPC	transmit power control
TPK	TDLS PeerKey
TPKSA	TDLS PeerKey security association
TPU	TDLS peer U-APSD
TRN-R	receive training
TRN-T	transmit training
TRQ	training request
TS	traffic stream
TSBTT	target short beacon transmission time
TSC	TKIP sequence counter
TSF	timing synchronization function
TSID	traffic stream identifier
TSN	transition security network
TSPEC	traffic specification
TTAK	TKIP-mixed transmitter address and key
TTL	time to live
TTP	trusted third party
TTTT	target TIM transmission time
TU	time unit
TVHT	television very high throughput
TVWS	television white spaces
TWT	target wake time
TX	transmit or transmitter
TXASSI	transmit antenna selection sounding indication

TXASSR	transmit antenna selection sounding request
TXE	transmit enable
TXOP	transmission opportunity
TXSS	transmit sector sweep
U-APSD	unscheduled automatic power save delivery
UCT	unconditional transition
UESA	unauthenticated emergency service accessible
ULS	Universal Licensing System
U-NII	unlicensed national information infrastructure
UP	user priority
UPSIM	unscheduled power save indication map
URI	Uniform Resource Identifier
URL	Universal Resource Locator
URN	Uniform Resource Name
UTC	Coordinated Universal Time
VHT	very high throughput
VLAN	virtual local area network
VoIP	voice over Internet Protocol (IP)
WEP	wired equivalent privacy
WLAN	wireless local area network
WM	wireless medium
WNM	wireless network management
WS	wakeup schedule
WSM	white space map
ZCZ	zero correlation zone

3.5 Acronyms and abbreviations in some regulatory domains

ISO 3166-1 defines the international two-letter designation for country names, and these designations are included [in square brackets] at the end of each abbreviation that has clear attribution to a regulatory domain.

PLMR/CRS	private land mobile radio/cellular radio service [US]
TVBD	television band device [US]
WSD	white space device [EU]

4. General description

4.1 General description of the architecture

This clause presents the concepts and terminology used within this standard. Specific terms are defined in Clause 3. Illustrations convey key IEEE 802.11 concepts and the interrelationships of the architectural components. IEEE Std 802.11 uses an architecture to describe functional components of an IEEE 802.11 LAN. The architectural descriptions are not intended to represent any specific physical implementation of IEEE Std 802.11.

4.2 How wireless local area networks (WLANs) are different

4.2.1 Introduction

Wireless networks have fundamental characteristics that make them significantly different from traditional wired LANs.

4.2.2 Wireless station (STA)

In the design of wired LANs it is implicitly assumed that an address is equivalent to a physical location. In wireless networks, this is not always the case. In IEEE Std 802.11, the addressable unit is a station (STA). Physical and operational characteristics are defined by modifiers that are placed in front of the term STA. For example, in the case of location and mobility, the addressable units are the fixed STA, the portable STA, and the mobile STA. The STA is an addressable destination, but not (in general) a fixed location.

A STA might take on multiple distinct characteristics, each of which shape its function. For example, a single addressable unit might simultaneously be a portable STA, a quality-of-service (QoS) STA, a dependent STA, and a hidden STA.

4.2.3 Media impact on design and performance

The PHYs used in IEEE Std 802.11 are fundamentally different from wired media. Thus IEEE 802.11 PHYs:

a) Use a medium that has neither absolute nor readily observable boundaries outside of which STAs with PHY transceivers are known to be unable to receive network frames
b) Are unprotected from other signals that are sharing the medium
c) Communicate over a medium significantly less reliable than wired PHYs
d) Have dynamic topologies
e) Lack full connectivity, and therefore the assumption normally made that every STA can hear every other STA is invalid (i.e., STAs might be “hidden” from each other)
f) Have time-varying and asymmetric propagation properties
g) Might experience interference from logically disjoint IEEE 802.11 networks operating in overlapping areas

Because of limitations on wireless PHY ranges, WLANs intended to cover reasonable geographic distances can be built from basic coverage building blocks. When providing QoS services, the MAC endeavors to provide QoS “service guarantees” within the limitations of the medium properties identified above. In other words, particularly in unlicensed spectrum, true guarantees are often not possible. However, gradations of service are always possible; and in sufficiently controlled environments, QoS guarantees are possible.

4.2.4 The impact of handling mobile STAs

One of the requirements of IEEE Std 802.11 is to handle *mobile* as well as *portable* STAs. A *portable* STA is one that is moved from location to location, but that is used only while at a fixed location. *Mobile* STAs access the LAN while in motion.

For technical reasons, it is not sufficient to handle only portable STAs. Propagation effects blur the distinction between portable and mobile STAs; stationary STAs often appear to be mobile due to propagation effects.

Mobile STAs typically are battery powered. Hence power management is an important consideration. For example, it cannot be presumed that a STA's receiver is always powered on.

4.2.5 Interaction with other IEEE 802® layers

IEEE Std 802.11 is required to appear to higher layers [logical link control (LLC) sublayer] as a general-purpose IEEE 802 LAN. This requires that the IEEE 802.11 network handle STA mobility within the MAC sublayer. To meet reliability assumptions (that LLC makes about lower layers), it is necessary for IEEE Std 802.11 to incorporate functionality that is untraditional for MAC sublayers.

In a robust security network association (RSNA), IEEE Std 802.11 provides functions to protect Data frames, IEEE Std 802.1X-2010 provides authentication and a Controlled Port, and IEEE Std 802.11 and IEEE Std 802.1X-2010 collaborate to provide key management. All STAs in an RSNA have a corresponding IEEE 802.1X entity that handles these services. This standard defines how an RSNA utilizes IEEE Std 802.1X-2010 to access these services. Within IEEE Std 802.11, EAPOL PDUs are carried as MSDUs within one or more Data frames, as described in Clause 12 of IEEE Std 802.1X-2010. Within this standard, Data frames used for this purpose are generally referred to as *EAPOL-Key frames*, *EAPOL-Key request frames*, and *EAPOL-Start frames*.

When used to support applications that have QoS requirements, each IEEE 802.11 LAN provides a link within an end-to-end QoS environment that can be established between, and managed by, higher layer entities. To handle QoS traffic in a manner comparable to other IEEE 802 LANs, the IEEE 802.11 QoS facility requires the IEEE 802.11 MAC sublayers to incorporate functionality that is not traditional for MAC sublayers. In addition, it might be necessary for certain higher layer management entities to be "WLAN aware" at least to the extent of understanding that the available bandwidth and other QoS characteristics of a WLAN are subject to frequent, and sometimes substantial, dynamic changes due to causes other than traffic load and are outside the direct control of network management entities.

4.2.6 Interaction with non-IEEE-802 protocols

An RSNA utilizes non-IEEE-802 protocols for its authentication and key management (AKM) services. Some of these protocols are defined by other standards organizations, such as the Internet Engineering Task Force (IETF).

4.3 Components of the IEEE 802.11 architecture

4.3.1 General

The IEEE 802.11 architecture consists of several components that interact to provide a WLAN that supports STA mobility transparently to upper layers.

The basic service set (BSS) is the basic building block of an IEEE 802.11 LAN. Figure 4-1 shows two BSSs, each of which has two STAs that are members of the BSS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

It is useful to think of each oval depicting a BSS as the coverage area within which the member STAs of the BSS can remain in communication. In the case of transmissions such as in a directional multi-gigabit (DMG) BSS, the individual coverage area of a transmission from one member STA to another can be thought of as a cone and hence is referred to as a *directional transmission*. The collection of all possible directional transmissions by a member STA defines the coverage area. (The concept of area, while not precise, is often good enough.) This area is called the *Basic Service Area (BSA)*. If a STA moves out of its BSA, it can no longer directly communicate with other STAs present in the BSA.

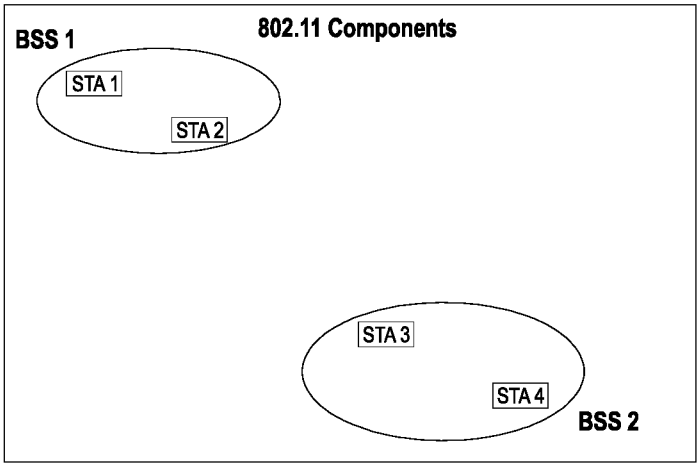

Figure 4-1—BSSs

4.3.2 Independent BSS (IBSS)

The IBSS is the most basic type of IEEE 802.11 LAN. Since the BSSs shown in Figure 4-1 are simple and lack other components (contrast this with Figure 4-2), the two can be taken to be representative of two IBSSs.

This mode of operation is possible when IEEE 802.11 STAs are able to communicate directly. This type of IEEE 802.11 LAN is often formed without preplanning.

4.3.3 Personal BSS (PBSS)

Similar to the IBSS, the PBSS is a type of IEEE 802.11 LAN in which STAs communicate directly with each other.

In contrast to the IBSS, in the PBSS one STA assumes the role of the PBSS control point (PCP). The PCP provides the basic timing for the PBSS through DMG Beacon and Announce frames as well as allocation of service periods and contention based access periods.

A PBSS can be established only by DMG STAs. Not every DMG BSS is a PBSS. A DMG BSS can be a PBSS, an infrastructure BSS, or an IBSS.

4.3.4 STA membership in a BSS is dynamic

A STA's membership in a BSS is dynamic (STAs turn on, turn off, come within range, and go out of range). To become a member of an infrastructure BSS or an IBSS, a STA joins the BSS using the synchronization procedure described in 11.1.4.5. To start a new mesh BSS or to become a member of a mesh BSS, a STA starts the transmission of Beacon frames and performs the synchronization maintenance procedure described in 14.13. To access all of the services of an infrastructure BSS, a STA becomes "associated." These

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

associations are dynamic and involve the use of the distribution system service (DSS), which is described in 4.4.4. A mesh STA does not become associated as there is no central entity in a mesh BSS (MBSS). Instead, a mesh STA peers with other mesh STAs.

4.3.5 Distribution system (DS) concepts

4.3.5.1 Overview

PHY limitations determine the direct station-to-station distance that is supported. For some networks this distance is sufficient; for other networks, increased coverage is required.

Instead of existing independently, an infrastructure BSS might also form a component of an extended form of network that is built with multiple BSSs. The architectural component used to interconnect infrastructure BSSs is the DS for non-general link (non-GLK) operation. The DS and extended service set (ESS) are mechanisms for expanding connectivity for non-GLK operation. For GLK operation, an IEEE 802.1Q™ bridge might be used to form an extended network (see 4.3.28).

IEEE Std 802.11 logically separates the WM from the distribution system medium (DSM). Each logical medium is used for different purposes, by a different component of the architecture. The IEEE 802.11 definitions neither preclude, nor demand, that the multiple media be either the same or different.

Recognizing that the multiple media are *logically* different is key to understanding the flexibility of the architecture. The IEEE 802.11 LAN architecture is specified independently of the physical characteristics of any specific implementation.

The DS enables mobile device support by providing the logical services necessary to handle address to destination mapping and seamless integration of multiple BSSs.

An access point (AP) is any entity that has STA functionality and a distribution system access function (DSAF), which enables access to the DS, via the WM for associated STAs.

Figure 4-2 adds the DS, DSM, and AP components to the IEEE 802.11 architecture picture.

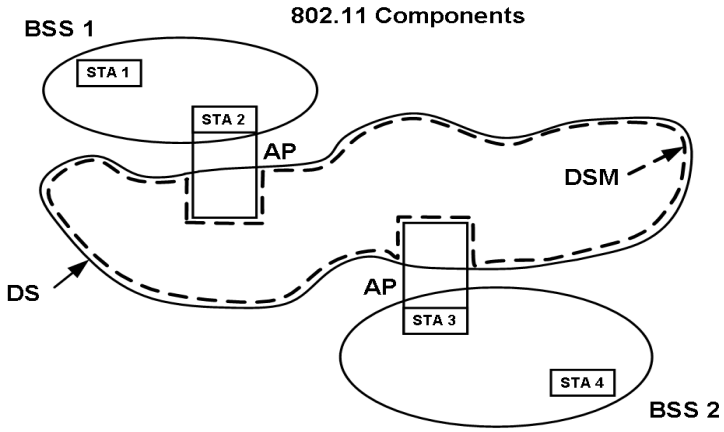

Figure 4-2—DSs and APs

Data move between a BSS and the DS via the DSAF in an AP. An AP contains a STA and is addressable on the WM using its STA address. The addresses used by an AP for communication on the WM and on the DSM are not necessarily the same.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Data sent to the AP's STA address by one of the STAs associated with it are always received at the uncontrolled port for processing by the IEEE 802.1X port access entity. In addition, if the controlled port is authorized, these frames conceptually transit the DS.

4.3.5.2 Extended service set (ESS): the large coverage network

The DS and infrastructure BSSs allow IEEE Std 802.11 to create a wireless network of arbitrary size and complexity. IEEE Std 802.11 refers to this type of network as the ESS. An ESS is the union of the infrastructure BSSs with the same SSID connected by a DS. The ESS does not include the DS.

The key concept is that the ESS appears the same to an LLC layer as an IBSS. STAs within an ESS can communicate and mobile STAs might move from one BSS to another (within the same ESS) transparently to LLC.

Owing to its distributed nature, a mesh BSS (MBSS) has no central entity like the AP of an infrastructure BSS. Instead, an MBSS forms a single set of independent mesh STAs. This set is indivisible and cannot be further unified. The ESS concept does not apply to the MBSS. However, it is possible to use a Mesh BSS as all or part of the DS that connects an ESS.

Nothing is assumed by IEEE Std 802.11 about the relative physical locations of the BSSs in Figure 4-3.

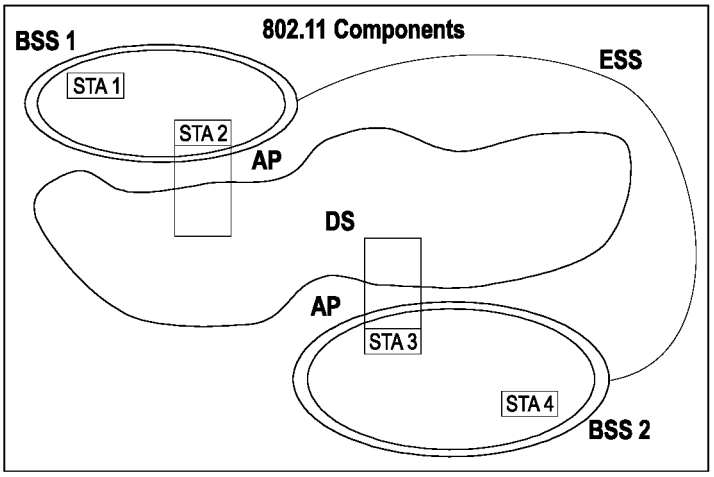

Figure 4-3—ESS

All of the following are possible:

a) The BSSs partially overlap. This is commonly used to arrange coverage within a physical volume.
b) The BSSs could be physically disjoint. Logically there is no limit to the distance between BSSs.
c) The BSSs are physically collocated. This could be done to provide redundancy.
d) One (or more) IBSSs or ESSs are physically present in the same location as one (or more) ESSs. This could arise for a number of reasons. Some examples are when an IBSS is operating in a location that also has an ESS, when physically overlapping IEEE 802.11 networks have been set up by different organizations, and when two or more different access and security policies are needed in the same location.

4.3.6 Area concepts

For wireless PHYs, well-defined coverage areas simply do not exist. Propagation characteristics are dynamic and unpredictable. Small changes in position or direction might produce dramatic differences in signal strength. Similar effects occur whether a STA is stationary or mobile (as moving objects might impact station-to-station propagation).

Figure 4-4 shows a signal strength map for a simple square room with a standard metal desk and an open doorway. This figure is a static snapshot; the propagation patterns change dynamically as STAs and objects in the environment move. The dark (solid) blocks in the lower left are a metal desk and there is a doorway at the top right of the figure. The figure indicates relative differences in field strength with different intensities and indicates the variability of field strength even in a static environment. The difference between the greatest signal strength and the least signal strength in this figure is 50 dB.

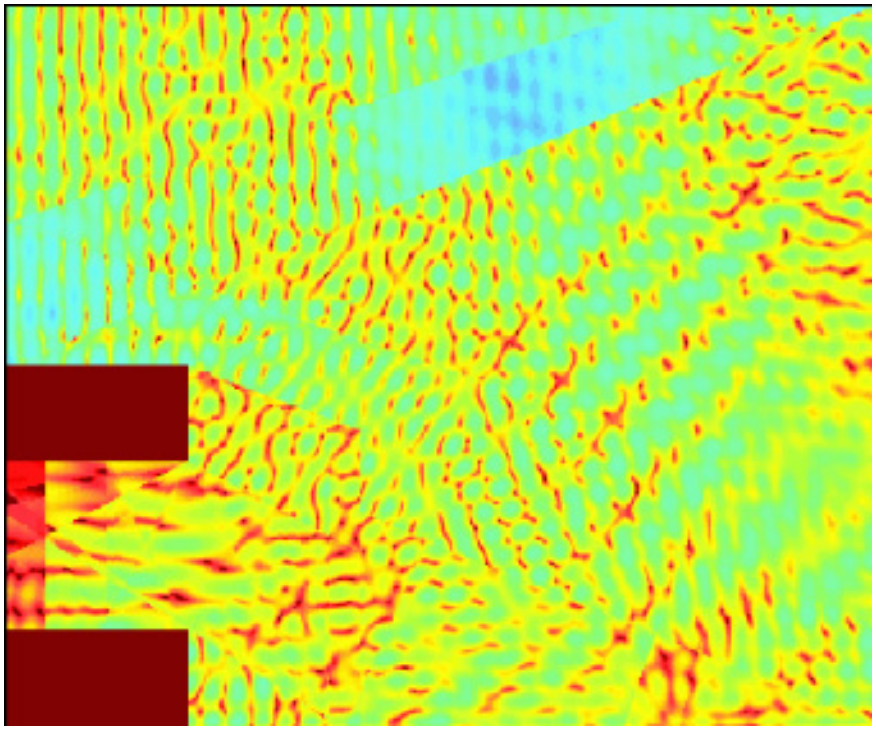

Figure 4-4—A representative signal intensity map

While the architecture diagrams show sharp boundaries for BSSs, this is an artifact of the pictorial representation, not a physical reality. Because dynamic three-dimensional field strength pictures are difficult to draw, well-defined shapes are used by IEEE 802.11 architectural diagrams to represent the coverage of a BSS.

Further description difficulties arise when attempting to describe collocated coverage areas. Consider Figure 4-5, in which STA 6 could belong to BSS 2 or BSS 3.

While the concept of sets of STAs is correct, it is often convenient to talk about areas. For many topics the concept of area is sufficient. *Volume* is a more precise term than area, though still not technically correct. For historical reasons and convenience, this standard uses the common term *area*.

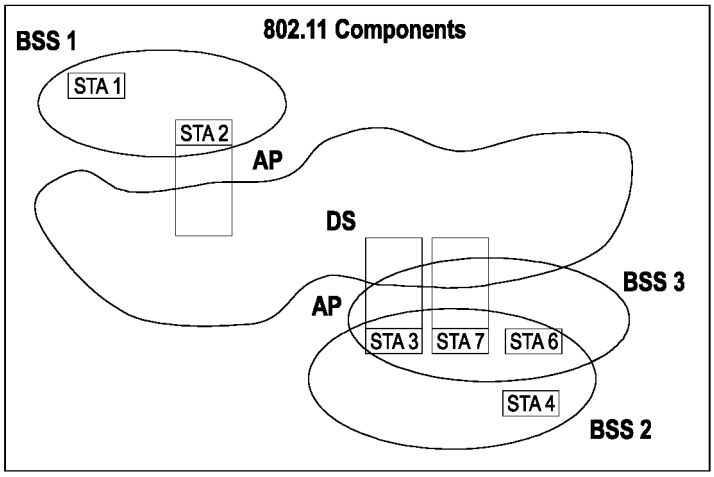

Figure 4-5—Collocated coverage areas

4.3.7 Integration with non-IEEE-802.11 LANs

To integrate the IEEE 802.11 non-GLK architecture with a non-IEEE-802.11 LAN, including a traditional wired LAN, a final logical architectural component is introduced—a *portal*. The IEEE 802.11 GLK architecture (see 4.3.28) does not include the concept of a portal.

A portal is the logical point at which the integration service is provided. All data from or to non-IEEE-802.11 LANs enter or leave the IEEE 802.11 architecture via a portal. The integration service is responsible for any addressing changes or other logical mappings that might be required when MSDUs pass between the DS and the integrated LAN. It is possible for one device to offer both the functions of an AP and a portal. For example, a portal to a wired IEEE 802 LAN is shown in Figure 4-6.

4.3.8 Robust security network association (RSNA)

The following features are defined for an RSNA:

- Enhanced authentication mechanisms for STAs
- Key management algorithms
- Cryptographic key establishment
- Enhanced data cryptographic encapsulation mechanisms, such as counter mode with cipher-block chaining message authentication code protocol (CCMP), Galois/counter mode protocol (GCMP), and, optionally, temporal key integrity protocol (TKIP)
- Fast basic service set (BSS) transition (FT) mechanism
- Enhanced cryptographic encapsulation mechanisms for robust Management frames

An RSNA might rely on components external to the IEEE 802.11 architecture.

The first component is an IEEE 802.1X port access entity (PAE). PAEs are present on all STAs in an RSNA and control the forwarding of data to and from the medium access control (MAC). An AP always implements the Authenticator PAE and Extensible Authentication Protocol (EAP) Authenticator roles, and a non-AP STA always implements the Supplicant PAE and EAP peer roles. In an IBSS or PBSS, each STA implements both the Authenticator PAE and Supplicant PAE roles and both EAP Authenticator and EAP peer roles.

A second component is the Authentication Server (AS). The AS authenticates the elements of the RSNA itself, i.e., the STAs provide material that the RSNA elements use to authenticate each other. The AS communicates through the IEEE 802.1X Authenticator with the IEEE 802.1X Supplicant on each STA, enabling the STA to be authenticated to the AS and vice versa. An RSNA depends upon the use of an EAP method that supports mutual authentication of the AS and the STA, such as those that meet the requirements in IETF RFC 4017. In certain applications, the AS might be integrated into the same physical device as the AP, or into a STA in an IBSS or PBSS.

In some applications, there is no need for a PAE or AS, and a STA and AP, or two IBSS STAs, or two mesh STAs in an MBSS, might authenticate each other using a password.

An RSNA using fast BSS transition relies on an external protocol to distribute keys between the pairwise master key (PMK) R0 key holder (R0KH) and PMK-R1 key holder (R1KH) Authenticator components. The requirements for this protocol are described in 13.2.2.

4.3.9 Centralized coordination service set (CCSS) and extended centralized AP or PCP clustering (ECAPC)

AP or PBSS control point (PCP) clustering is a protocol between a DMG synchronization AP or DMG synchronization PCP (S-AP or S-PCP) and other APs and PCPs within the cluster, known as member APs and PCPs. This protocol is used to improve spatial sharing and interference mitigation among the DMG BSSs of the S-AP or S-PCP and member APs and PCPs. AP or PCP clustering allows an AP or PCP within a cluster to schedule transmissions in nonoverlapping time periods with respect to other APs and PCPs that are in the same cluster. There are two types of clustering:

- In decentralized AP or PCP clustering, there is a single S-AP or S-PCP in the BSA of the S-AP or S-PCP.
- In centralized AP or PCP clustering, there can be multiple S-APs in the BSA of any one S-AP and all S-APs are coordinated via a single centralized coordination service set (CCSS).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A CCSS comprises a centralized coordination service root (CCSR) and a set of one or more synchronization APs that while operating are stationary with respect to their local environment and are connected to the CCSR via, for instance, one of the following:

— The DS to an AP (or beyond, to a STA associated to the AP)
— A combination of distribution system, portal, and external network

The CCSR provides coordination services for the CCSS, such as selecting the target beacon transmission time of S-APs within the CCSS to minimize interference. The CCSR might logically reside within an S-AP or in another entity as long as it has a globally administered MAC address. A CCSS is suited to an area and a frequency band having the following propagation characteristics:

— The BSAs of the S-APs within the CCSS cover the area, and
— Transmissions within the area are isolated to a high degree.

An extended centralized AP or PCP cluster (ECAPC) comprises a single CCSS and an accompanying set of centralized AP or PCP clusters. Each S-AP of one of the centralized AP or PCP clusters is inside the CCSS. The ECAPC also includes all STAs in the BSSs of the S-APs and member APs and PCPs of the centralized AP or PCP clusters. An example is shown in Figure 4-7, in which:

— STA3a and STA3b are two STAs coordinated by a one MM-SME component.
— STA4a and STA4b are two STAs coordinated by a second MM-SME component.
— The CCSR happens to be located in an external network.

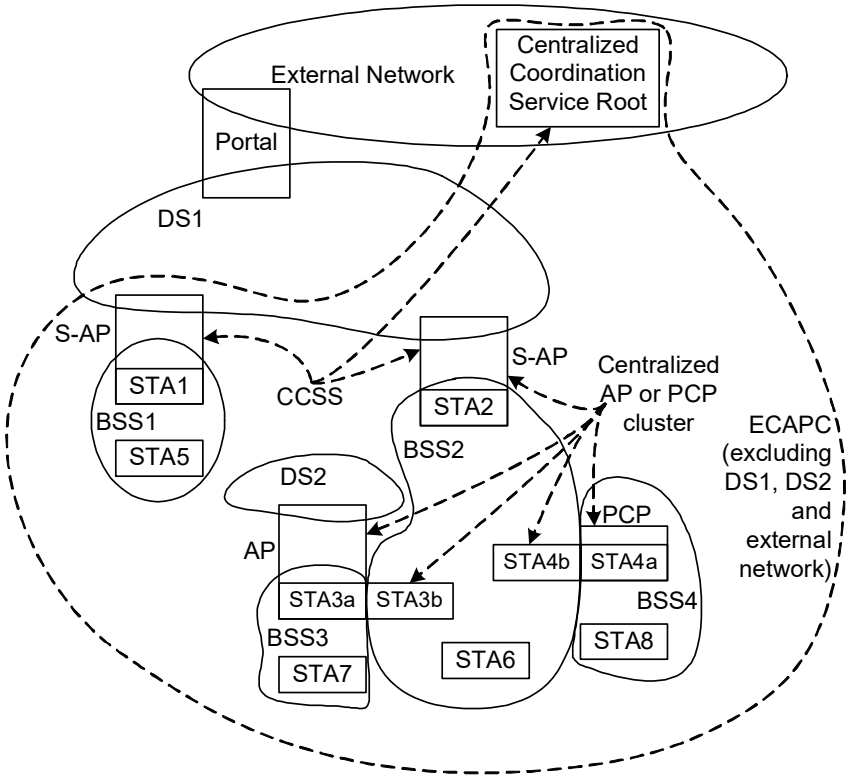

Figure 4-7—CCSS and ECAPC

The CCSS might contain whole ESSs, subsets of ESSs, or some combination of them.

Decentralized AP or PCP clustering can be employed without establishing a CCSS, CCSR, or ECAPC.

4.3.10 QoS BSS

The IEEE 802.11 QoS facility provides MAC enhancements to support LAN applications with QoS requirements. The QoS enhancements are available to QoS STAs associated with a QoS access point or PCP in a QoS BSS. A subset of the QoS enhancements is available for use between STAs that are members of the same QoS IBSS.

Similarly, a subset of the QoS enhancements is available for use between neighbor peer mesh STAs. A mesh BSS is one type of QoS BSS and it is described in 4.3.21.

A QoS STA that is a non-DMG STA might associate with a non-QoS access point in a non-QoS BSS, to provide the non-QoS MAC data service, for example, when there is no QoS access point with which to associate.

As a mesh STA does not implement the necessary service, the mesh STA does not associate with any access point.

A DMG STA is a QoS STA. A DMG BSS is a QoS BSS.

The enhancements that distinguish QoS STAs from non-QoS STAs and QoS APs from non-QoS APs are collectively termed the *QoS facility*. Which of the QoS-specific mechanisms a QoS STA supports might vary among QoS implementations, as well as between QoS STAs and QoS APs, over ranges specified in subsequent clauses. All service primitives, frame formats, coordination function and frame exchange rules, and management interface functions except for the block acknowledgment (block ack) function, and automatic power save delivery (APSD) are part of the core QoS facility. A QoS STA or QoS AP implements those core QoS facility necessary for its QoS functions to interoperate with other QoS STAs. Functions such as the block ack, and APSD are separate from the core QoS facility; and the presence of these functions is indicated by STAs separately from the core QoS facility.

For infrastructure BSS and IBSS, this standard provides four mechanisms for the support of applications with QoS requirements.

The first mechanism, designated the *enhanced distributed channel access* (EDCA), delivers traffic based on differentiating user priorities (UPs). This differentiation is achieved by varying the following for different UP values:

— Amount of time a STA senses the channel to be idle before backoff or transmission, or
— The length of the contention window to be used for the backoff, or
— The duration a STA transmits after it acquires the channel.

These transmissions might also be subject to certain channel access restrictions in the form of admission control. A DMG STA uses EDCA only within a contention based access period (CBAP). Details of EDCA are provided in 10.23.2 and, for DMG STAs, additional details are provided in 10.39.4, 10.39.5, and 10.39.6.3.

The second mechanism, designated the *hybrid coordination function* (HCF) *controlled channel access* (HCCA), which is not applicable to DMG STAs, allows for the reservation of transmission opportunities (TXOPs) with the hybrid coordinator (HC). A STA requests the HC for TXOPs, both for its own transmissions as well as for transmissions from the AP to it.[18] The request is initiated by the station management entity (SME) of the STA. The HC, which is collocated at the AP, either accepts or rejects the request based on an admission control policy. If the request is accepted, the HC schedules TXOPs for both STAs (both the AP and the non-AP STA). For transmissions from the non-AP STA, the HC polls the STA

[18] In the case of downlink traffic streams (TSs).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

based on the parameters supplied by the STA at the time of its request. For transmissions to the STA, the AP directly obtains TXOPs from the collocated HC and delivers the queued frames to the STA, again based on the parameters supplied by the STA. Details of the mechanism are provided in 10.23.3 and 11.4. This mechanism might be used for applications such as voice and video, which need periodic service from the HC. If the application constraints dictate the use of this mechanism, the application initiates this mechanism by using the management service primitives.

The third mechanism, designated the *service period* (SP) *access* or *service period channel access* (SPCA), is applicable only to DMG STAs and allows for the reservation of channel time by the AP or PCP. A non-AP and non-PCP STA requests SPs from an AP or PCP. These SPs can be used for transmission to any other STA in the BSS. The request is initiated by the SME of the non-AP and non-PCP STA. The AP or PCP either accepts or rejects the request based on an admission control policy. If the request is accepted, the AP or PCP uses the Extended Schedule element to schedule SPs for communication between the source and destination DMG STAs indicated within the request. Details of this mechanism are provided in 10.39.6.2, 10.39.6.4, 10.39.6.6, and 11.4.

The fourth mechanism, designated as *dynamic allocation*, is applicable only to DMG STAs and allows for near-real-time reservation of channel time with an AP or PCP. This type of access is used in addition to the service period and contention based access period mechanisms. An AP or PCP can poll a STA and receive requests for channel time allocation. Based on the received requests, the AP or PCP can accept a request and immediately allocate (within the same beacon interval) channel time for the STA to communicate with another STA by using a Grant frame. Details of this mechanism are provided in 10.39.7, 10.39.8, and 10.39.9.

The AP of a QoS BSS might allow non-QoS STAs to associate. All individually addressed frames that are sent to non-QoS STAs by an AP do not use the frame formats associated with the QoS facility.

A QoS STA associated in a non-QoS BSS acts as a non-QoS STA.

4.3.11 Wireless LAN radio measurements

4.3.11.1 General

Wireless LAN (WLAN) radio measurements enable STAs to understand the radio environment in which they exist. WLAN radio measurements enable STAs to observe and gather data on radio link performance and on the radio environment. A STA can choose to make measurements locally, request a measurement from another STA, or be requested by another STA to make one or more measurements and return the results. Radio measurement data is made available to STA management and upper protocol layers where it might be used for a range of applications. The measurements enable adjustment of STA operation to better suit the radio environment. The radio measurement service includes measurements that extend the capability, reliability, and maintainability of WLANs by providing standard measurements across vendors, and the service provides the resulting measurement data to upper layers in the communications stack.

In addition to featuring standard measurements and delivering measurement information to upper layers, there are applications that require quantifiable radio environment measurements in order to attain the necessary performance levels. These applications include VoIP, video over IP, location based applications, as well as applications requiring mitigation of harsh radio environments (e.g., multifamily dwellings, airplanes, factories, municipalities). Radio measurements address most of the existing issues in using unlicensed radio spectrum to meet the requirements of these emerging technologies.

To address the mobility requirements of technologies, such as VoIP and video streaming, radio measurements, such as Channel Load request/report and the Neighbor request/report, can be used to collect transition information, which can drastically speed up handoffs between BSSs within the same ESS. By accessing and using this information, the STAs (either in APs or in non-AP STAs) can make intelligent

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

decisions about the most effective way to utilize the available spectrum, power, and bandwidth for their communications.

The request/report measurements are as follows:

— Beacon
— Frame
— Channel Load
— Noise Histogram
— STA Statistics
— LCI (location configuration information)
— Neighbor Report
— Link Measurement
— Transmit Stream/Category Measurement

The request-only mechanism is as follows:

— Measurement Pause

The report-only mechanism is as follows:

— Measurement pilot

These measurement mechanisms provide the capability for a STA to manage and query its radio environment, and to make appropriate assessments about its health and efficiency. It is the first step in making WLAN smart and capable of making appropriate decisions for fast transition, for mesh connectivity, and for managing the radio environment for all wireless devices.

4.3.11.2 Beacon

The Beacon request/report pair enables a STA to request from another STA a list of APs whose beacons it can receive on a specified channel or channels. The Beacon report request/response provides a means for a requesting STA to obtain received beacon, probe response, and measurement pilot information from a responding STA.

4.3.11.3 Measurement pilot

The Measurement Pilot frame provides a subset of the information provided in a Beacon frame, is smaller than a Beacon frame, and is transmitted more often than a Beacon frame. The purpose of the Measurement Pilot frame is to assist a STA with scanning.

4.3.11.4 Frame

The Frame request/report pair returns a picture of all of the channel traffic and a count of all of the frames received at the measuring STA. For each unique Transmitter Address, the STA reports the Transmitter Address, number of frames received from this transmitter, average power level (RCPI) for these frames, and BSSID indicated by the transmitter.

4.3.11.5 Channel load

The Channel Load request/report pair returns the channel utilization measurement as observed by the measuring STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

4.3.11.6 Noise histogram

The Noise Histogram request/report pair returns a power histogram measurement of non-IEEE-802.11 noise power by sampling the channel when virtual carrier sense indicates idle and the STA is neither transmitting nor receiving a frame.

4.3.11.7 STA statistics

The STA Statistics request/report pair returns groups of values for STA counters and for BSS Average Access Delay. The STA counter group values include transmitted fragment counts, group addressed transmitted frame counts, failed counts, retry counts, multiple retry counts, frame duplicate counts, Request to Send (RTS) success counts, RTS failure counts, Acknowledgment (Ack) failure counts, received fragment counts, group addressed received frame counts, FCS error counts, and transmitted frame counts. BSS Average Access Delay group values include AP average access delay, average access delay for each access category, associated STA count, and channel utilization.

4.3.11.8 Location

The Location request/report pair returns a requested location in terms of latitude, longitude, and altitude. It includes types of altitude such as floors. A requested location can be the location of the requester (e.g., “Where am I?”) or the location of the reporting STA (e.g., “Where are you?”) or the location of another STA.

4.3.11.9 Measurement pause

The Measurement Pause request is defined, but no report comes back from this request. The measurement pause permits the inclusion of a quantified delay between the execution of individual measurements that are provided in a series within a Radio Measurement Request frame. The measurement pause used as the last measurement in a frame provides control of the measurement period when Radio Measurement Request frames are to be repeated.

4.3.11.10 Neighbor report

The neighbor report request is sent to an AP, which returns a neighbor report containing information about known neighbor APs that are candidates for a service set transition. This request/report pair enables a STA to gain information about the neighbors of the associated AP to be used as potential roaming candidates.

4.3.11.11 Link measurement

The link measurement request/report exchange provides measurements of the RF characteristics of a STA-to-STA link. This measurement indicates the instantaneous quality of a link.

4.3.11.12 Transmit stream/category measurement

When two QoS STAs have an ongoing traffic stream between them, the Transmit Stream/Category Measurement request/report pair enables either STA to query the other about the conditions of the stream. The transmit stream/category measurement report provides the transmit-side performance metrics for the measured traffic stream. Trigger conditions included in the Transmit Stream/Category Measurement request can initiate triggered Transmit Stream/Category Measurement reports upon detection of the trigger condition.

4.3.12 Operation in licensed frequency bands

4.3.12.1 General

IEEE 802.11 devices can operate on frequencies that are licensed by national regulatory bodies. Although this standard has been generalized so that it is independent of license type, band, and country of operation, only the bands and associated regulations listed in Annex D have been specifically considered.

4.3.12.2 Dynamic STA enablement (DSE) in licensed bands

The DSE operating procedures are used to automate the channel provisioning and regulatory controls needed for unregistered IEEE 802.11 STAs to operate as dependent STAs in licensed spectrum.[19]

4.3.12.3 Contention based protocol (CBP) in nonexclusively licensed bands

The granting of licenses on a nonexclusive, uncoordinated basis in the same area leads to the possibility of overlapping networks. When overlapping networks cause co-channel interference, regulations, such as those governing the 3650 MHz band in the United States, require the use of a CBP "by which a transmitter provides reasonable opportunities for other transmitters to operate."[20] IEEE 802.11 carrier sense multiple access with collision avoidance (CSMA/CA) is suitable for this purpose in most situations.

4.3.12.4 Using DSE STA identification to resolve interference

When CSMA/CA is not able to sufficiently sense the presence of another licensee's STA (i.e., a hidden STA) or if a secondary licensee causes inference to a primary licensee, the secondary licensee is obliged to resolve complaints that result from interference caused by any STA under its control (including dependent STAs). In order to facilitate the interference resolution processes, all STAs operating in nonexclusively licensed spectrum use the DSE STA and location information procedures.

The STA identification and location information procedures are tied because, by default, registered STAs broadcast their actual location as their unique identifier. Dependent STAs broadcast the location of the STA that has enabled them as well as a unique code selected by the licensee. This method puts a victim of the interference in contact with the party responsible for rectifying the problem, and, at the same time, it protects the privacy of the dependent STA's operator.

4.3.12.5 Further coexistence enhancements in nonexclusively licensed bands

While not explicitly required to meet specific rules, a number of optional IEEE 802.11 mechanisms, when used together, are able to meet general requirements for spectrum sharing, incumbent detection, and other cognitive radio functions in licensed bands. The specific mechanisms for each band are detailed in E.2.

4.3.13 High-throughput (HT) STA

The IEEE 802.11 HT STA provides PHY and MAC features that can support a throughput of 100 Mb/s and greater, as measured at the MAC data service access point (SAP). An HT STA supports HT features as identified in Clause 10 and Clause 19. An HT STA operating in the 5 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 17. An HT STA operating in the 2.4 GHz band supports transmission and reception of frames that are compliant with

[19] In some licensed frequency bands, wireless equipment can be owned and operated by individuals who do not hold a license. In such instances, devices are permitted to operate only if they are either communicating with, or receiving permission to transmit from, a STA that is maintained by a licensed operator. The Japanese 4.9 GHz band and the U.S. 4.94–4.99 GHz public safety band are examples in which IEEE 802.11 STAs operate under such arrangements.

[20] Definition of CBP from FCC 05-56, Report and Order and Memorandum Opinion and Order, clause 58.

mandatory PHY specifications as defined in Clause 16 and Clause 18. An HT STA is also a QoS STA. The HT features are available to HT STAs associated with an HT AP. A subset of the HT features is available for use between two HT STAs that are members of the same IBSS. Similarly, a subset of the HT features is available for use between two HT STAs that have established mesh peering (see 9.4.2.55 for details).

An HT STA has PHY features consisting of the modulation and coding scheme (MCS) set described in 19.3.5 and physical layer (PHY) protocol data unit (PPDU) formats described in 19.1.4. Some PHY features that distinguish an HT STA from a non-HT STA are referred to as *multiple input, multiple output (MIMO)* operation; spatial multiplexing (SM); spatial mapping (including transmit beamforming); space-time block coding (STBC); low-density parity check (LDPC) encoding; and antenna selection (ASEL). The allowed PPDU formats are non-HT format, HT-mixed format, and HT-greenfield format (see 19.1.4). The PPDUs can be transmitted with 20 MHz bandwidth and might be transmitted with 40 MHz bandwidth.

An HT STA has MAC features that include frame aggregation, some block ack features, power save multi-poll (PSMP) operation, reverse direction (RD), and protection mechanisms supporting coexistence with non-HT STAs.

4.3.14 Sub 1 GHz (S1G) STA

4.3.14.1 Overview

The IEEE 802.11 S1G STA operates in frequency bands below 1 GHz excluding the TV White Space bands.

An S1G STA supports S1G features identified in Clause 9, Clause 10, Clause 11, Clause 12, and Clause 23.

The main PHY features in an S1G STA are the following:

- Mandatory support for 1 MHz and 2 MHz channel width
- Mandatory support for S1G_1M PPDU
- Mandatory support for S1G_SHORT PPDU
- Mandatory support for S1G_LONG PPDU if ≥ 4 MHz channel width is supported
- Mandatory support for detection and decode of SIG-A field of the S1G_LONG preamble
- Mandatory support for single spatial stream S1G-MCS 0 to S1G-MCS 2 and S1G-MCS 10 (for 1 MHz PPDU only)
- Mandatory support for single spatial stream S1G-MCS 3 to S1G-MCS 7 in an S1G AP
- Mandatory support for binary convolutional code (BCC) coding
- Mandatory support for normal guard interval
- Mandatory support for fixed pilots
- Optional support for 2, 3, and 4 spatial streams (transmit and receive)
- Optional support for S1G_LONG PPDU if ≥ 4 MHz channel width is not supported
- Optional support for beamforming sounding (by sending an S1G NDP)
- Optional support for compressed beamforming feedback
- Optional support for STBC, LDPC (transmit and receive)
- Optional support for S1G MU PPDUs (transmit and receive)
- Optional support for 4 MHz, 8 MHz, or 16 MHz channel width
- Optional support for S1G-MCSs 8 and 9 (transmit and receive)
- Optional support for short guard interval
- Optional support for traveling pilots

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The main MAC features supported for S1G STA are the following:

- Mandatory support for NDP Ack, NDP BlockAck, and NDP CTS frames; mandatory support for the reception of NDP Probe Request frame for S1G AP; optional support for other NDP CMAC PPDUs
- Mandatory support for the reception of PV1 MPDUs but optional support for the transmission of PV1 MPDUs
- Mandatory support for the second virtual carrier sensing mechanism, i.e., response indication deferral (RID)
- Mandatory support for the hierarchical structure of TIM element by an S1G AP
- Mandatory support for extended BSS max idle periods and extended listen intervals with unified scaling factor
- Optional support for RAW
- Optional support for relay
- Optional support for grouping of non-AP STAs and group AID
- Optional support for TWT
- Optional support for BDT
- Optional support for sectorization
- Optional support for non-TIM mode
- Optional support for asymmetric BA, fragment BA
- Optional support for page slicing, dynamic AID assignment for an S1G AP
- Optional support for authentication control
- Optional support for SST
- Optional support for rescheduling STA's doze/awake cycle
- Optional support for either a sensor STA or a non-sensor STA
- Optional support for an EL STA

NOTE—Some NDP CMAC PPDUs are mandatory under certain conditions as indicated in B.4.4.2.

Most S1G features help either reduce a STA's energy consumption or increase the usable range between an AP and a non-AP STA.

An S1G STA is a nonmesh STA, and a QoS STA that does not support HCCA.

4.3.14.2 S1G relay

The S1G relay is a mechanism for expanding the coverage area of an AP. The AP is referred to as the root AP. An S1G relay consists of an S1G relay AP and an S1G relay STA. An S1G relay forwards frames between STAs associated to its S1G relay AP and the AP to which its S1G relay STA is associated.

4.3.15 Very high throughput (VHT) STA

A VHT STA is an HT STA that, in addition to features supported as an HT STA, supports VHT features identified in Clause 9, Clause 10, Clause 11, Clause 14, Clause 17, and Clause 21, but operates only in the 5 GHz band in the cited text.

The main PHY features in a VHT STA that are not present in an HT STA are the following:

- Mandatory support for 40 MHz and 80 MHz channel widths
- Mandatory support for VHT single-user (SU) PPDUs
- Optional support for 160 MHz and 80+80 MHz channel widths
- Optional support for VHT sounding protocol to support beamforming

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— Optional support for VHT multi-user (MU) PPDUs
— Optional support for VHT-MCSs 8 and 9

The main MAC features in a VHT STA that are not present in an HT STA are the following:

— Mandatory support for the A-MPDU padding of a VHT PPDU
— Mandatory support for S-MPDU
— Mandatory support for responding to a bandwidth indication (provided by the RXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT) in a non-HT and non-HT duplicate RTS frame
— Optional support for MPDUs of up to 11 454 octets
— Optional support for A-MPDU pre-end-of-frame (pre-EOF) padding (see 9.7.1) of up to 1 048 575 octets
— Optional support for VHT link adaptation

Most VHT features, among other benefits, increase the maximum throughput achievable between two VHT STAs over that achievable using HT features alone. The VHT features are available to VHT STAs associated with a VHT AP. A subset of the VHT features is available for use between two VHT STAs that are members of the same IBSS. Similarly, a subset of the VHT features is available for use between two VHT STAs that have established mesh peering. A subset of the VHT features is available for use between two VHT STAs that have established a TDLS link.

The support for VHT transmit beamforming sounding and VHT MU PPDUs in a VHT AP and more than one VHT STA within a VHT BSS enables the optional use of downlink MU multiple input, multiple output (DL-MU-MIMO). With DL-MU-MIMO the AP can create up to four A-MPDUs, each carrying MPDUs destined for an associated MU beamformee capable STA. The AP uses group identifiers (GIDs) to signal potential recipient STAs. The AP transmits the A-MPDUs simultaneously in separate space-time streams such that each recipient STA is able to demodulate the space-time streams carrying its A-MPDU. The simultaneous transmission of A-MPDUs in a single VHT MU PPDU provides a means to increase aggregate throughput over that achieved by sending the A-MPDUs in separate SU PPDUs.

The use of certain HT features, such as reduced interframe space (RIFS), is not permitted for VHT STAs.

4.3.16 Television very high throughput (TVHT) STA

The IEEE 802.11 TVHT STA operates in television white spaces (TVWS) bands.

A TVHT STA supports all mandatory features of a VHT STA as mandatory features except for HT-mixed format PPDUs and 20 MHz, 40 MHz, and 80 MHz channel widths. A TVHT STA supports all optional features of a VHT STA as optional features except for HT-greenfield format PPDUs, 160 MHz or 80+80 MHz channel widths, more than 4 spatial streams, and Short GI (which is mandatory).

The 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz channel widths and more than 4 spatial streams are not used in STAs operating as TVHT STAs. The features and behaviors of VHT STAs specified in Clause 6, Clause 8, Clause 9, Clause 10, Clause 11, Clause 14, and Annex G apply to TVHT STAs as well, unless stated otherwise.

For Clause 6, Clause 8, Clause 9, Clause 10, Clause 11, and Clause 14, the following replacements are applied for TVHT STAs:

— “TVHT_W/TVHT_2W” replaces “20/40 MHz”.
— “TVHT_W/TVHT_2W/TVHT_4W” replaces “20/40/80/160 MHz”.

Copyright © 2021 IEEE. All rights reserved.

- "TVHT_W", "TVHT_2W", and "TVHT_4W" replace "20 MHz", "40 MHz", and "80 MHz," respectively.
- "TVHT_W" replaces "CBW20".
- "TVHT_2W" replaces "CBW40".
- "TVHT_4W" replaces "CBW80" and "CBW80+80".
- "secondaryTVHT_2W" replaces "secondary40".
- "TVHT STA" replaces "VHT STA".
- "TVHT AP" replaces "VHT AP".
- "TVHT BSS" replaces "VHT BSS".
- "TVHT-MCS" replaces "VHT-MCS".
- "TVHT Operation" replaces "VHT Operation".
- "dot11TVHTOptionImplemented" replaces "dot11VHTOptionImplemented".
- "dot11TVHTControlFieldOptionImplemented" replaces both "dot11VHTControlFieldOptionImplemented" and "dot11HTControlFieldSupported".
- "dot11TVHTShortGIOptionIn4WActivated" replaces "dot11VHTShortGIOptionIn80Activated".
- "dot11TVHTSUBeamformerOptionImplemented" replaces "dot11VHTSUBeamformerOptionImplemented".
- "dot11TVHTSUBeamformeeOptionImplemented" replaces "dot11VHTSUBeamformeeOptionImplemented".
- "dot11TVHTMUBeamformerOptionImplemented" replaces "dot11VHTMUBeamformerOptionImplemented".
- "dot11TVHTMUBeamformeeOptionImplemented" replaces "dot11VHTMUBeamformeeOptionImplemented".
- "dot11TVHTTXOPPowerSaveOptionImplemented" replaces "dot11VHTTXOPPowerSaveOptionImplemented".
- "dot11TVHTOBSSScanCount" replaces "dot11VHTOBSSScanCount".
- "dot11TVHTExtendedNSSBWCapable" replaces "dot11VHTExtendedNSSBWCapable".
- Reference to 9.4.1.50 replaces reference to 9.4.1.49.
- Reference to 9.4.1.52 replaces reference to 9.4.1.51.
- Reference to 9.4.2.171 replaces reference to 9.4.2.158.
- Reference to 11.41 replaces reference to 11.38.1.
- Reference to Clause 22 and its subclauses replace reference to Clause 21 and its subclauses.

For Annex G, the following replacements are applied for TVHT STAs:

- "TVHT" replaces "VHT".
- "tvht" replaces "vht".

The main PHY features in a TVHT STA that are not present in a VHT STA are the following:

- Mandatory support for TVHT_W channel width.
- Optional support for TVHT_W+W channel width.
- Optional support for TVHT_2W channel width.
- Optional support for TVHT_4W channel width.
- Optional support for TVHT_2W+2W channel width.

These TVHT features are available to TVHT STAs associated with a TVHT AP. A subset of the TVHT features is available for use between two TVHT STAs that are members of the same IBSS.

4.3.17 STA transmission of Data frames outside the context of a BSS

In addition to defining procedures for STA communication within a BSS, this standard also defines procedures for a STA that is not a member of a BSS to transmit Data frames. Such Data frames are defined as being transmitted outside the context of a BSS (OCB). A STA transmits a Data frame outside the context of a BSS only if dot11OCBActivated is true.

NOTE—The specific frame subtypes that a STA is allowed to send when it has dot11OCBActivated true are specified in 11.18.

When dot11OCBActivated is true, a Data frame can be sent to either an individual or a group destination MAC address. This type of communication is possible only between STAs that are able to communicate directly over the wireless medium. It allows immediate communication, avoiding the latency associated with establishing a BSS. When dot11OCBActivated is true, a STA is not a member of a BSS and it does not utilize the IEEE 802.11 authentication, association, or data confidentiality services. This capability is particularly well suited for use in rapidly varying communication environments such as those involving mobile STAs in which the interval over which the communication exchanges take place is of very short duration (e.g., on the order of tens or hundreds of milliseconds). Since IEEE 802.11 MAC sublayer authentication services are not used when dot11OCBActivated is true, any required authentication services are provided by the station management entity (SME) or by applications outside of the MAC sublayer, such as those described in the IEEE 1609 [B22] family of standards.

A STA whose MIB does not include dot11OCBActivated operates as if the attribute is false.

Communication of Data frames when dot11OCBActivated is true might take place in a frequency band that is dedicated for its use, and such a band might require licensing depending on the regulatory domain (see Annex E). A STA for which dot11OCBActivated is true initially transmits and receives on a channel known in advance, either through regulatory designation or some other out-of-band communication. A STA's SME determines PHY parameters, as well as any changes in the operating channel, e.g., using information obtained via out-of-band communication or over-the-air frame exchange. When dot11OCBActivated is true, a sending STA sets the BSSID field to the wildcard BSSID value (see 9.2.4.3.4).

The Vendor Specific frame (see 9.6.5) provides one means for STAs to exchange management information prior to communicating Data frames outside the context of a BSS.

4.3.18 Tunneled direct-link setup

Tunneled direct-link setup (TDLS) is characterized by the use of signaling frames that are encapsulated in Data frames so that the signaling frames are transmitted through an AP transparently. Therefore, the AP does not need to be direct-link aware, nor does it have to support the same set of capabilities that are used on the direct link, in order for TDLS to be used. To allow a STA to enter a TDLS power save mode, TDLS provides two power save mechanisms: TDLS peer unscheduled automatic power save delivery (U-APSD) (TPU) and TDLS peer power save mode (PSM). TDLS allows STAs to use the TDLS PeerKey (TPK) handshake to provide data confidentiality and message authentication. STAs that set up a TDLS direct link remain associated with the AP and transmit frames directly to the other TDLS peer STA.

4.3.19 Wireless network management

4.3.19.1 Overview

Wireless network management (WNM) enables STAs to exchange information for the purpose of improving the overall performance of the wireless network. STAs use WNM protocols to exchange operational data so that each STA is aware of the network conditions, allowing STAs to be more cognizant of the topology and state of the network. WNM protocols provide a means for STAs to be aware of the presence of collocated interference, and enable STAs to manage RF parameters based on network conditions.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In addition to providing information on network conditions, WNM also provides a means to exchange location information, provide support for the multiple BSSID capability on the same wireless infrastructure, support efficient delivery of group addressed frames, and enable a WNM sleep mode in which a STA can sleep for long periods of time without receiving frames from the AP.

The WNM service includes the following:

— BSS max idle period management
— BSS transition management
— Channel usage
— Collocated interference reporting
— Diagnostic reporting
— Directed multicast service (DMS)
— Event reporting
— Flexible multicast service (FMS)
— Location services
— Multicast diagnostic reporting
— Multiple BSSID capability
— Proxy Address Resolution Protocol (ARP)
— QoS traffic capability
— SSID list
— Triggered STA statistics
— TIM broadcast
— Timing measurement
— Traffic filtering service
— U-APSD coexistence
— WNM notification
— WNM sleep mode

4.3.19.2 BSS max idle period management

BSS max idle period management enables an AP to indicate a time period during which the AP does not disassociate a STA due to nonreceipt of frames from the STA. This supports improved STA power saving and AP resource management.

4.3.19.3 BSS transition management

BSS transition management enables an AP to request non-AP STAs to transition to a specific AP, or to indicate to a non-AP STA a set of preferred APs, due to network load balancing or BSS Termination.

4.3.19.4 Channel usage

Channel usage information is provided by the AP to the non-AP STA to recommend channels for BSSs that are not infrastructure BSSs or an off-channel TDLS direct link. The non-AP STAs can use the channel usage information as part of channel selection processing for a BSS that is not an infrastructure BSS or an off-channel TDLS direct link.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

4.3.19.5 Collocated interference reporting

Collocated interference reporting enables the requesting STA to obtain information on interference due to collocated radios at the reporting STA. The requesting STA can use that information to schedule its transmissions to minimize the effects of the interference.

4.3.19.6 Diagnostic reporting

Diagnostic requests enable a STA to request a non-AP STA to report information that might be helpful in diagnosing and resolving problems with the WLAN. Diagnostic reports include information on hardware, configuration, and STA capabilities.

4.3.19.7 Directed multicast service (DMS)

The DMS enables a non-AP STA to request the AP to transmit group addressed frames destined to the requesting STA as individually addressed frames.

4.3.19.8 Event reporting

Event requests enable a STA to request a non-AP STA to send particular real-time event reports. The types of events include transition, RSNA, WNM log, and peer-to-peer link events. A transition event is transmitted after a non-AP STA successfully completes a BSS transition. Transition events are used to diagnose transition performance problems. An RSNA event report describes the type of Authentication used for the RSNA. RSNA events are used to diagnose security and authentication performance problems. A WNM log event report enables a non-AP STA to transmit a set of WNM log event messages to the requesting STA. WNM log event reports are used to access the contents of a STA's WNM log. A peer-to-peer link event report enables a non-AP STA to inform the requesting STA that a peer-to-peer link has been established. Peer-to-peer link event reports are used to monitor the use of peer-to-peer links in the network.

4.3.19.9 Flexible multicast service (FMS)

The flexible multicast service enables a non-AP STA to request an alternate delivery traffic indication map (DTIM) delivery interval for one or more sets of group addressed streams that the non-AP STA receives. This enables the non-AP STA to wake up at the alternate DTIM interval rather than every DTIM and enables significant power saving when a non-AP STA receives group addressed traffic. The FMS also enables a STA to establish a data rate and delivery interval for group addressed traffic higher than the minimum data rate available.

Delivery of group addressed data to power saving STAs using a DTIM beacon is described in 11.2.3.4.

4.3.19.10 Location services

Location Configuration Request and Response frames enable STAs to configure a collection of location related parameters for Location Track Notification frames. The AP can indicate that it can provide location data to support applications such as emergency services. Location services also provide the ability for STAs to exchange location information using Radio Measurement Request and Radio Measurement Report frames. The protocol supports exchange-by-value and exchange-by-reference mechanisms. The location value can be exchanged in geospatial (LCI) and civic formats. The location reference is a URL that defines from where the location value is retrieved.

4.3.19.11 Multicast Diagnostic report

Multicast Diagnostic reports enable a non-AP STA to report statistics for multicast traffic it received from a transmitting STA. This can be used by an AP to measure quality of multicast reception by a non-AP STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

4.3.19.12 Multiple BSSID capability

The Multiple BSSID capability enables the advertisement of information for BSSIDs using a single Beacon or Probe Response frame instead of multiple Beacon and Probe Response frames, each corresponding to a single BSSID. The Multiple BSSID capability also enables the indication of buffered frames for multiple BSSIDs using a single TIM element in a single beacon.

4.3.19.13 Proxy ARP

The Proxy ARP service enables an AP to respond to ARP and Neighbor Discovery frames on behalf of associated non-AP STAs. Associated STAs do not receive ARP or IPv6 Neighbor Discovery frames. The Proxy ARP service enables associated STAs to remain in power save for longer periods of time.

4.3.19.14 QoS traffic capability

QoS traffic capability procedures enable the QoS STA to indicate that it is capable of transmitting traffic belonging to the corresponding user priority (UP) from applications that require generation of such traffic. The QoS Traffic Capability might be used for example as an input to estimate the blocking probability of a voice application based on the number of voice capable non-AP STAs.

4.3.19.15 SSID list

The SSID List element enables the non-AP STA to request information on a list of SSIDs. This is intended to reduce the number of Probe Request frames sent by the non-AP STA.

4.3.19.16 Triggered STA statistics

The Triggered STA Statistics reporting capability enables generation of a STA statistics report (see 4.3.11.9) when the statistics of interest reach a predefined threshold.

4.3.19.17 TIM broadcast

The TIM broadcast protocol defines a mechanism to enable a STA to receive an indication of buffered individually addressed traffic, independent of the Beacon frame, reducing the wake time of the STA.

4.3.19.18 Timing measurement

Timing Measurement frames allow a recipient STA to accurately measure the offset of its clock relative to a clock in the sending STA. With the regular transfer of Timing Measurement frames from one STA to another, it is possible for the recipient STA to track changes in the offset of its clock with respect to the sending STA over time and thus detect and compensate for any drift between the clocks.

4.3.19.19 Fine timing measurement

Fine timing measurement allows a STA to accurately measure the round trip time (RTT) between it and another STA. With the regular transfer of Fine Timing Measurement frames it is possible for the recipient STA to track changes in its relative location with other STAs in the environment.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

4.3.19.20 Traffic filtering service

The traffic filtering service enables an AP to determine if MSDUs and Management frames destined for a STA match a specific set of traffic filters that are enabled at the AP per the request of the STA. Individually addressed frames that do not match any of the traffic filters in the set are discarded. Individually addressed frames that do match at least one of the set of the enabled traffic filters are delivered to the STA. The STA can also negotiate to have a notification frame sent prior to the delivery of the frame matching the traffic filter.

4.3.19.21 U-APSD coexistence

The U-APSD coexistence capability enables the non-AP STA to indicate a requested transmission duration to the AP for use of U-APSD service periods. Use of the transmission duration enables the AP to transmit frames during the service period and improve the likelihood that the non-AP STA receives the frames when the non-AP STA is experiencing interference. The U-APSD coexistence capability reduces the likelihood that the AP transmits frames during the service period that are not received.

4.3.19.22 WNM notification

WNM notification provides a mechanism for a STA to notify another STA of a management event. The following events are defined:

— Firmware update notification
— Beacon protection failure

4.3.19.23 WNM sleep mode

WNM sleep mode is an extended power save mode for non-AP STAs in which a non-AP STA need not listen for every DTIM Beacon frame, and need not perform GTK/IGTK/BIGTK updates. WNM sleep mode enables a non-AP STA to signal to an AP that it might sleep for a specified length of time. This enables a non-AP STA to reduce power consumption and remain associated while the non-AP STA has no traffic to send to or receive from the AP.

4.3.20 Subscription service provider network (SSPN) interface

An AP can interact with external networks using a SSPN interface for the purpose of authenticating users and provisioning services, as shown in Figure 4-8. The exchange of authentication and provisioning information between the SSPN and the AP passes transparently through the portal. The protocol used to exchange this information is outside the scope of this standard. The logical SSPN interface provides the means for an AP to consult an SSPN for authenticating and authorizing a specific non-AP STA and to report statistics and status information to the SSPN. Authentication and provisioning information for non-AP STAs received from the SSPN are stored in the AP management information base (MIB) and are used to limit layer-2 services provided to that non-AP STA. Detailed interactions describing the SSPN interface are provided in 11.22.5.

The SSPN interface provides the non-AP STA access to the services provisioned in the SSPN via the currently associated BSS. Services might include virtual local area network (VLAN) mapping and tunnel establishment that are transparent to the non-AP STA and outside the scope of this standard. The SSPN interface also allows the non-AP STA to access services in destination networks (DNs) other than the SSPN. An example of a DN other than SSPN is the provision of Internet access via the IEEE 802 LAN, or an intermediary network that connects the IEEE 802.11 infrastructure and the SSPN.

NOTE—The SSPN Interface Service is not supported in an IBSS.

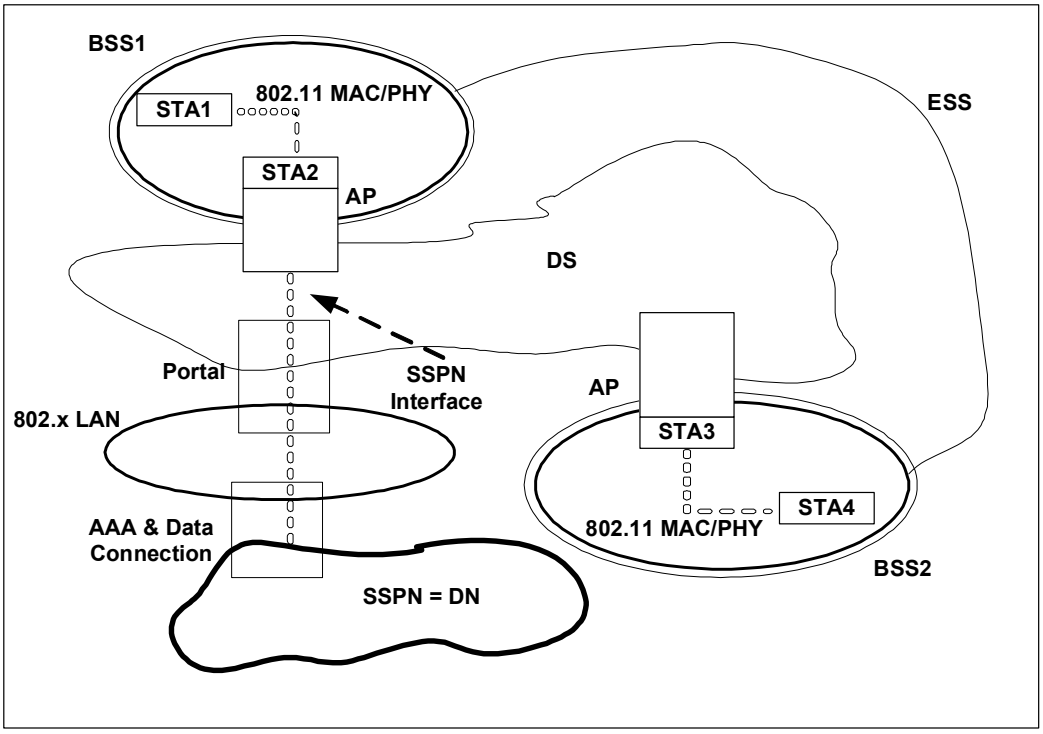

Figure 4-8—SSPN interface service architecture

4.3.21 Mesh BSS

4.3.21.1 General

The IEEE 802.11 mesh facility provides MAC enhancements to support wireless LAN mesh topologies. The mesh facilities are available to mesh STAs that belong to a mesh BSS (MBSS). Only the mesh discovery service is available to a mesh STA that has not become a member of an MBSS. The enhancements that distinguish mesh STAs from nonmesh STAs are collectively termed the “mesh facility.” The mesh-specific mechanisms vary among implementations.

4.3.21.2 Overview of the mesh BSS

A mesh BSS is an IEEE 802.11 LAN consisting of autonomous STAs. Inside the mesh BSS, all STAs establish wireless links with neighbor STAs to mutually exchange MSDUs. Further, using the multi-hop capability, MSDUs and Management frames can be transferred between STAs that are not in direct communication with each other over a single instance of the wireless medium. From the data delivery point of view, it appears as if all STAs in a mesh BSS are directly connected at the MAC layer even if the STAs are not within range of each other. The multi-hop capability enhances the range of the STAs and benefits wireless LAN deployments.

STAs in a mesh BSS might be sources, sinks, or propagators of traffic; some mesh STAs might propagate traffic for other STAs, but do not act as a source or sink of traffic. As described in 4.3.21.4, a mesh BSS might have interfaces to external networks and can be a DSM for infrastructure BSSs.

Within a mesh BSS, STAs utilize the mesh coordination function (MCF) to access the channel. MCF is based on the core QoS facility described in 4.3.10, and a mesh BSS is categorized as one type of QoS BSS. MCF is specified in 10.24.

4.3.21.3 Mesh STA

A STA that belongs to a mesh BSS is termed a "mesh station" (mesh STA). Mesh STAs are QoS STAs that support mesh services, i.e., they participate in formation and operation of a mesh basic service set (MBSS). A mesh STA implements a subset of the QoS functionality:

— Use of QoS frame format
— EDCA (as a part of MCF)
— Block acknowledgment (optional)
— No acknowledgment (optional)
— Use of TSPEC, TCLAS, and TCLAS Processing elements to establish DMS or GCR agreements (optional)

A mesh BSS does not incorporate the full hybrid coordinator (HC) and BSS QoS functionality. MBSSs do not incorporate the following:

— HCCA
— Traffic stream (TS) management
— Admission control
— Automatic power save delivery (APSD)
— Tunneled direct-link setup (TDLS)

4.3.21.4 IEEE 802.11 components and mesh BSS

Example mesh and infrastructure BSSs are illustrated in Figure 4-9. Only mesh STAs participate in mesh functionalities such as formation of the mesh BSS, path selection, and forwarding. Accordingly, a mesh STA is not a member of an IBSS or an infrastructure BSS. Consequently, mesh STAs do not communicate with nonmesh STAs.

However, instead of existing independently, an MBSS might also interconnect with other BSSs through the distribution system (DS) or a bridged LAN. Then, mesh STAs can communicate with nonmesh STAs. A logical architectural component is introduced in order to integrate the non-GLK mesh STA with the DS: the mesh gate. Data move between a non-GLK MBSS and the DS via one or more mesh gates. Thus the mesh gate is the logical point at which MSDUs from a non-GLK MBSS enter the DS. In a GLK MBSS, mesh STAs can communicate with nonmesh STAs via a GLK mesh STA with an attached bridge port and from there to the bridged LAN. Once an MBSS contains a mesh gate that connects it to the DS or a GLK mesh STA that connects it to a bridge port, the MBSS can be integrated with other infrastructure BSSs, given that their APs connect to the same DS or bridged network. Several mesh gates are shown in Figure 4-9 connecting different MBSSs to the DS.

When an MBSS accesses the DS or a bridged network, the MBSS can be integrated with a non-IEEE-802.11 LAN. To integrate the a DS to which this MBSS connects, the DS needs to contain a portal. See 4.3.7. Consequently, mesh gate and portal are different entities. The portal integrates the IEEE 802.11 architecture with a non-IEEE-802.11 LAN (e.g., a traditional wired LAN). The mesh gate integrates the MBSS with the DS. A GLK mesh STA integrates the MBSS with a bridged network.

It is possible for one device to offer any combination of the functions of an AP, a portal, and a mesh gate; see 14.11.5. An example device combining the functions of an AP and a mesh gate is shown in Figure 4-10. The implementation of such collocated entities is beyond the scope of this standard. The configuration of a mesh gate that is collocated with an access point allows the utilization of the mesh BSS as a distribution system medium. In this case, two different entities (mesh STA and access point) exist in the collocated device and the mesh BSS is hidden to STAs that associate to the access point. The mesh STA collocation is outlined in 14.11.5, which states that the usage of a distinct MAC address for each collocated STA avoids ambiguities.

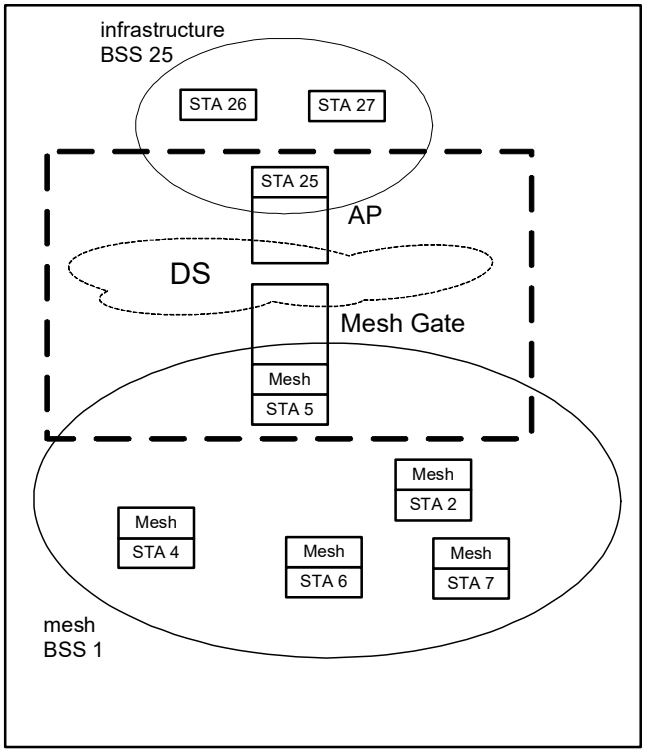

Figure 4-10—Example device consisting of mesh STA and AP STA to connect an MBSS and an infrastructure BSS

4.3.21.5 Introduction to mesh functions

4.3.21.5.1 General

A mesh BSS is formed and operated by the set of services called *mesh services*. Mesh services are provided by the following major mesh facilities:

- Mesh discovery
- Mesh peering management
- Mesh security
- Mesh beaconing and synchronization
- Mesh coordination function
- Mesh power management
- Mesh channel switching
- Three address, four address, and extended address frame formats
- Mesh path selection and forwarding

— Interworking with external networks
— Intra-mesh congestion control
— Emergency service support in mesh BSS

4.3.21.5.2 Mesh discovery

A mesh STA performs either active scanning or passive scanning to discover an operating mesh BSS. Each mesh STA transmits Beacon frames periodically and responds with Probe Response frames when a Probe Request frame is received, so that neighbor mesh STAs can perform mesh discovery appropriately. The identification of the mesh BSS is given by the Mesh ID element contained in the Beacon and the Probe Response frames. The details for the mesh discovery facility are described in 14.2.

4.3.21.5.3 Mesh peering management (MPM)

Within a mesh BSS, direct communication between neighbor mesh STAs is allowed only when they are peer mesh STAs. After mesh discovery, two neighbor mesh STAs agree to establish a mesh peering to each other, and, after successfully establishing the mesh peering, they become peer mesh STAs. A mesh STA can establish a mesh peering with multiple neighbor mesh STAs. The mesh peering management (MPM) facilitates the mesh peering establishment and closure of the mesh peerings. The details of MPM are described in 14.3.

4.3.21.5.4 Mesh security

In an MBSS, mesh link security protocols are used to authenticate a pair of mesh STAs and to establish session keys between them. Mesh authentication protocols establish a shared, common pairwise master key (PMK), and authenticate a peer mesh STA. The authenticated mesh peering exchange protocol relies on the existence of the PMK between the two mesh STAs to establish an authenticated peering and derive session keys. The details of mesh security are described in 12.4, 14.3.3, 14.5, and 14.6.

4.3.21.5.5 Mesh beaconing and synchronization

In order to assist mesh discovery, mesh power management, and synchronization in a mesh BSS, all mesh STAs periodically transmit Beacon frames. Synchronization in a mesh BSS is maintained by the MBSS's active synchronization method. The default synchronization method is the neighbor offset synchronization method. Mesh beacon collision avoidance (MBCA) mitigates collisions of Beacon frames among hidden nodes. The details of mesh beaconing and synchronization are described in 14.13.

4.3.21.5.6 Mesh coordination function (MCF)

A mesh STA uses the mesh coordination function (MCF) for channel access. MCF consists of EDCA (contention based channel access defined in 10.24.2) and MCCA (controlled channel access defined in 10.24.3). MCCA is a reservation based channel access method and aims to optimize the efficiency of frame exchanges in a mesh BSS.

4.3.21.5.7 Mesh power management

A mesh STA can manage the activity level of its links per mesh peering. A mesh STA sets the activity level of each of its mesh peerings to either active mode, light sleep mode, or deep sleep mode. The mesh STA performs mesh power management mode tracking for each of its neighbor peer mesh STAs, and delivers the frames based on the rules defined in 14.14.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

4.3.21.5.8 Mesh channel switching

When a mesh STA switches the operating channel, it uses the channel switching protocol defined in 11.8.8 and 11.9. The channel switching protocol enables the propagation of channel switch notifications throughout the mesh BSS, prior to the channel switch execution.

4.3.21.5.9 Frame addressing in an MBSS

Three address, four address, and extended address frame formats enable the distribution of MSDUs over multiple instances of the wireless medium within a mesh BSS and integration to the ESS. Frame format details are described in Clause 9 and 9.3.5.

4.3.21.5.10 Mesh path selection and forwarding

Mesh path selection enables path discovery over multiple instances of the wireless medium within a mesh BSS. The overview of the mesh path selection framework is described in 14.8. The hybrid wireless mesh protocol (HWMP) is defined as the default path selection protocol for the mesh BSS. HWMP provides both proactive path selection and reactive path selection. The details of HWMP are described in 14.10. The path selection protocol uses link metrics in the assessment of a mesh path to the destination. The details of link metrics are described in Table 14.9. The airtime link metric is the default link metric. The high PHY rate airtime link metric is another link metric intended for mesh STAs that are capable of transmitting frames with PHY rate higher than 54 Mb/s. The details of the airtime link metric and high PHY rate airtime link metric are described in 14.9.2.

Once the mesh path of a particular pair of the source mesh STA and the destination mesh STA is found through the mesh path selection function, mesh STAs propagate the data by the forwarding function. The details of the forwarding function are described in 10.38.

As a result of the mesh path selection and forwarding, MSDUs are transmitted among all of the mesh STAs in a mesh BSS, even if the mesh STAs are not neighbor STAs of each other. Figure 4-11 depicts the MSDU transfer within a mesh BSS.

4.3.21.5.11 Interworking with the DS

A mesh BSS might contain one or more mesh gates that connect to one or more distribution systems. A mesh gate can announce its presence in the mesh BSS by sending Gate Announcement frames. Alternatively a mesh gate can announce its presence in the mesh BSS by sending HWMP Path Selection frames with the RANN element or the PREQ element indicating mesh gate announcement, when it is configured as a root mesh STA. Typically a mesh gate announces its presence when it is collocated with a portal or it has access to a portal. Gate announcements allow mesh STAs to select the appropriate mesh gate and build a path toward it. Note that, when multiple mesh gates that have access to the same DS are present in the mesh BSS, proper configuration is necessary.

When a mesh gate has access to IEEE 802 STAs outside the mesh BSS, the mesh gate acts as a proxy for the IEEE 802 STAs outside the MBSS. Such a mesh gate is called a *proxy mesh gate*. The details of the proxy functionality are described in 14.11.3.

The details of the mesh BSS interworking are described in 14.11.

4.3.21.5.12 Intra-mesh congestion control

Intra-mesh congestion control is used to provide flow control over the multi-hop communication. Intra-mesh congestion control is useful to mitigate wasteful wireless medium utilization caused by buffer overflow at mesh STAs. Intra-mesh congestion control consists of three main mechanisms: local congestion monitoring and congestion detection, congestion control signaling, and local rate control. The details of the intra-mesh congestion control are described in 14.12.

4.3.21.5.13 Emergency service support in mesh BSS

Depending on regulations, emergency services support might be mandated over the mesh network. In this case the Beacon and Probe Response frames inform whether a mesh STA supports emergency services, advertising to other mesh STAs that mesh peering for emergency services is possible. If a mesh STA subsequently requires emergency services, an emergency indication is then set within the Mesh Peering Open frame. Mesh STAs that support emergency services, accept peering from other mesh STAs requiring emergency services, transferring frames to an emergency server (such as a PSAP).

4.3.22 DMG STA

The IEEE 802.11 DMG STA provides PHY and MAC features that can support a throughput of 1 Gb/s and greater, as measured at the MAC data service access point (SAP). A DMG STA supports DMG features as identified in Clause 10, Clause 11, and Clause 20. A DMG STA operates in a DMG BSS and supports transmission and reception of frames that are compliant with PHY specifications as defined in Clause 20. A DMG STA is also a QoS STA. The basic channel access of a DMG STA (see 10.39) allows it to operate in an Infrastructure BSS, in an IBSS, and in a PBSS. Certain DMG features such as service period allocation are available only to DMG STAs that are associated with an AP or with a PCP, while other DMG features such as EDCA operation in a PBSS do not require association. A DMG STA supports beamforming (BF) as described in 10.42 and 20.9 and GCM encryption as described in 12.5.5.

A DMG STA supports the PHY signaling as described in 20.4, 20.5, and 20.6. At a minimum, a DMG STA supports the mandatory modulation and coding scheme (MCS) and PHY protocol data unit (PPDU) formats described in 20.4 and 20.5. A DMG STA has PHY features that include a low-density parity check (LDPC) encoding, a preamble making use of Golay sequences, and beamforming. The PPDUs are always transmitted with the same channel spacing as described in Annex E.

A DMG STA supports MAC features that provide channel access in an environment in which transmissions use a directional antenna pattern. A DMG STA has MAC features that include frame aggregation, block ack

features, service periods, contention based access periods, DMG protected period, AP or PCP clustering, dynamic channel time management, reverse direction, spatial sharing, beamforming, and operation (fast session transfer) in a multi-band device. A DMG STA is not a mesh STA. A DMG STA does not use any of the following: HCCA, power save multi-poll (PSMP), TDLS, GCR.

4.3.23 DMG relay

The IEEE 802.11 DMG relay function allows a source relay endpoint DMG STA (REDS) to transmit frames to a destination REDS with the assistance of another DMG STA, the relay DMG STA (RDS), as shown in Figure 4-12. Relaying can improve the reliability of communication in a DMG BSS in the case the direct link between the source REDS and the destination REDS has poor quality or is disrupted. Following the DMG relay setup procedures, a source REDS can discover and select an appropriate RDS to act as the relay for a particular destination REDS, prior to Data frame transmission using the relay. A relay operating as a link switching type of relay uses the RDS to forward frames between the source and destination REDS if the direct link between the REDS is disrupted. In a link cooperation of relay operation, the RDS simultaneously repeats the transmission of frames between the source and destination REDS, which can possibly increase the signal quality received at the destination REDS.

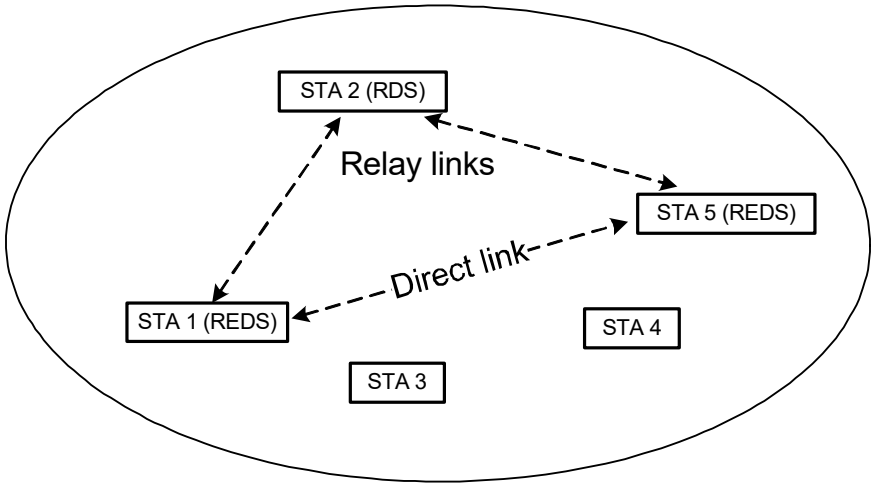

Figure 4-12—DMG relay in a DMG BSS

4.3.24 Robust audio video (AV) streaming

4.3.24.1 Introduction

Robust AV streaming improves AV streaming performance when using IEEE Std 802.11 for consumer and enterprise applications.

4.3.24.2 Groupcast with retries (GCR)

The GCR service allows a STA to request greater reliability for one or more group addressed streams that the STA receives. Greater reliability is provided via unsolicited retries or the block ack mechanism. A non-AP STA can request delivery so that the AP transmits the frames via EDCA within GCR service periods when all associated non-AP STAs are in active mode or the awake state of the PS mode.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

4.3.24.3 Stream classification service (SCS)

SCS enables the establishment of a classification using layer 2 and/or layer 3 signaling to match incoming individually addressed MSDUs. Once classified, individually addressed MSDUs matching the classification are assigned to an access category and are tagged with their drop eligibility. When intra-access category prioritization is enabled (see 4.3.24.7), SCS allows MSDUs matching the classification to be assigned to the primary or alternate transmit queues so that finer grained prioritization can be applied.

4.3.24.4 Mirrored stream classification service (MSCS)

MSCS enables the establishment of classification using layer 2 and/or layer 3 signaling to classify incoming individually addressed MSDUs into streams. Once classified, individually addressed MSDUs in each stream are assigned to a user priority based on the user priority of MSDUs matching the stream in the reverse direction.

4.3.24.5 Overlapping BSS (OBSS) management

The objective of OBSS management is to facilitate cooperative sharing of the medium between APs that operate in the same channel and that are able to receive or obtain frames from each other, including Beacon frames. These frames might be received directly or via associated STAs that support the Beacon request capability (see 11.10.10).

OBSS management provides the means to

- Provide additional information for channel selection
- Extend the admission control mechanism to a distributed environment
- Enable the coordination of scheduled TXOPs between OBSSs

OBSS management enables stationary and portable APs to provide to neighboring APs information for the selection of a channel and for the cooperative sharing of that channel. The main component of OBSS management is the QLoad report that provides information on

- The reporting AP's overlap situation
- The reporting AP's QoS traffic load
- The total QoS traffic load of BSSs directly overlapping the reporting AP's BSS

This information might be used to aid an AP when searching for a channel and also when sharing a channel in an overlap situation.

To coordinate the TXOPs of overlapping HCCA APs, OBSS management provides a means for an AP to advertise its TXOP allocations so another AP might schedule its own TXOPs to avoid those already scheduled.

4.3.24.6 Interworking with IEEE 802.1Q Stream Reservation Protocol (SRP)

Support for SRP from IEEE Std 802.1Q enables integration of the TSPEC ADDTS request/response protocol with IEEE 802.1Q SRP to enable end-to-end SRP reservations when one or more IEEE 802.11 links are part of a path from IEEE 802.1Q Talker to IEEE 802.1Q Listener.

4.3.24.7 Intra-access category prioritization

Intra-access category prioritization provides six transmit queues that map to four enhanced distributed channel access functions (EDCAFs) to enable differentiation between traffic streams that are in the same access category in order for finer grained prioritization to be applied between individual AV streams or voice streams.

4.3.25 Operation under geolocation database (GDB) control

Regulators designate television broadcast bands for the deployment of dynamic sharing technologies. Different schemes result in different times that elapse from the moment an authorized database is told to change access to a particular slice of spectrum and the time that sharing radios are required to change their operations.

One current system design allows the GDBs to utilize a fully populated map of all protected services, and the databases have precalculated maps that are effective on timescales of one to two days.

Another system design allows the protected services to negotiate with controllers of unlicensed devices so that both can share available broadcast channels and facilitate response times of less than an hour where necessary and even within minutes if desired.

Another system design has the GDB fully control all white space devices by requiring them to tell the database their intended location and emissions footprint and receive permission before any broadcast band transmission starts. Any change of intended frequencies or powers is told to the database, and permission is received before the change takes place.

The architectural role of components depends on the security and timeliness requirements in particular regulatory domains. Figure 4-13 shows two infrastructure BSSs in which APs are geolocation database dependent (GDD) enabling STAs and the other STAs are GDD dependent STAs.

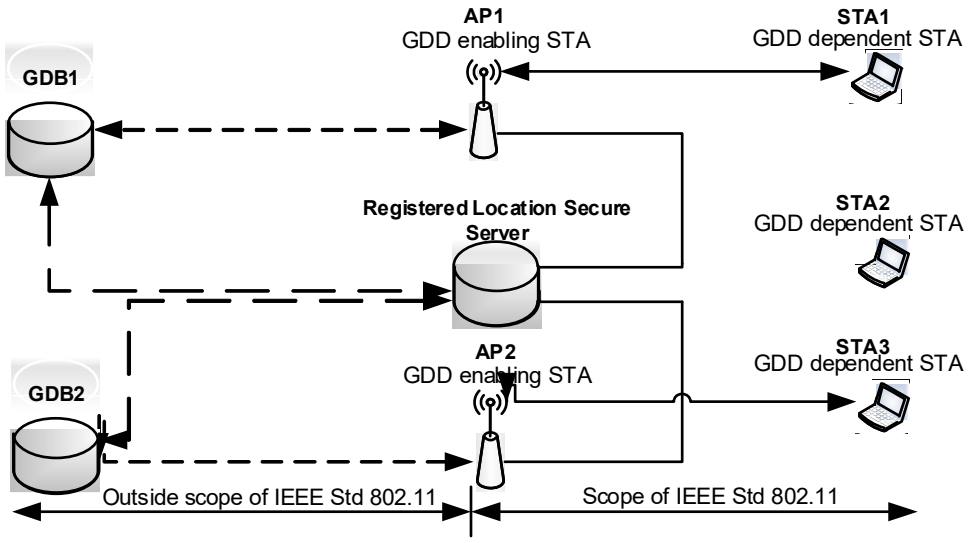

Figure 4-13—Multiple APs and multiple GDBs

In most regulatory domains, GDD enabling STAs are required to

- Securely communicate with GDBs
- Maintain the white space maps (WSMs) and other information received from GDBs
- Create and transmit a contact verification signal to inform GDD dependent STAs that the map they received is still valid

A registered location query protocol (RLQP) is provided to share the WSMs and current channel use among GDD enabling STAs in a neighborhood. GDD dependent STAs can query both their GDD enabling STA and the registered location secure server (RLSS) about WSMs and channel utilization. In some regulatory domains, a RLSS can provide GDBs with the current channel use information for all of the BSSs and IBSSs

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

that communicate with it. In some regulatory domains, the RLSS communicates with controllers of other white space systems to coordinate emissions footprints of their services. By accessing and using this information, the STAs can make intelligent decisions about the most effective way to utilize the available spectrum, power, and bandwidth for their communications.

The specific mechanisms are as follows:

— Channel availability query, used to obtain one or more WSMs of available channels for an area or a geolocation
— Channel schedule management, used to obtain start and ending times for each available white space channel
— Contact verification signal, used by a GDD dependent STA to verify it is still receiving frames from its GDD enabling STA
— GDD enablement, the procedure where a GDD enabling STA forms a network and maintains the network under the control of a GDB
— Network channel control, used to inform a local channel controller that has a view of nearby transmitters and their emissions footprints
— WSM, used to retrieve the available white space channels and their transmit power restrictions

The use of the mechanisms in a particular regulatory domain depends on the specific regulatory requirements. Table 4-1 gives a view of the use of specific mechanisms to meet regulatory requirements in terms of daily, hourly, and minute timescales. Implementers are referred to the regulatory sources in Table D.1 for further information. Operation in countries within defined regional regulatory domains might be subject to additional or alternative national regulations.

Table 4-1—GDD mechanisms and timescales

Mechanism	Daily consultation required	Hourly consultation required	Minute responsiveness
Channel availability query	Informative	Informative	Not applicable
Channel schedule management	Informative	Informative	Not applicable
Contact verification signal	Required to be secure	Might be secure	Loss of consecutive signals requires action
GDD enablement	Required	Required	Required
Network channel control	Informative	Informative	Not applicable
WSM	Required for GDD enabling STA, might be translated for GDD dependent STA	Required for GDD enabling STA, might be translated for GDD dependent STA	Required for GDD enabling STA, might be translated for GDD dependent STA

These mechanisms allow a BSS to manage and query its radio environment and a GDB to control the radio environment for all wireless services.

4.3.26 CDMG STA

An IEEE 802.11 CDMG STA is a DMG STA that supports CDMG operation in the Chinese 60 GHz frequency band, and has dot11CDMGOptionImplemented equal to true. In addition to CDMG features, a CDMG STA supports DMG features as described in 4.3.22. A CDMG STA also supports CDMG features as

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

identified in Clause 10, Clause 11, and Clause 24. A CDMG STA supports transmission and reception of frames that are compliant with PHY specifications as defined in Clause 24. A CDMG STA is also a QoS STA. The basic channel access of a CDMG STA (see 10.39 and 10.64) allows it to operate in an Infrastructure BSS or in an IBSS or in a PBSS.

Besides supporting DMG PHY features defined in Clause 20, a CDMG STA also supports the PHY signaling as described in 24.4, 24.5, and 24.6. At a minimum, a CDMG STA supports the mandatory modulation and coding scheme (MCS) and PHY protocol data unit (PPDU) formats described in 24.4 and 24.5.

4.3.27 CMMG STA

The IEEE 802.11 CMMG STA operates in 42.3 GHz to 47.3 GHz or 47.2 GHz to 48.4 GHz frequency bands.

The main PHY features in a CMMG STA are the following:

- 540 MHz channel width
- Control mode and SC mode (directional transmit and receive)
- Single spatial stream MCS 0 (control mode transmit and receive) in all supported channel widths
- Single spatial stream MCSs 1 to 3 (SC mode transmit and receive) in all supported channel widths
- LDPC coding with length 672
- Normal guard interval as defined in Table 25-3
- Optional support for 1080 MHz channel width
- Optional support for CMMG-MCSs 4 to 8 (SC mode transmit and receive)
- Optional support for CMMG-MCSs 9 to 16 (OFDM mode transmit and receive)
- Optional support for short guard interval (transmit and receive)
- Optional support for LDPC coding with length 2016
- Optional support MIMO transmission (SC mode and OFDM mode transmit and receive)
- Optional support for STBC (transmit and receive)
- Optional support for transmit beamforming sounding (by sending a CMMG NDP)
- Optional support for responding to transmit beamforming sounding

The CMMG STA provides PHY and MAC features that can support a throughput of 1 Gb/s and greater, as measured at the MAC data service access point (SAP). A CMMG STA supports CMMG features as identified in Clause 10, Clause 11, and Clause 25. A CMMG STA operates in a CMMG BSS and supports transmission and reception of frames that are compliant with PHY specifications as defined in Clause 25. A CMMG STA is also a QoS STA. The basic channel access of a CMMG STA (see 10.39) allows it to operate in an Infrastructure BSS, in an IBSS, or in a PBSS. Certain CMMG features such as service period allocation are available only to CMMG STAs that are associated with an AP or with a PCP, while other CMMG features such as EDCA operation in a PBSS do not require association. A CMMG STA supports beamforming (BF) as described in 10.42 and 20.10 and GCM encryption as described in 12.5.5.

A CMMG STA supports the PHY signaling as described in 25.4, 25.5, and 25.6. At a minimum, a CMMG STA supports the mandatory modulation and coding scheme (MCS) and PHY protocol data unit (PPDU) formats described in 25.4 and 25.5. A CMMG STA has PHY features that include a low-density parity check (LDPC) encoding, a preamble making use of zero correlation zone (ZCZ) sequences, and beamforming. The PPDUs are always transmitted with the same channel spacing as described in Annex E.

A CMMG STA supports MAC features that provide channel access in an environment in which transmissions use a directional antenna pattern or use multiple input multiple output antenna pattern. A

CMMG STA has MAC features that include frame aggregation, block ack features, service periods, contention based access periods, CMMG protected period, AP or PCP clustering, dynamic channel time management, reverse direction, spatial sharing, beamforming, and fast session transfer in a multi-band device. A CMMG STA is not a mesh STA. A CMMG STA follows the same channel access rules irrespective of the type of BSS in which it operates.

4.3.28 General link (GLK)

4.3.28.1 General

GLK STAs establish general links with other GLK STAs. These general links are suitable to be used as links inside an IEEE 802.1Q network. For an infrastructure general link example, see Figure 4-15 (in 4.3.28.3.3).

A GLK STA coordinates with a GLK convergence function to provide the Internal Sublayer Service, as defined in IEEE Std 802.1AC-2016, to an IEEE 802.1Q bridge for each peer GLK STA with which it is communicating. GLK STAs also provides link metrics for the use of external path selection protocols such as spanning tree protocol.

A GLK STA that starts a BSS uses membership selector values to set the BSS policy of requiring or not requiring general link or Ethertype protocol discrimination (EPD) support for any STA that joins the BSS.

A non-AP STA acts as either a GLK STA or a non-GLK STA. A GLK AP might permit associations from non-GLK STAs and acts as a non-GLK AP for those associated non-GLK STAs. GLK DMG STAs can establish a general link through a DMG relay. GLK S1G STAs cannot use or be an S1G relay.

The four-address MAC header can be used in GLK transmissions of Data frames. The use of the four-address MAC header or basic A-MSDU format is necessary for such MPDUs if the frame's SA, TA, RA, and DA fields (source address, transmitter address, receiver address, and destination address, respectively) are all different from each other. The three-address frame format can be used, as defined by Table 9-3, provided the addresses are consistent with Table 9-30.

A SYNRA is an RA that is a group address used by a GLK AP to forward frames to a subset of GLK non-AP STAs, as required by IEEE 802.1Q bridges. The use of a SYNRA can improve bandwidth usage in some cases. SYNRAs are used in GLK AP transmissions.

As described in 4.3.28.2, when a GLK AP transmits a Data frame with a four-address MAC header whose RA contains a group address, the contents of the RA is a synthetic receiver address (SYNRA), and therefore its RA and DA values are not equal. A GLK non-AP STA supports selective reception of group addressed frames by supporting SYNRA reception.

4.3.28.2 Selective reception of group addressed frames

For the reasons given below, when transmitting a Data frame that has an RA that is a group address to a set of receiving STAs, the GLK transmitter needs to transmit those MSDUs so that they are accepted by a specified subset of the associated GLK STAs indicated by the IEEE 802.1Q bridge.

The reason for such selective reception is to support requirements of IEEE 802.1Q bridges and can include the MAC service requirements that, when an MSDU is sent, it is not subsequently received and processed by the transmitting station or to break loops in the network topology. When a GLK STA associated with a GLK AP sends an MSDU to that AP with a group address destination, the AP retransmits it and uses the selective reception facility to stop the originating GLK STA from accepting it. Also, since the AP Internal Sublayer Service SAPs are mapped to IEEE 802.1Q bridge ports, loop prevention might need the traffic to be blocked to one or more of the associated GLK STAs. Such blocking can be implemented by the selective reception facility.

Implementation of this selective reception facility in a BSS case includes use of an RA that is a synthetic group address (SYNRA addressing, see 9.3.2.1.2). As an alternative to the use of a SYNRA, selective reception includes sending a copy of the Data frame to each intended receiver using individually addressed MPDUs. In either case, an appropriate address format is needed because the DA is different from the RA (since the RA is either the SYNRA or a serial individual RA). SYNRA addressed MPDUs are transmitted by APs only.

All GLK non-AP STAs in an infrastructure BSS support receipt of SYNRAs (see 9.3.2.1.2 and 10.65). A GLK AP that is requested to deliver an MPDU to multiple GLK STAs can choose to construct and transmit a SYNRA addressed MPDU, use a sequence of individually addressed MPDUs, or both.

Parameters exchanged during the association (or reassociation) of a GLK STA with a GLK AP determine the mechanism used by the GLK AP to enable selective reception at the GLK STA of group addressed frames transmitted by the GLK AP. One such mechanism is GLK-GCR, which is a subset of GCR customized for general links (see 11.21.16). In GLK-GCR the group address is a SYNRA. Features of GCR that do not apply to GLK-GCR are as follows:

a) DMS Request and DMS Response frame exchange to set up GLK-GCR service
b) ADDBA Request/Response frame exchange to setup block ack agreement
c) GCR-SP delivery method
d) Unsolicited DMS Response frame for “GCR Advertise”
e) Concealment address

4.3.28.3 GLK Service Sets

4.3.28.3.1 Provision of the MAC service

MAC service data unit (MSDU) delivery services in an IEEE 802.1Q network can be supported by the IEEE 802.1AC™ MAC service. GLK STAs coordinate with an IEEE 802.1AC-compliant GLK convergence function, to provide access to the WM via one or more Internal Sublayer Service SAPs. The routing of all MSDUs that are provided by an IEEE 802.1Q relay entity via GLK STAs is controlled by the routing protocols of the IEEE 802.1Q network to which the GLK STA is attached. This enables the routing protocols to use all the general links available to the GLK STA.

4.3.28.3.2 GLK IBSS and PBSS

A GLK IBSS or GLK PBSS can provide access to the WM via general links that are suitable for use in an IEEE 802.1Q network. Figure 4-14 shows an example of a GLK IBSS (or equivalently a PBSS) involving three GLK non-AP STAs. Each participating STA provides MAC services at the MS SAP, with the inclusion of a station vector that is then mapped to one or more Internal Sublayer Service SAPs by the IEEE 802.1AC GLK Convergence Function. Three general links are shown that connect three pairs of Internal Sublayer Service SAPs in a point-to-point manner. Each of the Internal Sublayer Service SAPs is then mapped to either an Enhanced Internal Sublayer Service (EISS) SAP or MAC SAP, by the IEEE 802.1Q Media Independent Function or the Internal Sublayer Service to MAC SAP function, respectively. The EISS SAP provides EISS services to the MAC relay entity of a VLAN bridge component (IEEE 802.1Q MAC Relay Entity). The MAC SAP provides services to the LLC Sublayer.

NOTE—IEEE Std 802.11 does not specify the details of the IEEE 802.1AC GLK Convergence Function, the IEEE 802.1Q Media Independent Function, the Internal Sublayer Service to MAC SAP function, the IEEE 802.1Q MAC Relay Entity, and the LLC Sublayer. These entities are specified in other documents such as IEEE Std 802.1AC-2016 and IEEE Std 802.1Qbz™-2016 [B20]. These entities are shown with dashed outlines in the figure. Entities that IEEE Std 802.11 does specify are shown with solid outlines and are within the box labeled “802.11 GLK IBSS/PBSS”.

A difference from a non-GLK STA’s IEEE 802.11 IBSS/PBSS is that either or both MAC SAPs could directly connect to an IEEE 802.1Q bridge.

For example, each of the STAs and attached bridges (including the IEEE 802.1Q MAC Relay Entities) shown could be at the top of a rack in a data center to provide inter-rack connectivity. The two MAC SAPs shown could even be safely connected to the same IEEE 802.1Q network, since such a network provides protection from loops.

Also, shown in the figure is the possibility to provide a point-to-point link between two LLC Sublayer entities that are each attached to a GLK non-AP STA. For example, this link could allow a computer attached to a GLK STA to directly connect to a network attached storage device attached to a GLK STA.

4.3.28.3.3 Infrastructure BSS with general links

A GLK infrastructure BSS can provide access to the WM via general links that are suitable for use in an IEEE 802.1Q network. Figure 4-15 shows an example of a GLK infrastructure BSS with three GLK non-AP STAs and one GLK AP. Each participating STA provides MAC services at the MS SAP, with the inclusion of a station vector that is then mapped to one or more Internal Sublayer Service SAPs by the IEEE 802.1AC GLK Convergence Function. Four general links are shown that connect four pairs of Internal Sublayer Service SAPs in a point-to-point manner. Each of the Internal Sublayer Service SAPs is then mapped, by the IEEE 802.1Q Media Independent Function or the Internal Sublayer Service to MAC SAP function, to either an EISS SAP or a MAC SAP, respectively. The EISS SAP provides EISS services to the MAC relay entity of a VLAN bridge component (IEEE 802.1Q MAC Relay Entity). The MAC SAP provides services to the LLC Sublayer.

NOTE—IEEE Std 802.11 does not specify the details of the IEEE 802.1AC GLK Convergence Function, the IEEE 802.1Q Media Independent Function, the Internal Sublayer Service to MAC SAP function, the IEEE 802.1Q MAC Relay Entity, and the LLC Sublayer. These entities are specified in other documents such as IEEE Std 802.1AC-2016 and IEEE Std 802.1Qbz-2016 [B20]. These entities are shown with dashed outlines in the figure. Entities that IEEE Std 802.11 does specify are shown with solid outlines and are with in the box labeled “802.11 BSS”.

Although transmissions by an AP are typically received by all STAs associated with that AP, the service provided by a GLK infrastructure BSS might be considered as separate point-to-point links between the corresponding Internal Sublayer Service SAPs. Provisioning of such apparent point-to-point links is natural for MPDUs with an RA that is an individual address. In order to provide such apparent point-to-point links for group addressed frames, the GLK AP can transmit them so that they are accepted by a subset of the associated GLK STAs. Such selective transmission can be provided through the GLK SYNRA addressing facility (see 4.3.28.2) or by serial transmissions to the desired receivers.

Three types of example general links are shown in Figure 4-15:

— The first type is an infrastructure general link that connects a non-AP GLK STA attached bridge port of an IEEE 802.1Q MAC Relay Entity with an GLK AP attached bridge (two of these general links are shown in the figure). These links could be used to enhance the reliability and routing options of an IEEE 802.1Q-compliant LAN by providing redundant wireless links between the bridges in the LAN.

— The second type is a non-AP GLK STA to non-AP GLK STA link that connects the STAs’ attached bridges (IEEE 802.1Q MAC Relay Entities). This type of general link is similar to the IBSS or PBSS STA to STA link.

— The third type of general link is a “leaf-node” type of general link that connects entities in the LLC layer attached to a non-AP GLK STA via a general link and an IEEE 802.1Q bridge attached to the GLK AP to another entity available via the IEEE 802.1Q network attached to the GLK AP. Such a general link could provide a connection between a network printer attached to the LAN and a computer attached to the non-AP GLK STA.

A difference between a GLK AP’s IEEE 802.11 links and a non-GLK AP’s IEEE 802.11 links, which can only be connected to an Internal Sublayer Service SAP via a DS and portal, is that an Internal Sublayer Service SAP could directly connect to an IEEE 802.1Q bridge.

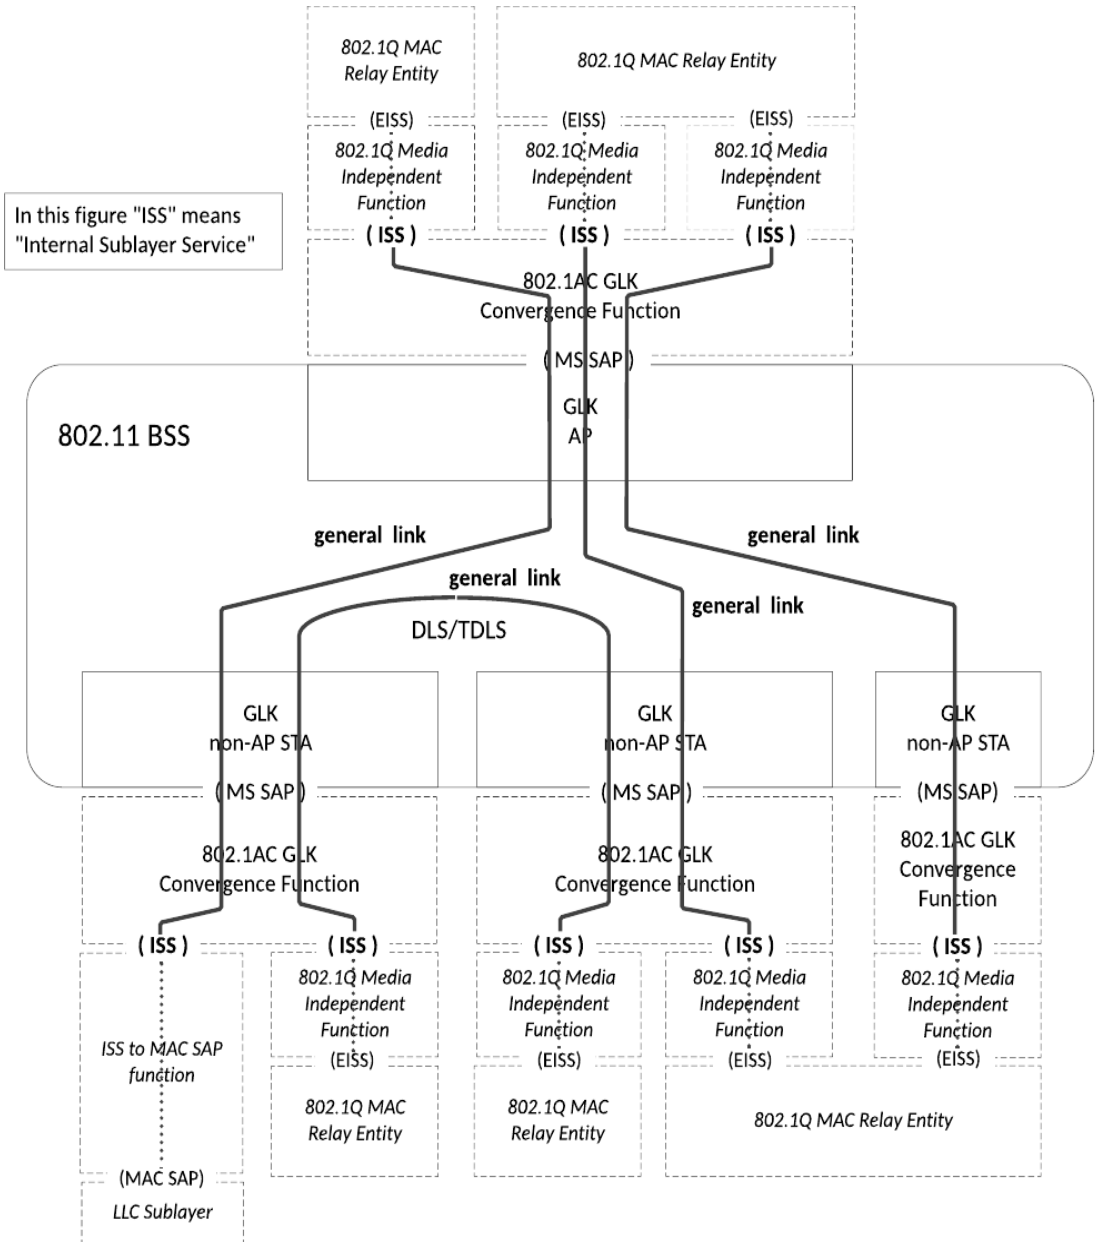

Figure 4-15—Example of infrastructure BSS with general links

4.3.28.3.4 Infrastructure BSSs with general links in the presence of an ESS

BSSs that support general links can be components of an extended form of network by using the general links within an IEEE 802.1Q bridged network. In such a bridged network, the concept of the DS in a non-GLK ESS is replaced by the other components of the IEEE 802.1Q network. However, such a GLK topology is more general than the non-GLK infrastructure mode. For example, Figure 4-16 shows a network consisting of three types of BSSs: a GLK infrastructure BSS (with only GLK STAs), an infrastructure BSS (with both GLK and non-GLK STAs), and an infrastructure BSS (containing only non-GLK STAs). The example ESS shown in the figure consists of all the non-GLK non-AP STAs, the non-GLK AP, and the portion of the GLK AP that has associated non-GLK non-AP STAs. In the ESS the portal that is connected

to the DS does not show any additional connection because the portal could be connected to any type of bridge, switch, or LAN. Hence no specific interconnection is shown. The general links shown in Figure 4-16 are similar to those shown in Figure 4-15 and provide point-to-point links as described in 4.3.28.3.3. Also, shown in the figure is an example of the possible configuration of more than one IEEE 802.1Q MAC relay entity being attached to a GLK AP or GLK non-AP STA and the possible configuration of more than one GLK AP or GLK non-AP STA being attached to the same IEEE 802.1Q MAC relay entity. These configurations show the flexibility available with general links.

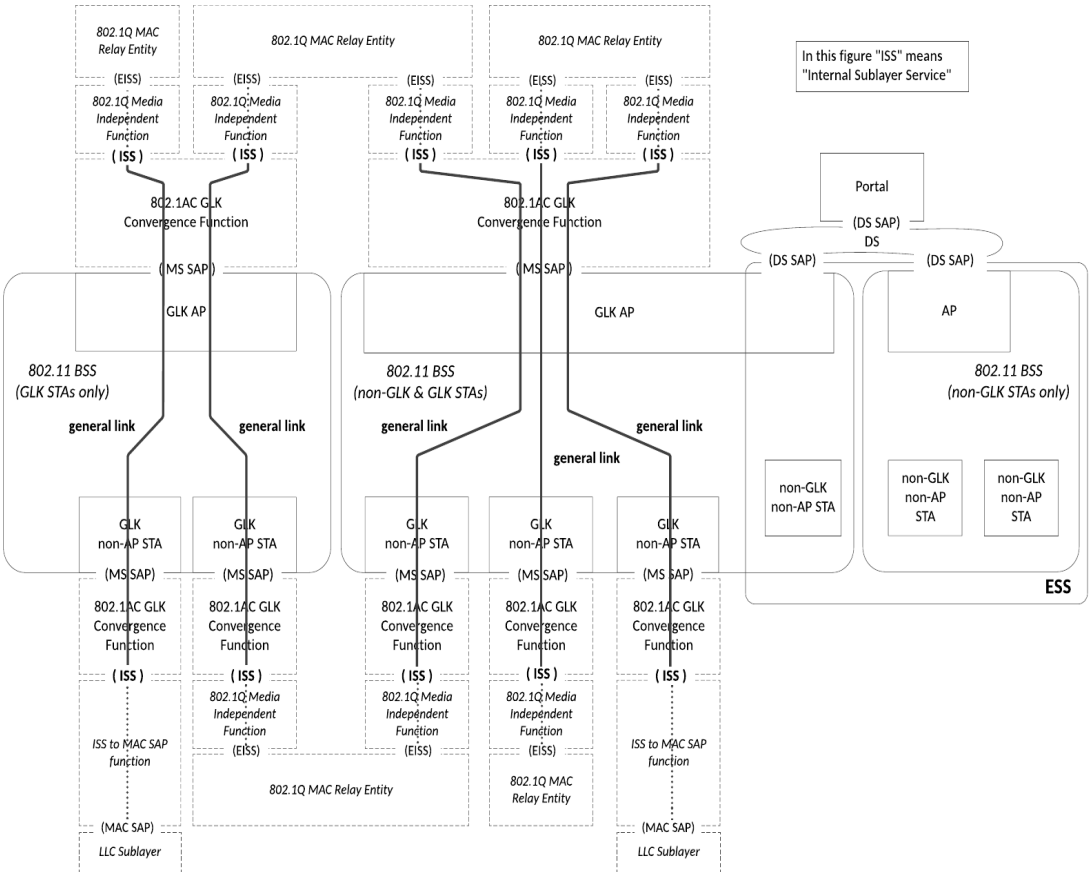

Figure 4-16—Example of an ESS and extended network with general links

NOTE—IEEE Std 802.11 explicitly does not specify the details of the IEEE 802.1AC GLK Convergence Function, the IEEE 802.1Q Media Independent Function, the Internal Sublayer Service to MAC SAP function, the IEEE 802.1Q MAC Relay Entity, and the LLC Sublayer. These entities are specified in other documents such as IEEE Std 802.1AC-2016 and IEEE Std 802.1Qbz-2016 [B20]. These entities are shown with dashed outlines in the figure. Entities that IEEE Std 802.11 does specify are shown with solid outlines.

4.3.29 Ethertype protocol discrimination (EPD)

IEEE Std 802 describes the two LLC sublayer protocols: Ethertype protocol discrimination (EPD) and LLC protocol discrimination (LPD). LPD is the default for IEEE 802.11 MSDUs with the exception of the 5.9 GHz bands where EPD is used for the transmission of all MSDUs (see E.2.3 and E.2.4). While not the default, EPD might be used in other bands when it is known that the addressed STAs and the transmitting STA support EPD.

An EPD STA is a STA that supports EPD format MSDUs. EPD STAs, other than those operating in the 5.9 GHz bands, indicate their support through a bit in the Capability Information field, DMG STA Capability Information field, and Relay Capabilities element. An EPD STA, when transmitting an MPDU

with an RA that is an individual address, uses EPD if the recipient supports EPD; otherwise, such individually addressed transmissions use LPD.

In an MPDU transmitted with a groupcast RA, the choice between of EPD or LPD format of MSDUs in the MPDU is controlled by the policy of the BSS (see 5.1.4).

4.4 Logical service interfaces

4.4.1 General

IEEE Std 802.11 explicitly does not specify the details of implementations. Instead, IEEE Std 802.11 specifies services to aid understanding how the architectural components are logically organized. The services are associated with different components of the architecture. There are three categories of IEEE 802.11 service—the station service (SS), the PCP service (PCPS), and the distribution system service (DSS). These categories of service are used by the IEEE 802.11 MAC sublayer.

The complete set of IEEE 802.11 architectural services are as follows:

a) Authentication
b) Association
c) Deauthentication
d) Disassociation
e) Distribution
f) Integration
g) Data confidentiality
h) Reassociation
i) MSDU delivery
j) DFS
k) TPC
l) Higher layer timer synchronization (QoS facility only)
m) QoS traffic scheduling (QoS facility only)
n) Radio measurement
o) DSE

This set of services is divided into three groups: the SS, the PCPS, and the DSS. The SS is part of every STA. The PCPS is provided by the PCP of a PBSS. The DSS is provided by the DS.

4.4.2 SS

The service provided by STAs is known as the SS.

The SS is present in every IEEE 802.11 STA (including APs, as APs include STA functionality). The SS is specified for use by MAC sublayer entities. All STAs provide the SS.

The SS is as follows:

a) Authentication (not used when dot11OCBActivated is true)
b) Deauthentication (not used when dot11OCBActivated is true)
c) Data confidentiality (not used when dot11OCBActivated is true)
d) MSDU delivery

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

e) DFS
f) TPC
g) Higher layer timer synchronization (QoS facility only)
h) QoS traffic scheduling (QoS facility only)
i) Radio measurement
j) DSE

4.4.3 PBSS control point service (PCPS)

The service provided by the PCP of a PBSS is known as the PCPS. Since each STA within a PBSS can operate as a PCP, each STA in the PBSS is capable of providing the PCPS, if it becomes the PCP of the PBSS. Non-PCP STAs do not provide the PCPS.

The services that comprise the PCPSs are the following:

a) Association
b) Disassociation
c) Reassociation
d) QoS traffic scheduling

The PCPS is specified for use by MAC sublayer entities.

4.4.4 DSS

The service provided by the DS is known as the DSS. IEEE Std 802.11 explicitly does not specify the details of DS implementation structure. Instead, IEEE Std 802.11 specifies the services that are provided by a DS implementation. A DS can be created from many different technologies including current IEEE 802 wired LANs. IEEE Std 802.11 does not constrain the DS to be either data link or network layer based. Nor does IEEE Std 802.11 constrain a DS to be either centralized or distributed in nature.

This service is represented in the IEEE 802.11 architecture by arrows within APs and mesh gates, indicating that the service is used to cross media and possibly address space logical boundaries. An AP and a mesh gate are logical entities, and the functions described might be shared by one or more physical entities.

The services that comprise the DSS are as follows:

a) Association (not mesh facility)
b) Disassociation (not mesh facility)
c) Distribution
d) Integration
e) Reassociation (not mesh facility)
f) QoS traffic scheduling (QoS facility only)
g) DSE
h) Interworking with the DS (mesh facility only)

DSSs are specified for use by MAC sublayer entities.

Figure 4-17 combines the components from previous figures with the three types of services to show the IEEE 802.11 architecture for infrastructure BSS and PBSS.

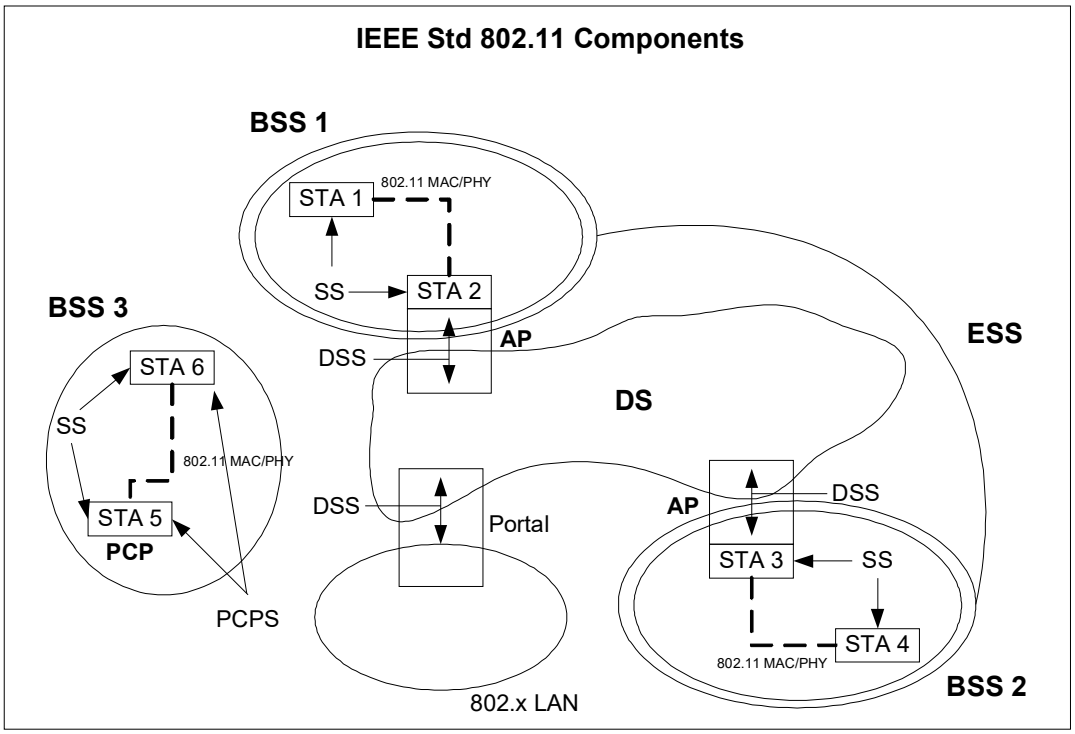

Figure 4-17—IEEE 802.11 architecture for infrastructure BSS and PBSS

4.5 Overview of the services

4.5.1 General

There are many services specified by IEEE Std 802.11. Six of the services are used to support medium access control (MAC) service data unit (MSDU) delivery between STAs. Three of the services are used to control IEEE 802.11 LAN access and confidentiality. Two of the services are used to provide spectrum management. One of the services provides support for LAN applications with QoS requirements. Another of the services provides support for higher layer timer synchronization. One of the services is used for radio measurement.

This subclause presents the services, an overview of how each service is used, and a description of how each service relates to other services and the IEEE 802.11 architecture. The services are presented in an order designed to help build an understanding of the operation of an IEEE 802.11 network. As a result, the services that comprise the SS and DSS are intermixed in order (rather than being grouped by category). The services that comprise the PCPS are a subset of the services provided by the SS and DSS.

Each of the services is supported by one or more MAC frame types. Some of the services are supported by MAC management PDUs, which are transported in MAC Management frames. The MSDU delivery service is supported by MAC Data frames. All of these frames gain access to the WM via the IEEE 802.11 MAC sublayer medium access method specified in Clause 10.

The IEEE 802.11 MAC sublayer uses four types of frame—*Data*, *Management*, *Extension,* and *Control* (see Clause 9). Data frames are handled by the MAC data plane (see Figure 5-1).

MAC Management frames and MAC Extension frames (see 9.3.4) are handled via the MAC management plane.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

MAC Control frames are used to support the delivery of IEEE 802.11 Data, Management, and Extension frames.

The examples here assume an ESS environment. The differences among the ESS, the PBSS, and the IBSS environments are discussed separately in 4.7.

4.5.2 Distribution of MSDUs within a DS

4.5.2.1 Distribution

This is the primary service used by IEEE 802.11 non-GLK STAs. It is conceptually invoked by every data message to or from an IEEE 802.11 non-GLK STA operating in an ESS (when the frame is sent via the DS). Distribution is via the DSS.

Refer to the ESS in Figure 4-18 and consider an MSDU being sent from STA 1 to STA 4. One or more frames containing the MSDU are sent from STA 1 and received by STA 2 (the "input" AP). The AP gives a MAC service tuple containing the MSDU to the DSS. It is the job of the distribution system to deliver the MAC service tuple within the DS in such a way that it arrives at the appropriate DS destination for the intended recipient. In this example, the MAC service tuple is distributed to STA 3 (the "output" AP) and STA 3 accesses the WM to send one or more frames containing the MSDU to STA 4 (the intended destination).

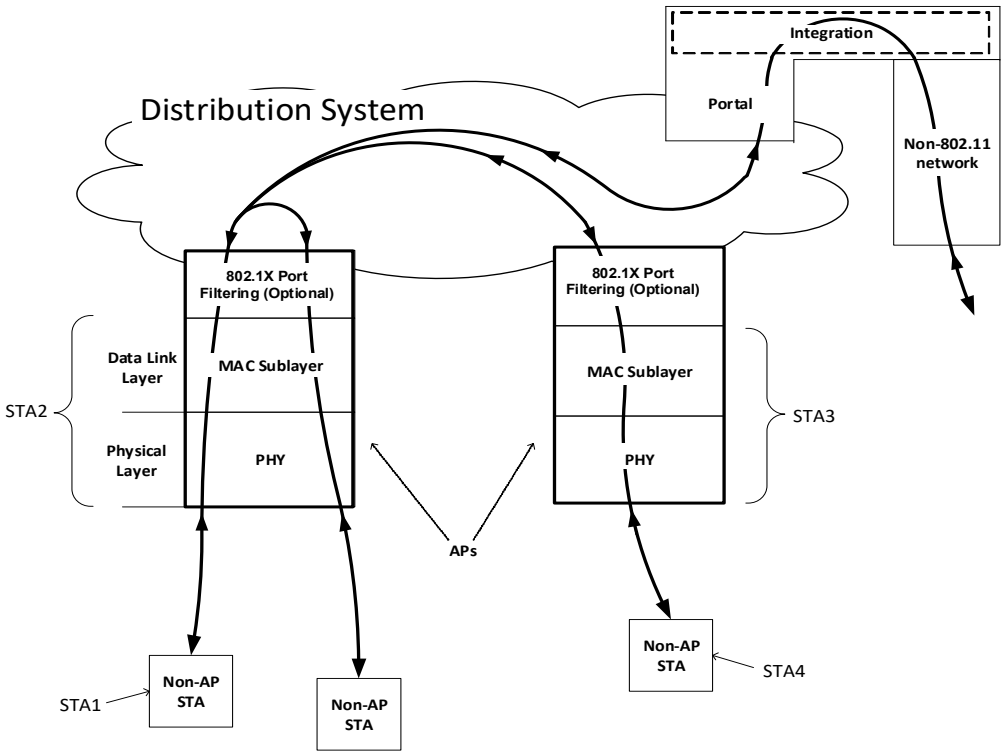

Figure 4-18—IEEE 802.11 Infrastructure model

The previous example was a case in which the AP that invoked the distribution system service was different from the AP that received the distributed MAC service tuple. If the MSDU had been intended for a STA that was a member of the same BSS as the sending STA, then the "input" and "output" APs for the MAC service tuple would have been the same.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If a MAC service tuple with a group addressed destination is provided to the DS, the DS is responsible for delivering that MAC service tuple to all appropriate APs in the ESS, including the "input" AP, to allow the AP to send frame(s) containing the MSDU to other associated non-AP STAs in its BSS. Generally, the DS delivers the MAC service tuple to all the APs in the ESS. Optionally, an implementation-specific or higher layer filtering might be applied to restrict the delivery to a known subset of the APs in the ESS; such filtering is beyond the scope of this standard.

How the MAC service tuple is distributed within the DS is not specified by IEEE Std 802.11. All IEEE Std 802.11 is required to do is to provide the DS with enough information for the DS to be able to determine the "output" point that corresponds to the intended recipient. The necessary information is provided to the DS by the three association related services (association, reassociation, and disassociation).

In all the examples above, the distribution system service was logically invoked. Whether the MAC service tuple actually had to traverse the physical DSM or not is a DS implementation matter and is not specified by this standard.

While IEEE Std 802.11 does not specify DS implementations, it does recognize and support the use of the WM as one possible DSM. This is specifically supported by the IEEE 802.11 frame formats. (Refer to Clause 9 for details.) A mesh BSS might form an entire DS or a part of a DS using the WM, as shown in Figure 4-9. Mesh services are used to form a mesh BSS and distribute MSDUs. Clause 14 defines how mesh BSSs are formed and how MSDUs are distributed through a mesh BSS.

4.5.2.2 Integration

When the distribution system service determines that the intended recipient of an MSDU is a member of an integrated LAN, the "output" point of the DS is a portal instead of an AP.

MAC service tuples that are distributed to a portal cause the DS to invoke the Integration function (conceptually after the distribution system service). The Integration function is responsible for accomplishing whatever is needed to deliver a MAC service tuple from the DSM to the integrated LAN media (including any required media or address space translations).

MSDUs received from an integrated LAN invoke the Integration function before the MAC service tuple is distributed by the distribution system.

The details of an Integration function are dependent on a specific portal implementation and are outside the scope of this standard.

4.5.2.3 QoS traffic scheduling

QoS traffic scheduling provides intra-BSS QoS frame transfers under the HCF, using either contention based or controlled channel access. At each TXOP, a traffic scheduling entity at the STA selects a frame for transmission, from the set of frames at the heads of a plurality of traffic queues, based on requested UP and/or parameter values in the traffic specification (TSPEC) for the requested MSDU. Additional information is available in 10.23.

4.5.3 Connectivity-related services

4.5.3.1 General

The primary purpose of a MAC sublayer is to transfer MSDUs between MAC sublayer entities. The information required for the distribution system service to operate is provided by the association services. Before an MSDU can be handled by the distribution system service, a STA is "associated."

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

To understand the concept of association, it is necessary first to understand the concept of mobility.

4.5.3.2 Mobility types

The three transition types of significance to this standard that describe the mobility of STAs within a network are as follows:

a) ***No-transition:*** In this type, two subclasses that are usually indistinguishable are identified:
   1) Static—no motion.
   2) Local movement—movement within the PHY range of the communicating STAs, i.e., movement within a basic service area (BSA).

b) ***BSS-transition:*** This type is defined as a STA movement from one BSS in one ESS to another BSS within the same ESS. A fast BSS transition is a BSS transition that establishes the state necessary for data connectivity before the reassociation rather than after the reassociation.

c) ***ESS-transition:*** This type is defined as STA movement from a BSS in one ESS to a BSS in a different ESS. This case is supported only in the sense that the STA might move. Maintenance of upper-layer connections cannot be guaranteed by IEEE Std 802.11; in fact, disruption of service is likely to occur.

The FT protocol provides a mechanism for a STA to perform a BSS transition between access points (APs) in a robust security network (RSN) or when quality-of-service (QoS) admission control is enabled in the ESS.

The different association services support the different categories of mobility.

4.5.3.3 Association

To deliver an MSDU within an ESS via the DS, the DS needs to know which AP within the ESS to deliver the MSDU, so that the MSDU might ultimately be delivered to the addressed IEEE 802.11 STA. This information is provided to the DS by the concept of association. Association is necessary, but not sufficient, to support BSS-transition mobility. Association is sufficient to support no-transition mobility. Association is one of the services in the DSS.

Before a STA is allowed to send an MSDU via an AP, it first becomes associated with the AP.

For a non-GLK STA, the act of becoming associated invokes the association service, which provides the STA to AP mapping to the DS. How the information provided by the association service is stored and managed within the DS is not specified by this standard.

For a GLK STA, the act of becoming associated invokes the association service, which establishes a general link between two instances of the IEEE 802.1D Internal Sublayer Service. This link provides a point-to-point link between the two Internal Sublayer Service SAPs. The GLK AP STA and the GLK non-AP STA each coordinate with higher layer services and each other to create the point-to-point link. The higher layer services create or enable the Internal Sublayer Service SAPs, inform the GLK convergence function of the mapping of the Internal Sublayer Service SAPs, and inform the network routing protocol of the existence of the general link. The GLK AP and the GLK non-AP STA each establish a service_access_point_identifier for each general link, for their respective MS SAPs. This process allows for the establishment of a point-to-point link suitable for use in an IEEE 802.1Q network.

Within a robust security network (RSN), association is handled differently. In an RSNA, the IEEE 802.1X Port determines when to allow data traffic across an IEEE 802.11 link. A single IEEE 802.1X Port maps to one association, and each association maps to an IEEE 802.1X Port. An IEEE 802.1X Port consists of an IEEE 802.1X Controlled Port and an IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. Once the AKM completes successfully, data protection is enabled to prevent unauthorized access, and the IEEE 802.1X Controlled Port unblocks to allow protected data traffic. IEEE 802.1X Supplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. It is expected that most other protocol exchanges use the IEEE 802.1X Controlled Ports. However, a given protocol might need to bypass the authorization function and make use of the IEEE 802.1X Uncontrolled Port.

NOTE—See IEEE Std 802.1X-2010 for a discussion of Controlled Port and Uncontrolled Port.

At any given instant, a STA is associated with no more than one AP. This allows the DS to determine a unique answer to the question, "Which AP is serving STA X?" Once an association is completed, a STA can make full use of a DS (via the AP) to communicate. Association is always initiated by the non-AP STA, not the AP.

An AP might be associated with many STAs at the same time.

A STA learns what APs are present and what operational capabilities are available from each of those APs and then invokes the association service to establish an association. A FILS STA is able to discover, authenticate and associate with the AP with a reduced number of frame transmissions. For details of how a STA learns about what APs are present, see 11.1.4.

4.5.3.4 Reassociation

Association is sufficient for no-transition MSDU delivery between IEEE 802.11 STAs. Additional functionality is needed to support BSS-transition mobility. The additional required functionality is provided by the reassociation service. Reassociation is one of the services in the DSS.

The reassociation service is invoked to "move" a current association of a non-AP STA from one AP to another. In an ESS with a DS, the reassociation service informs the DS of the current mapping between AP and STA as the STA moves from BSS to BSS within the ESS. For a general link in an IEEE 802.1Q network, the reassociation service informs higher layer services how the link is reconfigured, commonly, with which BSS the GLK non-AP STA is a member of. The higher layer services will then destroy, disable, or maintain the existing Internal Sublayer Service SAPs, create or enable new Internal Sublayer Service SAPs, inform the GLK convergence function of the reconfigured general link mapping of the Internal Sublayer Service SAPs, and inform the network routing protocol of the updated general link. The GLK AP and GLK non-AP STA each then establish or maintain a service_access_point_identifier for the reconfigured general link, for their respective MS SAPs. Reassociation also enables changing association attributes of an established association while the non-AP STA remains associated with the same AP. Reassociation is always initiated by the non-AP STA.

Only the fast BSS transition facility can move an RSNA during reassociation. Therefore, if FT is not used, the old RSNA is deleted and a new RSNA is constructed.

4.5.3.5 Disassociation

The disassociation service is invoked when an existing association is to be terminated. Disassociation is one of the services in the DSS.

For a non-GLK STA, the act of becoming disassociated invokes the disassociation service, which voids any existing STA to AP mapping known to the DS, for the disassociating STA. How the information provided by the disassociation service is managed within the DS is not specified by this standard. For a general link, disassociation removes or disables the corresponding Internal Sublayer Service SAPs that were configured

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

for the general link. The IEEE 802.1Q bridge uses this information to update bridging for the GLK non-AP STA.

For an IEEE 802.11 link that is the basis of a general link, the disassociation service informs higher layer services of the IEEE 802.1Q network that the general link has been destroyed. The GLK AP and the GLK non-AP STA each coordinate with higher layer services and each other to destroy the point-to-point link. The higher layer services destroy or disable the Internal Sublayer Service SAPs, inform the GLK convergence function of the deletion of the mapping of the Internal Sublayer Service SAPs, and inform the network routing protocol of the destruction of the general link, for their respective MS SAPs. This process destroys the previously existing point-to-point link that was suitable for use in an IEEE 802.1Q network.

The disassociation service can be invoked by either party in an association (non-AP STA or AP). Disassociation is a notification, not a request. Disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

An AP can disassociate STAs to enable the AP to be removed from a network for service or for other reasons.

STAs attempt to disassociate when they leave a network. However, the MAC protocol does not depend on STAs invoking the disassociation service. (MAC management is designed to accommodate loss of communication with an associated STA.)

4.5.4 Access control and data confidentiality services

4.5.4.1 General

Two services are required for IEEE Std 802.11 to provide functionality equivalent to that which is inherent to wired LANs. The design of wired LANs assumes the physical attributes of wire. In particular, wired LAN design assumes the physically closed and controlled nature of wired media. The physically open medium nature of an IEEE 802.11 LAN violates those assumptions.

In a WLAN that does not support RSNA, two services, authentication and data confidentiality, are defined. IEEE 802.11 authentication is used instead of the wired media physical connection. WEP encryption was defined to provide the data confidentiality aspects of closed wired media.

An RSNA uses the IEEE 802.1X authentication service along with enhanced data cryptographic encapsulation mechanisms, such as TKIP, CCMP, and GCMP, to provide access control. The IEEE 802.11 station management entity (SME) provides key management via an exchange of EAPOL-Key frames. Data confidentiality and data integrity are provided by RSN key management together with the enhanced data cryptographic encapsulation mechanisms.

4.5.4.2 Authentication

IEEE 802.11 authentication operates at the link level between IEEE 802.11 STAs. IEEE Std 802.11 does not provide either end-to-end (MSDU origin to MSDU destination) or user-to-user authentication.

IEEE Std 802.11 attempts to control LAN access via the authentication service. IEEE 802.11 authentication is an SS. This service might be used by all STAs to establish their identity to STAs with which they communicate, in both ESSs and IBSSs. If a mutually acceptable level of authentication has not been established between two STAs, an association is not established.

IEEE Std 802.11 defines five IEEE 802.11 authentication methods: Open System authentication, Shared Key authentication, FT authentication, simultaneous authentication of equals (SAE), and FILS authentication. Open System authentication admits any STA to the DS. Shared Key authentication relies on

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

WEP to demonstrate knowledge of a WEP encryption key. FT authentication relies on keys derived during the initial mobility domain association to authenticate the stations as defined in Clause 13. SAE authentication uses finite field cryptography to prove knowledge of a shared password. FILS authentication allows for faster connection to the network for FILS non-AP STAs by providing authentication, association, and key confirmation information in an efficient number of frame exchanges (see 4.10.3.6). The IEEE 802.11 authentication mechanism also allows definition of new authentication methods.

An RSNA might support SAE authentication, FILS authentication, or both. An RSNA also supports authentication based on IEEE Std 802.1X-2010, or preshared keys (PSKs) after Open System authentication. IEEE 802.1X authentication utilizes the EAP to authenticate STAs and the AS with one another. This standard does not specify an EAP method that is mandatory to implement. See 12.6.5 for a description of the IEEE 802.1X authentication and PSK usage within an IEEE 802.11 IBSS.

In an RSNA, IEEE 802.1X Supplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port.

SAE authentication and Open System IEEE 802.11 authentication are used by STAs in an RSN for an infrastructure BSS. FILS authentication can be used by FILS STAs in an RSN for an infrastructure BSS. SAE authentication, Open System IEEE 802.11 authentication, or no IEEE 802.11 authentication is used in an RSN for an IBSS. SAE authentication is used for an MBSS. In an RSN, Shared Key IEEE 802.11 authentication is not used. In an RSN for DMG BSS, Open System IEEE 802.11 authentication is not used (12.2.4).

A STA might be authenticated with many other STAs at the same time.

Because the IEEE 802.1X authentication process could be time-consuming (depending on the authentication protocol in use), the authentication service can be invoked independently of the association service.

This type of preauthentication is typically done by a STA while it is already associated with an AP (with which it previously authenticated). IEEE Std 802.11 does not require that STAs preauthenticate with APs. However, authentication is required before an association establishment is complete.

If the authentication is left until reassociation time, this might impact the speed with which a STA reassociates between APs, limiting BSS-transition mobility performance. The use of preauthentication takes the authentication service overhead out of the time-critical reassociation process.

SAE authentication is performed prior to association and a STA can take advantage of the fact that it can be IEEE 802.11 authenticated to many APs simultaneously by completing the SAE protocol with any number of APs while still being associated to another AP. RSNA security can be established after association using the resulting shared key.

4.5.4.3 Deauthentication

The deauthentication service is invoked when an existing Open System, Shared Key, FT, SAE, or FILS authentication is to be terminated. Deauthentication is an SS.

In an ESS, because authentication is a prerequisite for association, the act of deauthentication causes the STA to be disassociated. The deauthentication service can be invoked by either authenticated party (non-AP STA or AP). Deauthentication is not a request; it is a notification. The association at the transmitting STA is terminated when the STA sends a deauthentication notice to an associated STA. Deauthentication, and if associated, disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In an RSN ESS, deauthentication results in termination of any association for the deauthenticated STA. It also results in the IEEE 802.1X Controlled Port for that STA, if used for this association, being disabled and deletes the pairwise transient key security association (PTKSA). The deauthentication notification is provided to IEEE Std 802.1X-2010 via the MAC layer.

In an RSNA, deauthentication also deletes any related pairwise transient key security association (PTKSA), group temporal key security association (GTKSA), TPK security association (TPKSA), integrity group temporal key security association (IGTKSA), beacon integrity group temporal key security association (BIGTKSA), mesh GTKSA, and mesh TKSA that exist in the STA and closes the associated IEEE 802.1X Controlled Port, if used for this association. If pairwise master key security association (PMKSA) caching is not enabled, deauthentication also deletes the PMKSA or mesh PMKSA.

In an RSN IBSS, Open System authentication is optional, but a STA is required to recognize Deauthentication frames. Deauthentication results in the IEEE 802.1X Controlled Port for that STA being disabled and deletes the PTKSA.

4.5.4.4 Data confidentiality

In a wired LAN, only those STAs physically connected to the wire can send or receive LAN traffic. With a wireless shared medium, there is no physical connection, and all STAs and certain other RF devices in or near the LAN might be able to send, receive, and/or interfere with the LAN traffic. A STA receives traffic that is within range and transmits to any other STA within range. Thus, the connection of a single wireless link (without data confidentiality) to an existing wired LAN might seriously degrade the security level of the wired LAN.

To bring the security of the WLAN up to the level implicit in wired LAN design, IEEE Std 802.11 provides the ability to protect the contents of frames. This functionality is provided by the data confidentiality service. Data confidentiality is an SS.

IEEE Std 802.11 provides several cryptographic algorithms to protect data traffic, including: WEP, TKIP, CCMP, and GCMP. WEP and TKIP are based on the ARC4[21] algorithm, and CCMP and GCMP are based on the advanced encryption standard (AES). A means is provided for STAs to select the algorithm(s) to be used for a given association.

IEEE Std 802.11 provides the following security protocols for protection of individually addressed robust Management frames: CCMP and GCMP. This standard provides data confidentiality for certain Action frames as indicated in Table 9-51.

IEEE Std 802.11 provides one security protocol, CCMP, for protection of individually addressed and group addressed Data frames between mesh STAs.

The default data confidentiality state for all IEEE 802.11 STAs is “in the clear,” i.e., without protection. If the data confidentiality service is not invoked, all frames are sent unprotected. If this policy is unacceptable to the sender, it does not send Data frames; and if the policy is unacceptable to the receiver, it discards any received Data frames. Unprotected Data frames and unprotected robust Management frames received at a STA configured for mandatory data confidentiality, as well as protected Data frames and protected robust Management frames using a key not available at the receiving STA, are discarded without an indication to LLC (or without indication to distribution system services in the case of “To DS” frames received at an AP).

[21] Details of the ARC4 algorithm are available from RSA Security, Inc. Contact RSA Security, 174 Middlesex Turnpike, Bedford, MA 01730 (http://www.rsasecurity.com/), for algorithm details and the uniform ARC4 license terms that RSA offers to anyone wishing to use ARC4 for the purpose of implementing the IEEE 802.11 WEP option. If necessary, contact the IEEE Standards Department Intellectual Property Rights Administrator for details on how to communicate with RSA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

These frames are acknowledged on the WM [if received without frame check sequence (FCS) error] to avoid wasting WM bandwidth on retries of frames that are being discarded.

4.5.4.5 Key management

The enhanced data confidentiality, data authentication, and replay protection mechanisms require fresh cryptographic keys and corresponding security associations. The procedures defined in this standard provide fresh keys by means of protocols called the 4-way handshake, FT 4-way handshake, FT protocol, FT resource request protocol, group key handshake, and FILS authentication protocol.

4.5.4.6 Data origin authenticity

The data origin authenticity mechanism defines a means by which a STA that receives a Data or robust Management frame can determine which STA transmitted the MAC protocol data unit (MPDU). This feature is required in an RSNA to prevent one STA from masquerading as a different STA.

Data origin authenticity is applicable only to individually addressed Data frames, and individually addressed robust Management frames. The protocols do not guarantee data origin authenticity for group addressed frames, as this cannot be accomplished using symmetric keys and public key methods are too computationally expensive.

4.5.4.7 Replay detection

The replay detection mechanism defines a means by which a STA that receives a Data or robust Management frame from another STA can detect whether the received frame is an unauthorized retransmission. This replay protection mechanism is provided for Data frames for STAs that use enhanced data cryptographic encapsulation mechanisms. The replay protection mechanism is also provided for robust Management frames for STAs that use CCMP, GCMP, and broadcast/multicast integrity protocol (BIP).

4.5.4.8 Fast BSS transition

The FT mechanism defines a means for a STA to set up security and QoS parameters prior to reassociation to a new AP. This mechanism allows time-consuming operations to be removed from the time-critical reassociation process. During a handover across mobility domains, the overhead incurred during the FT initial mobility domain association in an RSN can be reduced using FILS authentication.

4.5.4.9 Management frame protection

Robust Management frames are a set of Management frames that can be protected by the management frame protection service.

Management frame protection protocols in an infrastructure BSS or IBSS apply to robust Management frames after RSNA PTK establishment for protection of individually addressed frames is completed and after delivery of the IGTK to protect group addressed frames. Beacon frames are protected in an infrastructure BSS after delivery of the BIGTK.

Management frame protection protocols in an MBSS apply to the following frames:

— Individually addressed robust Management frames after establishment of the RSNA MTK,
— Group addressed robust Management frames that are specified with Yes in the “Group Addressed Privacy” column of Table 9-51 after establishment of the RSNA MGTK, and
— Group addressed robust Management frames that are specified with No in the “Group Addressed Privacy” column of Table 9-51 after establishment of the RSNA IGTK.

See 14.7 for details.

Management frame protection is implemented by CCMP, GCMP, and BIP confidentiality protocols and the SA Query procedure.

4.5.4.10 MAC privacy enhancements

When a non-AP STA searches for, and connects to, an infrastructure BSS, IBSS, or PBSS or attempts to discover services on a network preassociation, it defines the addressing of its MAC layer for the particular connection. If the STA uses a fixed MAC address it is trivial to track the STA. An MSDU transmitted by a STA is assigned a sequence number that, if never reset, can also be used to track a device irrespective of the MAC address. If OFDM is used, the PHY DATA scrambler used can enable tracking of a device irrespective of the MAC address if it is not reseeded. The dynamic nature of BSS membership combined with this tracking information allows for construction of a network of connections, locations, and behavior. This network can be used to glean private and sensitive information regarding the individual behind the device.

Furthermore, even without establishing a connection, a mobile or portable STA that gratuitously transmits Probe Request frames containing SSIDs of favored infrastructure BSS networks, or announces the existence of IBSS networks, can reveal potentially sensitive information about its location and location history.

To mitigate this sort of traffic analysis a STA can support the ability to periodically and randomly change its MAC addresses and reset counters and seeds prior to association. While discovering networks, a STA can refrain from gratuitously transmitting Probe Request frames containing SSIDs of favored BSS networks.

4.5.5 Spectrum management services

4.5.5.1 General

Two services are required to satisfy requirements in some regulatory domains (see Annex D and Annex E) for operation in the 5 GHz band. These services are called *transmit power control (TPC)* and *dynamic frequency selection (DFS)*.

4.5.5.2 TPC

Regulations that apply to the 5 GHz band in certain regulatory domains require RLANs operating in the 5 GHz band to use transmitter power control, involving specification of a regulatory maximum transmit power and a mitigation requirement for each allowed channel. The TPC service is used to satisfy this regulatory requirement.

The TPC service provides for the following:

- Association of STAs with an AP based on the STAs' power capability
- Specification of regulatory and local maximum transmit power levels for the current channel
- Selection of a transmit power for each transmission in a channel within constraints imposed by regulatory requirements
- Adaptation of transmit power based on a range of information, including path loss and link margin estimates

4.5.5.3 DFS

Regulations that apply to the 5 GHz band in certain regulatory domains require RLANs operating in the 5 GHz band to avoid co-channel operation with radar systems and to provide uniform utilization of available channels. The DFS service is used to satisfy these regulatory requirements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The DFS service provides for the following:

- Association of STAs with an AP based on the STAs' supported channels.
- Quieting the current channel so it can be tested for the presence of radar with less interference from other STAs.
- Testing channels for radar before using a channel and while operating in a channel.
- Discontinuing operations after detecting radar in the current channel to avoid interference with radar.
- Detecting radar in the current and other channels based on regulatory requirements.
- Requesting and reporting of measurements in the current and other channels.
- Selecting and advertising a new channel to assist the migration of a BSS after radar is detected.

4.5.6 Traffic differentiation and QoS support

4.5.6.1 General

IEEE Std 802.11 uses a shared medium and provides differentiated control of access to the medium to handle data transfers with QoS requirements. The QoS facility (per MSDU traffic category and TSPEC negotiation) allows an IEEE 802.11 LAN to become part of a larger network providing end-to-end QoS delivery or to function as an independent network providing transport on a per-link basis with specified QoS commitments. The specifications regarding the integration and operability of the QoS facility with any other end-to-end QoS delivery mechanism like Resource Reservation Protocol (RSVP) are beyond the scope of this standard.

4.5.6.2 Quality-of-service management frame support

When the quality-of-service management frame (QMF) service is enabled, some Management frames might be transmitted using an access category other than the access category assigned to voice traffic (access category AC_VO, see 9.4.2.28) in order to improve the quality of service of other traffic streams. This is achievable by the use of a QMF policy. A QMF policy defines the access categories of different Management frames. Only QoS STAs are able to implement QMF policy. A non-AP QMF STA uses the default QMF policy or the QMF policy accepted from a peer QMF STA to transmit Management frames to that peer QMF STA. A QMF AP sets its own QMF policy for the transmission of QMFs to its associated STAs. A QMF STA uses access category AC_VO to transmit Management frames to STAs that do not support the QMF service.

4.5.7 Support for higher layer timer synchronization

Some applications, e.g., the transport and rendering of audio or video streams, require synchronized timers shared among different STAs. Greater accuracy (in terms of jitter bounds) or finer timer granularity than that provided by a BSS timing synchronization function (TSF) might be an additional requirement. In support of such applications, this standard defines a MAC service that enables layers above the MAC to accurately synchronize application-dependent timers shared among STAs. The service is usable by more than one application at a time.

Although the timer synchronization methods and accuracy requirements are application-dependent and are beyond the scope of this standard, they rely on an indication from each MAC that is provided essentially simultaneously, via group addressed transmissions, to the STAs. The MAC accomplishes this by indicating the occurrence of the end of the last symbol of particular Data frames; the Data frames of interest are identified by their MAC header Address 1 field when it contains a group address previously registered with the MAC. The last symbol is observed[22] on the WM by STAs within a BSS while the delay between the

[22] The synchronization indication (observed time) within the BSS varies slightly due to propagation.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

observation and the delivery of the indication is known within a MAC by design (and communicated to the application by implementation dependent means). The common reference point in time provided by the end of last symbol indication is the essential building block upon which a variety of application-dependent timer synchronization methods might be based.

4.5.8 Radio measurement service

The Radio measurement service provides the following:

- The ability to request and report radio measurements in supported channels.
- The ability to perform radio measurements in supported channels.
- An interface for upper layer applications to retrieve radio measurements using MLME primitives and/or MIB access.
- Information about neighbor APs.

4.5.9 Interworking with external networks

4.5.9.1 General

The interworking service allows non-AP STAs to access services provided by an external network according to the subscription or other characteristics of that external network. An IEEE 802.11 non-AP STA might have a subscription relationship with an external network, e.g., with an SSPN.

An overview of the interworking functions addressed in this standard is provided below:

- Network discovery and selection
  - Discovery of suitable networks through the advertisement of access network type, roaming consortium and venue information, via Management frames
  - Selection of a suitable IEEE 802.11 infrastructure using advertisement services (e.g., access network query protocol (ANQP) or an IEEE 802.21™ Information Server) in the BSS or in an external network reachable via the BSS.
  - Selection of an SSPN or external network with its corresponding IEEE 802.11 infrastructure
- Preassociation discovery (PAD)
  - Discovery of services offered by a BSS or an external network reachable via that BSS
- Emergency services
  - Emergency Call and Network Alert support at the link level
- QoS mapping distribution
- SSPN interface service between the AP and the SSPN

The generic advertisement service (GAS), described in 4.5.10, provides both support for a STA's network discovery and selection, and support for a conduit for communication by a non-AP STA with other information resources in a network before joining the wireless LAN.

The interworking service supports emergency services by providing methods for users to access emergency services via the IEEE 802.11 infrastructure, advertising that emergency services are supported (see 11.22.6) and identifying that a traffic stream is used for emergency services.

The interworking service provides QoS mapping for SSPNs and other external networks. Since each SSPN or other external network might have its own layer-3 end-to-end packet marking practice (e.g., differentiated services code point (DSCP) usage conventions), a means to remap the layer-3 service levels to a common over-the-air service level is necessary. The QoS Map service provides STAs a mapping of network-layer QoS packet marking to over-the-air QoS frame marking (i.e., user priority).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The SSPN Interface service supports service provisioning and transfer of user permissions from the SSPN to the AP. The method and protocol by which these permissions are transferred from the SSPN are outside the scope of this standard.

4.5.9.2 Preassociation discovery (PAD)

4.5.9.2.1 Introduction

PAD is an interworking function provided by a BSS to allow a non-AP and non-PCP STA, prior to association, to discover information concerning services that might be available to the STA when it is associated with the BSS. PAD provides a method for the STA to gather information to aid in the decision to select a BSS with which to become a member.

4.5.9.2.2 Architecture

Figure 4-19 and Figure 4-20 show the functional flow of MAC messaging and service information between a service information client (SIC) and a service information registry (SIR). These entities are described in 4.5.9.2.3, 4.5.9.2.4, and 4.5.9.2.5. The active components within the architecture differ depending upon whether unsolicited or solicited PAD is being used.

NOTE—A SIR can be either co-located with the AP or outside the AP. An SIR can only be co-located with a PCP. The communications between the SIR and the AP, together with the SIR and the ANQP server are out of the scope of this standard.

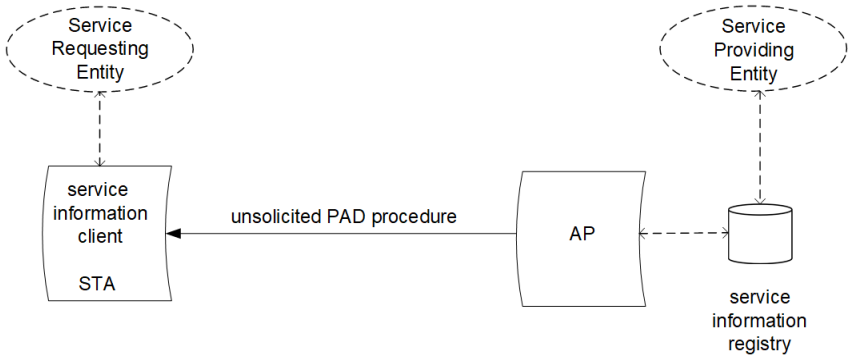

Figure 4-19—Unsolicited PAD architecture

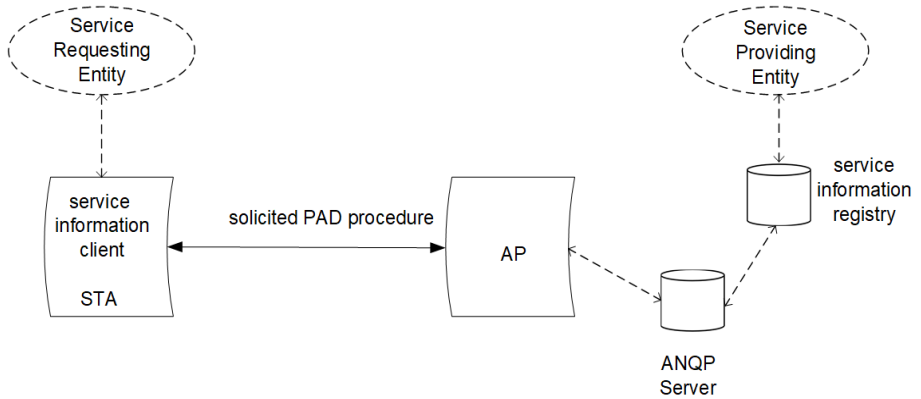

Figure 4-20—Solicited PAD architecture

The unsolicited PAD procedure is described in 11.23.2 and solicited PAD procedure is described in 11.23.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

4.5.9.2.3 Service information entities

The SIC and SIR are used to exchange PAD service information. The PAD procedures operate between the SIC and SIR.

4.5.9.2.4 Service information registry (SIR)

The SIR caches information about services that might be reachable via the BSS and therefore might be available to the STA once the STA is associated with that BSS. How the SIR obtains the information about services is outside the scope of this standard.

There is typically one SIR assigned to each ESS. It can be addressed by each AP and each service within that ESS. It includes supporting service discovery requests and responses from the BSS.

The SIR communicates with the ANQP server to respond to ANQP requests.

4.5.9.2.5 Service information client (SIC)

The SIC initiates service discovery. The SIC exchanges service discovery requests and responses between the SME and applications.

The SME determines whether to use unsolicited PAD or solicited PAD procedures. The SME also composes ANQP requests for solicited PAD procedures.

4.5.10 Generic advertisement service (GAS)

GAS provides functionality that enables STAs to discover the availability of information related to desired network services, e.g., information about services such as provided in an IBSS, local access services, available subscription service providers (SSPs) and/or SSPNs or other external networks. GAS uses a generic container to advertise network services' information over an IEEE 802.11 network. Public Action frames are used to transport this information.

While the specification of network services information is outside the scope of this standard, in an infrastructure BSS there is a need for STAs to query for information on network services provided by SSPNs or other external networks beyond an AP, before they associate with the wireless LAN. The exchange of information can also be performed after associating to the BSS.

In an IBSS/PBSS, GAS functionality enables a STA to access the availability and information related to desired services provided by other STAs in the IBSS/PBSS. Exchange of information using GAS can be performed either prior to joining an IBSS/PBSS or after joining the IBSS/PBSS.

There are a number of reasons why providing information to a STA in a preassociated state is beneficial:

— It supports more informed decision making about an IEEE 802.11 infrastructure BSS or PBSS of which to become a member. This is generally more efficient than requiring a non-AP and non-PCP STA to associate with an AP or PCP before discovering the information and then deciding whether to stay associated.
— It is possible for the non-AP and non-PCP STA to query multiple networks in parallel.
— The non-AP STA can discover information about APs that are not part of the same administrative group as the AP with which it is associated, supporting the selection of an AP belonging to a different IEEE 802.11 infrastructure that has an appropriate SSP roaming agreement in place.

4.6 Multiple logical address spaces

Just as the IEEE 802.11 architecture allows for the possibility that the WM, DSM, and an integrated non-IEEE-802.11 LAN might all be different physical media, it also allows for the possibility that each of these components might be operating within different address spaces. IEEE Std 802.11 uses and specifies only the use of the WM address space.

Each IEEE 802.11 PHY operates in a single medium—the WM. The IEEE 802.11 MAC operates in a single address space. MAC addresses are used on the WM in the IEEE 802.11 architecture. Therefore, it is unnecessary for the standard to explicitly specify that its addresses are "WM addresses." This is assumed throughout this standard.

IEEE Std 802.11 has chosen to use the IEEE 802 48-bit address space (see 9.2.4.3.2). Thus IEEE 802.11 addresses are compatible with the address space used by the IEEE 802 LAN family.

The IEEE 802.11 choice of address space implies that for many instantiations of the IEEE 802.11 architecture, the non-IEEE-802.11 LAN MAC address space and the IEEE 802.11 MAC address space might be the same. In the situations where a DS that uses MAC-level IEEE 802 addressing is appropriate, all three of the logical address spaces used within a system could be identical. While this is a common case, it is not the only combination allowed by the architecture. The IEEE 802.11 architecture allows for all three logical address spaces to be distinct. In the GLK case, IEEE 802.1Q bridges are included in the network topology; therefore, the wired LAN MAC address space and IEEE 802.11 MAC address space are the same

A multiple address space example is one in which the DS implementation uses network layer addressing. In this case, the WM address space and the DS address space are different.

Note that IEEE 802.11 STAs within a single ESS share the same address space, fulfilling the transparency requirement from the definition of the DS. The DSS uses this same address space, even in the case where the DSM uses a different address space.

The ability of the architecture to handle multiple logical media and address spaces is key to the ability of IEEE Std 802.11 to be independent of the DS implementation and to interface cleanly with network layer mobility approaches. The implementation of the DS is unspecified and is beyond the scope of this standard.

4.7 Differences among ESS, PBSS, and IBSS LANs

In 4.3.2 the concept of the IBSS LAN was introduced, and in 4.3.3 the concept of the PBSS LAN was introduced. In an IBSS or PBSS, a STA communicates directly with one or more other STAs.

Consider the full IEEE 802.11 architecture as shown in Figure 4-21.

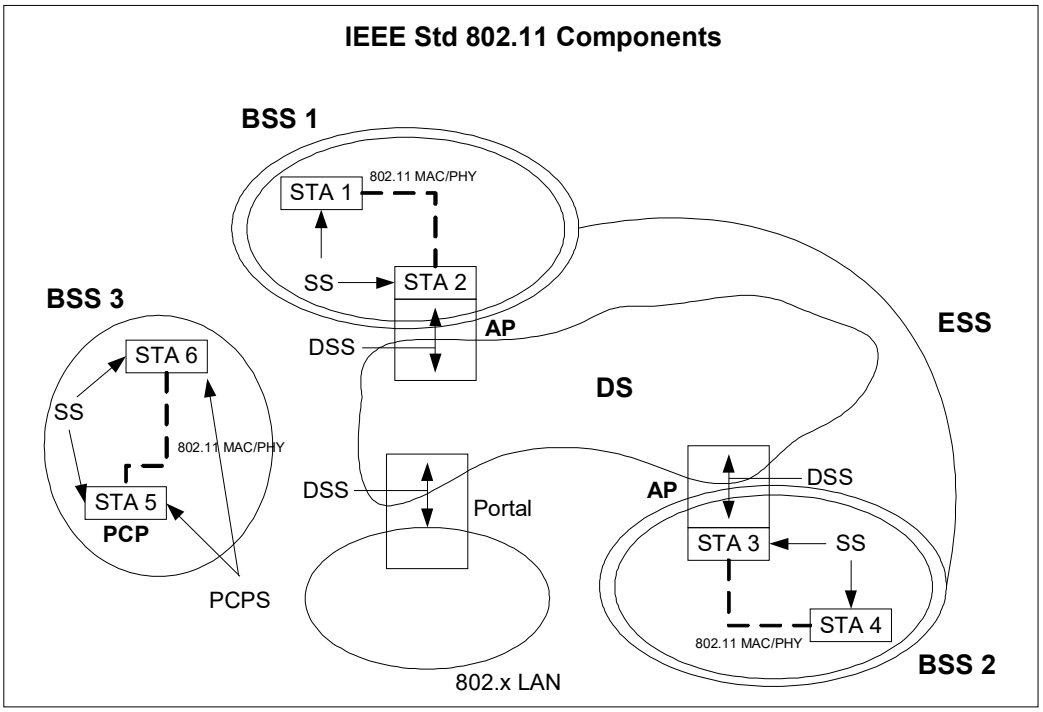

Figure 4-21—IEEE 802.11 architecture (again)

An IBSS consists of STAs that are directly connected. Thus there is (by definition) only one BSS. Further, because there is no physical DS, there is no portal, integrated non-IEEE-802.11 LAN, or DSS. The logical picture reduces to Figure 4-22.

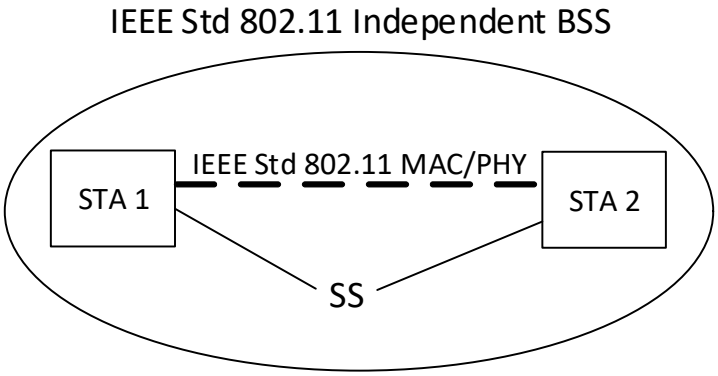

Figure 4-22—Logical architecture of an IBSS

An important difference between the IBSS and the PBSS is that, within the PBSS, Beacon frames are not transmitted by every STA and instead only a single STA, namely the PCP, is responsible for DMG Beacon frame transmission. Within the IBSS, all STAs are responsible for Beacon frame transmission. When compared to the infrastructure BSS, the PBSS does not provide certain DSSs as described in 4.4.3.

There can be more than one PBSS in the same BSA. One of the STAs within each PBSS assumes the role of the PCP. The logical picture of the PBSS reduces to Figure 4-23.

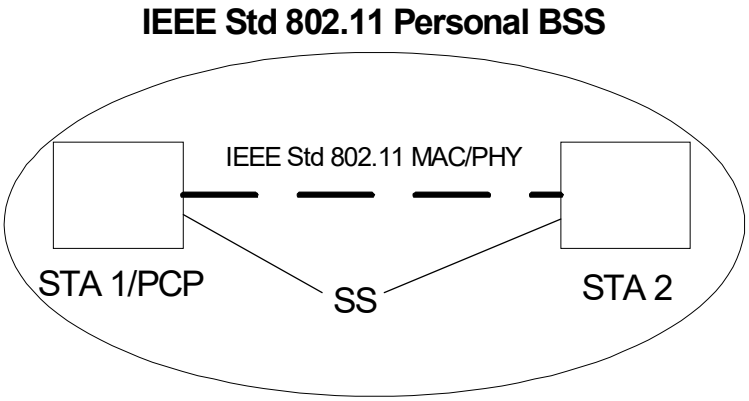

Figure 4-23—Logical architecture of a PBSS

Only the minimum two STAs are shown in Figure 4-22. An IBSS can have an arbitrary number of members. In an IBSS only Class 1 and Class 2 frames are allowed because there is no DS in an IBSS.

The services that apply to an IBSS are the SSs. A QoS IBSS supports operation under the HCF using TXOPs gained through the EDCA mechanism. The parameters that control differentiation of the delivery of MSDUs with different priority using EDCA are fixed. A QoS IBSS has no HC and does not support polled TXOP operation and setting up of TSPEC.

The services that apply to the PBSS are the SSs and the PCPSs as described in 4.4.3. A PBSS supports operation under the HCF using TXOPs gained through the EDCA mechanism. In a PBSS, the EDCA mechanism is used only within CBAPs. The parameters that control differentiation of traffic classes using EDCA can be configured by the PCP in a PBSS. The PCP of a PBSS has no HC, but can support TSPEC setup, DMG TSPEC setup, and service periods.

In an IBSS each STA enforces its own security policy. In an infrastructure BSS or a PBSS, an AP or a PCP, respectively, can enforce a uniform security policy across all STAs.

4.8 Differences between ESS and MBSS LANs

In 4.3.21, the concept of the MBSS LAN was introduced. It was noted that using the multi-hop capability it appears as if all mesh STAs are directly connected at the MAC layer even if the STAs are not within range of each other. This is different from an IBSS, where STAs cannot communicate if they are not within range of each other.

Unlike the IBSS, an MBSS might have access to the DS. An MBSS connects through one or more mesh gates to the DS. Since in an MBSS it appears as if all mesh STAs are directly connected at the MAC layer, the MBSS can be used as a DSM. APs, a portal, and mesh gates might use the MBSS as a DSM to provide the DSS. Thus, different infrastructure BSSs can unite over the MBSS to form an ESS for example.

An AP identifies the infrastructure BSS that it forms. This is different from the MBSS where no such central entity exists. Whereas infrastructure BSSs need the ESS and thus the DS to unite, the MBSS appears the same to an LLC layer without the need for access to a DS. However, if an MBSS has one or more mesh gates providing access to the DS, the MBSS might exist in disjointed areas and yet form a single network.

4.9 Reference model

4.9.1 General

This standard presents the architectural view, emphasizing the separation of the system into two major parts: the MAC of the data link layer (DLL) and the PHY. These layers are intended to correspond closely to the lowest layers of the ISO/IEC basic reference model of Open Systems Interconnection (OSI) (ISO/IEC 7498-1:1994). The layers and sublayers described in this standard are shown in Figure 4-24.

There is an interface between the IEEE 802.1X Supplicant and Authenticator and the SME not shown in Figure 4-24. This interface is described in IEEE Std 802.1X-2010.

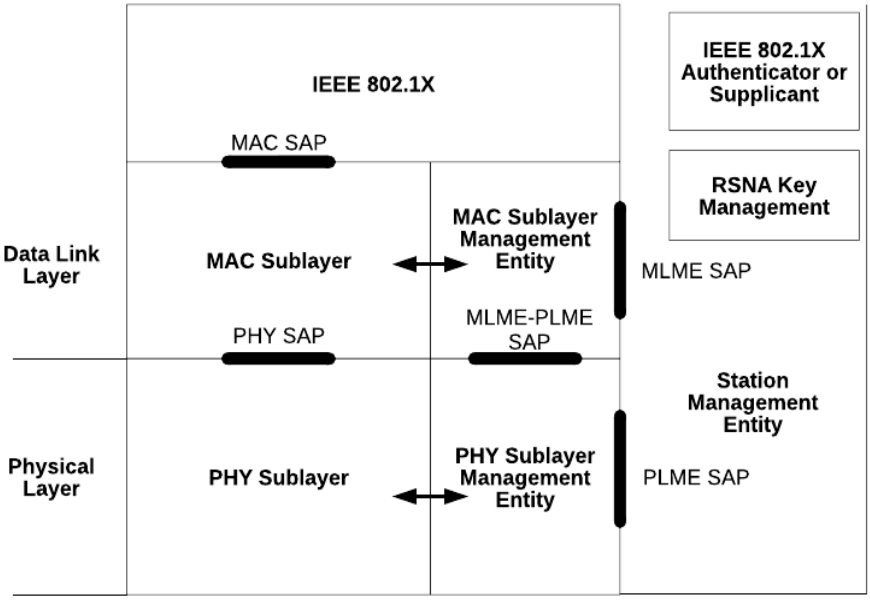

Figure 4-24—Portion of the ISO/IEC basic reference model covered in this standard

4.9.2 Interworking reference model

The MAC state generic convergence function (MSGCF) provides services to higher layer protocols based on MAC state machines and interactions between the layers.

Interworking functions might require correlating information from multiple management entities. It is the function of the MSGCF to correlate information for higher layer entities. The MSGCF observes the interactions between the MLME and SME, and between the PLME and SME. After correlation of lower-layer MLME and PLME events, the MSGCF might synthesize indications to higher layer entities.

Figure 4-25 shows an entity, the MSGCF, defined in 6.4, that has access to all management information through exposure to the MAC sublayer and PHY management entities, and provides management information to higher level entities, such as Mobility Managers, supporting heterogeneous medium mobility.

An example of how the MSGCF interfaces to these higher layer entities, is provided by the media independent service (MIS) interface, as defined in IEEE Std 802.21-2017.

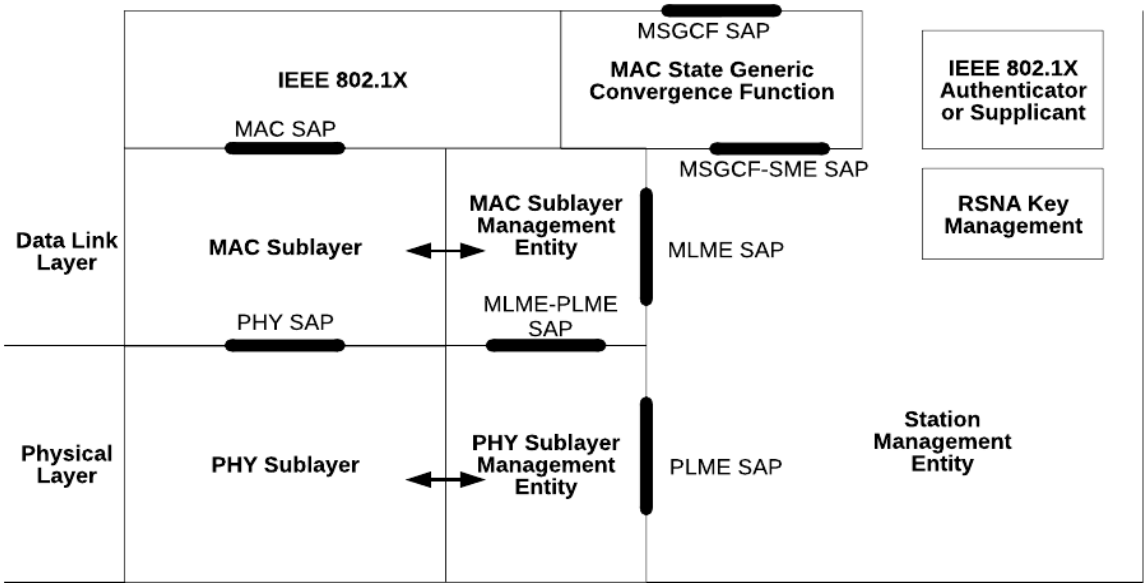

Figure 4-25—Interworking reference model

The MSGCF is designed to provide the status of the connection of a non-AP STA to a set of BSSs comprising a single ESS. Figure 4-26 illustrates the concept of an ESS link. This reflects the state of a connection to an ESS independent of any particular access point. In Figure 4-26, STA3 is associated with either AP1 or AP2. The state of the ESS link is up when STA3 is associated with any of the APs comprising an ESS.

4.9.3 Reference model for supporting multiple MAC sublayers

An MM-SME function interfaces with the SMEs of the coordinating STAs. STAs managed under the MM-SME share the same antennas and PHY and optionally unify power management. The reference model for supporting multiple MAC sublayers is shown in Figure 4-27.

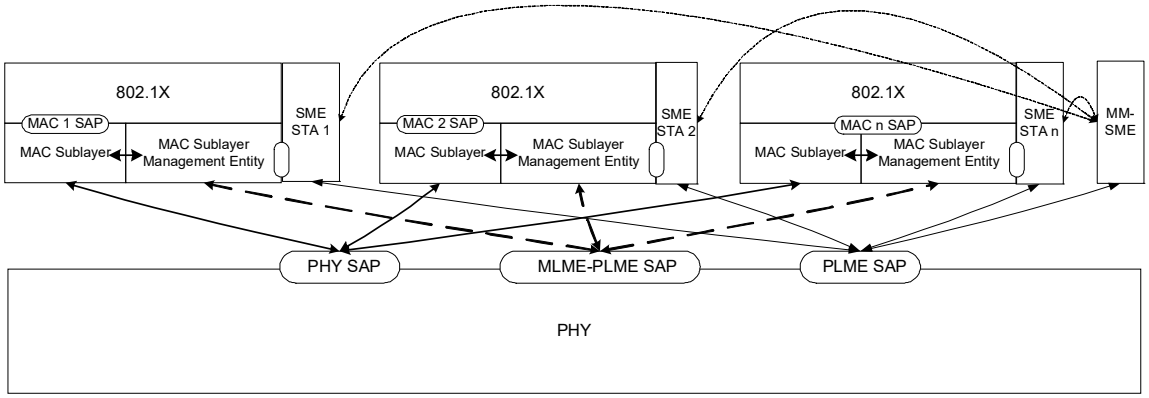

Figure 4-27—Reference model for supporting multiple MAC sublayers

An MM-SME coordinates the management of multiple MAC sublayers. Each MAC sublayer has a separate MAC SAP and MLME SAP. A MAC SAP together with its corresponding MLME SAP is identified by a MAC address.

Even when coordinated by an MM-SME, each MAC retains its single MAC address, and each STA contains a single MAC; therefore, the MM-SME coordinates multiple STAs as well as multiple MACs.

Multiple STAs coordinated by an MM-SME have a single PHY that is shared by the multiple MAC sublayers. Transmission attempts of different MAC sublayers can collide internally if the STAs share a single PHY, and a backoff procedure is invoked in this case. Since multiple STAs coordinated by the same MM-SME share the PHY, the STAs cannot directly exchange frames with each other.

NOTE—The multiple MAC reference model shown in Figure 4-27 defines how multiple STAs can share the same physical layer entity. If this model is used in conjunction with the reference model for multi-band operation (see 4.9.4), the multiple MAC reference model applies within each physical layer entity contained in the multi-band device, whereas the multi-band operation reference model applies to different physical layers.

The MM-SME accesses each of the MLME SAPs of the coordinated STAs separately to deliver MLME SAP primitives. STAs that are coordinated by the same MM-SME can establish a multiple MAC sublayers link (MMSL) with a peer STA. The set of all MMSLs between a pair of STAs creates an MMSL cluster.

An MM-SME controls the power management mode, DMG antenna configuration, and other parameters and states of the coordinated STAs to eliminate unnecessary duplication of functions. A change in the power management mode of the STAs coordinated by an MM-SME is signaled to a peer STA via any one of the STAs' MAC sublayer. Also, a beamforming link established between STAs can be used by all of the MAC sublayers of any of the STAs coordinated by the same MM-SME. For these purposes, a Multiple MAC Sublayers (MMS) element is used.

The MMS element contains multiple MAC addresses of the MACs coordinated by the same MM-SME. The element can be included in any frame that advertises the MM-SME capabilities, such as Probe Request and Probe Response frames and Information Request and Information Response frames, and the frames that establish communication agreements, such as Association, ADDTS Request, ADDTS Response, BlockAckReq, and BlockAck.

4.9.4 Reference model for multi-band operation

The reference model of a device that is multi-band capable (see 11.31) and that supports transparent fast session transfer (FST) is shown in Figure 4-28. The reference model of a device that is multi-band capable and that supports nontransparent FST is shown in Figure 4-29.

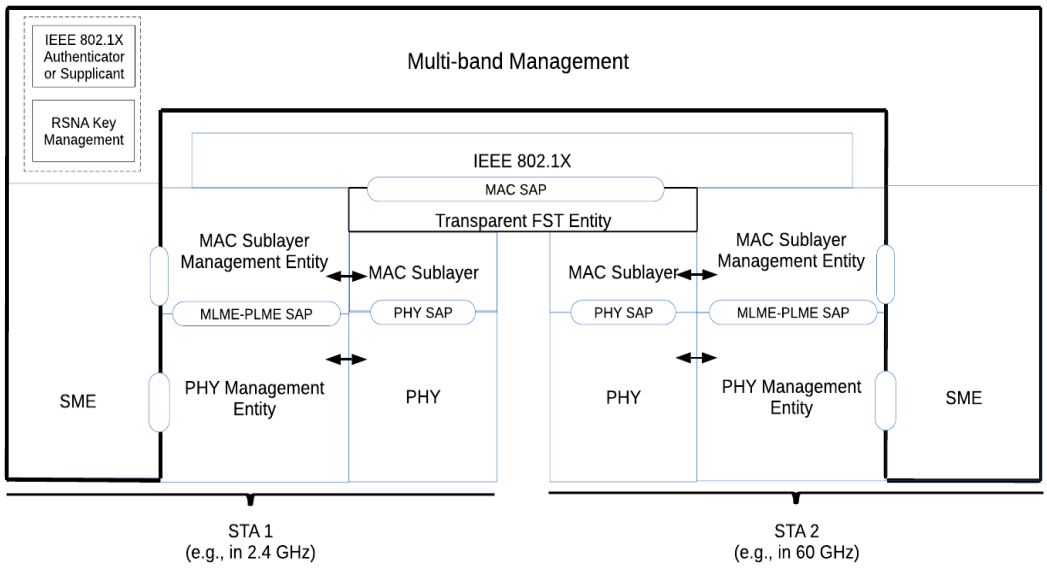

Figure 4-28—Reference model for a multi-band capable device (transparent FST)

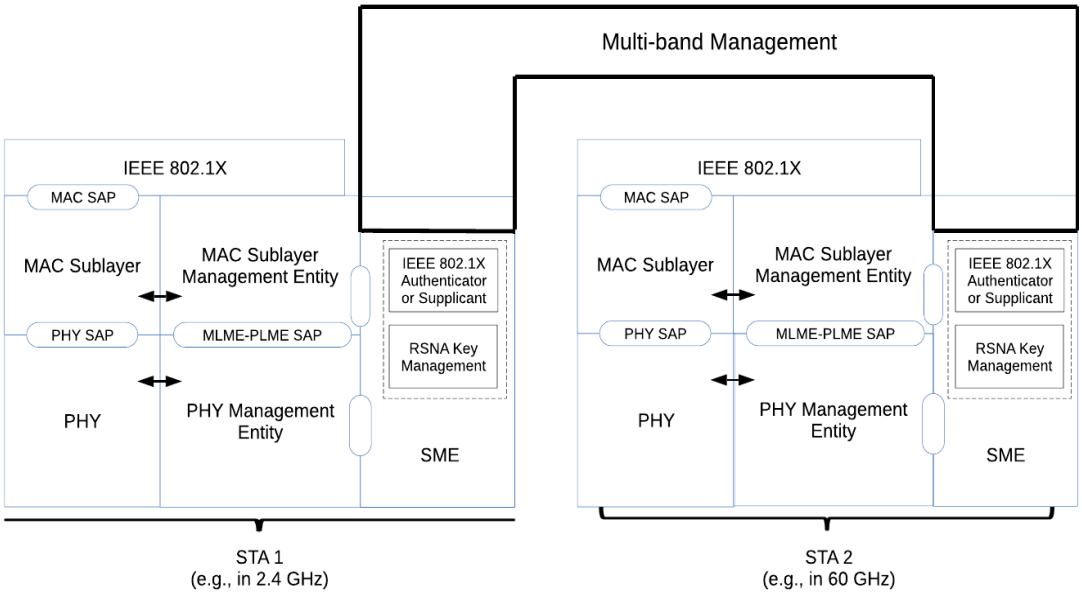

Figure 4-29—Reference model for a multi-band capable device (nontransparent FST)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A multi-band capable device can manage operation over more than one frequency band/channel. The operation across the different frequency bands/channels can be simultaneous or nonsimultaneous.

A multi-band capable device can also support multiple MAC sublayers; in this case, it is coordinated by an MM-SME.

NOTE—For simplicity, Figure 4-28 and Figure 4-29 depict the reference model when there is a one-to-one mapping between PHYs and MACs. However, the reference model for a multi-band capable device can be applied in conjunction with the reference model for STAs that support multiple MAC sublayers (see 4.9.3).

When used in the context of FST, the term "session" refers to non-PHY state information that is kept in a pair of STAs that communicate directly (i.e., excludes forwarding) and that is available prior to and following a fast session transfer. This state information is different depending if transparent or nontransparent is used. For transparent FST, a shared multi-band management entity has access to the local information within each SME; and in this case the state information includes block ack agreements, TSs, association state, RSNA, security keys, sequence counter, and PN counter. For nontransparent FST, the function of the multi-band management entity is restricted to coordinating the setup and teardown of a fast session transfer with no access to other local information within each SME. Therefore, with nontransparent FST, any information local to an SME needs to be reestablished for the new band/channel, and this can be done either prior to or following the fast session transfer (see 11.31).

The SME of a multi-band capable device contains a multi-band management entity that is responsible for coordinating the setup, configuration, teardown, and transfer of FST sessions from a band/channel to another band/channel supported by the multi-band capable device. If using nontransparent FST, the multi-band management entity can employ a combination of the source and destination MAC addresses in both the old and new band/channel to configure the routing of MSDUs and MLME primitives within the STA. If using transparent FST, in addition to the MAC addresses, the multi-band management entity can employ the TID of an FST session for this routing.

The multi-band procedures (see 11.31) allow a pair of multi-band capable devices to discover, synchronize, (de)authenticate, (re)associate, disassociate, and manage resources with each other on any common band/channel that is supported by both STAs.

By using the on-channel tunneling (OCT) multi-band procedure described in 11.31.5, the SME of a multi-band capable device can instruct one of its MLMEs to use the OCT services provided by another MLME of the same multi-band capable device to communicate with a peer MLME of a peer multi-band capable device. This enables the SMEs of a pair of multi-band capable devices to provide a seamless FST, including performing (de)authentication and (re)association across bands/channels. The MLMEs that use the OCT services provided by another MLME within the same multi-band capable device to communicate are referred to as being *over-the-WM disabled* with respect to each other. Following a frame exchange on the new band/channel (e.g., after FST), two peer over-the-WM disabled MLMEs can become over-the-WM enabled with respect to each other.

As described in 5.1.5, a MAC address is not unique within the multi-band capable device when transparent FST is intended to be used. When transparent FST is used, a single MAC SAP at each peer is presented to the higher layers of that peer for all of the frequency bands/channels that are identified by the same MAC address at that peer. When nontransparent FST is used, different MAC SAPs are presented to higher layers since different MAC addresses are used prior to and following an FST. Therefore, when nontransparent FST is used, higher layers are responsible for managing the FST.

Each MAC SAP is controlled by a separate and independent RSNA key management entity and IEEE 802.1X Authenticator or Supplicant unless transparent FST is used, in which case the multi-band management entity is responsible for coordinating with each of the SMEs to ensure that a single RSNA key management entity and IEEE 802.1X Authenticator or Supplicant are shared among the MACs and that a single IEEE 802.1X entity is controlled.

4.10 IEEE Std 802.11 and IEEE Std 802.1X-2010

4.10.1 General

An RSNA relies on IEEE Std 802.1X-2010 to provide authentication services and uses the IEEE 802.11 key management scheme defined in 12.7. The IEEE 802.1X access control mechanisms apply to the association between a STA and an AP and to the relationship between the IBSS STA and STA peer. The AP's SME performs the Authenticator and, optionally, the Supplicant and AS roles. In an infrastructure BSS, a non-AP STA's SME performs the Supplicant role. In an IBSS the SME takes on both the Supplicant and Authenticator roles and might take on the AS role.

4.10.2 IEEE 802.11 usage of IEEE Std 802.1X-2010

IEEE Std 802.11 depends upon IEEE Std 802.1X-2010 to control the flow of MAC service data units (MSDUs) between the DS and STAs by use of the IEEE 802.1X Controlled/Uncontrolled Port model. IEEE 802.1X EAPOL PDUs are transmitted in one or more IEEE 802.11 Data frames and passed via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. It is the responsibility of both the Supplicant and the Authenticator to implement port blocking. Each association between a pair of STAs creates a unique pair of IEEE 802.1X Ports, and authentication takes place relative to those ports alone.

IEEE Std 802.11 depends upon IEEE Std 802.1X-2010 and various IEEE 802.11 protocols and handshakes, described in Clause 12 and Clause 13, to establish and change cryptographic keys. Keys are established after authentication has completed. Keys might change for a variety of reasons, including expiration of an IEEE 802.1X authentication timer, key compromise, danger of compromise, or policy.

4.10.3 Infrastructure functional model overview

4.10.3.1 General

This subclause summarizes the system setup and operation of an RSN, in three cases: when a password or PSK is used during IEEE 802.11 authentication, when an IEEE 802.1X AS is used after Open System authentication, and when a PSK is used after Open System authentication. In an RSN, an AP includes an Authenticator, and each associated STA includes a Supplicant.

4.10.3.2 AKM operations with AS

The following AKM operations are carried out when an IEEE 802.1X AS is used:

a) Prior to any use of IEEE Std 802.1X-2010, IEEE Std 802.11 assumes that the Authenticator and AS have established a secure channel. The security of the channel between the Authenticator and the AS is outside the scope of this standard.

   Authentication credentials are distributed to the Supplicant and AS prior to association.

b) A STA discovers the AP's security policy through passively monitoring Beacon frames or through active probing (shown in Figure 4-30). If IEEE 802.1X authentication is used, the EAP authentication process starts when the Authenticator sends the EAP-Request (shown in Figure 4-31) or the Supplicant sends the EAPOL-Start frame. EAP messages pass between the Supplicant and AS via the Authenticator and Supplicant's Uncontrolled Ports. This is shown in Figure 4-31.

c) The Supplicant and AS authenticate each other and generate a PMK. The PMK is sent from the AS to the Authenticator over the secure channel. See Figure 4-31.

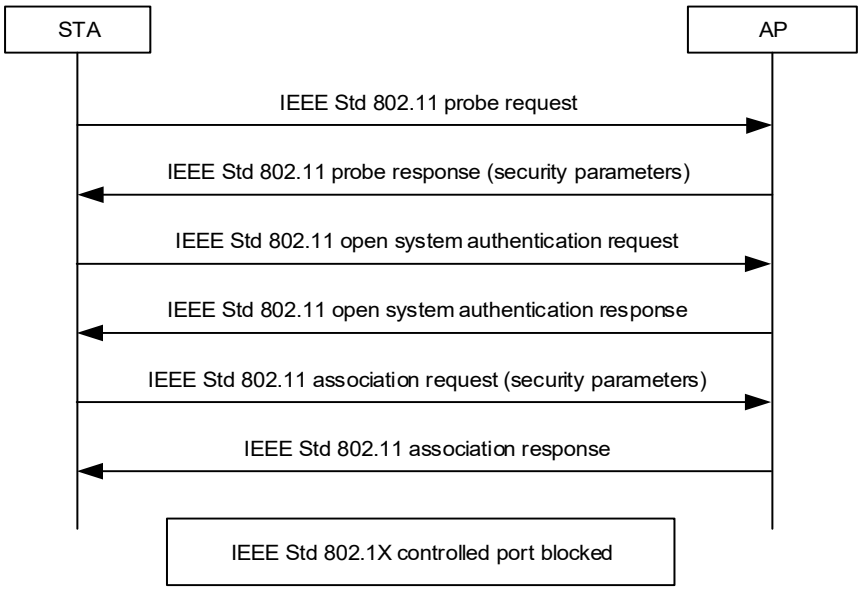

Figure 4-30—Establishing the IEEE 802.11 association

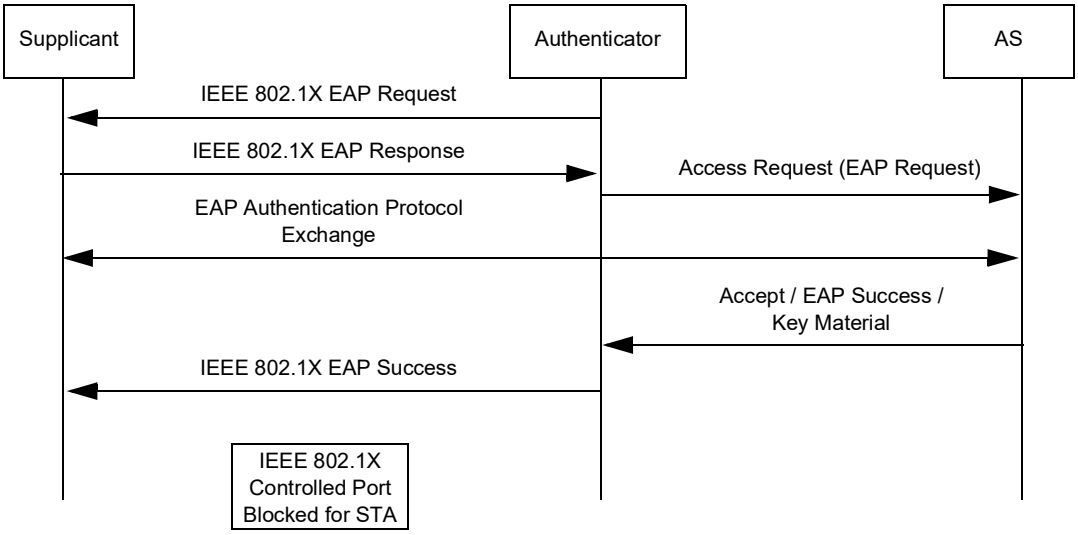

Figure 4-31—IEEE 802.1X EAP authentication

A 4-way handshake or FT 4-way handshake utilizing EAPOL-Key frames is initiated by the Authenticator to do the following:

— Confirm that a live peer holds the PMK.
— Confirm that the PMK is current.
— In the case of fast BSS transition, derive PMK-R0s and PMK-R1s.
— Derive a fresh pairwise transient key (PTK) from the PMK or, in the case of fast BSS transition, from the PMK-R1.
— Install the pairwise encryption and integrity keys.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— Transport the group temporal key (GTK) and GTK sequence number from Authenticator to Supplicant and install the GTK and GTK sequence number in the STA and, if not already installed, in the AP.
— If management frame protection is negotiated, transport the IGTK and the IGTK packet number (IPN) from the Authenticator to the Supplicant and install these values in the STA and, if not already installed, in the AP.
— If beacon protection is enabled, transport the BIGTK and the BIGTK packet number (BIPN) from the Authenticator to the Supplicant and install these values in the STA and, if not already installed, in the AP.
— Verify that the RSN capabilities negotiated are valid as defined in 9.4.2.24.4.
— Confirm the cipher suite selection.

Installing the PTK, and where applicable the GTK and, if management frame protection is negotiated, the IGTK, causes the MAC to encrypt and decrypt all subsequent MSDUs irrespective of their path through the controlled or uncontrolled ports. Installing the BIGTK when beacon protection is enabled causes the MAC to integrity protect at the AP or validate subsequent Beacon frames at the non-AP STA.

Upon successful completion of the 4-way handshake, the Authenticator and Supplicant have authenticated each other; and the IEEE 802.1X Controlled Ports are unblocked to permit general data traffic. See Figure 4-32.

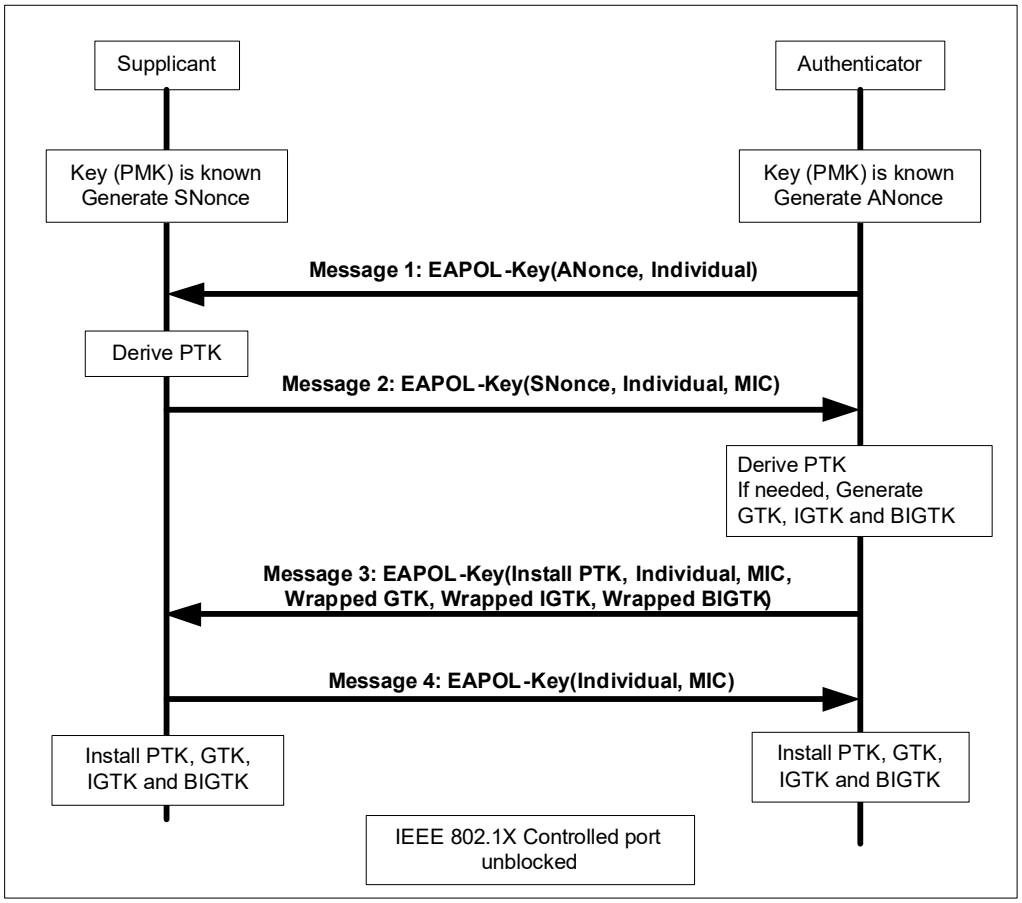

Figure 4-32—Establishing pairwise and group keys

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the Authenticator later changes the GTK, it sends the new GTK and GTK sequence number to the Supplicant using the group key handshake to allow the Supplicant to continue to receive group addressed frames and, optionally, to transmit and receive individually addressed frames. EAPOL-Key frames are used to carry out this exchange. See Figure 4-33.

When management frame protection is negotiated, the Authenticator also uses the group key handshake with all associated STAs to change the IGTK, and BIGTK if beacon protection is enabled. The Authenticator encrypts the GTK, IGTK and BIGTK values in the EAPOL-Key frame as described in 12.7.

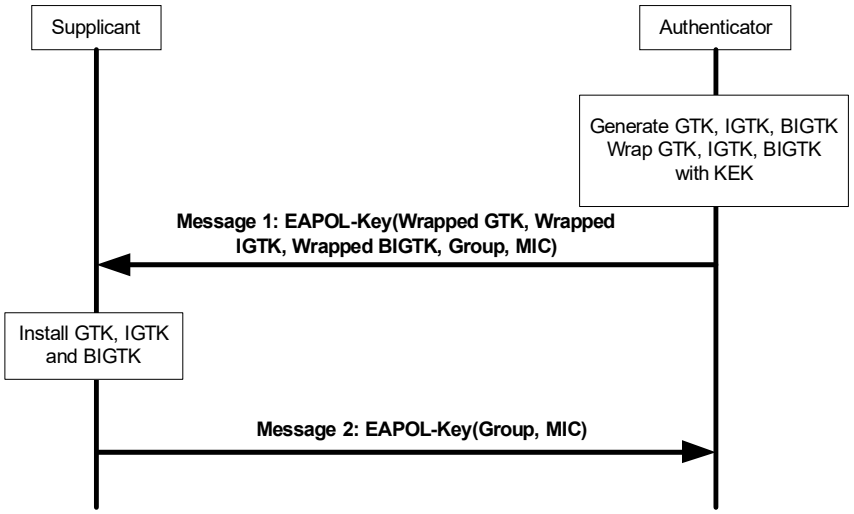

Figure 4-33—Delivery of subsequent group keys

4.10.3.3 AKM operations with a password or PSK

The following AKM operations are carried out when authentication is accomplished using a Password or PSK:

— A STA discovers the AP's security policy through passively monitoring the Beacon frames or through active probing. After discovery the STA performs SAE authentication using Authentication frames with the AP (see Figure 4-34).

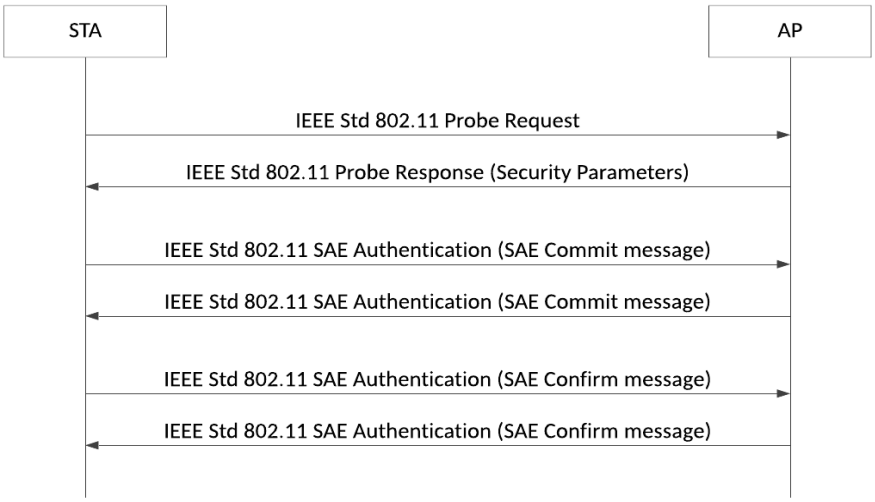

Figure 4-34—Example using SAE authentication

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— Upon the successful conclusion of SAE, both the STA and AP generate a PMK. The STA then associates to an AP and negotiates security policy. The AKM in the Association Request and Response frames is confirmed to be the AKM of SAE or of fast BSS transition.
— The PMK generated by SAE is used in a 4-way handshake using EAPOL-Key frames, just as with IEEE 802.1X authentication when an AS is present. See Figure 4-32.
— The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-32 and Figure 4-33.

4.10.3.4 Alternate operations with PSK

The following AKM operations represent an alternate operation of using a PSK. This operation has security vulnerabilities if used with a low-entropy key and is recommended to be used only after taking that into account. When this operation is carried out, the PMK is a PSK:

— A STA discovers the AP's security policy through passively monitoring Beacon frames or through active probing (shown in Figure 4-30). A STA associates with an AP and negotiates a security policy. The PMK is the PSK.
— The 4-way handshake using EAPOL-Key frames is used, just as with IEEE 802.1X authentication, when an AS is present. See Figure 4-32.
— The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-32 and Figure 4-33.
— If management frame protection is negotiated, the IGTK and IGTK packet number are sent from the Authenticator to the Supplicant just as in the AS case. If beacon protection is enabled, the BIGTK and BIPN are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-32 and Figure 4-33.

4.10.3.5 Disassociation

Disassociation initiated by either STA in an RSNA causes the deletion of the PTKSA at both ends and the deletion of the GTKSA in a non-AP STA. The controlled and uncontrolled ports created for this association are also deleted.

4.10.3.6 AKM operations using FILS authentication

4.10.3.6.1 General

FILS authentication allows faster link setup to the network by performing authentication, association, and key confirmation using four frames—two Authentication frames, one (Re)Association Request frame, and one (Re)Association Response frame.

The following three FILS authentication methods are defined:

a) FILS Shared Key authentication performed without perfect forward security (PFS)
b) FILS Shared Key authentication performed with PFS
c) FILS Public Key authentication with PFS

FILS Shared Key authentication with and without PFS is described in 4.10.3.6.2.

FILS Public Key authentication exchange is described in 4.10.3.6.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

4.10.3.6.2 AKM operations using FILS Shared Key authentication

A non-AP STA and a trusted third party (TTP) using FILS Shared Key authentication verify mutual possession of a shared key (rRK) (as defined in IETF RFC 5295 and IETF RFC 6696) using Extensible Authentication Protocol (EAP) reauthentication protocol (EAP-RP) signaling. EAP-RP signaling is encapsulated using FILS wrapped data in an Authentication frame as shown in Figure 4-35. A valid rRK is derived using a prior full authentication using the full EAP as defined in 4.10.3.2. This rRK can be used for multiple runs of EAP-RP authentications as specified in IETF RFC 5295 and IETF RFC 6696.

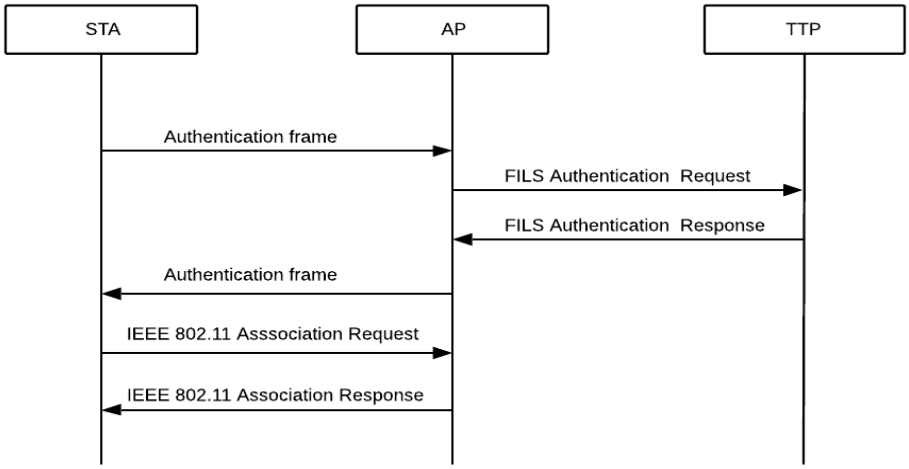

Figure 4-35—FILS authentication using TTP

4.10.3.6.3 AKM operations using FILS Public Key authentication

When using FILS Public Key authentication, it is assumed that both STAs using FILS have either:

— Obtained a public key certificate from a certificate authority (CA) and are capable of verifying each other's certificate during execution of FILS authentication procedures; or

— A priori knowledge of, and trust in, an uncertified public key.

The manner in which trust is obtained in certificates is outside the scope of this standard.

4.10.4 IBSS functional model description

4.10.4.1 General

This subclause summarizes the system setup and operation of an RSNA in an IBSS. An IBSS RSNA is specified in 12.6.11.

4.10.4.2 Key usage

In an IBSS the individually addressed Data frames between two STAs are protected with a pairwise key. The key is part of the PTK, which is derived during a 4-way handshake. In an IBSS the 4-way handshake can follow IEEE 802.11 authentication of one STA to another. Such authentication might be used by the peer to cause deletion of the PTKSA and Block the Controlled Port, resetting any previous handshake.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In an IBSS group addressed Data frames are protected by a key, e.g., named B1, that is generated by the STA transmitting the group addressed frame. To allow other STAs to decrypt group addressed frames, B1 is sent to all of the other STAs in the IBSS. B1 is sent in an EAPOL-Key frame, encrypted under the EAPOL-Key encryption key (KEK) portion of the PTK, and protected from modification by the EAPOL-Key confirmation key (KCK) portion of the PTK.

In an IBSS the SME responds to Deauthentication frames from a STA by deleting the PTKSA associated with that STA.

4.10.4.3 Sample IBSS 4-way handshakes

In this example (see Figure 4-36), there are three STAs: S1, S2, S3. The group addressed frames sent by S1 are protected by B1; similarly B2 for S2, and B3 for S3.

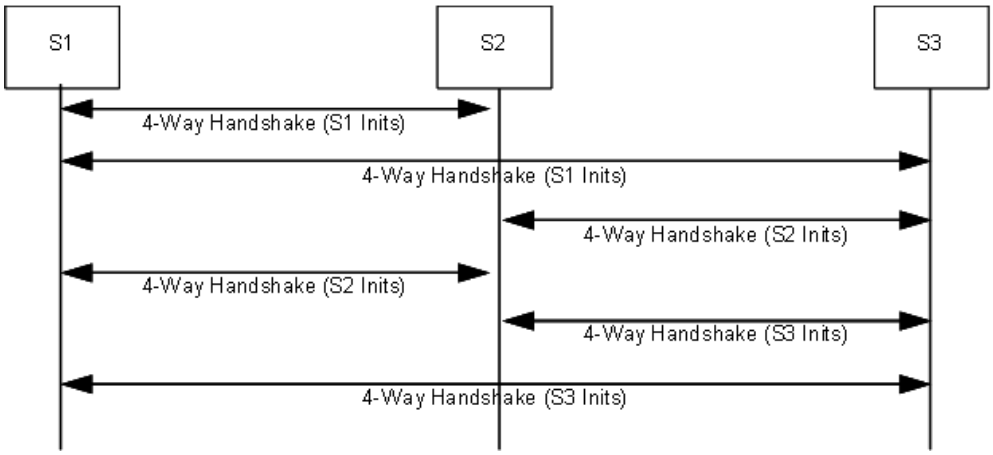

Figure 4-36—Sample 4-way handshakes in an IBSS

For STAs S2 and S3 to decrypt group addressed frames from S1, B1 is sent to S2 and S3. This is done using the 4-way handshake initially and using the group key handshake for GTK updates.

The 4-way handshake from S1 to S2 allows S1 to send group addressed frames to S2, but does not allow S2 to send group addressed frames to S1 because S2 has a different transmit GTK. Therefore, S2 needs to initiate a 4-way handshake to S1 to allow S1 to decrypt S2's group addressed frames. Similarly, S2 also needs to initiate a 4-way handshake to S3 to enable S3 to receive group addressed frames from S2.

In a similar manner S3 needs to complete the 4-way handshake with S1 and S2 to deliver B3 to S1 and S2.

In this example, there are six 4-way handshakes. In general, N Supplicants require $N(N–1)$ 4-way handshakes.

NOTE—In principle the KCK and KEK from a single 4-way handshake can be used for the group key handshake in both directions, but using two 4-way handshakes means the Authenticator key state machine does not need to be different between IBSS and ESS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The group key handshake can be used to send the GTKs to the correct STAs. The 4-way handshake is used to derive the pairwise key and to send the initial GTK. Because in an IBSS there are two 4-way handshakes between any two Supplicants and Authenticators, the pairwise key used between any two STAs is from the 4-way handshake initiated by the STA Authenticator with the higher MAC address (see 12.7.1 for the notion of address comparison). The KCK and KEK used for a group key handshake are the KCK and KEK derived by the 4-way handshake initiated by the same Authenticator that is initiating the group key handshake.

In an IBSS a secure link exists between two STAs when both 4-way handshakes have completed successfully. The Supplicant and Authenticator 4-way handshake state machines interact so the IEEE 802.1X variable portValid is not set to 1 until both 4-way handshakes complete.

If a fourth STA comes within range and its SME decides to initiate a security association with the three peers, its Authenticator initiates 4-way handshakes with each of the other three Supplicants. Similarly, the original three STA Authenticators in the IBSS need to initiate 4-way handshakes to the fourth STA Supplicant. A STA learns that a peer STA is RSNA-enabled and the peer's security policy (e.g., whether the Authentication and Key Management Protocol (AKMP) is SAE, PSK, or IEEE 802.1X authentication) from the Beacon or Probe Response frame. The initiation might start for a number of reasons:

a) The fourth STA receives a Beacon or Probe Response frame from a MAC address with which it has not completed a 4-way handshake.
b) An SME receives an MLME-PROTECTEDFRAMEDROPPED.indication primitive from a MAC address with which it has not completed a 4-way handshake. This could be a group addressed Data frame transmitted by any of the STAs. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.
c) An SME receives message 1 of the 4-way handshake sent to a STA because the initiator received a broadcast Data frame, Beacon frame, or Probe Response frame from that STA. In order to set up a security association to the peer STA, a STA that received a 4-way handshake but does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

4.10.4.4 IBSS IEEE 802.1X example

When IEEE 802.1X authentication is used, each STA needs to include an IEEE 802.1X Authenticator and AS. A STA learns that a peer STA is RSNA-enabled and the peer's security policy (e.g., whether the AKMP is PSK or IEEE 802.1X authentication) from the Beacon or Probe Response frame.

Each Supplicant sends an EAPOL-Start frame to every other STA to which it intends to authenticate, and each STA's Authenticator responds with the identity of the credential it intends to use.

The EAPOL-Start and EAP-Request/Identity messages are initiated when a protected Data frame (indicated via an MLME-PROTECTEDFRAMEDROPPED.indication primitive), an IEEE 802.1X message, Beacon frame, or Probe Response frame is received from a MAC address with which the STA has not completed IEEE 802.1X authentication. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

Although Figure 4-37 shows the two IEEE 802.1X exchanges serialized, they might occur interleaved.

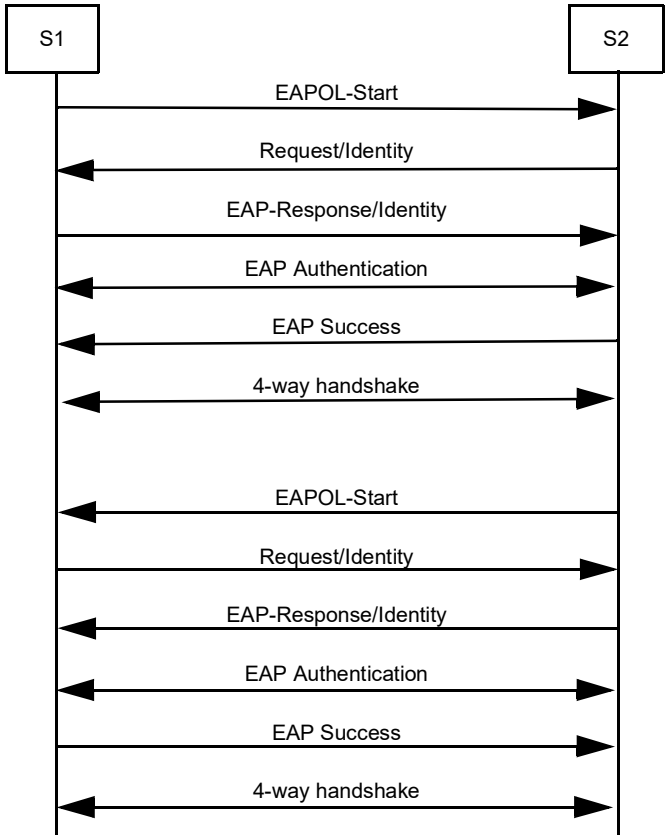

Figure 4-37—Example using IEEE 802.1X authentication

4.10.5 PBSS functional model description

This subclause summarizes the system setup and operation of an RSNA in a PBSS.

If a non-PCP STA chooses to associate with the PCP of the PBSS, the non-PCP STA establishes an RSNA with the PCP following the infrastructure functional model as specified in 4.10.3.

If a non-PCP STA wants to establish an RSNA with the PCP without association or if the non-PCP STA wants to establish an RSNA with another non-PCP STA, it can directly initiate an RSNA authentication with the peer STA, followed by a 4-way handshake. One difference between this model and the IBSS functional model is that only one RSNA authentication and one 4-way handshake are performed between two STAs. If both STAs initiate an RSNA setup at the same time, the RSNA setup initiated by the STA with the lower MAC address is carried through, while the RSNA setup initiated by the STA with the higher MAC address is terminated.

Figure 4-38 shows an example of the RSNA setup in a PBSS. An initiator STA discovers a peer STA's RSNA policies through the DMG Beacon frames from the peer STA if the peer STA is the PCP or through the Probe Response or Information Response frames from the peer STA. In this example, the initiator STA does not associate with the peer STA. The initiator STA performs RSNA authentication with the peer STA to derive a PMK. A 4-way handshake is then started to complete the RSNA setup.

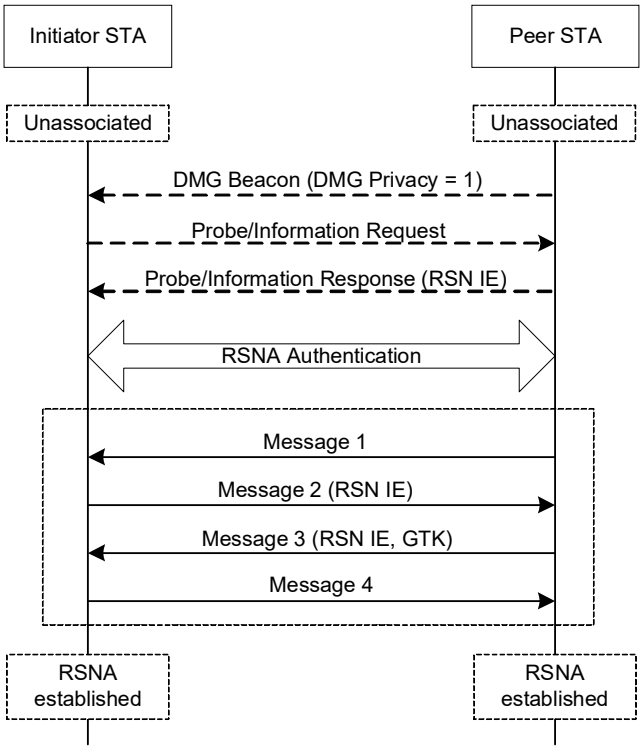

Figure 4-38—Example of RSNA setup in a PBSS

4.10.6 Authenticator-to-AS protocol

The Authenticator-to-AS authentication definition is out of the scope of this standard, but, to provide security assurances, the protocol needs to support the following functions:

a) Mutual authentication between the Authenticator and AS
b) A channel for the Supplicant and AS authentication
c) The ability to pass the generated key from the AS to the Authenticator in a manner that provides authentication of the key source, preserves integrity of the key transfer, and preserves data confidentiality of the key from all other parties

Suitable protocols include, but are not limited to, remote authentication dial-in user service (RADIUS) (IETF RFC 2865 [B33]) and Diameter (IETF RFC 3588 [B40]).

4.10.7 PMKSA caching

The Authenticator and Supplicant can cache PMKSAs, which include the IEEE 802.1X state. A PMKSA can be deleted from the cache for any reason and at any time.

A STA can supply a list of PMK identifiers in the (Re)Association Request frame or first FILS Authentication frame. Each key identifier names a PMKSA. The Authenticator can specify the selected PMK identifier in message 1 of the 4-way handshake or the second FILS Authentication frame. The selection of the key identifiers to be included by the STA and Authenticator is out of the scope of this standard.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A FILS authentication exchange results in a PMKSA, which can be cached. A FILS STA can benefit from such caching, as a FILS STA performing subsequent authentications can supply a list of PMK identifiers in its initial Authentication frame. FILS APs that support PMK caching can identify themselves using a cache identifier. A FILS STA that has successfully established a PMKSA at an AP identifying a particular cache identifier can attempt to use PMK caching in a subsequent attempt with any AP that uses the same cache identifier.

4.10.8 Protection of group addressed robust Management frames

When management frame protection is negotiated, all group addressed robust Management frames are encapsulated using the procedures defined in 11.12. This service provides integrity protection of group addressed robust Management frames using BIP.

5. MAC service definition

5.1 Overview of MAC services

5.1.1 Data service

5.1.1.1 General

This service provides peer LLC sublayer entities or IEEE 802.1Q bridge ports with the ability to exchange MSDUs. To support this service, the local MAC uses the underlying PHY-level services to transport an MSDU to a peer MAC entity, where it is delivered to the peer LLC sublayer or bridge port. Such asynchronous MSDU transport is performed on a connectionless basis. By default, MSDU transport is on a best-effort basis. However, the QoS facility uses a traffic identifier (TID) to specify differentiated services on a per-MSDU basis. The QoS facility also permits more synchronous behavior to be supported on a connection-oriented basis using TSPECs. There are no guarantees that the submitted MSDU will be delivered successfully. Group addressed transport is part of the data service provided by the MAC. Due to the characteristics of the WM, group addressed MSDUs might experience a lower QoS, compared to that of individually addressed MSDUs. All STAs support the data service, but only QoS STAs in a QoS BSS differentiate their MSDU delivery according to the designated traffic category or traffic stream (TS) of individual MSDUs. QoS STAs that support the QMF service differentiate their MMPDU delivery according to the MMPDU's access category. The access category of each MMPDU is designated by the transmitter's current QMF policy.

There are two service classes available in a QoS STA: QoSAck and QoSNoAck. The service classes are used to signal if the MSDU is to be transmitted with or without using the MAC-level acknowledgment.

In QoS STAs either associated in a BSS or having membership in an IBSS, the MAC uses a set of rules that tends to cause higher UP MSDUs in a BSS to be sent before lower UP MSDUs in the BSS. The MAC sublayer entities determine the UPs for MSDUs based on the TID values provided with those MSDUs. If a TSPEC has been provided for a TS, via the MAC sublayer management entity, the MAC attempts to deliver MSDUs belonging to that TS in accordance with the QoS parameter values contained in the TSPEC. In a BSS with some STAs supporting the QoS facility and others not supporting the QoS facility, in delivering an MSDU to a non-QoS STA, the QoS STA uses the access category (AC) corresponding to the UP of the MSDU.

5.1.1.2 Determination of UP

The QoS facility supports eight priority values, referred to as *UPs*. The values a UP may take are the integer values from 0 to 7 and are identical to the IEEE 802.1D™ priority tags. An MSDU with a particular UP is said to belong to a traffic category (TC) with that UP. The UP is provided with each MSDU at the medium access control service access point (MAC SAP) either directly, in the UP parameter, or indirectly, in a TSPEC or SCS Descriptor element designated by the UP parameter. For the transmission of an MSDU that was provided to the Internal Sublayer Service SAP associated with a general link, the UP is determined by the GLK convergence function based on the priority parameter of the MA_UNITDATA.request primitive. (See Annex R for recommended mapping guidelines.)

5.1.1.3 Interpretation of priority parameter in MAC service primitives

The value of the priority parameter in the MAC service primitives (see 5.2) may be a noninteger value of Contention or may be any integer value in the range 0 to 15.

When the priority parameter has an integer value, it is used in the TID subfields that appear in certain frames that are used to deliver and to control the delivery of QoS data across the WM.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Priority parameter and TID subfield values 0 to 7 are interpreted as UPs for the MSDUs. Outgoing MSDUs with UP values 0 to 7 are handled by MAC entities at STAs in accordance with the UP.

Priority parameter and TID subfield values 8 to 15 specify TIDs that are also TS identifiers (TSIDs) and select the TSPEC for the TS designated by the TID. Outgoing MSDUs with priority parameter values 8 to 15 are handled by MAC entities at STAs in accordance with the UP value determined from the UP subfield as well as other parameter values in the selected TSPEC. When an MSDU arrives with a priority value between 8 and 15 and for which there is no TSPEC defined, then the MSDU shall be sent with priority parameter set to 0.

The noninteger value of the priority parameter is allowed at all non-QoS STAs. The integer values of the priority parameter (i.e., TID) are supported only at QoS STAs that are in a QoS BSS. A range of 0 to 15 is supported by QoS STAs associated in a QoS BSS; whereas a range of 0 to 7 is supported by QoS STAs that are members of a QoS IBSS. If a QoS STA is associated in a non-QoS BSS, the STA is functioning as a non-QoS STA, so the priority value is always Contention.

At QoS STAs associated in a QoS BSS, MSDUs with a priority of Contention are considered equivalent to MSDUs with TID 0. At STAs associated in a non-QoS BSS, all MSDUs with an integer priority are considered equivalent to MSDUs with a priority of Contention.

The received individually addressed frames at a QoS STA may be as follows:

a) Non-QoS subtypes, in which case the STA shall assign to them a priority of Contention.
b) QoS subtypes, in which case the STA shall infer the UP value from the TID in the QoS Control field directly for TID values between 0 and 7. For TID values between 8 and 15 the STA shall extract the UP value in the UP subfield of the TS Info field in the associated TSPEC or from the UP field in the associated TCLAS (traffic classification) element, as applicable.

QoS APs deliver the UP with the received MSDUs to the DS or bridge port.

5.1.1.4 Interpretation of service class parameter in MAC service primitives in a STA

In QoS STAs, the value of the service class parameter in the MAC service primitive (see 5.2) may be a noninteger value of QoSAck or QoSNoAck.

When an MSDU is received from the MAC SAP with one of the following service class indications, and the recipient STA is a QoS STA:

— QoSAck, the MSDU is transmitted using one or more QoS Data frame(s) with an ack policy other than No Ack.
— QoSNoAck, the MSDU is transmitted using one or more QoS Data frame(s) with an ack policy of No Ack.

When an MSDU is received from the MAC SAP and the recipient STA is not a QoS STA, the MSDU is transmitted using one or more non-QoS Data frame(s).

When a QoS Data frame is received from another STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

— QoSAck, if the frame is a QoS Data frame with an ack policy other than No Ack; this includes when the frame was delivered via the DMS or the GCR block ack retransmission policy.
— QoSNoAck, if the frame is a QoS Data frame with an ack policy of No Ack. This service class is also used when the DA parameter is a group address unless the frame was delivered via DMS or the GCR block ack retransmission policy.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When a non-QoS Data frame is received at a QoS STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

— QoSAck, if the frame is an individually addressed frame and is acknowledged by the STA.
— QoSNoAck, if the frame is a group addressed frame and is not acknowledged by the STA.

In non-QoS STAs, the value of the service class parameter in invoked MAC service primitives (see 5.2) is ignored. The value of the service class parameter in generated MAC service primitives is set to ReorderableGroupAddressed.

5.1.2 Security services

Security services in IEEE Std 802.11 are provided by the authentication service and the CCMP, GCMP, and BIP. The scope of the security services provided is limited to station-to-station data and robust Management frame transmissions. When CCMP or GCMP is used, the data confidentiality service is provided for Data frames and individually addressed robust Management frames. For the purposes of this standard, CCMP, GCMP, and BIP are viewed as logical services located within the MAC sublayer as shown in the reference model, Figure 4-24 (in 4.9). Actual implementations of CCMP, GCMP, and BIP are transparent to the LLC sublayer and other layers above the MAC sublayer.

The security services provided by CCMP and GCMP in IEEE Std 802.11 are as follows:

a) Data Confidentiality;
b) Authentication; and
c) Access control in conjunction with layer management.

BIP provides message integrity and access control for group addressed robust Management frames.

During the authentication exchange, both parties exchange authentication information as described in Clause 12 and Clause 13.

The MAC sublayer security services provided by CCMP, GCMP, and BIP rely on information from non MAC sublayer management or system entities. Management entities communicate information to CCMP, GCMP, and BIP through a set of MAC sublayer management entity (MLME) interfaces and MIB attributes; in particular, the decision tree for CCMP, GCMP, and BIP is driven by MIB attributes.

WEP is obsolete. The WEP algorithm is unsuitable for the purposes of this standard.

The use of TKIP is deprecated. The TKIP algorithm is unsuitable for the purposes of this standard.

A STA that has associated with management frame protection enabled shall not use pairwise cipher suite selectors WEP-40, WEP-104, TKIP, or “Use group cipher suite.”

A mesh STA with dot11MeshSecurityActivated equal to true shall not use the pairwise cipher suite selectors WEP-40, WEP-104, or TKIP.

An S1G STA shall not use the pairwise cipher suite selectors WEP-40, WEP-104, TKIP, or “Use group cipher suite”.

5.1.3 MSDU ordering

The services provided by the MAC sublayer permit, and might in certain cases require, the reordering of MSDUs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In a non-QoS STA, the MAC does not intentionally reorder MSDUs except as might be necessary to improve the likelihood of successful delivery based on the current operational ("power management," FMS, DMS) mode of the designated recipient STA(s). The sole effect of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, is a change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs, originating from a single source STA address.

The MSDUs are reordered, not only to improve the likelihood of successful delivery based on the current operational mode of the designated recipient STA(s), but also to honor the priority parameters, specified in the MA-UNITDATA.request primitive, of the individual MSDUs. The effects of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, are:

a) A change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs, and
b) The reordering of MSDUs with different TID values, originating from a single source STA address.

There shall be no reordering of individually addressed MSDUs with the same TID value and addressed to the same destination.

STAs operating in a non-QoS BSS shall follow the reordering rules as defined for a non-QoS STA.

In order for the MAC to operate properly, this standard assumes that the DS meets the MSDU ("object") reordering requirements of IEEE Std 802.1AC-2012 [B17].

Operational restrictions that provide the appropriate ordering of MSDUs are specified in 10.7.

When MSDU or A-MSDU reordering is performed, the information in the MAC service tuple(s) for the MSDU(s) shall be maintained and reordered as a unit.

5.1.4 MSDU format

Logical Link Control (LLC) sublayer entities use the MAC sublayer service to exchange PDUs with peer LLC sublayer entities. These PDUs are termed MAC sublayer SDUs (MSDUs) when sent to the MAC sublayer. There are two LLC sublayer protocols used (see IEEE Std 802): LLC Protocol Discrimination (LPD) (see ISO/IEC 8802-2:1998) and Ethertype Protocol Discrimination (EPD) (see IEEE Std 802.3-2018). MSDUs are formatted in accordance with LPD or with EPD, as determined by the first condition below that is true. After a true condition has been found, subsequent conditions are ignored.

a) In the 5.9 GHz band in the United States (see E.2.3) use EPD.
b) For OCB communications outside of the 5.9 GHz bands, use LPD.
c) Within Data frames with RAs that are individual addresses, if both the transmitter and receiver are EPD STAs, use EPD.
d) Within Data frames with RAs that are individual addresses, if either the transmitter or the receiver are not EPD STAs, use LPD.
e) If the transmitting AP accepts association only from an EPD STA, use EPD.
f) If the transmitting mesh STA peers only with an EPD mesh STA, use EPD.
g) For all other cases, use LPD.

When LPD is used, in order to achieve interoperability, implementers are recommended to apply the procedures described in ISO/IEC Technical Report 11802-5:1997 (previously known as IEEE Std 802.1H, 1997 Edition [B19]), along with a selective translation table (STT) that handles a few specific network protocols, with specific attention to the operations required when passing MSDUs to or from LANs or operating system components that use the Ethernet frame format (EPD). Note that such translations might be required in a STA.

5.1.5 MAC data service architecture

5.1.5.1 General

The MAC data plane architecture (i.e., processes that involve transport of all or part of an MSDU) is shown in Figure 5-1 when transparent FST is not being used and shown in Figure 5-2 when transparent FST is being used.

The dotted line box labeled “Role-specific behaviors” is replaced by one of several options, depending on the role of the STA. See the following subclauses

During transmission, an MSDU goes through the processes shown in the left-hand side of Figure 5-1. When transparent FST is used, an MSDU first goes, as shown in Figure 5-2, through an additional transparent FST entity that contains a demultiplexing process that forwards the MSDU down to the selected TX MSDU Rate Limiting process and from there to MAC data plane processing as described in the previous sentence. IEEE Std 802.1X-2010 may block the MSDU at the Controlled Port before the preceding processing occurs. Otherwise, at some point, the Data frames that contain all or part of the MSDU are queued per AC/TS.

During reception, a received Data frame goes through the processes shown in the right-hand side of of Figure 5-1. Then, one or more MSDUs are delivered to the MAC SAP or, via the DSAF, to either the DS or an IEEE 802.1Q bridge port. When transparent FST is used, MSDUs originating from different PHY SAPs go, as shown in Figure 5-2, through a final step of a transparent FST entity that contains a multiplexing process before delivering the MSDU. The IEEE 802.1X Controlled/Uncontrolled Ports discard any received MSDU if the Controlled Port is not enabled and if the MSDU does not represent an IEEE 802.1X frame.

NOTE—Many of the processes shown in Figure 5-1 also apply to MMPDU flows for the MAC control plane architecture, and the processes shown at the bottom also apply to Control and Extension frames.

When transparent FST is used, the same security keys, sequence counter, and PN counter are used by the MAC data plane to encrypt the MPDU prior to and following an FST, and the same security keys are used to check the integrity and perform the protection of MSDUs. When nontransparent FST is used, independent RSNAs, security keys, sequence counters, and PN counters have to be established for each MAC data plane to be used prior to and following an FST. When transparent FST is used, a single MAC SAP at each peer is presented to the higher layers of that peer for all of the frequency bands/channels that are identified by the same MAC address at that peer. When nontransparent FST is used, different MAC SAPs are presented to higher layers since different MAC addresses are used prior to and following an FST.

5.1.5.2 Non-GLK non-AP STA role

The MAC data plane architecture of a non-GLK non-AP STA is completed by replacing the role-specific behavior block with that shown in Figure 5-3. The function of this block in a non-AP STA is to perform destination address filtering as described in 10.2.7.

NOTE—In implementations, the DA address filtering function may be done "lower in the stack." It is shown in the role-specific behavior block location for simplicity, and any implementation choice needs to provide equivalent behavior.

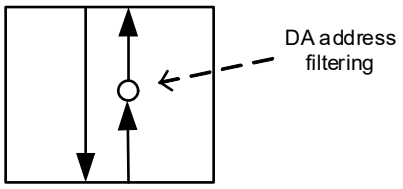

Figure 5-3—Role-specific behavior block for a non-GLK non-AP STA

5.1.5.3 Non-GLK AP role

In a non-GLK AP, the MAC data plane architecture includes distribution system access in its role-specific behavior block, as shown in Figure 5-4. This block provides access to the DS for associated non-AP STAs as described in 4.5.2.1.

NOTE—This behavior block indicates that there is no access through the controlled port to or from the local upper-layers (the LLC sublayer) at an AP. Any such access is logically achieved in the architecture via transition of the DS and Portal to an integrated LAN. In actual implementations, this is likely to be optimized, and Data frames appear to be delivered directly to one or more local LLC sublayer entities on the same physical device as the AP. Such optimization is effectively distributing the functions of the DS and Portal, and it is the responsibility of the implementation to ensure the logical behavior of these entities is maintained.

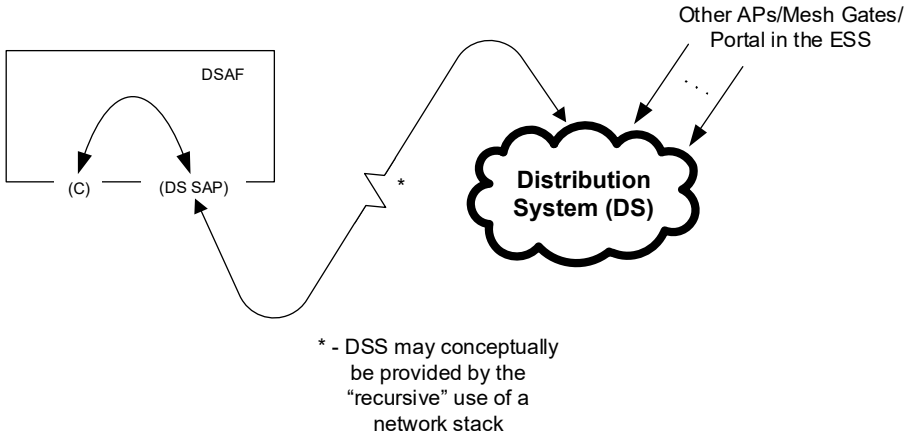

Figure 5-4—Role-specific behavior block for a non-GLK AP

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

5.1.5.4 Non-GLK mesh STA role

The MAC data plane architecture of a mesh STA is completed by replacing the role-specific behavior block with that shown in Figure 5-5. The function of this block in a mesh STA is described in 10.38. This role is not applicable when transparent FST is used, and does not apply to Figure 5-2.

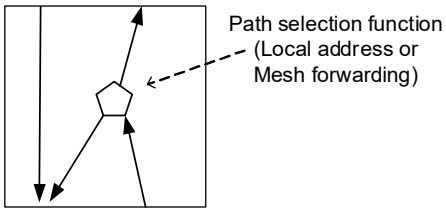

Figure 5-5—Role-specific behavior block for mesh STA

5.1.5.5 Mesh gate role

The MAC data plane architecture of a mesh gate is completed by replacing the role-specific behavior block with that shown in Figure 5-6. The function of this block in a mesh gate is described in 14.11. This role is not applicable when transparent FST is used and does not apply to Figure 5-2.

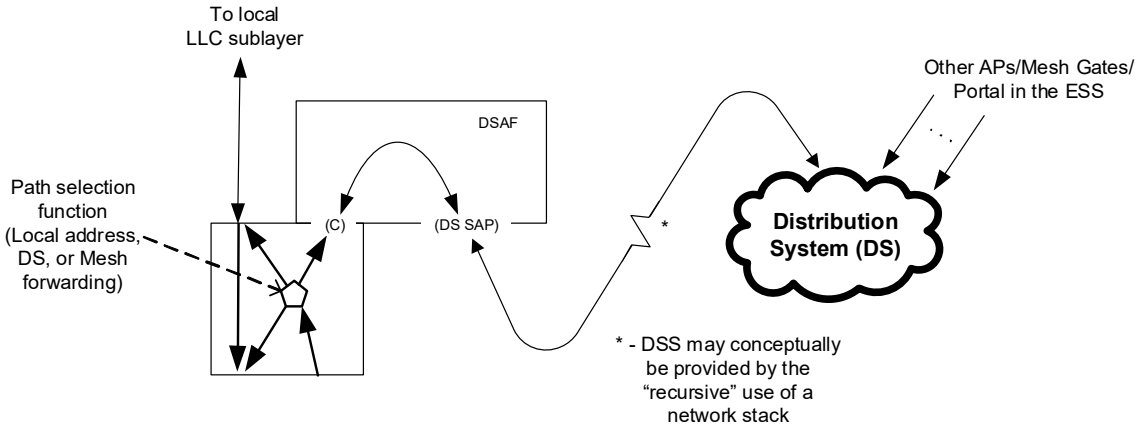

Figure 5-6—Role-specific behavior block for mesh gate

5.1.5.6 S1G relay

An S1G relay comprises a relay AP, a relay STA and a relay function (see Figure 5-7).

A relay STA is a non-AP STA associated to a root AP or the relay AP of another relay. A relay AP is an AP that offers the relay function to its associated non-AP STAs, and provides access to the DS indirectly through the relay STA’s path to the root AP. The relay function performs local reception or selective forwarding of MSDUs between the relay STA and relay AP, based on the destination address, as described in 10.54.

The MAC data plane architecture of an S1G relay is shown in Figure 5-7.

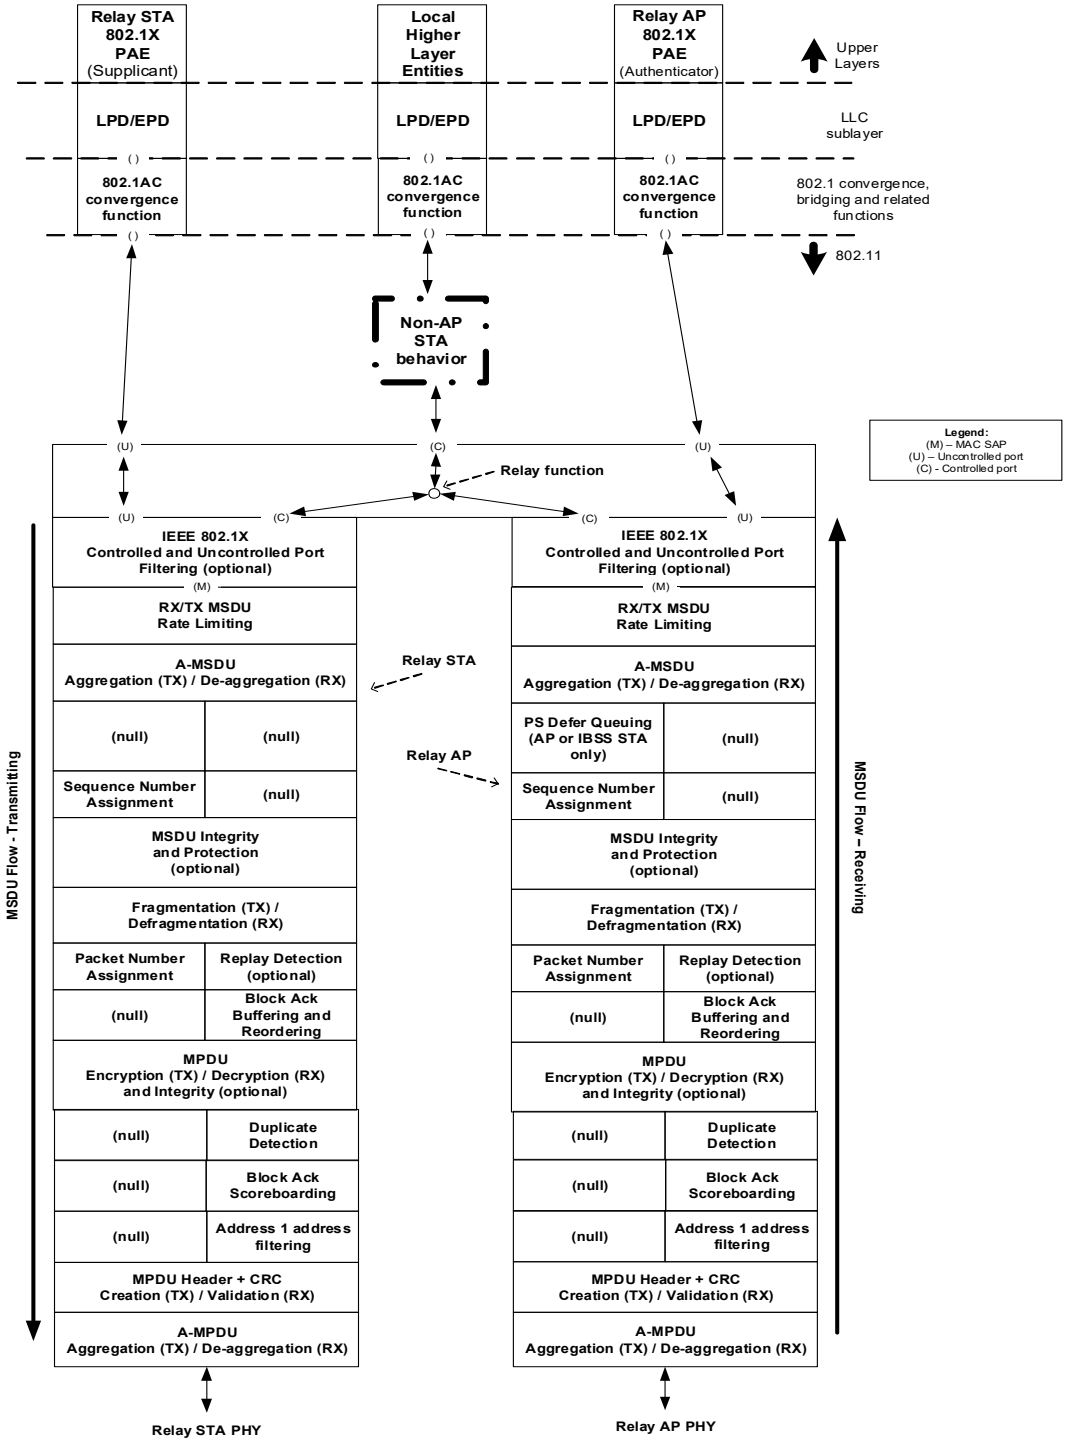

Figure 5-7—S1G relay data plane architecture

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

5.1.5.7 GLK STA role

In a GLK STA's MAC data plane architecture, the role-specific behavior block is as shown in Figure 5-8. The MAC service interface to this block includes a station vector, to provide the selective delivery service to a GLK convergence function. This block performs destination address filtering, as described in 10.2.7, and provides access to the GLK convergence function and ultimately to the bridge ports.

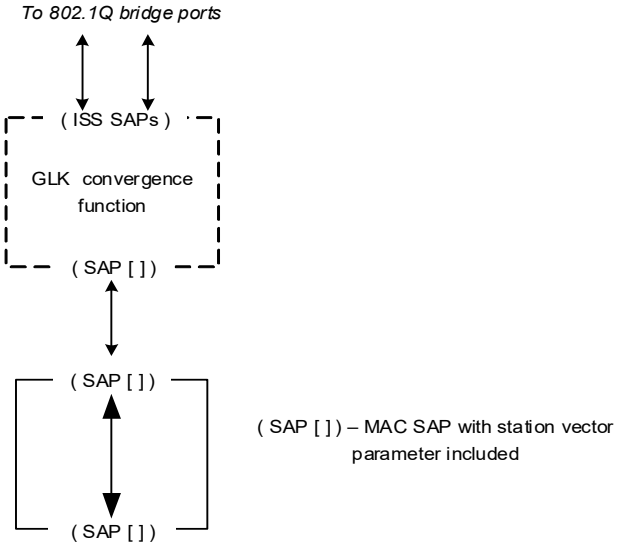

Figure 5-8—Role-specific behavior block for a GLK STA

5.1.5.8 GLK AP role

A GLK AP that supports only general links (dot11GLKRequired is true) has the same general architectural structure as described in 5.1.5.7 for a general GLK STA.

A GLK AP that supports both general links and non-GLK links provides access between the bridge ports and general links, and between the DS and non-GLK links. The DSAF behavior of such an AP is extended by adding a switching function to direct received MSDUs to either the DS or toward a bridge port, as appropriate, as shown in Figure 5-9.

5.1.5.9 GLK mesh STA role

The only type of mesh STA that has explicit support for GLK is the GLK mesh STA, which is the equivalent of a mesh gate, except it is attached to a bridge rather than a DS. Other mesh STA types implicitly may support general links with the role specific structure shown in 5.1.5.4.

The MAC data plane architecture of a GLK mesh STA, like that for a non-GLK mesh STA, is completed by replacing the role-specific behavior block with that shown in Figure 5-10. In a GLK mesh STA, the function of this block is described in 10.38, to provide access to bridge ports, through provision of the station vector parameter, rather than access to only the local DA like a non-GLK mesh STA.

This role is not applicable when transparent FST is used and does not apply to Figure 5-2.

5.2 MAC data service specification

5.2.1 General

The IEEE 802.11 MAC supports the following service primitives as defined in ISO/IEC 8802-2:1998:

— MA-UNITDATA.request
— MA-UNITDATA.indication
— MA-UNITDATA-STATUS.indication

IEEE Std 802.11 places restrictions and semantics on the parameter values for these primitives, as described in 5.2.3 to 5.2.5.

5.2.2 GLK MAC data service specification

A GLK STA coordinates with the GLK convergence function to create a virtual point-to-point LAN for each general link to an associated or peered GLK STA. This point-to-point LAN is presented by the convergence function as a unique Internal Sublayer Service SAP, which is ultimately mapped to an IEEE 802.1Q bridge port. Each such SAP is identified by a locally unique service_access_point_identifier (as defined in IEEE Std 802.1Q), generated by the STA and the convergence function.

In a GLK STA the MAC data plane architecture's MAC service uses the two parameters, a set of service_access_point_identifiers and an MSDU format indicator.

When GLK is in use, the MAC service primitives presented require the presence of the parameter station vector on request and supply a non-null value for this parameter on indication. In an MA-UNITDATA.request primitive, this parameter is a set of service_access_point_identifiers specifying the one or more general links that are to be used for this request. In an MA-UNITDATA.indication primitive, it is a vector of exactly one service_access_point_identifier specifying the general link that carried this MSDU.

When GLK is in use, the MAC service primitives make use of the MSDU format parameter. In an MA-UNITDATA.request primitive, this parameter indicates whether the supplied MSDU is in EPD or LPD format. If the format is inappropriate for the transmission that carries this MSDU as described in 5.1.4, the STA converts the format before transmission. In an MA-UNITDATA.indication primitive, this parameter indicates the format of the received MSDU, which is determined as described in 5.1.4. The MAC service user uses this information to parse the MSDU correctly.

5.2.3 MA-UNITDATA.request

5.2.3.1 Function

This primitive requests a transfer of an MSDU from a local LLC sublayer entity to a single peer LLC sublayer entity or bridge port, or multiple peer LLC sublayer entities or bridge port in the case of group addresses.

5.2.3.2 Semantics of the service primitive

The parameters of the primitive are as follows:

MA-UNITDATA.request(
source address,
destination address,
routing information,
data,
priority,
drop eligible,

service class,
station vector,
MSDU format
)

The source address (SA) parameter specifies an individual MAC sublayer address of the sublayer entity from which the MSDU is being transferred.

The destination address (DA) parameter specifies either an individual or a group MAC sublayer entity address.

The routing information parameter specifies the route for the data transfer (a null value indicates source routing is not to be used). For IEEE Std 802.11, the routing information parameter shall be null.

The data parameter specifies the MSDU to be transmitted by the MAC sublayer entity. The length of the MSDU shall be less than or equal to the value shown in Table 9-25.

The priority parameter specifies the requested priority of the data unit transfer. The allowed values of priority are described in 5.1.1.3.

NOTE—For a GLK STA, the bridge port provides the priority. That priority might have been derived from a priority tag in the frame arriving on another port of the bridge or from the configuration of that port if the frame arrived there untagged.

The drop eligible parameter is a Boolean that indicates whether this MSDU can be discarded in preference to other MSDUs when there are insufficient resources in a STA. If drop eligible is true, the MSDU can be discarded in preference to other MSDUs for which drop eligible is false.

The service class parameter specifies the requested service class of the data unit transfer. The allowed values of service class are described in 5.1.1.4 and 5.1.3.

The station vector parameter is a set of service_access_point_identifiers (see 5.2.2) and is not null when dot11GLKImplemented is true and is null or not present otherwise. It indicates the set of virtual point-to-point LANs for these data transfers, which are mapped to the set of general links over which the MSDU is transferred.

The MSDU format parameter indicates whether the supplied MSDU is in EPD or LPD format.

5.2.3.3 When generated

This primitive is generated by the LLC sublayer entity when an MSDU is to be transferred to a peer LLC sublayer entity or entities or to a peer bridge or bridges.

5.2.3.4 Effect of receipt

On receipt of this primitive, the MAC sublayer entity determines whether it is able to fulfill the request according to the requested parameters. A request that cannot be fulfilled according to the requested parameters is discarded, and this action is indicated to the LLC sublayer entity using an MA-UNITDATA-STATUS.indication primitive that describes why the MAC was unable to fulfill the request. If the request can be fulfilled according to the requested parameters, the MAC sublayer entity properly formats a frame and passes it to the lower layers for transfer to a peer MAC sublayer entity or entities (see 5.1.4), and indicates this action to the LLC sublayer entity or bridge port using an MA-UNITDATA-STATUS.indication primitive with transmission status set to Successful.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having a destination address that is an individual address and a priority of Contention, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in

Copyright © 2021 IEEE. All rights reserved.

dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted. The specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having a destination address that is an individual address for which the priority is an integer in the range 0 to 7, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 10-1. The AP's MAC sublayer shall retrieve the MIB attributes listed below from the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted and perform the following operations:

— If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and

dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having a destination address that is an individual address whose priority is an integer in the range 8 to 15, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMMMSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMMMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.4 MA-UNITDATA.indication

5.2.4.1 Function

This primitive defines the transfer of an MSDU from the MAC sublayer entity to the LLC sublayer entity or bridge port, or entities or bridge ports in the case of group addresses. In the absence of error, the contents of the data parameter are logically complete and unchanged relative to the data parameter in the associated MA-UNITDATA.request primitive.

5.2.4.2 Semantics of the service primitive

The parameters of the primitive are as follows:

```
MA-UNITDATA.indication(
                        source address,
                        destination address,
                        routing information,
                        data,
                        reception status,
                        priority,
                        drop eligible,
                        service class,
                        station vector,
                        MSDU format
                        )
```

The SA parameter is an individual address as specified by the SA field of the incoming frame.

The DA parameter is either an individual or a group address as specified by the DA field of the incoming frame.

The routing information parameter specifies the route that was used for the data transfer. The MAC sublayer entity shall set this field to null.

The data parameter specifies the MSDU as received by the local MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The reception status parameter indicates the success or failure of the received frame. The MAC always reports "success" because all failures of reception are discarded without generating MA-UNITDATA.indication primitive.

The drop eligible parameter is a Boolean that indicates whether the received MSDU was designated as drop eligible in the DEI subfield of the HT variant HT Control field of the incoming frame, if present. If no HT variant HT Control field was present, the parameter value is false.

The priority parameter specifies the receive processing priority that was used for the data unit transfer. The allowed values of priority are described in 5.1.1.3.

The service class parameter specifies the receive service class that was used for the data unit transfer. The allowed values of service class are described in 5.1.1.4 and 5.1.3.

The station vector parameter is a set of service_access_point_identifiers (see 5.2.2) and is not null when dot11GLKImplemented is true. It indicates only the single virtual point-to-point LAN for this data transfer, which is mapped from the general link over which the MSDU was received.

The MSDU format parameter indicates if the received MSDU is in EPD or LPD format.

5.2.4.3 When generated

The MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities to, or bridge port or ports, indicate the arrival of a frame at the local MAC sublayer entity. Frames are reported only if they are validly formatted at the MAC sublayer, received without error, received with valid (or null) security and integrity information, and their destination address designates the local MAC sublayer entity. The MA-UNITDATA.indication primitive might also be passed from the MAC sublayer entity, in coordination with the MAC sublayer management entity, to the LLC sublayer entity to indicate the arrival of a FILS higher layer protocol (HLP) Container element.

5.2.4.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer or bridge port is dependent on the content of the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of a frame with the Type subfield equal to Data having a group DA, the AP's MAC sublayer shall discard the frame if dot11NonAPStationAuthSourceMulticast is false in the dot11InterworkingEntry identified by the source MAC address of the received frame. If dot11NonAPStationAuthSourceMulticast is true, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxSourceMulticastRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationMulticastMSDUCount shall be incremented by 1 and dot11NonAPStationMulticastOctetCount shall be incremented by the number of octets in the MSDU.
— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedMulticastMSDUCount. shall be incremented by 1 and dot11NonAPStationDroppedMulticastOctetCount. shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data and a priority of Contention, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data, for which the priority is an integer in the range 0 to 7, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 10-1. The AP's MAC sublayer shall retrieve the MIB attributes from the dot11InterworkingEntry identified by the source MAC address of the received frame and perform the following operations:

— If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then

dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data for which the priority is an integer in the range 8 to 15, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this standard.

— If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMMMSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMMMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.5 MA-UNITDATA-STATUS.indication

5.2.5.1 Function

This primitive has local significance and provides the LLC sublayer or bridge port with status information for the corresponding preceding MA-UNITDATA.request primitive.

5.2.5.2 Semantics of the service primitive

The parameters of the primitive are as follows:

```
MA-UNITDATA-STATUS.indication(
                                source address,
                                destination address,
                                transmission status,
                                provided priority,
                                provided service class
                                )
```

The SA parameter is an individual MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The DA parameter is either an individual or group MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The transmission status parameter is used to pass status information back to the local requesting LLC sublayer entity or bridge port. IEEE Std 802.11 specifies the following values for transmission status:

a) Successful.
b) Undeliverable (excessive data length).
c) Undeliverable (non-null source routing).
d) Undeliverable: unsupported priority (for priorities other than Contention at a non-QoS STA; or for priorities other than Contention, or an integer in the range 0 to 15 at a QoS STA).
e) Undeliverable: unsupported service class (for service classes other than ReorderableGroupAddressed for non-QoS STAs and service classes other than QoSAck or QoSNoAck for QoS STAs).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

f) Unavailable priority (for an integer in the range 1 to 15 at a STA that is associated in a non-QoS BSS, or an integer in the range 8 to 15 at an IBSS STA, in which case the MSDU is transmitted with a provided priority of Contention).

g) Undeliverable: unavailable service class.

h) Undeliverable (no BSS available).

i) Undeliverable (cannot encrypt with a null key).

j) In a STA in which dot11RejectUnadmittedTraffic is true, Undeliverable: unadmitted traffic (for a requested priority in the range 0 to 7 because there is no admitted TS for this priority and admission control is required for the AC).

k) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVoiceRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

l) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVideoRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

m) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

n) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationAuthMaxBackgroundRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

o) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationAuthMaxHCCAHEMMRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

If the transmission status parameter is Successful, the provided priority parameter specifies the priority used for the associated data unit transfer (Contention or an integer in the range 0 to 15); otherwise the provided priority parameter is not present.

If the transmission status parameter is Successful, the provided service class parameter specifies the class of service for the associated data unit transfer; otherwise the provided service class parameter is not present. In non-QoS STAs, the value of this parameter is ReorderableGroupAddressed. In QoS STAs, it is QoSAck or QoSNoAck.

5.2.5.3 When generated

The MA-UNITDATA-STATUS.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or bridge port to indicate the status of the service provided for the corresponding MA-UNITDATA.request primitive.

5.2.5.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer or bridge port is dependent upon the type of operation employed by the LLC sublayer entity or bridge port.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6. Layer management

6.1 Overview of management model

Both the MAC sublayer and PHY conceptually include management entities, called *MLME* and *PLME*, respectively. These entities provide the layer management service interfaces through which layer management functions are invoked.

In order to provide correct MAC operation, an SME is present within each STA. The SME is a layer-independent entity that resides in a separate management plane or resides "off to the side." Some of the functions of the SME are specified in this standard. Typically this entity is responsible for such functions as the gathering of layer-dependent status from the various layer management entities (LMEs), and similarly setting the value of layer-specific parameters. The SME typically performs such functions on behalf of general system management entities and would implement standard management protocols. Figure 4-24 (in 4.9) depicts the relationship among management entities.

The various entities within this model interact in various ways. Certain of these interactions are defined explicitly within this standard, via a SAP across which defined primitives are exchanged. This definition includes the GET and SET operations between MLME, PLME and SME as well as other individually defined service primitives, represented as double arrows within Figure 6-1. Other interactions are not defined explicitly within this standard, such as the interfaces between the MAC and MLME and between the PLME and PHY; the specific manner in which these MAC and PHY LMEs are integrated into the overall MAC sublayer and PHY is not specified within this standard. A STA includes only one instance of a PHY entity.

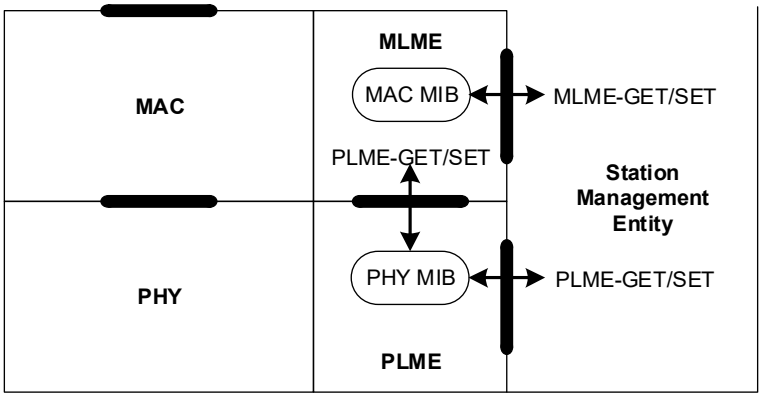

Figure 6-1—GET and SET operations

The management SAPs within this model are the following:

— SME-MLME SAP
— SME-PLME SAP
— MLME-PLME SAP

The latter two SAPs support identical primitives, and in fact might be viewed as a single SAP (called the *PLME SAP*) that is used either directly by MLME or by SME. In this fashion, the model reflects what is anticipated to be a common implementation approach in which PLME functions are controlled by the MLME (on behalf of SME).

6.2 Generic management primitives

The management information specific to each layer is represented as a MIB for that layer. The MLME and PLME are viewed as "containing" the MIB for that layer. The generic model of MIB-related management primitives exchanged across the management SAPs is to allow the SAP user-entity to either GET the value of a MIB attribute, or to SET the value of a MIB attribute. The invocation of a SET.request primitive might require that the layer entity perform certain defined actions.

Figure 6-1 depicts these generic primitives.

The GET and SET primitives are represented as REQUESTs with associated CONFIRM primitives. These primitives are prefixed by MLME or PLME depending upon whether the MAC sublayer or PHY management SAP is involved. In the following, XX denotes MLME or PLME:

XX-GET.request(MIBattribute)
: Requests the value of the given MIBattribute.

XX-GET.confirm(status, MIBattribute, MIBattributevalue)
: Returns the appropriate MIB attribute value if status = "success," otherwise returns an error indication in the Status field. Possible error status values include "invalid MIB attribute" and "attempt to get write-only MIB attribute."

XX-SET.request(MIBattribute, MIBattributevalue)
: Requests that the indicated MIB attribute be set to the given value. If this MIBattribute implies a specific action, then this requests that the action be performed.

XX-SET.confirm(status, MIBattribute)
: If status = "success," this confirms that the indicated MIB attribute was set to the requested value; otherwise it returns an error condition in status field. If this MIBattribute implies a specific action, then this confirms that the action was performed. Possible error status values include "invalid MIB attribute" and "attempt to set read-only MIB attribute."

Additionally, there are certain requests that can be invoked across a given SAP that do not involve the setting or getting of a specific MIB attribute. One of these is supported by each SAP, as follows:

— XX-RESET.request: where XX is MLME or PLME as appropriate

This service is used to initialize the management entities, the MIBs, and the datapath entities. It might include a list of attributes for items to be initialized to nondefault values.

Other SAP-specific primitives are identified in 6.3.

6.3 MLME SAP interface

6.3.1 Introduction

The services provided by the MLME to the SME are specified in this subclause. These services are described in an abstract way (following the model described in ITU-T Recommendation X.210 [B56]) and do not imply any particular implementation or exposed interface. MLME SAP primitives are of the general form ACTION.request primitive followed by ACTION.confirm primitive (for an exchange initiated by the SAP client) and ACTION.indication primitive followed by ACTION.response primitive (for an exchange initiated by the MLME). The SME uses the services provided by the MLME through the MLME SAP.

6.3.2 Power management

6.3.2.1 Introduction

This mechanism supports the process of establishment and maintenance of the power management mode of a STA.

6.3.2.2 MLME-POWERMGT.request

6.3.2.2.1 Function

This primitive requests a change in the power management mode.

6.3.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-POWERMGT.request(
                        PowerManagementMode,
                        ReceiveDTIMs,
                        ReceiveTIMs
                        )
```

Name	Type	Valid range	Description
PowerManagementMode	Enumeration	ACTIVE, POWER_SAVE	An enumerated type that describes the requested power management mode of the STA.
ReceiveDTIMs	Boolean	true, false	Non-DMG BSS: When true, this parameter causes the STA to awaken to receive all DTIM frames. When false, the STA is not required to awaken for every DTIM Beacon frame. DMG BSS: Not applicable
ReceiveTIMs	Boolean	true, false	The parameter is present if dot11S1GOptionImplemented is true; otherwise not present. This parameter is set to the boolean complement of dot11NonTIMModeActivated. When true, this parameter causes the S1G STA to awaken to receive a Beacon frame, as determined by the STA's ListenInterval and the ReceiveDTIMs parameter. When this parameter is false, the S1G STA transmits at least one frame every listen interval without receiving a Beacon frame.

6.3.2.2.3 When generated

This primitive is generated by the SME to implement the power saving strategy of an implementation.

6.3.2.2.4 Effect of receipt

This request sets the STA's power management parameters. The MLME subsequently issues an MLME-POWERMGT.confirm primitive that reflects the results of the power management change request.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.2.3 MLME-POWERMGT.confirm

6.3.2.3.1 Function

This primitive confirms the change in power management mode.

6.3.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-POWERMGT.confirm(
                                    ResultCode
                                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, NOT_SUPPORTED	Indicates the result of the MLME-POWERMGT.request primitive.

6.3.2.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-POWERMGT.request primitive to establish a new power management mode. It is not generated until the change has completed as defined in 11.2.3.

6.3.2.3.4 Effect of receipt

The SME is notified of the change of power management mode.

6.3.3 Scan

6.3.3.1 Introduction

This mechanism supports the process of determining the characteristics of the available BSSs.

6.3.3.2 MLME-SCAN.request

6.3.3.2.1 Function

This primitive requests a survey of potential BSSs that the STA can later elect to try to join.

6.3.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCAN.request(
                                    BSSType,
                                    BSSID,
                                    SSID,
                                    ScanType,
                                    ActiveScanType,
                                    ProbeDelay,
                                    ChannelList,
                                    MinChannelTime,
                                    MaxChannelTime,
                                    RequestInformation,
```

Name	Type	Valid range	Description
BSSType	Enumeration	INFRASTRUCTURE, PERSONAL, INDEPENDENT, MESH, ANY_BSS	Determines whether infrastructure BSS, PBSS, IBSS, MBSS, or all, are included in the scan.
BSSID	MAC address	Any valid individual address, or broadcast address	Identifies a specific or wildcard BSSID.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.
ScanType	Enumeration	ACTIVE, PASSIVE	Indicates either active or passive scanning.
ActiveScanType	Enumeration	FRAME, NDP	Indicates active scanning type by the transmission of either Probe Request frames or NDP Probe Request frames. This parameter is optionally present if dot11S1GOptionImplemented is true and if ScanType is ACTIVE; otherwise not present.
ProbeDelay	Integer	N/A	Delay (in microseconds) to be used prior to transmitting a Probe frame during active scanning.
ChannelList	Set of integers	Each channel is selected from the valid channel range for the appropriate PHY and carrier set.	Specifies a list of channels that are examined when scanning for a BSS. If the Multi-band local and Multi-band peer parameters are present in the primitive, the ChannelList parameter specifies the channels used by the TR-MLME and the Multi-band peer parameter contains the channels to be scanned (see 11.31.5).
MinChannelTime	Integer	N/A	The minimum time (in TU) to spend on each channel when scanning.

Name	Type	Valid range	Description
MaxChannelTime	Integer	≥ MinChannelTime	The maximum time (in TU) to spend on each channel when scanning.
RequestInformation	A list of element identifiers	As defined in 9.4.2.9 and 9.4.2.10.	This parameter is optionally present if dot11RadioMeasurementActivated is true and is placed in a Probe Request frame to request that the responding STA include the requested information in the Probe Response frame.
SSID List	A set of SSID element	As defined in 9.4.2.2.	One or more SSID elements that are optionally present when dot11SSIDListActivated is true.
ChannelUsage	A set of Channel Usage element	As defined in 9.4.2.85	Specifies request types for the Channel Usage request.
AccessNetworkType	As defined in Table 9-236	0 to 15	Specifies the target specific access network type or the wildcard access network type. This field is present when dot11InterworkingServiceActivated is true.
HESSID	MAC address	Any valid individual address or the broadcast address	Specifies the target specific HESSID network identifier or the wildcard network identifier. This field is present when dot11InterworkingServiceActivated is true.
Mesh ID	Octet string	0–32 octets	Present only if BSSType = MESH or BSSType = ANY_BSS. Specifies the target Mesh ID or wildcard Mesh ID.
DiscoveryMode	Integer	0–1	Indicates, if equal to 1, that a DMG Beacon frame is transmitted during active scanning with the Discovery Mode field set to 1 and, if equal to 0, that a DMG Beacon frame is not transmitted during active scanning. Present only when dot11DMGOptionImplemented is true.
FILSRequestParameters	As defined in 9.4.2.177	As defined in 9.4.2.177	Used in determining whether to transmit a Probe Response frame. This parameter is optionally present if dot11FILSActivated is true; otherwise not present.
ReportingOption	Enumeration	IMMEDIATE, CHANNEL_ SPECIFIC, AT_END	Indicates the result reporting mode as described in 11.1.4. This parameter is optionally present if dot11FILSActivated is true; otherwise not present.
APConfigurationSequenceNumber	Integer	As defined in 9.4.2.181	Indicates the configuration sequence number for the static information fields and elements as described in 11.1.4.3.11. This parameter is optionally present if dot11FILSActivated is true and BSSID is an individual MAC address; otherwise not present.
S1GRelayDiscovery	S1G Relay Discovery element	As defined in 9.4.2.207	Indicates link budget information and QoS requirements for relay discovery. This element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
PV1ProbeResponseOption	PV1 Probe Response Option element	As defined in 9.4.2.209	Indicates which optional information is requested to be included in the PV1 Probe Response frame. This element is optionally present if dot11PV1ProbeResponseOptionImplemented is true; otherwise not present.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
S1GCapabilities	S1G Capabilities element	As defined in 9.4.2.200	Indicates S1G capabilities of an S1G STA. The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
ChangeSequence	Change Sequence element	As defined in 9.4.2.198	Specifies the parameters within the Change Sequence element that are supported by the MAC entity. The parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
ELOperation	EL Operation element	As defined in 9.4.2.210	Specifies the parameters within the EL Operation element that are supported by the MAC entity. The parameter is present if dot11S1GELOperationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
GeneralLinkType	Enumeration	GLK_SUPPORTED, GLK_UNSPECIFIED	This parameter is present if dot11GLKImplemented is true. If GLK_SUPPORTED, a BSS in which the AP supports GLK is requested. If GLK_UNSPECIFIED, the GLK nature of the BSS is ignored.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: a value in dot11SupportedDataRatesRxTable, for each member of the set DMG BSS: 0-12, 9.1, 12.1-12.6, or 25-31, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the STA is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter of the SelectedBSS parameter. DMG BSS: The set of MCS indexes that the STA uses for communication within the BSS. Present only if ScanType = ACTIVE.
HT Capabilities	As defined in frame format HT Capabilities element	As defined in 9.4.2.55; the HT-MCSs in the element are present in dot11SupportedHTMCSRxTable and the highest supported data rate in the element does not exceed dot11HighestSupportedDataRate	Specifies the parameters in the HT Capabilities element that are supported by the STA. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present. Present only if ScanType = ACTIVE.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.157; the VHT-MCSs in the element are present in dot11VHTRxVHTMCSMap/ dot11VHTTxVHTMCSMap and the highest supported rates in the element do not exceed dot11VHTRxHighestDataRateSupported/ dot11VHTTxHighestDataRateSupported	Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise. Present only if ScanType = ACTIVE.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.3.2.3 When generated

This primitive is generated by the SME for a STA to determine if there are other BSSs that it can join.

6.3.3.2.4 Effect of receipt

This request initiates the scan process when the current frame exchange sequence is completed.

6.3.3.3 MLME-SCAN.confirm

6.3.3.3.1 Function

This primitive returns the descriptions of the set of BSSs detected by the scan process. Multiple MLME-SCAN.confirm primitives can be issued when the value of the ReportingOption parameter in the MLME-SCAN.request primitive is CHANNEL_SPECIFIC or IMMEDIATE. When the value of the ReportingOption parameter is AT_END, or the ReportingOption parameter is not present, a single MLME-SCAN.confirm primitive is issued.

6.3.3.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCAN.confirm(
BSSDescriptionSet,
BSSDescriptionFromMeasurementPilotSet,
BSSDescriptionFromFDSet,
ResultCode,
Multi-band local,
Multi-band peer,
ScannedChannelList,
VendorSpecificInfo
)

Name	Type	Valid range	Description
BSSDescriptionSet	Set of BSSDescriptions	N/A	The BSSDescriptionSet is returned to indicate the results of the scan request. It is a set containing zero or more instances of a BSSDescription.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
BSSDescriptionFromMeasurementPilotSet	Set of BSSDescriptionFromMeasurementPilots	N/A	The BSSDescriptionFromMeasurementPilotSet is returned to indicate the results of the scan request derived from Measurement Pilot frames. It is a set containing zero or more instances of a BSSDescriptionFromMeasurementPilot. Present if dot11RMMeasurementPilotActivated is nonzero; otherwise not present.
BSSDescriptionFromFDSet	Set of BSSDescriptionFromFDs	N/A	The BSSDescriptionFromFDSet is returned to indicate the results of the scan request derived from FILS Discovery frames. It is a set containing zero or more instances of a BSSDescriptionFromFD. Present if dot11FILSActivated is true; otherwise not present.
ResultCode	Enumeration	SUCCESS, INTERMEDIATE_SCAN_RESULT, NOT_SUPPORTED, PARTIAL_SCAN	Indicates the result of the MLME-SCAN.confirm primitive. The INTERMEDIATE_SCAN_RESULT is used to report the discovered BSSs when the value of the ReportingOption parameter in the MLME-SCAN.request primitive is CHANNEL_SPECIFIC or IMMEDIATE and is valid if dot11FILSActivated is true. The PARTIAL_SCAN is used to report that not all channels have been scanned as specified in the ChannelList parameter, if present, of the corresponding MLME-SCAN.request primitive. The ScannedChannelList parameter contains the list of scanned channels.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
ScannedChannelList	Each channel is selected from the valid channel range for the appropriate PHY and carrier set	Each channel is selected from the valid channel range for the appropriate PHY and carrier set	This parameter is valid only if the ResultCode parameter has a value of PARTIAL_SCAN, and specifies a list of channels that were scanned. This list of channels is a subset of the channels present in the ChannelList parameter of the corresponding MLME-SCAN.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Each BSSDescription consists of the parameters shown in the following table, in which the term *peer STA* refers to the STA transmitting the Beacon frame, S1G Beacon frame, Probe Response frame, or PV1 Probe Response frame from which the BSSDescription was determined and the term *local STA* refers to the STA performing the scan, and in which the "IBSS adoption" column indicates whether

a) This parameter is adopted by a STA that is joining an IBSS.

b) This parameter is adopted by a STA that is a member of an IBSS that receives a beacon or S1G beacon from a STA that is a member of the same IBSS and that has a timestamp value that is greater than the local TSF value (see 11.1.5).

Name	Type	Valid range	Description	IBSS adoption
BSSID	MAC address	N/A	The BSSID of the found BSS or the MAC address of the found mesh STA.	Adopt
SSID	Octet string	0–32 octets	The SSID of the found BSS.	Adopt
BSSType	Enumeration	INFRASTRUCTURE, PERSONAL, INDEPENDENT, MESH	The type of the found BSS.	Adopt
Beacon Period	Integer	N/A	The beacon period (in TU) of the found BSS if the BSSType is not MESH, or of the found mesh STA if the BSSType = MESH.	Adopt
DTIM Period	Integer	As defined in 9.4.2.5	The DTIM period (in beacon periods) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType = MESH.	Adopt
Timestamp	Integer	N/A	The timestamp of the received frame (Probe Response/ Beacon or PV1 Probe Response/S1G Beacon) from the found BSS. When a PV1 Probe Response or an S1G Beacon frame is received, the timestamp is reconstructed as described in 11.1.3.10.3. If the Multi-band local and Multi-band peer parameters are present in the MLME-SCAN.confirm primitive, the Timestamp parameter is reserved.	Adopt
Local Time	Integer	N/A	The value of the local STA's TSF timer at the start of reception of the first octet of the timestamp field of the received frame (Probe Response or Beacon) from the found BSS.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
PHY Parameter Set	As defined in frame format or according to the relevant PHY clause.	As defined in frame format or according to the relevant PHY clause.	The parameter sets relevant to the PHY from the received Beacon or Probe Response frame. If no PHY Parameter Set element is present in the received frame, this parameter contains the channel number on which the frame was received. Valid channel numbers are defined in the relevant PHY clause.	Adopt
IBSS Parameter Set	IBSS Parameter Set element	As defined in 9.4.2.6	The parameter set for the IBSS, if found BSS is an IBSS.	Adopt
CapabilityInformation	Capability Information field	As defined in 9.4.1.4	The advertised capabilities of the BSS.	Do not adopt
BSSBasicRateSet	Set of integers	Non-DMG BSS: 1–127 excluding values from Table 9-93, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that all STAs in the BSS are able to use for communication. All STAs in the BSS are able to receive and transmit at each of the data rates listed in the set. DMG BSS: Empty.	Adopt
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: 1–127 excluding values from Table 9-93, for each member of the set DMG BSS: 0–12, 9.1, 12.1–12.6, or 25–31, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the peer STA is able to use for communication within the BSS. The peer STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indexes that the peer STA uses for communication within the BSS.	Do not adopt
Country	As defined in the Country element	As defined in the Country element	The information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain. Present if TPC functionality is required, as specified in 11.7, or dot11MultiDomainCapability Activated is true or dot11RadioMeasurementActivated is true; otherwise not present.	Adopt

Name	Type	Valid range	Description	IBSS adoption
IBSS DFS Recovery Interval	Integer	1–255	The time interval that is used for DFS recovery. Present if DFS functionality is required, as specified in 11.8 and BSSType = INDEPENDENT; otherwise not present.	Adopt
RSN	RSNE	As defined in 9.4.2.24	A description of the cipher suites and AKM suites supported in the BSS.	Do not adopt
Load	BSS Load element	As defined in 9.4.2.27	The values from the BSS Load element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
EDCAParameterSet	EDCA Parameter Set element	As defined in 9.4.2.28	The values from the EDCA Parameter Set element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
QoSCapability	QoS Capability element	As defined in 9.4.2.34	The values from the QoS Capability element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
AP Channel Report	Set of AP Channel Report elements	As defined in 9.4.2.35	The values from the AP Channel Report element(s) if present in the Probe Response or Beacon frame, else null.	Adopt
BSS Average Access Delay	BSS Average Access Delay element	As defined in 9.4.2.38	The values from the BSS Average Access Delay element if such an element was present in Probe Response or Beacon frame, else null.	Adopt
Antenna	Antenna element	As defined in 9.4.2.39	The values from the Antenna element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
BSS Available Admission Capacity	BSS Available Admission Capacity element	As defined in 9.4.2.42	The values from the BSS Available Admission Capacity element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
BSS AC Access Delay	BSS AC Access Delay element	As defined in 9.4.2.43	The values from the BSS AC Access Delay element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
Measurement Pilot Transmission Information	Measurement Pilot Transmission element	As defined in 9.4.2.41	The values from the Measurement Pilot Transmission element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
Multiple BSSID	As defined in Multiple BSSID element	As defined in 9.4.2.45	The values from the Multiple BSSID element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
RM Enabled Capabilities	RM Enabled Capabilities element	As defined in 9.4.2.44	The values from the RM Enabled Capabilities element if such an element was present in the Probe Response or Beacon frame, else null.	Adopt
RCPIMeasurement	Integer	As defined in 9.4.2.37	The RCPI of the received frame.	Adopt
RSNIMeasurement	Integer	As defined in 9.4.2.40	The RSNI of the received frame.	Adopt
Requested elements	Set of elements	As defined in 9.4.1.35	Elements requested by the Request element or Extended Request element of the Probe Request frame.	Adopt
DSERegisteredLocation	DSE Registered Location element	As defined in 9.4.2.51	The information from the DSE Registered Location element, if such a field is present in the Probe Response or Beacon frame, else null. Present if DSE functionality is required, as specified in 11.11, or dot11LCIDSERequired is true; otherwise not present.	Adopt
HT Capabilities	As defined in frame format	As defined in 9.4.2.55	The values from the HT Capabilities element if such an element was present in the Probe Response or Beacon frame, else null. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present.	Do not adopt
HT Operation	As defined in frame format	As defined in 9.4.2.56	The values from the HT Operation element if such an element was present in the Probe Response or Beacon frame, else null. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present.	Adopt
BSSMembershipSelectorSet	Set of integers	A value from Table 9-93 for each member of the set	The set of features that are supported by all STAs joining this BSS.	Adopt
Extended Capabilities	As defined in frame format	As defined in 9.4.2.26	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.	Do not adopt
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.59	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
Overlapping BSS Scan Parameters	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the Overlapping BSS Scan Parameters element that are indicated by the MAC entity. This parameter is optionally present if dot11FortyMHzOptionImplemented is true and is not present if dot11FortyMHzOptionImplemented is false.	Adopt
FMSDescriptor	FMS Descriptor element	As defined in 9.4.2.74	The values from the FMS Descriptor element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
QoSTrafficCapability	QoS Traffic Capability element	As defined in 9.4.2.77	The values from the QoS Traffic Capability element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
ChannelUsage	A set of Channel Usage element	As defined in 9.4.2.85	Specifies parameters for the Channel Usage.	Do not adopt
TimeAdvertisement	Time Advertisement element	As defined in 9.4.2.60	The values from the Time Advertisement element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
TimeZone	Time Zone element	As defined in 9.4.2.86	The values from the Time Zone element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
MeshID	Mesh ID element	As defined in 9.4.2.98	The value of MeshID element if such element was present in the Probe Response or Beacon frame, else null.	Do not adopt
MeshConfiguration	Mesh Configuration element	As defined in 9.4.2.97	The values from the Mesh Configuration element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
Mesh Awake Window	Mesh Awake Window element	As defined in 9.4.2.103	The values from the Mesh Awake Window element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
BeaconTiming	Beacon Timing element	As defined in 9.4.2.104	The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
MCCAOP Advertisement Overview	MCCAOP Advertisement Overview element	As defined in frame format	The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
MCCAOP Advertisement	MCCAOP Advertisement	As defined in frame format	The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	The values from the QMF Policy element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
QLoad Report	As defined in frame format	As defined in 9.4.2.122	The values from the QLoad Report element if such an element was present in the Probe Response frame, else null.	Do not adopt.
Sector Sweep	As defined in frame format	As defined in 9.3.4.2	The values from the Sector Sweep field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true.	Adopt
Beacon Interval Control	As defined in frame format	As defined in 9.3.4.2	The values from the Beacon Interval Control field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true.	Adopt
DMG Parameters	As defined in frame format	As defined in 9.3.4.2	The values from the DMG Parameters field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true.	Adopt
Clustering Control	As defined in frame format	As defined in 9.3.4.2	The values from the Clustering Control field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true.	Do not adopt
DMG Capabilities	As defined in frame format	As defined in 9.4.2.127	The values from the DMG Capabilities element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
DMG Operation	As defined in frame format	As defined in 9.4.2.127	The values from the DMG Operation element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
Extended Schedule	As defined in frame format	As defined in 9.4.2.131	The values from the Extended Schedule element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
Next DMG ATI	As defined in frame format	As defined in 9.4.2.135	The values from the Next DMG ATI element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
DMG BSS Parameter Change	As defined in frame format	As defined in 9.4.2.126	The values from the DMG BSS Parameter Change element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
Multi-band	As defined in frame format	As defined in 9.4.2.138	The values from the Multi-band element if such an element was present in the Probe Response or DMG Beacon frame, else null. The Multi-band element is optionally present if dot11MultibandImplemented is true.	Adopt
DMG Wakeup Schedule	As defined in frame format	As defined in 9.4.2.130	The values from the DMG Wakeup Schedule element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt

Name	Type	Valid range	Description	IBSS adoption
Antenna Sector ID Pattern	As defined in frame format	As defined in 9.4.2.156	The values from the Antenna Sector ID Pattern element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11DMGOptionImplemented is true.	Adopt
Relay Capabilities	As defined in frame format	As defined in 9.4.2.147	The values from the Relay Capabilities element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present if dot11RelayActivated is true.	Do not adopt
VHT Capabilities	As defined in frame format	As defined in 9.4.2.157	The values from the VHT Capabilities element. The parameter is present if dot11VHTOptionImplemented is true and a VHT Capabilities element was present in the Probe Response or Beacon frame from which the BSSDescription was determined. The parameter is not present otherwise.	Do not adopt
VHT Operation	As defined in frame format	As defined in 9.4.2.158	The values from the VHT Operation element. The parameter is present if dot11VHTOptionImplemented is true and a VHT Operation element was present in the Probe Response or Beacon frame from which the BSSDescription was determined. The parameter is not present otherwise.	Adopt
TVHT Operation	As defined in frame format	As defined in 9.4.2.171	The values from the TVHT Operation element if such an element was present in the Probe Response or Beacon frame; otherwise, null. The parameter is optionally present if dot11TVHTOptionImplemented is true.	Adopt
CAG Number	As defined in 9.4.2.176	As defined in 9.4.2.176	One or more Common Advertisement Group (CAG) tuples. Each CAG Tuple describes the CAG Version, Scope, and partial advertisement protocol ID. This parameter is optionally present when dot11FILSActivated is true; otherwise not present.	Do not adopt.

Name	Type	Valid range	Description	IBSS adoption
DILS	As defined in 9.4.2.186	As defined in 9.4.2.186	The values from the DILS element. It is optionally present when dot11FILSActivated is true and if such an element was present in the Probe Response or Beacon frame; otherwise not present.	Do not adopt
Compressed SSID	Integer	N/A	The Compressed SSID of the received frame (PV1 Probe Response or S1G Beacon) from the found BSS. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt
Next TBTT	Integer	N/A	Highest 3 octets of the 4 least significant octets of the next TBTT. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt
S1G Relay Discovery	As defined in frame format	As defined in 9.4.2.207	The values from the S1G Relay Discovery element if such an element was present in the Probe Response, PV1 Probe Response, or S1G Beacon frame. More description is provided in 10.54.6.	Do not adopt
RPS	RPS element	As defined in 9.4.2.191	The parameter set for group-based restricted medium access, if such element was present in the S1G Beacon, PV1 Probe Response, or Probe Response frame, else null. The support of the feature is described on RAW-based medium access 10.23.5.	Do not adopt
Page Slice	Page Slice element	As defined in 9.4.2.192	The set of page slices present in DTIM interval, if such element was present in the S1G Beacon, or Probe Response, or PV1 Probe Response frame, else null. The support of the feature is described 10.51.	Do not adopt
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	The values from the S1G Capabilities element. The parameter is present if dot11S1GOptionImplemented is true and an S1G Capabilities element was present in the S1G Beacon, or Probe Response, or PV1 Probe Response frame from which the BSSDescription was determined; otherwise not present.	Adopt

Name	Type	Valid range	Description	IBSS adoption
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.203	The values from the TSF Timer Accuracy element if such an element was present in the Probe Response, PV1 Probe Response, or S1G Beacon frame, else null. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.	Adopt
Change Sequence	As defined in frame format	As defined in 9.4.2.198	A Change Sequence element indicates the change of system information within a BSS. The support of the feature is described 10.46.2.	Do not adopt
S1GRelay	As defined in frame format	As defined in 9.4.2.204	The S1G Relay element is present in the S1G Beacon frame if dot11RelayAPOperationActivated is true or if dot11RelayAPImplemented is true; otherwise not present. The S1G Relay element is optionally present in Probe Response, or PV1 Probe Response, if dot11RelayAPImplemented is true. More description is provided in 10.54.	Do not adopt
S1GOperation	As defined in frame format	As defined in 9.4.2.212	The values from the S1G Operation element if such an element was present in the Probe Response, PV1 Probe Response, or S1G Beacon frame, else null. The parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt
ShortBeaconPeriod	As defined in frame format	As defined in 9.4.2.197	The short beacon period, in TUs, of the found BSS if the Short Beacon Interval element was present in the Probe Response, PV1 Probe Response, or S1G Beacon frame, else null. The parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt
ShortBeaconDTIM Period	As defined in frame format	As defined in 9.4.2.5	The values from the TIM element if such an element was present in the S1G Beacon frame, else null. The parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.	Adopt

Name	Type	Valid range	Description	IBSS adoption
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.	Do not adopt
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.	Do not adopt
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.	Do not adopt
CMMG Operation	CMMG Operation element	As defined in 9.4.2.230	Specifies the parameters within the CMMG Operation element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.	Do not adopt
ServiceHint	Service Hint element	As defined in 9.4.2.237	Provides an indication of the services advertised in Beacon frames and Probe Response frames. The values from the Service Hint element, if such an element was present in the Beacon or Probe Response frame; else null.	Do not adopt
ServiceHash	Service Hash element	As defined in 9.4.2.238	Specifies services advertised in Beacon and Probe Response frames. The values from the Service Hash element, if such an element was present in the Beacon or Probe Response frame; else null.	Do not adopt

Each BSSDescriptionFromMeasurementPilot consists of the following parameters, in which the term *peer STA* refers to the STA transmitting the Measurement Pilot frame from which the BSSDescription was determined and the term *local STA* refers to the STA performing the scan:

Name	Type	Valid range	Description
BSSID	MAC address	N/A	The BSSID of the found BSS.
BSS Type	Enumeration	INFRASTRUCTURE	The type of the found BSS.
Local Time	Integer	N/A	The value of the local STA's TSF timer at the start of reception of the first octet of the timestamp field of the received frame from the found BSS.
Condensed Capability Information	Condensed Capability Information field	As defined in 9.6.7.3	The advertised condensed capabilities of the BSS.
Condensed Country String	Condensed Country String field	As defined in 9.6.7.3	Together with the Operating Class, the information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain.
Operating Class	Operating Class field	The field is defined in 9.6.7.3, valid values for the field are defined in Annex E.	Together with the Condensed Country String, the information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain.
Channel	Channel field	The field is defined in 9.6.7.3, valid values for the field are defined in Annex E.	The operating channel of the BSS indicated in the received frame.
Measurement Pilot Interval	Measurement Pilot Interval field	As defined in 9.6.7.3	The measurement pilot interval of the BSS indicated in the received frame.
Multiple BSSID element	Multiple BSSID element	As defined in 9.4.2.45	Indicates that the BSS is within a multiple BSSID set (see 11.10.14). The range of BSSIDs is determined by the BSSID and Multiple BSSID element.
PHY Type	Integer	As defined in Annex C	The dot11PHYType of the received frame.
RCPIMeasurement	Integer	As defined in 9.4.2.37	The RCPI of the received frame.
RSNIMeasurement	Integer	As defined in 9.4.2.40	The RSNI of the received frame.

The BSSDescriptionFromFDSet parameter is present if dot11FILSActivated is true; otherwise, it is not present. Each BSSDescriptionFromFD consists of the parameters shown in the following table:

Name	Type	Valid range	Description
BSSID	MAC address	N/A	The BSSID of the found BSS.
SSID	Octet String	As defined in 9.4.2.2	The SSID of the found BSS. This parameter is present if the Short SSID Indicator field in the received FILS Discovery frame is equal to 0.
Short SSID	Integer	As defined in the 9.4.2.170	The short SSID of the found BSS. This parameter is present if the Short SSID Indicator field in the received FILS Discovery frame is equal to 1.
FD Capability	As defined in 9.6.7.36	As defined in 9.6.7.36	The FD Capability contains the capabilities and operational indications of the BSS. This parameter is optional.
Operating class	Integer	As defined in 9.4.1.36	The operating class of the advertised BSS.
Access Network Options	As defined in 9.4.2.91	As defined in 9.4.2.91	The advertised access network options of the BSS. This parameter is optional.
Primary Channel	Integer	1–255	The Primary Channel of the advertised BSS. The Primary Channel is defined within the indicated Operating Class as shown in Annex E. This parameter is optional.
FD RSN Information	As defined in 9.6.7.36	As defined in 9.6.7.36	The information for robust security network. This parameter is optional.
Channel Center Frequency Segment 1	Integer	1–255	The channel frequency index of the 80 MHz channel of frequency segment 1 when the BSS operates on an 80+80 MHz operating channel width. This parameter is optional.
AP-CSN	Integer	As defined in 9.4.2.181	The value of the Configuration Sequence Number in the found BSS. This parameter is optional.
AP's next TBTT Offset	Integer	As defined in 9.6.7.36	The information of next target beacon transmission time of the found BSS. This parameter is optional.
Reduced Neighbor Report	As defined in 9.4.2.170	As defined in 9.4.2.170	The information of the Reduced Neighbor Information field of the received FILS Discovery frame. This parameter is optional.
FILS Indication	As defined in 9.4.2.182	As defined in 9.4.2.182	The information related to FILS authentication and upper layer set up capabilities of the found AP. This parameter is optional.

6.3.3.3.3 When generated

This primitive is generated by the MLME to report the operating environment of the STA. It is issued after receiving an MLME-SCAN.request primitive or, if dot11FILSActivated is true, after receiving an MLME-SCAN-STOP.request primitive following an MLME-SCAN.request primitive.

6.3.3.3.4 Effect of receipt

The SME is notified of the results of the scan procedure. If dot11FILSActivated is true, these results might be intermediate results, according to the value of ResultCode.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.3.4 MLME-SCAN-STOP.request

6.3.3.4.1 Function

This primitive terminates any ongoing scan.

6.3.3.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCAN-STOP.request(
                        Multi-band local,
                        Multi-band peer
                        )
```

Name	Type	Valid range	Description
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band elemen	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.

6.3.3.4.3 When generated

This primitive is generated by the SME in order to stop all ongoing active or passive scan processes in the STA.

6.3.3.4.4 Effect of receipt

This request terminates all ongoing scan procedures.

6.3.4 Synchronization

6.3.4.1 Introduction

This mechanism supports the process of selection of a peer in the authentication process.

6.3.4.2 MLME-JOIN.request

6.3.4.2.1 Function

This primitive requests synchronization with a BSS, of which type is infrastructure or independent.

6.3.4.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-JOIN.request(
                        SelectedBSS,
                        JoinFailureTimeout,
                        NAVSyncDelay,
```

OperationalRateSet,
Capability Information,
HT Capabilities,
VHT Capabilities,
DMG Capabilities,
S1G Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
InterworkingInfo,
AdvertisementProtocolInfo,
VendorSpecificInfo
)

Name	Type	Valid range	Description
SelectedBSS	BSSDescription	N/A	The BSSDescription of the BSS to join. The SelectedBSS is a member of the set of descriptions that was returned as a result of an MLME-SCAN.request primitive.
JoinFailureTimeout	Integer	≥ 1	The time limit, in units of beacon intervals, after which the join procedure is terminated.
NAVSyncDelay	Integer	N/A	Delay (in microseconds) to be used prior to transmitting when changing from doze to awake state, if no frame is detected by which the network allocation vector (NAV) can be set.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: a value in dot11SupportedDataRatesRxTable, for each member of the set DMG BSS: 0-12, 9.1, 12.1-12.6, or 25-31, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the STA is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter of the SelectedBSS parameter. DMG BSS: The set of MCS indexes that the STA uses for communication within the BSS.
CapabilityInformation	Capability Information field	As defined in 9.4.1.4	Specifies the parameters in the Capability Information field that are supported by the STA.
HT Capabilities	As defined in frame format HT Capabilities element	As defined in 9.4.2.55; the HT-MCSs in the element are present in dot11SupportedHTMCSRxTable and the highest supported data rate in the element does not exceed dot11HighestSupportedDataRate	Specifies the parameters in the HT Capabilities element that are supported by the STA. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.157; the VHT-MCSs in the element are present in dot11VHTRxVHTMCSMap/ dot11VHTTxVHTMCSMap and the highest supported rates in the element do not exceed dot11VHTRxHighestDataRateSupported/ dot11VHTTxHighestDataRateSupported	Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.127	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	Specifies the parameters in the S1G Capabilities element that are supported by the STA. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.26	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.59	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.
InterworkingInfo	As defined in frame format	As defined in Interworking element in 9.4.2.91	Specifies the Interworking capabilities of STA. This field is present when dot11InterworkingServiceActivated is true.
AdvertisementProtocolInfo	Integer or Sequence of integers	As defined in Advertisement Protocol element in Table 9-237	Identifies zero or more advertisement protocols and advertisement control to be used in the BSSs. This field is present when dot11InterworkingServiceActivated is true.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.4.2.3 When generated

This primitive is generated by the SME for a STA to establish synchronization with a BSS.

6.3.4.2.4 Effect of receipt

This primitive initiates a synchronization procedure once the current frame exchange sequence is complete. The MLME synchronizes its timing with the specified BSS based on the information provided in the SelectedBSS parameter. The MLME subsequently issues an MLME-JOIN.confirm primitive that reflects the results.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the MLME of a non-DMG STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicRateSet parameter that contains any unsupported rates, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a Basic HT-MCS Set field in the HT Operation parameter that contains any unsupported MCSs, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a VHT STA receives an MLME-JOIN.request primitive with a SelectedBSS parameter containing a Basic VHT-MCS And NSS Set field in the VHT Operation parameter that contains any unsupported <VHT-MCS, NSS> tuple, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a DMG STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicRateSet parameter that is not empty, or with the OperationalRateSet parameter containing any unsupported MCSs, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an S1G STA receives an MLME-JOIN.request primitive with a SelectedBSS parameter containing a Basic S1G-MCS and NSS Set field in the S1GOperation parameter that contains any unsupported <S1G-MCS, NSS> tuple, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

6.3.4.3 MLME-JOIN.confirm

6.3.4.3.1 Function

This primitive confirms synchronization with a BSS.

6.3.4.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-JOIN.confirm(
                                    ResultCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, JOIN_FAILURE_TIMEOUT	Indicates the result of the MLME-JOIN.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.4.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-JOIN.request primitive to establish synchronization with a BSS.

6.3.4.3.4 Effect of receipt

The SME is notified of the results of the synchronization procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.5 Authenticate

6.3.5.1 Introduction

This mechanism supports the process of establishing an authentication relationship with a peer MAC entity.

6.3.5.2 MLME-AUTHENTICATE.request

6.3.5.2.1 Function

This primitive requests authentication with a specified peer MAC entity.

6.3.5.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.request(
PeerSTAAddress,
AuthenticationType,
AuthenticateFailureTimeout,
Content of FT Authentication elements,
Content of SAE Authentication frame,
Multi-band local,
Multi-band peer,
Content of FILS Authentication frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the authentication process.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY, FAST_BSS_TRANSITION, SAE, FILS_SHARED_KEY WITHOUT_PFS, FILS_SHARED KEY_WITH_PFS, FILS_PUBLIC_KEY	Specifies the type of authentication algorithm to use during the authentication process.
AuthenticateFailureTimeout	Integer	≥ 1	Specifies a time limit (in TU) after which the authentication procedure is terminated.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the first message of the FT authentication sequence, as described in 13.8.2. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
Content of SAE Authentication frame	Sequence of elements and fields	As defined in 9.4.1.37, 9.4.1.38, 9.4.1.39, 9.4.1.40, 9.4.1.41, and 9.4.1.42	The set of elements and fields to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Content of FILS Authentication frame	Sequence of elements and fields	As defined in 9.4.1.42, 9.4.1.40, 9.4.2.24, 9.4.2.179, 9.4.2.187, and 9.4.2.189	The set of elements and fields to be included in the first message of the FILS authentication sequence, as described in 12.11. Present if AuthenticationType indicates FILS SHARED KEY WITHOUT PFS, FILS SHARED KEY WITH PFS, or FILS PUBLIC KEY; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.5.2.3 When generated

This primitive is generated by the SME for a STA to establish authentication with a specified peer MAC entity in order to permit Class 2 frames, or mesh peering Management frames for AMPE utilizing SAE authentication, to be exchanged between the two STAs. During the authentication procedure, the SME might generate additional MLME-AUTHENTICATE.request primitives.

If dot11S1GCentralizedAuthenticationControlActivated is true and a STA's MAC variable AuthenticationRequestTransmission is false, then the STA shall not invoke this primitive.

6.3.5.2.4 Effect of receipt

This primitive initiates an authentication procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-AUTHENTICATE.confirm primitive that reflects the results.

6.3.5.3 MLME-AUTHENTICATE.confirm

6.3.5.3.1 Function

This primitive reports the results of an authentication attempt with a specified peer MAC entity.

6.3.5.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.confirm(
PeerSTAAddress,
AuthenticationType,
ResultCode,
Content of FT Authentication elements,
Content of SAE Authentication frame,
Multi-band local,

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Multi-band peer,
Content of FILS Authentication frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the authentication process was attempted. This value matches the peerSTAAddress parameter specified in the corresponding MLME-AUTHENTICATE.request primitive.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY FAST_BSS_TRANSITION, SAE, FILS_SHARED KEY_WITHOUT_PFS, FILS_SHARED_KEY_WI TH_PFS, FILS_PUBLIC_KEY	Specifies the type of authentication algorithm that was used during the authentication process. This value matches the AuthenticationType parameter specified in the corresponding MLME-AUTHENTICATE.request primitive.
ResultCode	Enumeration	SUCCESS, REFUSED, ANTI_CLOGGING_TOKE N_REQUIRED, FINITE_CYCLIC_GROUP _NOT_SUPPORTED, AUTHENTICATION_REJ ECTED, AUTH_FAILURE_TIMEO UT	Indicates the result of the MLME-AUTHENTICATE.request primitive.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the second message of the FT authentication sequence, as described in 13.8.3. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
Content of SAE Authentication frame	Sequence of elements	As defined in 9.4.1.37, 9.4.1.38, 9.4.1.39, 9.4.1.40, 9.4.1.41, and 9.4.1.42	The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify the local MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Content of FILS Authentication frame	Sequence of elements and fields	As defined in 9.4.1.42, 9.4.1.40, 9.4.2.24, 9.4.2.175, 9.4.2.179, 9.4.2.187, and 9.4.2.189	The set of elements and fields included in the second message of the FILS authentication sequence, as described in 12.11. Present if AuthenticationType indicates FILS SHARED KEY WITHOUT PFS, FILS SHARED KEY WITH PFS, or FILS PUBLIC KEY; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.5.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-AUTHENTICATE.request primitive to authenticate with a specified peer MAC entity.

6.3.5.3.4 Effect of receipt

The SME is notified of the results of the authentication procedure.

6.3.5.4 MLME-AUTHENTICATE.indication

6.3.5.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an authentication relationship with the STA processing this primitive.

6.3.5.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.indication(
PeerSTAAddress,
AuthenticationType,
Content of FT Authentication elements,
Content of SAE Authentication frame,
Multi-band local,
Multi-band peer,
Content of FILS Authentication frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the authentication relationship was established.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY, FAST_BSS_ TRANSITION, SAE, FILS_SHARED_KEY_WITHOUT_PFS, FILS_SHARED_KEY_WITH_PFS, FILS_PUBLIC_KEY	Specifies the type of authentication algorithm that was used during the authentication process.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the first message of the FT authentication sequence, as described in 13.8.2. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
Content of SAE Authentication frame	Sequence of elements	As defined in 9.4.1.37, 9.4.1.38, 9.4.1.39, 9.4.1.40, 9.4.1.41, and 9.4.1.42	The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify and are supported by the local MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify and are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Content of FILS Authentication frame	Sequence of elements and fields	As defined in 9.4.1.42, 9.4.1.40, 9.4.2.24, 9.4.2.175, 9.4.2.179, 9.4.2.187, and 9.4.2.189	The set of elements and fields included in the first message of the FILS authentication sequence, as described in 12.11. Present if AuthenticationType indicates FILS SHARED KEY WITHOUT PFS, FILS SHARED KEY WITH PFS, or FILS PUBLIC KEY; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.5.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an authentication request from a specific peer MAC entity.

6.3.5.4.4 Effect of receipt

The SME is notified of the receipt of the authentication request.

6.3.5.5 MLME-AUTHENTICATE.response

6.3.5.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested authentication with the STA that issued this primitive.

6.3.5.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-AUTHENTICATE.response(
                                    PeerSTAAddress,
                                    ResultCode,
                                    Content of FT Authentication elements,
                                    Content of SAE Authentication frame,
                                    Multi-band local,
                                    Multi-band peer,
                                    Content of FILS Authentication frame,
                                    VendorSpecificInfo
                                    )
```

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the authentication request was received.
ResultCode	Enumeration	SUCCESS, REFUSED, ANTI_CLOGGING_TOKEN_REQUIRED, FINITE_CYCLIC_GROUP_NOT_SUPPORTED, AUTHENTICATION_REJECTED	Indicates the result response to the authentication request from the peer MAC entity.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the second message of the FT authentication sequence, as described in 13.8.3. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
Content of SAE Authentication frame	Sequence of elements	As defined in 9.4.1.37, 9.4.1.38, 9.4.1.39, 9.4.1.40, 9.4.1.41, and 9.4.1.42	The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if the AuthenticationType of the MLME-AUTHENTICATE.indication primitive that generated this response indicated SAE authentication; otherwise not present.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
Content of FILS Authentication frame	Sequence of elements and fields	As defined in 9.4.1.42, 9.4.1.40, 9.4.2.24, 9.4.2.179, 9.4.2.187, and 9.4.2.189	The set of elements and fields to be included in the second message of the FILS authentication sequence, as described in 12.11. Present if AuthenticationType indicates FILS SHARED KEY WITHOUT PFS, FILS SHARED KEY WITH PFS, or FILS PUBLIC KEY; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.5.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-AUTHENTICATE.indication primitive.

6.3.5.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested authentication.

6.3.6 Deauthenticate

6.3.6.1 Introduction

This mechanism supports the process of invalidating an authentication relationship with a peer MAC entity.

6.3.6.2 MLME-DEAUTHENTICATE.request

6.3.6.2.1 Function

This primitive requests that the authentication relationship with a specified peer MAC entity be invalidated.

6.3.6.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEAUTHENTICATE.request(
                                    PeerSTAAddress,
                                    ReasonCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the deauthentication process.
ReasonCode	Reason Code field	As defined in 9.4.1.7	Specifies the reason for initiating the deauthentication procedure.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.6.2.3 When generated

This primitive is generated by the SME for a STA to invalidate authentication with a specified peer MAC entity in order to prevent the exchange of Class 2 frames, or mesh peering Management frames for AMPE utilizing SAE authentication, between the two STAs. During the deauthentication procedure, the SME might generate additional MLME-DEAUTHENTICATE.request primitives.

6.3.6.2.4 Effect of receipt

This primitive initiates a deauthentication procedure. The MLME subsequently issues an MLME-DEAUTHENTICATE.confirm primitive that reflects the results.

6.3.6.3 MLME-DEAUTHENTICATE.confirm

6.3.6.3.1 Function

This primitive reports the results of a deauthentication attempt with a specified peer MAC entity.

6.3.6.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-DEAUTHENTICATE.confirm(
                                    PeerSTAAddress
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the deauthentication process was attempted.

6.3.6.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DEAUTHENTICATE.request primitive to invalidate the authentication relationship with a specified peer MAC entity.

6.3.6.3.4 Effect of receipt

The SME is notified of the results of the deauthentication procedure.

6.3.6.4 MLME-DEAUTHENTICATE.indication

6.3.6.4.1 Function

This primitive reports the invalidation of an authentication relationship with a specific peer MAC entity.

6.3.6.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEAUTHENTICATE.indication(
                                    PeerSTAAddress,
                                    ReasonCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the authentication relationship was invalidated.
ReasonCode	Reason Code field	As defined in 9.4.1.7	Specifies the reason the deauthentication procedure was initiated.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.6.4.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an authentication relationship with a specific peer MAC entity.

6.3.6.4.4 Effect of receipt

The SME is notified of the invalidation of the specific authentication relationship.

6.3.7 Associate

6.3.7.1 Introduction

The following primitives describe how a STA becomes associated with an AP.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.7.2 MLME-ASSOCIATE.request

6.3.7.2.1 Function

This primitive requests association with a specified peer MAC entity that is within an AP.

6.3.7.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.request(
PeerSTAAddress,
BSSMaxIdlePeriod,
ListenInterval,
Supported Channels,
RSN,
QoSCapability,
Content of FT Authentication elements,
SupportedOperatingClasses,
SM Power Save,
QoSTrafficCapability,
TIMBroadcastRequest,
EmergencyServices,
Multi-band local,
Multi-band peer,
MMS,
FILSHLPContainer,
FILSIPAddressAssignment,
AID Request,
TWT,
MaxAwayDuration,
S1GRelayActivation,
ReachableAddress,
CDMG Capabilities,
CMMG Capabilities,
GLK-GCR Parameter Set,
MSCS Descriptor,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the association process.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.78	Indicates the preferred BSS max idle period parameters. This parameter is optionally present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or if dot11S1GOptionImplemented is true; otherwise not present.
ListenInterval	Integer	≥ 0	Specifies how often the STA awakens and listens for the next Beacon frame, if it enters power save mode.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Supported Channels	As defined in the Supported Channels element	As defined in the Supported Channels element	The list of channels in which the STA is capable of operating. Present if DFS functionality is required, as specified in 11.8; otherwise not present.
RSN	RSNE	As defined in 9.4.2.24	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 9.4.2.34	Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.4	The set of elements to be included in the initial mobility domain association request, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 9.4.2.53	Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
SM Power Save	Integer	As defined in Table 9-184	Indicates the spatial multiplexing power save mode that is in operation immediately after association.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 9.4.2.77	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise.
TIMBroadcastRequest	As defined in the TIM Broadcast Request element	As defined in 9.4.2.82	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise.
EmergencyServices	Boolean	true, false	Specifies that the non-AP STA intends to associate for the purpose of unauthenticated access to emergency services. The parameter is optionally present if dot11InterworkingServiceActivated is true and is not present otherwise.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
FILSHLPContainer	As defined in 9.4.2.183	As defined in 9.4.2.183	A set of elements containing encapsulated data of higher layer protocol frames (e.g., DHCP message) that is transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.184	As defined in 9.4.2.184	An explicit request for an IP address. The request is either for a new IP address or for a specified IP address. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
AID Request	AID Request element	As defined in 9.4.2.193	Indicates the device characteristic of the non-AP STA requesting AID assignment. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.199	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Indicates if the STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and the AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ReachableAddress	Reachable Address element	As defined in 9.4.2.205	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.234	This parameter is present if dot11GLKGCRImplemented is true and not present otherwise. Specifies the GLK-GCR capabilities supported by the STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.243	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Additional parameters needed to perform the association procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.7.2.3 When generated

This primitive is generated by the SME when a STA wishes to establish association with an AP or PCP.

6.3.7.2.4 Effect of receipt

This primitive initiates an association procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-ASSOCIATE.confirm primitive that reflects the results.

6.3.7.3 MLME-ASSOCIATE.confirm

6.3.7.3.1 Function

This primitive reports the results of an association attempt with a specified peer MAC entity that is in an AP or PCP.

6.3.7.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.confirm(
ResultCode,
CapabilityInformation,
AssociationID,
EDCAParameterSet,
RCPI of Request,
RSNI of Request,
RCPI of Response,
RSNI of Response,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
Extended Capabilities,
20/40 BSS Coexistence,
TimeoutInterval,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
QosMapSet,
QMFPolicy,
DMG Capabilities,
Multi-band local,
Multi-band peer,
MMS,

Copyright © 2021 IEEE. All rights reserved.

FILSHLPContainer,
FILSIPAddressAssignment,
KeyDelivery,
S1G Sector Operation,
S1G Capabilities,
AID Response,
TSF Timer Accuracy,
TWT,
Sectorized Group ID List,
MaxAwayDuration,
S1GRelayActivation,
S1GOperation,
SSTOperation,
S1GRelay,
HeaderCompression,
CDMG Capabilities,
CMMG Capabilities,
GLK-GCR Parameter Set,
MSCS Descriptor,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_ NOT_SUPPORTED, REFUSED_TEMPORARILY	Indicates the result of the MLME-ASSOCIATE.request primitive.
Capability-Information	Capability Information field	As defined in 9.4.1.4	Specifies the operational capabilities advertised by the AP or PCP.
AssociationID	Integer	Non-DMG: 1–2007 DMG: 1–254	If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned by the AP or PCP. This parameter is not present if dot11S1GOptionImplemented is true.
EDCAParameter Set	EDCA Parameter Set element	As defined in 9.4.2.28	Specifies the EDCA parameter set that the STA should use. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
RCPI of Request	Integer	As defined in 9.4.2.37	Indicates the RCPI value contained in the received Association Response frame. This value represents the RCPI that the AP or PCP measured at the time it received the corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI of Request	Integer	As defined in 9.4.2.40	Indicates the RSNI value contained in the received Association Response frame. This value represents the RSNI that the AP or PCP measured at the time it received the corresponding Association Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RCPI of Response	Integer	As defined in 9.4.2.37	The RCPI value represents the measured RCPI of the corresponding Association Response frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI of Response	Integer	As defined in 9.4.2.40	RSNI at the time the corresponding Association Response frame was receive. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.44	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.4	The set of elements included in the initial mobility domain association response, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.53	Indicates the supported operating classes of the AP or PCP. This parameter is optionally present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.26	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.59	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.
TimeoutInterval	Timeout Interval element, as defined in frame format	As defined in 9.4.2.48	This parameter is present when ResultCode is REFUSED_TEMPORARILY.
BSSMaxIdlePeriod	As defined in BSS Max Idle Period element	As defined in 9.4.2.78	Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented is true and is not present otherwise.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 9.4.2.83	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 9.4.2.94	Specifies the QoS Map the non-AP and non-PCP STA should use.
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	The values from the QMF Policy element if such an element was present in the Association Response frame; otherwise, null.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.127	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify and are supported by the local MAC entity. The parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify and are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.

Name	Type	Valid range	Description
FILSHLPContainer	As defined in 9.4.2.183	As defined in 9.4.2.183	A set of elements containing encapsulated data of higher layer protocol (HLP) frames (e.g., DHCP message) that is transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.184	As defined in 9.4.2.184	The IP address of a network layer entity associated with the STA. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
KeyDelivery	As defined in 9.4.2.185	As defined in 9.4.2.185	The KDE(s) and the Key RSC. The parameter is present if dot11FILSActivated is true; otherwise not present.
S1G Sector Operation	S1G Sector Operation element	As defined in 9.4.2.195	Specifies the sectorization scheme, period, subperiod sector intervals, and sector training.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	Specifies the parameters in the S1G Capabilities element that are supported by the AP. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the Association Response frame received from the AP; otherwise not present.
AID Response	AID Response element	As defined in 9.4.2.194	Parameters describing an AID assignment. This parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.203	Indicates the information about the TSF timer accuracy. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.199	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.211	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Indicates if the STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and the AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.212	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.214	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.204	Indicates the support of the relay operation by the STA transmitting the element.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.

Name	Type	Valid range	Description
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.234	Specifies the values from the GLK-GCR Parameter Set element if such an element was present in the Association Response frame, otherwise null.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.243	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.7.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ASSOCIATE.request primitive or receipt of an Association Response frame from the peer MAC entity to associate with a specified peer MAC entity that is in an AP or PCP.

6.3.7.3.4 Effect of receipt

The SME is notified of the results of the association procedure.

6.3.7.4 MLME-ASSOCIATE.indication

6.3.7.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting association with the local MAC entity, which is in an AP or PCP.

6.3.7.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.indication(
PeerSTAAddress,
CapabilityInformation,
BSSMaxIdlePeriod,
ListenInterval,
SSID,
OperationalRateSet,
BSSMembershipSelectorSet,
RSN,
QoSCapability,
RCPI,
RSNI,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
DSERegisteredLocation,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
QoSTrafficCapability,
TIMBroadcastRequest,

GLK-GCR Parameter Set,
MSCS Descriptor,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the association was received.
Capability-Information	Capability Information field	As defined in 9.4.1.4	Specifies the operational capability definitions provided by the peer MAC entity as part of the association request.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.78	Indicates the preferred BSS max idle period parameters. This parameter is optionally present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAP STA are true, or if dot11S1GOptionImplemented is true; otherwise not present.
ListenInterval	Integer	≥ 0	Specifies the listen interval provided by the peer MAC entity as part of the association request.
SSID	Octet string	0–32 octets	Specifies the SSID provided by the peer MAC entity as part of the association request.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: 1-127 excluding values from Table 9-93 for each member of the set DMG BSS: 0-12, 9.1, 12.1-12.6, or 25-31, for each member of the set	The set of data rates (in units of 500 kb/s) that the STA that is requesting association is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indexes that the AP or PCP uses for communication within the BSS.
BSSMembershipSelectorSet	Set of integers	A value from Table 9-93, for each member of the set	The set of features that the STA that is requesting association is able to use for communication
RSN	RSNE	As defined in 9.4.2.24	A description of the cipher suites and AKM suites selected by the STA.

Name	Type	Valid range	Description
QoSCapability	QoS Capability element	As defined in 9.4.2.34	Specifies the parameters within the QoSCapability that are supported by the peer MAC entity. The parameter is optionally present if dot11QosOptionImplemented is true; otherwise not present.
RCPI	Integer	As defined in 9.4.2.37	The RCPI value represents the measured RCPI of the corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI	Integer	As defined in 9.4.2.40	The RSNI value represents the measured RSNI at the time the corresponding Association Request frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.44	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.4	The set of elements included in the initial mobility domain association, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.53	Indicates the supported operating classes of the STA. This parameter is optionally present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 9.4.2.51	Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present if dot11LCIDSERequired is true; otherwise not present.
HT Capabilities	As defined in frame format	As defined in 9.4.2.55	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.26	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.59	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 9.4.2.77	Specifies the QoS Traffic Capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 9.4.2.82	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
EmergencyServices	Boolean	true, false	Specifies the setting of the UESA field received from the non-AP and non-PCP STA, if an Interworking element was present in the Association Request frame. The parameter is present if dot11InterworkingServiceActivated is true; otherwise not present.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.127	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify and are supported by the local MAC entity. The parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify and are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.157	Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and the VHT Capabilities element is present in the Association Request frame received from the STA. The parameter is not present otherwise.
FILSHLPContainer	As defined in 9.4.2.183	As defined in 9.4.2.183	A set of elements containing encapsulated data of higher layer protocol frames (e.g., DHCP message) that is transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.184	As defined in 9.4.2.184	An explicit request for an IP address. The request is for a new IP address or a specified IP address. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
AID Request	AID Request element	As defined in 9.4.2.193	Indicates the device characteristic of the non-AP STA requesting AID assignment. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	Specifies the parameters in the S1G Capabilities element that are supported by the STA. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the Association Request frame received from the STA; otherwise not present.
TWT	TWT element	As defined in 9.4.2.199	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Indicates if the STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and the AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ReachableAddress	Reachable Address element	As defined in 9.4.2.205	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219.	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229.	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.234	Specifies the values from the GLK-GCR Parameter Set element if such an element was present in the Association Request frame, otherwise not present.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.243	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.7.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an association request from a specific peer MAC entity.

6.3.7.4.4 Effect of receipt

The SME is notified of the receipt of the association request.

Copyright © 2021 IEEE. All rights reserved.

6.3.7.5 MLME-ASSOCIATE.response

6.3.7.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested an association with the STA that issued this primitive, which is in an AP or PCP.

6.3.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.response(
PeerSTAAddress,
ResultCode,
AssociationID,
RCPI,
RSNI,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
TimeoutInterval,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
QoSMapSet,
Multi-band local,
Multi-band peer,
MMS,
FILSHLPContainer,
FILSIPAddressAssignment,
KeyDelivery,
S1G Sector Operation,
S1G Capabilities,
AID Response,
TSF Timer Accuracy,
TWT,
Sectorized Group ID List,
MaxAwayDuration,
S1GRelay,
S1GRelayActivation,
S1GOperation,
HeaderCompression,
SSTOperation,
CDMG Capabilities,
CMMG Capabilities,
GLK-GCR Parameter Set,
MSCS Descriptor,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the association request was received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY, GLK_NOT_AUTHORIZED	Indicates the result response to the association request from the peer MAC entity.
AssociationID	Integer	Non-DMG: 1–2007 DMG: 1–254	If the association request result was SUCCESS and dot11S1GOptionImplemented is not true, then AssociationID specifies the association ID value assigned to the peer MAC entity by the AP or PCP; otherwise not present.
RCPI	Integer	As defined in 9.4.2.37	The RCPI value represents the measured RCPI of the corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI	Integer	As defined in 9.4.2.40	The RSNI value represents the measured RSNI at the time the corresponding Association Request frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.44	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.4	The set of elements to be included in the initial mobility domain association response, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.53	Specifies the supported operating classes of the AP or PCP. This parameter is present if dot11ExtendedChannelSwitchActivated ot dot11OperatingClassesRequired is true; otherwise not present.
TimeoutInterval	Timeout Interval element, as defined in frame format	As defined in 9.4.2.48	This parameter is present when ResultCode is REFUSED_TEMPORARILY.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.78	Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented is true or dot11S1GOptionImplemented is true; otherwise not present.(
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 9.4.2.83	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 9.4.2.94	Specifies the QoS Map the non-AP and non-PCP STA should use.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity, and negotiated for the association. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.183	As defined in 9.4.2.183	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.184	As defined in 9.4.2.184	The IP address of a network layer entity associated with the STA. The parameter is optionally present if dot11FILSActivated is true; otherwise not present
KeyDelivery	As defined in 9.4.2.185	As defined in 9.4.2.185	KDE(s) and the current Key RSC. The parameter is present if dot11FILSActivated is true; otherwise not present.
S1G Sector Operation	S1G Sector Operation element	As defined in 9.4.2.195	Specifies the sectorization scheme, period, subperiod sector intervals, and sector training.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	Specifies the parameters in the S1G Capabilities element that are supported by the AP. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the Association Response frame received from the AP; otherwise not present.
AID Response	AID Response element	As defined in 9.4.2.194	Parameters describing an AID assignment. This parameter is present if dot11S1GOptionImplemented is true; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.203	Indicates the information about the TSF timer accuracy. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.199	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.211	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.204	Indicates the support of the relay operation by the STA transmitting the element.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Indicates if the STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and the AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.212	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.214	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219.	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229.	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.234	This parameter is present only if the AP selects GLK-GCR for groupcast (either unsolicited retry or block ack) over the general link. Describes the parameters that define how GLK-GCR operates.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.243	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Additional parameters needed to perform the association response procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.7.5.3 When generated

This primitive is generated by the SME of a STA that is in an AP or PCP as a response to an MLME-ASSOCIATE.indication primitive.

6.3.7.5.4 Effect of receipt

This primitive initiates transmission of an AssociationResponse to the specific peer MAC entity that requested association.

6.3.8 Reassociate

6.3.8.1 Introduction

The following primitives describe how a STA becomes associated with another AP or PCP.

6.3.8.2 MLME-REASSOCIATE.request

6.3.8.2.1 Function

This primitive requests a change in association to a specified new peer MAC entity that is in an AP or PCP.

6.3.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.request(
NewPCPorAPAddress,
BSSMaxIdlePeriod,
ListenInterval,
Supported Channels
RSN,
QoSCapability,
Content of FT Authentication elements,
SupportedOperatingClasses,
SM Power Save,
QoSTrafficCapability,
TIMBroadcastRequest,
FMSRequest,
DMSRequest,

Name	Type	Valid range	Description
NewPCPorAPAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the reassociation process.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.78	Indicates the preferred BSS max idle period parameters. This parameter is optionally present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or if dot11S1GOptionImplemented is true; otherwise not present.
ListenInterval	Integer	≥ 0	Specifies how often the STA awakens and listens for the next Beacon frame, if it enters power save mode.
Supported Channels	As defined in the Supported Channels element	As defined in the Supported Channels element	The list of channels in which the STA is capable of operating. Present if DFS functionality is required, as specified in 11.8; otherwise not present.
RSN	RSNE	As defined in 9.4.2.24	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 9.4.2.34	Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the third message of the FT authentication sequence, as described in 13.8.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 9.4.2.53	Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
SM Power Save	Integer	As defined in Table 9-184	Indicates the spatial multiplexing power save mode that is in operation immediately after reassociation.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 9.4.2.77	Specifies the QoS Traffic Capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 9.4.2.82	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise.
FMSRequest	As defined in FMS Request element	As defined in 9.4.2.75	Specifies the proposed multicast parameters for FMS Request. This parameter is optionally present if dot11FMSActivated is true and is not present otherwise.
DMSRequest	Sequence of DMS Request elements	As defined in 9.4.2.87	Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11DMSActivated is true and is not present otherwise.
EmergencyServices	Boolean	true, false	Specifies that the non-AP and non-PCP STA intends to reassociate for the purpose of unauthenticated access to emergency services. The parameter shall be present only if dot11InterworkingServiceActivated is true.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.183	As defined in 9.4.2.183	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) that is transported in FILS association. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Name	Type	Valid range	Description
FILSIPAddressAssignment	As defined in 9.4.2.184	As defined in 9.4.2.184	An explicit request for an IP address. The request may be for a new IP address or a specified IP address. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
AID Request	AID Request element	As defined in 9.4.2.193	Indicates the device characteristic of the non-AP STA requesting AID assignment. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.199	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.211	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Indicates if the STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and the AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ELOperation	EL Operation element	As defined in 9.4.2.210	The EL Operation element is optionally present if dot11S1GELOperationActivated is true; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.204	Specifies the parameters within the S1G Relay element that are supported by the MAC entity. The parameter is present if dot11RelaySTAImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
ReachableAddress	Reachable Address element	As defined in 9.4.2.205	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.212	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.214	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.

Name	Type	Valid range	Description
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.234	This parameter is present if dot11GLKGCRImplemented is true and not present otherwise. Specifies the GLK-GCR capabilities supported by the STA.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.243	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Additional parameters needed to perform the reassociation procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.8.2.3 When generated

This primitive is generated by the SME for a STA to change association to a specified new peer MAC entity that is in an AP or PCP.

6.3.8.2.4 Effect of receipt

This primitive initiates a reassociation procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-REASSOCIATE.confirm primitive that reflects the results.

6.3.8.3 MLME-REASSOCIATE.confirm

6.3.8.3.1 Function

This primitive reports the results of a reassociation attempt with a specified peer MAC entity that is in an AP or PCP.

6.3.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.confirm(
ResultCode,
CapabilityInformation,
AssociationID,
EDCAParameterSet,
RCPI of Request,
RSNI of Request,
RCPI of Response,
RSNI of Response,

Name	Type	Valid range	Description
Capability-Information	Capability Information field	As defined in 9.4.1.4	Specifies the operational capabilities advertised by the AP or PCP.
AssociationID	Integer	Non-DMG: 1–2007 DMG: 1–254	If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned by the AP or PCP. This parameter is not present if dot11S1GOptionImplemented is true.
EDCAParameterSet	EDCA Parameter Set element	As defined in 9.4.2.28	Specifies the EDCA parameter set that the STA should use. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
RCPI of Request	Integer	As defined in 9.4.2.37	Indicates the RCPI value contained in the received Reassociation Response frame. This value represents the RCPI that the AP or PCP measured at the time it received the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI of Request	Integer	As defined in 9.4.2.40	Indicates the RSNI value contained in the received Reassociation Response frame. This value represents the RSNI that the AP or PCP measured at the time it received the corresponding Reassociation Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RCPI of Response	Integer	As defined in 9.4.2.37	The RCPI value represents the measured RCPI of the corresponding Reassociation Response frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI of Response	Integer	As defined in 9.4.2.40	RSNI at the time the corresponding Reassociation Response frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.44	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the fourth message of the FT authentication sequence, as described in 13.8.5. This includes an optional response to a resource request (RIC). Present if dot11FastBSSTransitionActivated is true; otherwise not present.

Name	Type	Valid range	Description
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 9.4.2.53	Indicates the supported operating classes of the AP or PCP. This parameter is optionally present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.26	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.59	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagement Support is true.
TimeoutInterval	Timeout Interval element, as defined in frame format	As defined in 9.4.2.48	This parameter is present when ResultCode is REFUSED_TEMPORARILY.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.78	Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented is true or dot11S1GOptionImplemented is true; otherwise not present.
TIMBroadcastResp onse	As defined in TIM Broadcast Response element	As defined in 9.4.2.83	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
FMSResponse	As defined in FMS Response element	As defined in 9.4.2.76	Specifies the multicast parameters for FMS Response. This parameter is optionally present if dot11FMSActivated is true and the FMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
DMSResponse	Sequence of DMS Response elements	As defined in 9.4.2.88	Specifies the multicast parameters for DMS Response. This parameter is optionally present if dot11DMSActivated is true and the DMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 9.4.2.94	Specifies the QoS Map the non-AP and non-PCP STA should use.
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	Describes the QMF policy of the AP. This parameter is present when dot11QMFActivated is true and is not present otherwise.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.127	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.

Copyright © 2021 IEEE. All rights reserved.

Name	Type	Valid range	Description
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify and are supported by the local MAC entity. The parameter is present if OCT is being used and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify and are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
FILSHLPContainer	As defined in 9.4.2.183	As defined in 9.4.2.183	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) that is transported in FILS association. The parameter is present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.184	As defined in 9.4.2.184	The IP address assigned to the STA for higher layer communication. The parameter is present if dot11FILSActivated is true; otherwise not present.
KeyDelivery	As defined in 9.4.2.185	As defined in 9.4.2.185	KDE(s) and the current Key RSC. The parameter is present if dot11FILSActivated is true; otherwise not present.
S1G Sector Operation	S1G Sector Operation element	As defined in 9.4.2.195	Specifies the sectorization scheme, period, subperiod sector intervals, sector training.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	Specifies the parameters in the S1G Capabilities element that are supported by the AP. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the (Re)Association Response frame received from the AP; otherwise not present.
AID Response	AID Response element	As defined in 9.4.2.194	Parameters describing an AID assignment. This parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.203	Indicates the information about the TSF Timer Accuracy. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.199	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Indicates if the STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and the AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ELOperation	EL Operation element	As defined in 9.4.2.210	The EL Operation element is optionally present if dot11S1GELOperationActivated is true; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.204	Specifies the parameters within the S1G Relay element that are supported by the MAC entity. The parameter is present if dot11RelaySTAImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.212	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
SectorizedGroupID List	Sectorized Group ID List element	As defined in 9.4.2.211	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.214	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.234	Specifies the values from the GLK-GCR Parameter Set element if such an element was present in the Reassociation Response frame, otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Name	Type	Valid range	Description
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.243	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.8.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-REASSOCIATE.request primitive to reassociate with a specified peer MAC entity that is in an AP or PCP.

6.3.8.3.4 Effect of receipt

The SME is notified of the results of the reassociation procedure.

6.3.8.4 MLME-REASSOCIATE.indication

6.3.8.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting reassociation with the local MAC entity, which is in an AP or PCP.

6.3.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.indication(
PeerSTAAddress,
CurrentAPAddress,
CapabilityInformation,
BSSMaxIdlePeriod,
ListenInterval,
SSID,
OperationalRateSet,
BSSMembershipSelectorSet,
RSN,

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the reassociation request was received.
CurrentAPAddress	MAC address	Any valid individual MAC address	Specifies the address of the AP or PCP with which the peer STA is currently associated.
Capability-Information	Capability Information field	As defined in 9.4.1.4	Specifies the operational capability definitions provided by the peer MAC entity as part of the reassociation request.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.78	Indicates the preferred BSS max idle period parameters. This parameter is optionally present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or if dot11S1GOptionImplemented is true; otherwise not present.
ListenInterval	Integer	≥ 0	Specifies the listen interval provided by the peer MAC entity as part of the reassociation request.
SSID	Octet string	0–32 octets	Specifies the desired SSID provided by the peer MAC entity as part of the reassociation request.

Name	Type	Valid range	Description
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: 1–127 excluding values from Table 9-93 for each member of the set DMG BSS: 0–12, 9.1, 12.1–12.6, or 25–31, for each member of the set	The set of data rates (in units of 500 kb/s) that the STA that is requesting association is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indexes that the AP or PCP uses for communication within the BSS.
BSSMembershipSelectorSet	Set of integers	A value from Table 9-93, for each member of the set	The set of features that the STA that is requesting association is able to use for communication.
RSN	RSNE	As defined in 9.4.2.24	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 9.4.2.34	Specifies the parameters within the QoS Capability that are supported by the peer MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present.
RCPI	Integer	As defined in 9.4.2.37	The RCPI value represents the measured RCPI of the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI	Integer	As defined in 9.4.2.40	The RSNI value represents the measured RSNI at the time the corresponding Reassociation Request frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.44	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the third message of the FT authentication sequence, as described in 13.8.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 9.4.2.53	Indicates the supported operating classes of the STA. This parameter is optionally present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 9.4.2.51	Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present if dot11LCIDSERequired is true; otherwise not present.

Name	Type	Valid range	Description
HT Capabilities	As defined in frame format	As defined in 9.4.2.55	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.26	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.59	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 9.4.2.77	Specifies the QoS Traffic Capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 9.4.2.82	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise.
FMSRequest	As defined in FMS Request element	As defined in 9.4.2.75	Specifies the proposed multicast parameters for FMS Request. This parameter is optionally present if dot11FMSActivated is true and is not present otherwise.
DMSRequest	Sequence of DMS Request elements	As defined in 9.4.2.87	Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11DMSActivated is true and is not present otherwise.
EmergencyServices	Boolean	true, false	Specifies the setting of the UESA field received from the non-AP and non-PCP STA, if an Interworking element was present in the Reassociation Request frame. The parameter is present if dot11InterworkingServiceActivated is true; otherwise not present.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.127	Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that identify the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the peer MAC entity. This parameter is present if OCT is being used and is absent otherwise.

Name	Type	Valid range	Description
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.157	Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and the VHT Capabilities element is present in the Reassociation Request frame received from the STA. The parameter is not present otherwise.
FILSHLPContainer	As defined in 9.4.2.183	As defined in 9.4.2.183	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) that is transported in FILS reassociation. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.184	As defined in 9.4.2.184	An explicit request for an IP address. The request may be for a new IP address or a specified IP address. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
AID Request	AID Request element	As defined in 9.4.2.193	Indicates the device characteristic of the non-AP STA requesting AID assignment. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	Specifies the parameters in the S1G Capabilities element that are supported by the STA. The parameter is present if dot11S1GOptionImplemented is true and the S1G Capabilities element is present in the Reassociation Request frame received from the STA; otherwise not present.
TWT	TWT element	As defined in 9.4.2.199	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.211	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Indicates if the STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and the AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
ELOperation	EL Operation element	As defined in 9.4.2.210	The EL Operation element is optionally present if dot11S1GELOperationActivated is true; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.204	Specifies the parameters within the S1G Relay element that are supported by the MAC entity. The parameter is present if dot11RelaySTAImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
ReachableAddress	Reachable Address element	As defined in 9.4.2.205	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.212	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.214	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.234	The GLK-GCR Parameter Set element from the received Reassociation Request frame.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.243	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.8.4.3 When generated

This primitive is generated by the MLME as a result of the establishment of a reassociation with a specific peer MAC entity that resulted from a reassociation procedure that was initiated by that specific peer MAC entity.

6.3.8.4.4 Effect of receipt

The SME is notified of the establishment of the reassociation.

6.3.8.5 MLME-REASSOCIATE.response

6.3.8.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested a reassociation with the STA that issued this primitive, which is in an AP or PCP.

6.3.8.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.response(
PeerSTAAddress,
ResultCode,
AssociationID,
RCPI,
RSNI,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
TimeoutInterval,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
FMSResponse,
DMSResponse,
QoSMapSet,
Multi-band local,
Multi-band peer,
MMS,
FILSHLPContainer,
FILSIPAddressAssignment,
KeyDelivery,
S1G Sector Operation,
S1G Capabilities,
AID Response,
TSF Timer Accuracy,
TWT,
Sectorized Group ID List,
MaxAwayDuration,
S1GRelay,
S1GRelayActivation,
S1GOperation,
HeaderCompression,
SSTOperation,
CDMG Capabilities,

CMMG Capabilities,
GLK-GCR Parameter Set,
MSCS Descriptor,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the reassociation request was received.
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY	Indicates the result response to the reassociation request from the peer MAC entity.
AssociationID	Integer	Non-DMG: 1–2007 DMG: 1–254	If the reassociation request result was SUCCESS, then AssociationID specifies the association ID value assigned to the peer MAC entity by the AP or PCP. This parameter is not present if dot11S1GOptionImplemented is true.
RCPI	Integer	As defined in 9.4.2.37	The RCPI value represents the measured RCPI of the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present.
RSNI	Integer	As defined in 9.4.2.40	The RSNI value represents the measured RSNI at the time the corresponding Reassociation Request frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 9.4.2.44	Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the fourth message of the FT authentication sequence, as described in 13.8.5. This includes an optional response to a resource request (RIC). Present if dot11FastBSSTransitionActivated is true; otherwise not present.

Name	Type	Valid range	Description
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 9.4.2.53	Specifies the supported operating classes of the AP or PCP. This parameter is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true; otherwise not present.
TimeoutInterval	Timeout Interval element, as defined in frame format	As defined in 9.4.2.48	This parameter is present when ResultCode is REFUSED_TEMPORARILY.
BSSMaxIdlePeriod	BSS Max Idle Period element	As defined in 9.4.2.78	Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented is true or dot11S1GOptionImplemented is true; otherwise not present.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 9.4.2.83	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
FMSResponse	As defined in FMS Response element	As defined in 9.4.2.76	Specifies the multicast parameters for FMS Response. This parameter is optionally present if dot11FMSActivated is true and the FMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
DMSResponse	Sequence of DMS Response elements	As defined in 9.4.2.88	Specifies the multicast parameters for DMS Response. This parameter is optionally present if dot11DMSActivated is true and the DMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 9.4.2.94	Specifies the QoS Map the non-AP and non-PCP STA should use.
Multi-band local	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
Multi-band peer	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are used to deliver messages to the peer MAC entity. The parameter is present if OCT is being used and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity, and negotiated for the association. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.

Name	Type	Valid range	Description
FILSHLPContainer	As defined in 9.4.2.183	As defined in 9.4.2.183	A set of elements containing encapsulated data of higher layer protocol frames (e.g., a DHCP message) that is transported in FILS reassociation. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
FILSIPAddressAssignment	As defined in 9.4.2.184	As defined in 9.4.2.184	The IP address of a network layer entity associated with the STA. The parameter is optionally present if dot11FILSActivated is true; otherwise not present.
KeyDelivery	As defined in 9.4.2.185	As defined in 9.4.2.185	KDE(s) and the current Key RSC. The parameter is present if dot11FILSActivated is true; otherwise not present.
S1G Sector Operation	S1G Sector Operation element	As defined in 9.4.2.195	Specifies the sectorization scheme, period, subperiod sector intervals, and sector training.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	Specifies the parameters in the S1G Capabilities element that are supported by the STA. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
AID Response	AID Response element	As defined in 9.4.2.194	Parameters describing an AID assignment. This parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
TSF Timer Accuracy	TSF Timer Accuracy element	As defined in 9.4.2.203	Indicates the information about the TSF timer accuracy. The parameter is optionally present if dot11TSFTimerAccuracyImplemented is true; otherwise not present.
TWT	TWT element	As defined in 9.4.2.199	Specifies the parameters in the TWT element. This parameter is optionally present if dot11TWTOptionActivated is true; otherwise not present.
Sectorized Group ID List	Sectorized Group ID List element	As defined in 9.4.2.211	Specifies the parameters in the Sectorized Group ID List element. This parameter is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
MaxAwayDuration	Integer	0–65 535	Indicates the maximum duration, in TUs, that the AP is unavailable for communications with the STA. The parameter is optionally present if dot11MaxAwayDuration is nonzero; otherwise not present.
S1GRelay	S1G Relay element	As defined in 9.4.2.204	Indicates the support of the relay operation by the STA transmitting the element.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Indicates if the STA with dot11RelaySTAImplemented equal to true requests to operate as a relay (in a request) and the AP with dot11RelayAPImplemented equal to true requests/confirms operation as a relay. The parameter is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
S1GOperation	S1G Operation element	As defined in 9.4.2.212	Provides additional information for operating the S1G BSS. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true; otherwise not present.
SSTOperation	SST Operation element	As defined in 9.4.2.214	The SST Operation element is optionally present if dot11SelectiveSubchannelTransmissionPermitted is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true; otherwise not present.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229.	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
GLK-GCR Parameter Set	GLK-GCR Parameter Set element	As defined in 9.4.2.234	This parameter is present only if the AP selects GLK-GCR for groupcast (either unsolicited retry or block ack) over the general link. Describes the parameters that define how GLK-GCR operates.
MSCS Descriptor	As defined in the MSCS Descriptor element	As defined in 9.4.2.243	The parameters used to classify streams using the procedures defined in 11.25.3. Optionally present if dot11MSCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Additional parameters needed to perform the reassociation response procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.8.5.3 When generated

This primitive is generated by the SME of a STA that is in an AP or PCP as a response to an MLME-REASSOCIATE.indication primitive.

6.3.8.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested reassociation.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.9 Disassociate

6.3.9.1 MLME-DISASSOCIATE.request

6.3.9.1.1 Function

This primitive requests disassociation with a specified peer MAC entity.

6.3.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DISASSOCIATE.request(
PeerSTAAddress,
ReasonCode,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the disassociation process.
ReasonCode	Reason Code field	As defined in 9.4.1.7	Specifies the reason for initiating the disassociation procedure.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.9.1.3 When generated

This primitive is generated by the SME for a STA to disassociate from a STA with which it has an association.

6.3.9.1.4 Effect of receipt

This primitive initiates a disassociation procedure. The MLME subsequently issues an MLME-DISASSOCIATE.confirm primitive that reflects the results.

6.3.9.2 MLME-DISASSOCIATE.confirm

6.3.9.2.1 Function

This primitive reports the results of a disassociation procedure with a specific peer MAC entity.

6.3.9.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DISASSOCIATE.confirm()

6.3.9.2.3 When generated

This primitive is generated by the MLME as a result of an MLME-DISASSOCIATE.request primitive to disassociate with a specified peer MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.9.2.4 Effect of receipt

The SME is notified of the results of the disassociation procedure.

6.3.9.3 MLME-DISASSOCIATE.indication

6.3.9.3.1 Function

This primitive reports disassociation with a specific peer MAC entity.

6.3.9.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.indication(
                                    PeerSTAAddress,
                                    ReasonCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the association relationship was invalidated.
ReasonCode	Reason Code field	As defined in 9.4.1.7	Specifies the reason the disassociation procedure was initiated.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.9.3.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an association relationship with a specific peer MAC entity.

6.3.9.3.4 Effect of receipt

The SME is notified of the invalidation of the specific association relationship.

6.3.10 Reset

6.3.10.1 Introduction

This mechanism supports the process of resetting the MAC.

6.3.10.2 MLME-RESET.request

6.3.10.2.1 Function

This primitive requests that the MAC entity be reset.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.10.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RESET.request(
STAAddress,
SetDefaultMIB
)

Name	Type	Valid range	Description
STAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address that is to be used by the MAC entity that is being reset. This value can be used to provide a locally administered STA address.
SetDefaultMIB	Boolean	true, false	If true, all MIB attributes are set to their default values. The default values are implementation dependent. If false, the MAC is reset, but all MIB attributes retain the values that were in place prior to the generation of the MLME-RESET.request primitive.

6.3.10.2.3 When generated

This primitive is generated by the SME to reset the MAC to initial conditions. The MLME-RESET.request primitive shall be used prior to use of the MLME-START.request primitive. The MLME-RESET.request primitive shall be used prior to the first use of the MLME-JOIN.request primitive, or any time a STA's state is to be reinitialized.

6.3.10.2.4 Effect of receipt

This primitive sets the MAC to initial conditions, clearing all MAC variables to the default values. MIB attributes can be reset to their implementation dependent default values by setting the SetDefaultMIB flag to true.

If dot11OCBActivated is true and if the SetDefaultMIB parameter is false, MAC operation shall resume in less than 2 TU after the STAAddress parameter is changed.

6.3.11 Start

6.3.11.1 Introduction

This mechanism supports the process of starting a new BSS or becoming a member of an MBSS.

6.3.11.2 MLME-START.request

6.3.11.2.1 Function

This primitive requests that the MAC entity start a new BSS or become a member of an MBSS.

6.3.11.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-START.request(
SSID,
BSSType,
BeaconPeriod,

Copyright © 2021 IEEE. All rights reserved.

ServiceHint,
ServiceHash,
VendorSpecificInfo
)

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	The SSID of the BSS.
BSSType	Enumeration	INFRASTRUCTURE, INDEPENDENT, MESH, PERSONAL	The type of the BSS.
Beacon Period	Integer	≥ 1	The beacon period (in TU) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType is MESH.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DTIM Period	Integer	As defined in 9.4.2.5	The DTIM Period (in beacon periods) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType is MESH.
PHY parameter sets	DSSS Parameter Set element	As defined in 9.4.2.4	The parameter sets relevant to the PHY.
IBSS parameter set	IBSS Parameter Set element	As defined in 9.4.2.6	The parameter set for the IBSS, if BSS is an IBSS.
NAVSyncDelay	Integer	N/A	Delay (in microseconds) to be used, while the STA is a member of this BSS, prior to transmitting when changing from doze to awake state, if no frame is detected by which the NAV can be set.
CapabilityInformation	Capability Information field	As defined in 9.4.1.4	The STA capabilities to be advertised for the BSS.
BSSBasicRateSet	Set of integers	Non-DMG BSS: a value in both dot11SupportedDataRatesRxTable and dot11SupportedDataRatesTxTable for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that all STAs in the BSS are able to use for communication. All STAs in the BSS, including the STA that is starting the BSS, are able to receive and transmit at each of the data rates listed in the set. DMG BSS: Empty.
OperationalRateSet	Non-DMG BSS: Set of integers DMG BSS: Set of numbers	Non-DMG BSS: a value in dot11SupportedDataRatesRxTable for each member of the set DMG BSS: 0-12, 9.1, 12.1-12.6, or 25-31, for each member of the set	Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the STA is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indexes that the STA uses for communication within the BSS.
Country	As defined in the Country element	As defined in the Country element	The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present if TPC functionality is required, as specified in 11.7 or dot11MultiDomainCapabilityActivated is true; otherwise not present.
IBSS DFS Recovery Interval	Integer	1–255	The time interval that is used for DFS recovery. Present if DFS functionality is required, as specified in 11.8 and BSSType = INDEPENDENT; otherwise not present.
EDCAParameterSet (QoS only)	EDCA Parameter Set element	As defined in 9.4.2.28	The initial EDCA parameter set values to be used in the BSS. The parameter is present if dot11QosOptionImplemented is true and dot11MeshActivated is true; otherwise not present.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 9.4.2.51	The information for the DSE Registered Location element. The parameter is present if dot11LCIDSERequired is true.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
HT Capabilities	As defined in frame format HT Capabilities element	As defined in 9.4.2.55; the HT-MCSs in the element are present in dot11SupportedHTMCSRxTable and the highest supported data rate in the element does not exceed dot11HighestSupportedDataRate	The STA's HT capabilities to be advertised for the BSS. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present.
HT Operation	As defined in frame format HT Operation element	As defined in 9.4.2.56; the HT-MCSs in the element are present in both dot11SupportedHTMCSRxTable and dot11SupportedHTMCSTxTable	Provides additional information for operating the HT BSS. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present.
BSSMembershipSelectorSet	Set of integers	A value from Table 9-93 for each member of the set	The set of features that are supported by all STAs in the BSS, including the STA that is starting the BSS.
Extended Capabilities	As defined in frame format	As defined in 9.4.2.26	Specifies the parameters within the Extended Capabilities element to be advertised for the BSS.
20/40 BSS Coexistence	As defined in frame format	As defined in 9.4.2.59	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.
Overlapping BSS Scan Parameters	As defined in frame format	As defined in 9.4.2.58	Specifies the parameters within the Overlapping BSS Scan Parameters element that are indicated by the MAC entity. This parameter is optionally present if dot11FortyMHzOptionImplemented is true; otherwise, it is not present.
MultipleBSSID	As defined in Multiple BSSID element in 9.4.2.45	As defined in Multiple BSSID element in 9.4.2.45	This element is optionally present when dot11RMMeasurementPilotActivated is a value between 2 and 7 and the AP is a member of a multiple BSSID set (see 11.10.14) with two or more members, or if dot11MultiBSSIDImplemented is true. This element is present when dot11FILSActivated is true and the AP is a member of a Multiple BSSID Set with two or more members.
InterworkingInfo	As defined in frame format	As defined in Interworking element in 9.4.2.91	Specifies the Interworking capabilities of STA. This field is present when dot11InterworkingServiceActivated is true.
AdvertisementProtocolInfo	Integer or Sequence of integers	As defined in Advertisement Protocol element in Table 9-237	Identifies zero or more advertisement protocols and advertisement control to be used in the BSSs. This field is present when dot11InterworkingServiceActivated is true.
RoamingConsortiumInfo	As defined in frame format	As defined in roaming consortium element in 9.4.2.95	Specifies identifying information for SSPs whose security credentials can be used to authenticate with the AP. This field is optionally present when dot11InterworkingServiceActivated is true.

Name	Type	Valid range	Description
Mesh ID	Octet string	0–32 octets	The value of MeshID. This element is present if the BSSType = MESH; otherwise not present.
Mesh Configuration	As defined in frame format	As defined in 9.4.2.97	Specifies the configuration of the mesh STA. This element is present if the BSSType = MESH; otherwise not present.
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	This element is present when dot11QMFActivated is true and BSSType = INFRASTRUCTURE or MESH, and it is not present otherwise. The element is provided by the SME to signal to the MLME the QMF policy to be used for this BSS.
DMG Capabilities	DMG Capabilities element	As defined in 9.4.2.127	Specifies the parameters within the DMG Capabilities element to be advertised for the BSS. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the parameters within the Multi-band element that are supported by the MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise.
DMG Operation	DMG Operation element	As defined in 9.4.2.127	Provides additional information for operating the DMG BSS. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise.
Clustering Control	Clustering Control field	As defined in 9.3.4.2	Specifies the parameters within the Clustering Control field that are supported by the MAC entity. The parameter is present if dot11ClusteringActivated is true and is absent otherwise.
CBAP Only	Integer	0 or 1	Specifies the setting of the CBAP Only field as defined in 9.3.4.2
PCP Association Ready	Integer	0 or 1	Specifies the setting of the PCP Association Ready field as defined in 9.3.4.2
VHT Capabilities	As defined in VHT Capabilities element	As defined in 9.4.2.157; the VHT-MCSs in the element are present in dot11VHTRxVHTMCSMap/ dot11VHTTxVHTMCSMap and the highest supported data rates in the element do not exceed dot11VHTRxHighestDataRateSupported/ dot11VHTTxHighestDataRateSupported	Specifies the parameters in the VHT Capabilities element to be advertised for the BSS. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
VHT Operation	As defined in VHT Operation element	As defined in 9.4.2.158; the VHT-MCSs in the element are present in both dot11VHTRxVHTMCSMap and dot11VHTTxVHTMCSMap	Provides additional information for operating the VHT BSS. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise.
Known OUIs	A set of OUIs, each of which is defined in 9.4.1.31	N/A	Zero or more OUIs that specify the OUIs considered known by the AP, in the context of determining if it should respond to certain Probe Request frames, as defined in 11.1.4.3.4.
S1G Capabilities	As defined in frame format	As defined in 9.4.2.200	Specifies the parameters in the S1G Capabilities element to be advertised for the BSS. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
S1GOperation	As defined in frame format	As defined in 9.4.2.212	Provides additional information for operating the S1G BSS. The parameter is present if dot11S1GOptionImplemented is true; otherwise not present.
ShortBeaconPeriod	As defined in frame format	As defined in 9.4.2.197	Provides the short beacon period of the S1G BSS. The parameter is present if dot11ShortBeaconInterval is true; otherwise not present.
ShortBeaconDTIMPeriod	As defined in frame format	As defined in 9.4.2.5	Provides the DTIM period (in short beacon periods) of the S1G BSS. The parameter is present if dot11ShortBeaconInterval is true; otherwise not present.
CDMG Capabilities	CDMG Capabilities element	As defined in 9.4.2.219	Specifies the parameters within the CDMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CDMGOptionImplemented is true.
CMMG Capabilities	CMMG Capabilities element	As defined in 9.4.2.229	Specifies the parameters within the CMMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true and is absent otherwise.
CMMG Operation	CMMG Operation element	As defined in 9.4.2.230.	Specifies the parameters within the CMMG Operation element that are supported by the MAC entity. The parameter is present if dot11CMMGOptionImplemented is true; otherwise not present.
ServiceHint	Service Hint element	As defined in 9.4.2.237	Provides an indication of the services advertised in Beacon and Probe Response frames. The element is optionally present if dot11UnsolicitedPADActivated is true and absent otherwise.
ServiceHash	Service Hash element	As defined in 9.4.2.238	Specifies services advertised in Beacon and Probe Response frames. The element is optionally present if dot11UnsolicitedPADActivated is true and absent otherwise.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.11.2.3 When generated

This primitive is generated by the SME to start an infrastructure BSS (with the MAC entity within an AP), an IBSS (with the MAC entity acting as the first STA in the IBSS), or an MBSS (with the MAC entity acting as the first mesh STA in the MBSS) or to become a member of an existing MBSS or a PBSS (with the MAC entity within a PCP). In an MBSS, this primitive starts the process of mesh beaconing.

The MLME-START.request primitive in an MBSS shall be generated before any synchronization or mesh peering have been attempted.

The MLME-START.request primitive shall not be used after successful use of the MLME-START.request primitive or successful use of the MLME-JOIN.request primitive without generating an intervening MLME-RESET.request primitive.

6.3.11.2.4 Effect of receipt

This primitive initiates the BSS initialization procedure once the current frame exchange sequence is complete. The MLME subsequently issues an MLME-START.confirm primitive that reflects the results of the creation procedure.

If the MLME of a non-DMG STA receives an MLME-START.request primitive with a BSSBasicRateSet parameter containing any unsupported rates, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-START.request primitive with the Basic HT-MCS Set field of the HT Operation parameter containing any unsupported MCSs, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a VHT STA receives an MLME-START.request primitive with a Basic VHT-MCS And NSS Set field in the VHT Operation parameter containing any unsupported <VHT-MCS, NSS> tuple, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a CMMG STA receives an MLME-START.request primitive with a Basic CMMG-MCS and NSS Set field in the CMMG Operation parameter containing any unsupported <CMMG-MCS, NSS> tuple, the MLME response in the resulting MLME-START.confirm primitive contains a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a DMG STA receives an MLME-START.request primitive with a BSSBasicRateSet parameter containing any rates, or with the OperationalRateSet parameter containing any unsupported MCSs, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an S1G STA receives an MLME-START.request primitive with a Basic S1G-MCS and NSS Set field in the S1GOperation parameter containing any unsupported <S1G-MCS, NSS> tuple, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

6.3.11.3 MLME-START.confirm

6.3.11.3.1 Function

This primitive reports the results of a BSS creation procedure or a procedure to become a member of an MBSS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.11.3.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-START.confirm(
ResultCode
)

Name	Type	Valid range	resetDescription
ResultCode	Enumeration	SUCCESS, BSS_ALREADY_STARTED_OR_JOINED, RESET_REQUIRED_BEFORE_ START, NOT_SUPPORTED	Indicates the result of the MLME-START.request primitive.

6.3.11.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-START.request primitive to create a new BSS or to become a member of an MBSS.

6.3.11.3.4 Effect of receipt

The SME is notified of the results of the BSS creation procedure or a procedure to become a member of an MBSS.

6.3.12 Stop

6.3.12.1 General

This mechanism supports the process of terminating an existing BSS.

6.3.12.2 MLME-STOP.request

6.3.12.2.1 Function

This primitive requests that the MAC entity stop a BSS previously started by using an MLME-START.request primitive

6.3.12.2.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-STOP.request(
SSID
)

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	The SSID of the BSS to be stopped.

6.3.12.2.3 When generated

This primitive is generated by the SME to terminate an infrastructure BSS (with the MAC entity within an AP) or a PBSS (with the MAC entity within the PCP). The MLME-STOP.request primitive shall be generated only after successful use of an MLME-START.confirm primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The MLME-STOP termination procedure does not reset the MAC to initial conditions. An MLME-RESET.request primitive shall be issued prior to use of the MLME-START.request primitive and subsequent to the use of an MLME-STOP.request primitive.

The SME should notify associated non-AP STAs of imminent infrastructure BSS termination before issuing the MLME-STOP.request primitive. This can be done with the BSS transition management procedure, using the Termination information.

6.3.12.2.4 Effect of receipt

This primitive initiates the termination of the BSS. All services provided by the AP to an infrastructure BSS, including Beacon and Probe Response frame transmissions and access to the DS, are stopped by the termination. All STAs in an infrastructure BSS are deauthenticated by the termination. In a PBSS, all of the services provided by the PCP, including DMG Beacon frames, are stopped by the termination. All of the STAs in a PBSS have their RSNA unestablished by the termination.

6.3.13 Protocol layer model for spectrum management and radio measurement

The layer management extensions for measurement, TPC, and channel switching assume a certain partition of functionality between the MLME and SME. This partitioning assumes that policy decisions (e.g., regarding measurement and channel switching) reside in the SME, while the protocol for measurement, switch timing, and the associated frame exchanges resides within the MLME (see Figure 6-2).

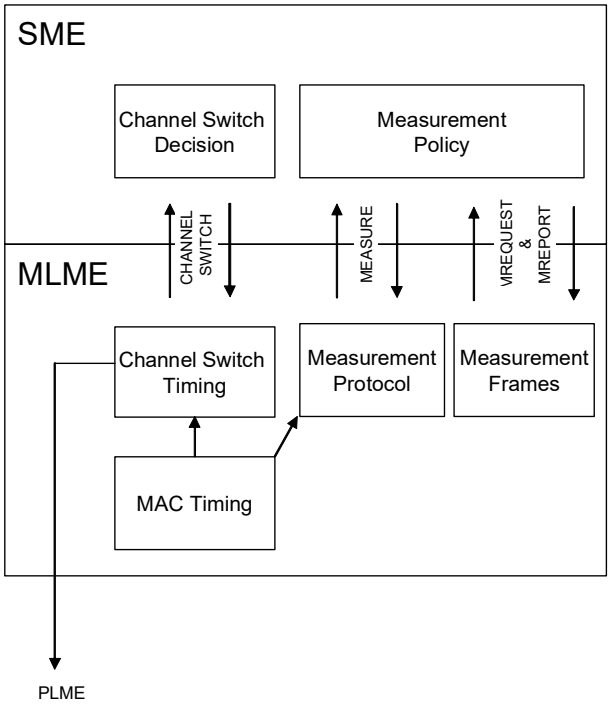

Figure 6-2—Layer management model

The diagrams within this subclause further illustrate the protocol layer model adopted. Figure 6-3 and Figure 6-4 depict the measurement process for a peer STA to accept and reject a measurement request, respectively. Figure 6-5 illustrates the TPC adaptation process. Lastly, Figure 6-6 depicts the management process for a channel switch using a Channel Switch Announcement frame.

Note that these diagrams are intended as examples and do not depict all possible protocol scenarios, e.g., a measurement request may result in more than one Spectrum or Radio Measurement Report frame as described in 11.8.7 and 11.10.

6.3.14 Measurement request

6.3.14.1 Introduction

This set of primitives supports the signaling of measurement requests between peer SMEs.

6.3.14.2 MLME-MREQUEST.request

6.3.14.2.1 Function

This primitive requests the transmission of a measurement request to a peer entity.

6.3.14.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MREQUEST.request(
Peer MAC Address,
Dialog Token,
Measurement Request Set,
Number of Repetitions,
Measurement Category,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual or group MAC address	The address of the peer MAC entity to which the measurement request is transmitted.
Dialog Token	Integer	1–255	The dialog token to identify the measurement transaction.
Measurement Request Set	Set of measurement requests, each as defined in the Measurement Request element format	Set of measurement requests, each as defined in 9.4.2.20	A set of measurement requests, each containing a measurement token, measurement request mode, measurement type, and measurement request.
Number of Repetitions	Integer	0–65 535	The number of times the Measurement Request Set is to be repeated. The parameter is present if Measurement Category is Radio Measurement and dot11RadioMeasurementActivated is true; otherwise not present.
Measurement Category	Enumeration	SPECTRUM MANAGEMENT, or RADIO MEASUREMENT	Indicates whether the contents of the Measurement Report Set parameter is a set of Spectrum Management requests or a set of Radio Measurement requests. The parameter is present if dot11RadioMeasurementActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.14.2.3 When generated

This primitive is generated by the SME to request that a Spectrum or Radio Measurement Request frame be sent to a peer entity to initiate one or more measurements.

6.3.14.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Spectrum or Radio Measurement Request frame containing the set of Measurement Request elements specified. This frame is then scheduled for transmission.

6.3.14.3 MLME-MREQUEST.indication

6.3.14.3.1 Function

This primitive indicates that a Spectrum or Radio Measurement Request frame has been received requesting the measurement of one or more channels.

6.3.14.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MREQUEST.indication(
Peer MAC Address,
Dialog Token,
Measurement Request Set,
Number of Repetitions,
Measurement Category,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the measurement request was received.
Dialog Token	Integer	1–255	The dialog token to identify the measurement transaction.
Measurement Request Set	Set of measurement requests, each as defined in the Measurement Request element format	Set of measurement requests, each as defined in 9.4.2.20	A set of measurement requests, each containing a Measurement Token, Measurement Request Mode, Measurement Type, and Measurement Request.
Number of Repetitions	Integer	0–65 535	The number of times the Measurement Request Set is to be repeated. The parameter is present if Measurement Category is Radio Measurement and dot11RadioMeasurementActivated is true; otherwise not present.
Measurement Category	Enumeration	SPECTRUM MANAGEMENT, or RADIO MEASUREMENT	Indicates whether the contents of the Measurement Report Set parameter is a set of Spectrum Management requests or a set of Radio Measurement requests. The parameter is present if dot11RadioMeasurementActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.14.3.3 When generated

This primitive is generated by the MLME when a Spectrum or Radio Measurement Request frame is received.

6.3.14.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the requested measurements.

6.3.15 Channel measurement

6.3.15.1 Introduction

This set of primitives supports the requesting and reporting of measurement data.

6.3.15.2 MLME-MEASURE.request

6.3.15.2.1 Function

This primitive is generated by the SME to request that the MLME initiate specified measurements.

6.3.15.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MEASURE.request(
                        Dialog Token,
                        Measurement Request Set
                        )
```

Name	Type	Valid range	Description
Dialog Token	Integer	0–255	The dialog token to identify the measurement transaction.
Measurement Request Set	Set of measurement requests, each as defined in the Measurement Request element	Set of measurement requests, each as defined in 9.4.2.20	A set of measurement requests, each containing a Measurement Token, Measurement Request Mode, Measurement Type, and Measurement Request.

6.3.15.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified measurements.

6.3.15.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the measurement process.

6.3.15.3 MLME-MEASURE.confirm

6.3.15.3.1 Function

This primitive reports the result of a measurement.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.15.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MEASURE.confirm(
Dialog Token,
Measurement Report Set,
)

Name	Type	Valid range	Description
Dialog Token	Integer	0–255	The dialog token to identify the measurement transaction.
Measurement Report Set	Set of measurement reports, each as defined in the Measurement Report element	Set of measurement reports, each as defined in 9.4.2.21	A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report.

6.3.15.3.3 When generated

This primitive is generated by the MLME to report the results when a measurement set completes.

6.3.15.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result code and, if appropriate, stores the channel measurements pending communication to the requesting entity or for local use.

6.3.16 Measurement report

6.3.16.1 Introduction

This set of primitives supports the signaling of measurement reports.

6.3.16.2 MLME-MREPORT.request

6.3.16.2.1 Function

This primitive supports the signaling of measurement reports between peer SMEs.

6.3.16.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MREPORT.request(
Peer MAC Address,
Dialog Token,
Measurement Report Set,
Measurement Category,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the measurement report is sent.
Dialog Token	Integer	0–255	The dialog token to identify the measurement transaction. Set to 0 for an autonomous report.
Measurement Report Set	Set of measurement reports, each as defined in the Measurement Report element format	Set of measurement reports, each as defined in 9.4.2.21	A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report.
Measurement Category	Enumeration	SPECTRUM MANAGEMENT, or RADIO MEASUREMENT	Indicates whether the Measurement Report Set is a set of Spectrum Management or Radio Measurement reports. The parameter is present if dot11RadioMeasurementActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.16.2.3 When generated

This primitive is generated by the SME to request that a frame be sent to a peer entity to report the results of measuring one or more channels.

6.3.16.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Spectrum or Radio Measurement Report frame containing the set of measurement reports. This frame is then scheduled for transmission.

6.3.16.3 MLME-MREPORT.indication

6.3.16.3.1 Function

This primitive indicates that a Spectrum or Radio Measurement Report frame has been received from a peer entity. This management report is either a response to an earlier measurement request (e.g., MLME-MREQUEST.request primitive) or an autonomous report.

6.3.16.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MREPORT.indication(
                        Peer MAC Address,
                        Dialog Token,
                        Measurement Report Set,
                        Measurement Category,
                        VendorSpecificInfo
                        )
```

Copyright © 2021 IEEE. All rights reserved.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Spectrum or Radio Measurement Report frame was received.
Dialog Token	Integer	0–255	The dialog token to identify the measurement transaction. Set to 0 for an autonomous report.
Measurement Report Set	Set of measurement reports, each as defined in the Measurement Report element format	Set of measurement reports, each as defined in 9.4.2.21	A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report.
Measurement Category	Enumeration	SPECTRUM MANAGEMENT, or RADIO MEASUREMENT	Indicates whether the Measurement Report Set is a set of Spectrum Management or Radio Measurement reports. The parameter is present if dot11RadioMeasurementActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.16.3.3 When generated

This primitive is generated by the MLME when a Spectrum or Radio Measurement Report frame is received.

6.3.16.3.4 Effect of receipt

On receipt of this primitive, measurement data might be available for SME processes, such as channel selection.

6.3.17 Channel switch

6.3.17.1 MLME-CHANNELSWITCH.request

6.3.17.1.1 Function

This primitive requests a switch to a new operating channel.

6.3.17.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELSWITCH.request(
Mode,
Channel Number,
Secondary Channel Offset,
Channel Switch Count,
Mesh Channel Switch Parameters,
Wide Bandwidth Channel Switch,
New Transmit Power Envelope,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
Channel Number	Integer	As defined in 17.3.8.4.3	Specifies the new channel number.
Secondary Channel Offset	Integer	As in Table 9-96	Specifies the position of secondary channel in relation to the primary channel. The parameter is present if dot11FortyMHzOperationImplemented is true; otherwise, the parameter is not present.
Channel Switch Count	As defined in 9.4.2.18	As defined in 9.4.2.18	Specifies the time period until the channel switch event, as described in 9.4.2.18.
Mesh Channel Switch Parameters	As defined in 9.4.2.102	As defined in 9.4.2.102	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if dot11MeshActivated is true; otherwise, the parameter is not present.
Wide Bandwidth Channel Switch	As defined in 9.4.2.160	As defined in 9.4.2.160	Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present.
New Transmit Power Envelope	Set of New Transmit Power Envelope elements	N/A	Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.17.1.3 When generated

This primitive is generated by the SME to schedule a channel switch and announce this switch to peer entities in the BSS.

6.3.17.1.4 Effect of receipt

On receipt of this primitive, the MLME schedules the channel switch event and announces this switch to other STAs in the BSS using the Channel Switch Announcement frame or element. The MLME sets the timing of the frame transmission taking into account the activation delay.

6.3.17.2 MLME-CHANNELSWITCH.confirm

6.3.17.2.1 Function

This primitive reports the result of a request to switch channel.

Copyright © 2021 IEEE. All rights reserved.

6.3.17.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELSWITCH.confirm(
ResultCode,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, UNSPECIFIED_FAILURE	Reports the result of a channel switch request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.17.2.3 When generated

This primitive is generated by the MLME when a channel switch request completes. Possible unspecified failure causes include an inability to schedule a channel switch announcement.

6.3.17.2.4 Effect of receipt

The SME is notified of the results of the channel switching procedure.

6.3.17.3 MLME-CHANNELSWITCH.indication

6.3.17.3.1 Function

This primitive indicates that a channel switch announcement has been received from a peer entity.

6.3.17.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELSWITCH.indication(
Peer MAC Address,
Mode,
Channel Number,
Secondary Channel Offset,
Channel Switch Count,
Mesh Channel Switch Parameters,
Wide Bandwidth Channel Switch,
New Transmit Power Envelope,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Channel Switch Announcement frame was received.
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
Channel Number	Integer	As defined in 17.3.8.4.3	Specifies the new channel number.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Secondary Channel Offset	Integer	As in Table 9-96	Specifies the position of secondary channel in relation to the primary channel. The parameter is optionally present if dot11FortyMHzOperationImplemented is true; otherwise not present.
Channel Switch Count	As defined in 9.4.2.18	As defined in 9.4.2.18	Specifies the time period until the channel switch event, as described in 9.4.2.18.
Mesh Channel Switch Parameters	As defined in 9.4.2.102	As defined in 9.4.2.102	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if dot11MeshActivated is true; otherwise, the parameter is not present.
Wide Bandwidth Channel Switch	As defined in 9.4.2.160	As defined in 9.4.2.160	Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present.
New Transmit Power Envelope	Set of New Transmit Power Envelope elements	N/A	Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.17.3.3 When generated

This primitive is generated by the MLME when a Channel Switch Announcement frame is received.

6.3.17.3.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the switch.

6.3.17.4 MLME-CHANNELSWITCH.response

6.3.17.4.1 Function

This primitive is used to schedule an accepted channel switch.

6.3.17.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELSWITCH.response(
Mode,
Channel Number,
Secondary Channel Offset,
Channel Switch Count,
Mesh Channel Switch Parameters,
Wide Bandwidth Channel Switch,
New Transmit Power Envelope,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
Channel Number	Integer	As defined in 17.3.8.4.3	Specifies the new channel number.
Secondary Channel Offset	Integer	As in Table 9-96	Specifies the position of secondary channel in relation to the primary channel. The parameter is optionally present if dot11FortyMHzOperationImplemented is true; otherwise not present.
Channel Switch Count	As defined in 9.4.2.18	As defined in 9.4.2.18	Specifies the time period until the channel switch event, as described in 9.4.2.18.
Mesh Channel Switch Parameters	As defined in 9.4.2.102	As defined in 9.4.2.102	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if dot11MeshActivated is true; otherwise, the parameter is not present.
Wide Bandwidth Channel Switch	As defined in 9.4.2.160	As defined in 9.4.2.160	Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present.
New Transmit Power Envelope	Set of New Transmit Power Envelope elements	N/A	Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.17.4.3 When generated

This primitive is generated by the SME to schedule an accepted channel switch request.

6.3.17.4.4 Effect of receipt

On receipt of this primitive, the MLME schedules the channel switch.

6.3.18 TPC request

6.3.18.1 Introduction

This set of primitives supports the adaptation of transmit power between peer entities as described in 11.7.7.

6.3.18.2 MLME-TPCADAPT.request

6.3.18.2.1 Function

This primitive supports the adaptation of transmit power between peer entities as specified in 11.7.7.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.18.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TPCADAPT.request(
Peer MAC Address,
Dialog Token,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual or group MAC address	The address of the peer MAC entity to which the TPC request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the TPC transaction.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.18.2.3 When generated

This primitive is generated by the SME to request that a TPC Request frame be sent to a peer entity to request that entity to report transmit power and link margin information.

6.3.18.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TPC Request frame. This frame is then scheduled for transmission.

6.3.18.3 MLME-TPCADAPT.confirm

6.3.18.3.1 Function

This primitive reports the result of the TPC adaptation procedure.

6.3.18.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TPCADAPT.confirm(
ResultCode
Transmit Power,
Link Margin,
Rate,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, UNSPECIFIED_FAILURE	Reports the outcome of a request to send a TPC Request frame.
Transmit Power	Integer	–127 to 127	Value of the Transmit Power field of the TPC Report element of the TPC Report frame.
Link Margin	Integer	–127 to 127	Value of the Link Margin field of the TPC Report element of the TPC Report frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Rate	Integer	As defined in 9.4.2.3	The rate at which the TPC Request frame was sent.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.18.3.3 When generated

This primitive is generated by the MLME when the TPC adaptation procedure completes.

6.3.18.3.4 Effect of receipt

The SME is notified of the results of the TPC adaptation procedure.

6.3.19 SetKeys

6.3.19.1 MLME-SETKEYS.request

6.3.19.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be set in the MAC and enabled for use.

6.3.19.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-SETKEYS.request(
Keylist
)

Name	Type	Valid range	Description
Keylist	A set of SetKeyDescriptors	N/A	The list of keys to be used by the MAC.

Each SetKeyDescriptor consists of the following parameters:

Name	Type	Valid range	Description
Key	Bit string	N/A	The temporal key value
Length	Integer	N/A	The number of bits in the Key to be used.
Key ID	Integer	0–3 shall be used with WEP, TKIP, CCMP, and GCMP; 4–5 with BIP for IGTK; 6-7 with BIP for BIGTK; and 8–4095 are reserved	Key identifier
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BIGTK	Defines whether this key is a group key, pairwise key, PeerKey, integrity group key, or beacon protection key.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Address	MAC address	Any valid individual MAC address	This parameter is valid only when the Key Type value is Pairwise, when the Key Type value is Group and the STA is in IBSS, or when the Key Type value is PeerKey.
Receive Sequence Count	8 octets	N/A	Value to which the RSC(s) is initialized. This parameter is valid only when the Key Type is Group, IGTK, or BIGTK.

6.3.19.1.3 When generated

This primitive is generated by the SME at any time when one or more keys are to be set in the MAC.

6.3.19.1.4 Effect of receipt

When the Key Type is Group, IGTK, or BIGTK, and the key matches the GTK, IGTK, or BIGTK, if any, installed as a result of EAPOL-Key frames (see 12.7.7.4) or exiting WNM sleep mode (see 11.2.3.16.1) receipt of this primitive shall have no effect. Otherwise, receipt of this primitive causes the MAC to apply the keys as follows, subject to the MLME-SETPROTECTION.request primitive:

— The MAC uses the key information (as defined by the Key Type, Key ID, and Address parameters) for the transmission of subsequent frames to which the key applies (as defined by the Key Type, Key ID and Address parameters).

— The MAC installs the key with the associated Key ID such that received frames for that cipher, of the appropriate type, and containing the matching Key ID are processed using that key and its associated state information, subject to validation based on the Receive Sequence Count, if applicable.

— When the Key, Address, Key Type, and Key ID parameters identify a new key to be set, the MAC initializes the transmitter TSC/PN/IPN/BIPN counter to 0. When the Key, Address, Key Type, and Key ID parameters identify an existing key, the MAC shall not change the current transmitter TSC/PN/IPN/BIPN counter or the receiver replay counter values associated with that key.

6.3.20 DeleteKeys

6.3.20.1 MLME-DELETEKEYS.request

6.3.20.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be deleted from the MAC and thus disabled for use.

6.3.20.1.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-DELETEKEYS.request(
                                    Keylist
                                    )
```

Name	Type	Valid range	Description
Keylist	A set of DeleteKeyDescriptors	N/A	The list of keys to be deleted from the MAC.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Each DeleteKeyDescriptor consists of the following parameters:

Name	Type	Valid range	Description
Key ID	Integer	0–3 shall be used with WEP, TKIP, CCMP, and GCMP; 4–5 with BIP for IGTK; 6-7 with BIP for BIGTK; and 8–4095 are reserved	Key identifier.
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BIGTK	Defines whether this key is a group key, pairwise key, PeerKey, integrity group key, or beacon protection key.
Address	MAC address	Any valid individual MAC address	This parameter is valid only when the Key Type value is Pairwise, or when the Key Type value is Group and is from an IBSS STA, or when the Key Type value is PeerKey.

6.3.20.1.3 When generated

This primitive is generated by the SME at any time when keys for a security association are to be deleted in the MAC.

6.3.20.1.4 Effect of receipt

Receipt of this primitive causes the MAC to delete all the temporal keys identified by each DeleteKeyDescriptor in the Keylist (as defined by the Key Type, Key ID and Address parameters), and to cease using them.

6.3.21 MIC (michael) failure event

6.3.21.1 MLME-MICHAELMICFAILURE.indication

6.3.21.1.1 Function

This primitive reports that a MIC failure event was detected.

6.3.21.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MICHAELMICFAILURE.indication (
                                    Count,
                                    Address,
                                    Key Type,
                                    Key ID,
                                    TSC
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Count	Integer	1 or 2	The current number of MIC failure events.
Address	MAC address	Any valid individual MAC address	The source MAC address of the frame.
Key Type	Enumeration	Group, Pairwise, PeerKey	The key type that the received frame used.
Key ID	Integer	0–3	Key identifier.
TSC	6 octets	N/A	The TSC value of the frame that generated the MIC failure.

6.3.21.1.3 When generated

This primitive is generated by the MAC when it has detected a MIC failure.

6.3.21.1.4 Effect of receipt

The SME is notified that the MAC has detected a MIC failure; see 12.5.2.4.

6.3.22 EAPOL

6.3.22.1 MLME-EAPOL.request

6.3.22.1.1 Function

This primitive is generated by the SME when the SME has an EAPOL-Key frame to send.

6.3.22.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EAPOL.request (
                    Source Address,
                    Destination Address,
                    Data
                    )
```

Name	Type	Valid range	Description
Source Address	MAC address	N/A	The MAC sublayer address from which the EAPOL PDU is being sent.
Destination Address	MAC address	N/A	The MAC sublayer entity address to which the EAPOL PDU is being sent.
Data	EAPOL PDU (as defined in Clause 11 of IEEE Std 802.1X-2010)	N/A	The EAPOL PDU to be transmitted.

6.3.22.1.3 When generated

This primitive is generated by the SME when the SME has a EAPOL-Key frame to send.

6.3.22.1.4 Effect of receipt

The MAC sends this EAPOL-Key frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.22.2 MLME-EAPOL.confirm

6.3.22.2.1 Function

This primitive indicates that this EAPOL-Key frame has been transmitted by the MAC.

6.3.22.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EAPOL.confirm (
                    ResultCode
                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, TRANSMISSION_FAILURE	Indicates whether the EAPOL-Key frame has been transmitted to the target STA.

6.3.22.2.3 When generated

This primitive is generated by the MAC as a result of an MLME-EAPOL.request primitive being generated to send an EAPOL-Key frame.

6.3.22.2.4 Effect of receipt

The SME is always notified whether this EAPOL-Key frame has been transmitted to the IEEE 802.11 MAC.

This primitive communicates that the frame has been transmitted; see the procedures in 12.5.2.4.1.

6.3.23 SetProtection

6.3.23.1 MLME-SETPROTECTION.request

6.3.23.1.1 Function

This primitive indicates whether protection is required for frames sent to and received from the indicated MAC address.

6.3.23.1.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-SETPROTECTION.request(
                           Protectlist
                           )
```

Name	Type	Valid range	Description
Protectlist	A set of ProtectDescriptors	N/A	The list of how each key is being used currently.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Each ProtectDescriptor consists of the following parameters:

Name	Type	Valid range	Description
Address	MAC address	Any valid individual MAC address	This parameter is valid only when the Key Type value is Pairwise or when the Key Type value is Group and is from an IBSS STA or PeerKey.
ProtectType	Enumeration	None, Rx, Tx, Rx_Tx	The protection value for this MAC.
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BIGTK	Defines whether this key is a group key, pairwise key, PeerKey, integrity group key, or beacon protection key.

6.3.23.1.3 When generated

This primitive is generated by the SME when protection is required for frames sent to and received from the indicated MAC address.

6.3.23.1.4 Effect of receipt

Receipt of this primitive causes the MAC to set the protection and to protect Data frames as indicated in the ProtectType parameter of the Protectlist parameter:

— None: Specifies that Data frames to and from the MAC address are not protected.
— Rx: Specifies that Data frames from the MAC address are protected (i.e., any Data frames without protection received from the MAC address are discarded) but Data frames to the MAC address are not protected.
— Tx: Specifies that Data frames to the MAC address are protected but Data frames from the MAC address are not protected.
— Rx_Tx: Specifies that Data frames to and from the MAC address are protected.

Once Data frames are protected to and/or from the specified MAC address, the MLME-SETPROTECTION.request primitive is used to reset the prior setting. Invocation of the MLME-SETPROTECTION.request primitive with a ProtectType of None deletes a protection state.

6.3.24 MLME-PROTECTEDFRAMEDROPPED

6.3.24.1 MLME-PROTECTEDFRAMEDROPPED.indication

6.3.24.1.1 Function

This primitive notifies the SME that a frame has been dropped because a temporal key was unavailable.

6.3.24.1.2 Semantics of the service primitive

This primitive has two parameters, the MAC addresses of the two STAs.

The primitive parameters are as follows:

```
MLME-PROTECTEDFRAMEDROPPED.indication (
                                        Address1,
                                        Address2
                                        )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Address1	MAC address	Any valid individual MAC address	MAC address of TA.
Address2	MAC address	Any valid individual MAC address	MAC address of RA.

6.3.24.1.3 When generated

This primitive is generated by the MAC when a frame is dropped because no temporal key is available for the frame.

6.3.24.1.4 Effect of receipt

The SME is notified that a frame was dropped. The SME can use this information in an IBSS to initiate a security association to the peer STA.

6.3.25 TS management interface

6.3.25.1 General

This mechanism supports the process of adding, modifying, or deleting a TS in a BSS using the procedures defined in 11.4.

The primitives used for this mechanism are called *TS Management primitives*, which include MLME-ADDTS.xxx, MLME-DELTS.xxx, and MLME-ADDTSRESERVE.xxx primitives, where xxx denotes request, confirm, indication, or response. Each primitive contains parameters that correspond to a QoS Action frame. Requests and responses might cause the transmission of the corresponding QoS Action frames. Confirms and indications are issued upon the receipt of the appropriate QoS Action frame.

Table 6-1 defines which primitives are supported by which type of STA.

Table 6-1—Supported TS management primitives

Primitive	Request	Confirm	Indication	Response
ADDTS (in the context of establishing a TS)	DMG STA CMMG STA non-AP QoS STA	DMG STA CMMG STA non-AP QoS STA	DMG STA CMMG STA HC	DMG STA CMMG STA HC
ADDTS (in the context of requesting an allocation)	Non-AP and non-PCP DMG STA CMMG STA	Non-AP and non-PCP DMG STA CMMG STA	DMG AP or PCP CMMG AP or PCP	DMG AP or PCP CMMG AP or PCP
DELTS	DMG STA CMMG STA non-AP QoS STA HC	DMG STA CMMG STA non-AP QoS STA HC	DMG STA CMMG STA non-AP QoS STA HC	—
ADDTSRESERVE	HC	HC	non-AP QoS STA	non-AP QoS STA

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.25.2 MLME-ADDTS.request

6.3.25.2.1 Function

This primitive requests addition (or modification) of a TS. It requests the HC or PCP to admit the new or changed TS.

6.3.25.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.request (
DialogToken,
TSPEC,
TCLAS,
TCLASProcessing,
U-APSD Coexistence,
EBR,
IntraAccessCategoryPriority,
HigherLayerStreamID,
STAAddress,
DMG TSPEC,
CMMG TSPEC,
Multi-band,
U-PID,
MMS,
VendorSpecificInfo
)

Name	Type	Valid range	Description
DialogToken	Integer	0–127	Identifies the ADDTS transaction.
TSPEC	As defined in TSPEC element with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified	As defined in 9.4.2.29 with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified	Specifies the TSID, traffic characteristics, and QoS requirements of the TS of concern.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.
TCLASProcessing	TCLAS Processing element	As defined in 9.4.2.32	Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.
U-APSD Coexistence	U-APSD Coexistence element	As defined in 9.4.2.90.	Indicates the coexistence parameters for requested transmission during a U-APSD service period.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
EBR	Expedited Bandwidth Request element	As defined in 9.4.2.93	Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.
IntraAccessCategoryPriority	Intra-Access Category Priority element	As defined in 9.4.2.120	Specifies the intra-AC priorities the STA should use.
HigherLayerStreamID	Higher Layer Stream ID element	As defined in 9.4.2.124	Identifies the higher layer stream.
STAAddress	MAC address		Specifies the MAC address of the peer STA for a PTP TSPEC.
DMG TSPEC	DMG TSPEC element	As defined in 9.4.2.133	Specifies the characteristics and QoS (scheduling) requirements of the DMG allocation request.
CMMG TSPEC	CMMG TSPEC element	As defined in 9.4.2.134.	Specifies the characteristics and QoS scheduling requirements of the CMMG allocation request.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the TSID is to be established. The parameter is absent if the TSID is intended to be established on the same frequency band and channel where the ADDTS Request frame is transmitted.
U-PID	U-PID element	As defined in 9.4.2.153	This parameter is optionally present and specifies the parameters of the LLC for the purpose of (de)multiplexing of frames associated with the TSID.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	This parameter is optionally present and specifies the parameters of an MMSL cluster establishment.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.25.2.3 When generated

This primitive is generated by the SME to request the addition of a new (or modification of an existing) TS in order to support parameterized QoS transport of the MSDUs belonging to this TS when a higher layer protocol or mechanism signals the STA to initiate such an addition (or modification).

6.3.25.2.4 Effect of receipt

The STA operates according to the procedures defined in 11.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.25.3 MLME-ADDTS.confirm

6.3.25.3.1 Function

This primitive reports the results of a TS addition (or modification) attempt.

6.3.25.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.confirm(
ResultCode,
DialogToken,
TSDelay,
TSPEC,
Schedule,
TCLAS,
TCLASProcessing,
EBR,
HigherLayerStreamID,
STAAddress,
DMG TSPEC,
CMMG TSPEC,
Multi-band,
U-PID,
MMS,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REJECTED_WITH_SUGGESTED_CHANGES, REJECTED_FOR_DELAY_PERIOD, REJECTED_WITH_SUGGESTED_BSS_TRANSITION, REQUESTED_TCLAS_NOT_SUPPORTED, TCLAS_RESOURCES_EXHAUSTED, REJECTED_HOME_WITH_SUGGESTED_CHANGES, REJECTED_FOR_SSP_PERMISSIONS, SUCCESS_STA_IN_PS_MODE, REJECT_U-PID_SETTING	Indicates the results of the corresponding MLME-ADDTS.request primitive.
DialogToken	Integer	As defined in the corresponding MLME-ADDTS.request primitive	Identifies the ADDTS transaction.
TSDelay	Integer	≥ 0	When the result code is REJECTED_FOR_DELAY_PERIOD, provides the amount of time a STA should wait before attempting another ADDTS Request frame.
TSPEC	TSPEC element	As defined in 9.4.2.29	Specifies the TS information, traffic characteristics, and QoS requirements of the TS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Schedule	Schedule element	As defined in 9.4.2.33	Specifies the schedule information, service start time, SI, and the specification interval.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.
TCLASProcessing	TCLAS Processing element	As defined in 9.4.2.32	Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.
EBR	Expedited Bandwidth Request element	As defined in 9.4.2.93	Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.
HigherLayerStream ID	Higher Layer Stream ID element	As defined in 9.4.2.124	Identifies the higher layer stream.
STAAddress	MAC address		Specifies the MAC address of the peer STA for a PTP TSPEC.
DMG TSPEC	DMG TSPEC element	As defined in 9.4.2.133	Specifies the characteristics and QoS (scheduling) requirements of the DMG allocation request.
CMMG TSPEC	CMMG TSPEC element	As defined in 9.4.2.134.	Specifies the characteristics and QoS scheduling requirements of the CMMG allocation request.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the TSID is to be established. The parameter is absent if the TSID is intended to be established on the same frequency band and channel where the ADDTS Request frame is transmitted.
U-PID	U-PID element	As defined in 9.4.2.153	This parameter is optionally present and specifies the parameters of the LLC for the purpose of (de)multiplexing of frames associated with the TSID.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	This parameter is optionally present and specifies the parameters of an MMSL cluster establishment.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For the ResultCode value of SUCCESS received by a non-DMG STA or a non-CMMG STA, the TSPEC and the optional TCLAS parameters describe the characteristics of the TS that has been created (or modified); and the specified (nonzero) parameters [with the exception of Service Start Time, Medium Time, and any possibly unspecified minimum set of parameters (see 10.23.4.3) in the TSPEC element in ADDTS Request frame] exactly match those of the matching MLME-ADDTS.request primitive.

For other values of ResultCode received by a non-DMG STA or a non-CMMG STA, no new TS has been created. In the case of REJECTED_WITH_ SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information about the current status of the MAC entity. In the case of REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information received from the SSPN interface. A TS is not created with this definition. If the suggested changes are acceptable to the STA, it is the responsibility of the STA to set up the TS with the suggested changes.

In the case of REJECTED_WITH_SUGGESTED_BSS_TRANSITION, non-AP STA should retry TS setup process with the newly associated AP once the transition is done.

If this is the result of a modification of an existing TS, the status of that TS remains unchanged.

For the ResultCode value of SUCCESS or SUCCESS_STA_IN_PS_MODE received by a DMG STA, the DMG TSPEC and the optional TCLAS parameters describe the characteristics of the allocation or TS that has been created (or modified); and the specified (nonzero) parameters [with the exception of Maximum Allocation in the DMG TSPEC in the ADDTS Request frame] exactly match those of the matching MLME-ADDTS.request primitive.

For other values of ResultCode received by a DMG STA, no new allocation or TS has been created. In the case of REJECTED_WITH_SUGGESTED_CHANGES or REJECT_U-PID_SETTING, then the DMG TSPEC, Multi-band, and U-PID parameters represent an alternative proposal by the peer STA. In such cases, an allocation or TS has not been created. If the suggested changes are acceptable to the STA, it is the responsibility of the STA to set up the allocation or TS with the suggested changes.

If this failure is the result of a modification of an existing allocation or TS, the status of that allocation or TS remains unchanged.

6.3.25.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDTS.request primitive indicating the results of that request.

This primitive is generated when that MLME-ADDTS.request primitive is found to contain invalid parameters, when a timeout occurs, or when the STA receives a response in the form of an ADDTS Response frame in the corresponding QoS Action frame from the HC, DMG STA, or CMMG STA.

6.3.25.3.4 Effect of receipt

The SME is notified of the results of the TS addition (or modification) procedure.

The SME should operate according to the procedures defined in 11.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.25.4 MLME-ADDTS.indication

6.3.25.4.1 Function

This primitive reports to the DMG STA's SME, CMMG STA's SME, or the HC's SME the request for adding (or modifying) a TS.

6.3.25.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.indication (
DialogToken,
STAAddress,
TSPEC,
TCLAS,
TCLASProcessing,
U-APSD Coexistence,
EBR,
IntraAccessCategoryPriority,
HigherLayerStreamID,
DMG TSPEC,
CMMG TSPEC,
Multi-band,
U-PID,
MMS,
VendorSpecificInfo
)

Name	Type	Valid range	Description
DialogToken	Integer	As defined in the received ADDTS Request frame	Identifies the ADDTS transaction.
STAAddress	MAC address		The MAC address of the STA that initiated the MLME-ADDTS.request primitive.
TSPEC	As defined in the TSPEC element, with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified	As defined in 9.4.2.29 with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified	Specifies the TSID, traffic characteristics, and QoS requirements of the TS.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.
TCLASProcessing	TCLAS Processing element	As defined in 9.4.2.32	Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
U-APSD Coexistence	U-APSD Coexistence element	As defined in 9.4.2.90	Indicates the coexistence parameters for requested transmission during a U-APSD service period.
EBR	Expedited Bandwidth Request element	As defined in 9.4.2.93	Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.
IntraAccessCategory Priority	Intra-Access Category Priority element	As defined in 9.4.2.120	Specifies the intra-AC priorities the STA should use.
HigherLayerStreamID	Higher Layer Stream ID element	As defined in 9.4.2.124	Identifies the higher layer stream.
DMG TSPEC	DMG TSPEC element	As defined in 9.4.2.133	Specifies the characteristics (scheduling) and QoS requirements of the DMG allocation request.
CMMG TSPEC	CMMG TSPEC element	As defined in 9.4.2.134.	Specifies the characteristics and QoS (scheduling) requirements of the CMMG allocation request.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the TSID is to be established. The parameter is absent if the TSID is intended to be established on the same frequency band and channel where the ADDTS Request frame is transmitted.
U-PID	U-PID element	As defined in 9.4.2.153	This parameter is optionally present and specifies the parameters of the LLC for the purpose of (de)multiplexing of frames associated with the TSID.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	This parameter is optionally present and specifies the parameters of an MMSL cluster establishment.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

The TCLAS is optional at the discretion of the STA that originated the request.

6.3.25.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a request to add (or modify) a TS by a specified STA in the form of an ADDTS Request frame.

6.3.25.4.4 Effect of receipt

The SME is notified of the request for a TS addition (or modification) by a specified STA.

This primitive solicits an MLME-ADDTS.response primitive from the SME that reflects the results of admission control at the HC or DMT STA on the TS requested to be added (or modified).

The SME should operate according to the procedures defined in 11.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The SME generates an MLME-ADDTS.response primitive within a dot11ADDTSResponseTimeout.

6.3.25.5 MLME-ADDTS.response

6.3.25.5.1 Function

This primitive responds to the request for a TS addition (or modification) by a specified STA's MAC entity.

6.3.25.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.response(
ResultCode,
DialogToken,
STAAddress,
TSDelay,
TSPEC,
Schedule,
TCLAS,
TCLASProcessing,
EBR,
HigherLayerStreamID,
DMG TSPEC,
CMMG TSPEC,
Multi-band,
U-PID,
MMS,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REJECTED_WITH_SUGGESTED_CHANGES, REJECTED_FOR_DELAY_PERIOD, REJECTED_WITH_SUGGESTED_BSS_TRANSITION, REQUESTED_TCLAS_NOT_SUPPORTED, TCLAS_RESOURCES_EXHAUSTED, REJECTED_HOME_WITH_SUGGESTED_CHANGES, REJECTED_FOR_SSP_PERMISSIONS, SUCCESS_STA_IN_PS_MODE, REJECT_U-PID_SETTING	Indicates the results of the corresponding MLME-ADDTS.indication primitive.
DialogToken	Integer	As defined in the corresponding MLME-ADDTS.indication	DialogToken of the matching MLME-ADDTS.indication primitive.
STAAddress	MAC address		The STA address of the matching MLME-ADDTS.indication primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TSDelay	Integer	≥ 0	When the result code is REJECTED_FOR_DELAY_ PERIOD, provides the amount of time a STA should wait before attempting another ADDTS request.
TSPEC	TSPEC element	As defined in 9.4.2.29	Specifies the QoS parameters of the TS.
Schedule	Schedule element	As defined in 9.4.2.33	Specifies the schedule information, service start time, SI, and the specification interval.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.
TCLASProcessing	TCLAS Processing element	As defined in 9.4.2.32	Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.
EBR	Expedited Bandwidth Request element	As defined in 9.4.2.93	Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.
HigherLayerStream ID	Higher Layer Stream ID element	As defined in 9.4.2.124	Identifies the higher layer stream.
DMG TSPEC	DMG TSPEC element	As defined in 9.4.2.133	Specifies the characteristics (scheduling) and QoS requirements of the DMG allocation request.
CMMG TSPEC(	CMMG TSPEC element	As defined in 9.4.2.134.	Specifies the characteristics and QoS (scheduling) requirements of the CMMG allocation request.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the TSID is to be established. The parameter is absent if the TSID is intended to be established on the same frequency band and channel where the ADDTS Request frame is transmitted.
U-PID	U-PID element	As defined in 9.4.2.153	This parameter is optionally present and specifies the parameters of the LLC for the purpose of (de)multiplexing of frames associated with the TSID.
MMS	Multiple MAC Sublayers element	As defined in 9.4.2.152	This parameter is optionally present and specifies the parameters of an MMSL cluster establishment.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The DialogToken and STAAddress parameters contain the values from the matching MLME-ADDTS.indication primitive.

If a non-DMG STA receives a result code of SUCCESS, the TSPEC and (optional) TCLAS parameters contain the values from the matching MLME-ADDTS-indication.

If a DMG STA receives a result code of SUCCESS or SUCCESS_STA_IN_PS_MODE, the DMG TSPEC and (optional) TCLAS parameters contain the values from the matching MLME-ADDTS.indication primitive.

If a non-DMG STA receives a result code of REJECTED_WITH_SUGGESTED_CHANGES or REJECTED_HOME_WITH_ SUGGESTED_CHANGES, the TSPEC and TCLAS parameters represent an alternative proposed TS either based on information local to the MAC entity or using additional information received across the SSPN interface. The TS, however, is not created. The TSID and direction values within the TSPEC are as in the matching MLME-ADDTS.indication primitive. The difference may lie in the QoS (e.g., minimum data rate, mean data rate, and delay bound) values, as a result of admission control performed at the SME of the HC on the TS requested to be added (or modified) by the STA. If sufficient bandwidth is not available, the QoS values may be reduced. In one extreme, the minimum data rate, mean data rate, and delay bound may be all set to 0, indicating that no QoS is to be provided to this TS.

If a DMG STA receives a result code of REJECTED_WITH_SUGGESTED_CHANGES or REJECT_U-PID_SETTING, then the DMG TSPEC, TCLAS, Multi-band, and U-PID parameters represent an alternative proposal for the allocation or TS. The allocation or TS, however, has not been created. The allocation ID value within the DMG TSPEC is as in the matching MLME-ADDTS.indication primitive. The difference might lie in the other parameter values, as a result of admission control performed at the SME of the peer STA on the allocation or TS requested to be added (or modified). If sufficient bandwidth is not available, the QoS values might be reduced.

If the result code is REJECTED_WITH_SUGGESTED_BSS_TRANSITION, the non-AP STA should initiate a transition query as defined in 11.21.7. Once the transition is completed, the STA should retry TS setup process, as defined in 11.4.4.

6.3.25.5.3 When generated

This primitive is generated by the SME at the HC or DMG STA as a result of an MLME-ADDTS.indication primitive to initiate addition (or modification) of a TS with a specified peer MAC entity or entities.

6.3.25.5.4 Effect of receipt

This primitive approves addition (or modification) of a TS requested by a specified STA’s MAC entity, with or without altering the TSPEC.

This primitive causes the MAC entity at the HC or DMG STA to send an ADDTS Response frame to the requesting STA containing the specified parameters.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.25.6 MLME-DELTS.request

6.3.25.6.1 Function

This primitive requests deletion of a TS with a specified peer MAC.

This primitive may be generated by one of the following:

— DMG STA
— Non-AP STA
— PCP
— HC

6.3.25.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DELTS.request(
STAAddress1,
TSInfo,
ReasonCode,
STAAddress2,
DMG Allocation Info,
Multi-band,
VendorSpecificInfo
)

Name	Type	Valid range	Description
STAAddress1	MAC address		Specifies the MAC address of the STA that initiated this TS or MAC address of the STA to which the second DELTS frame is sent, as defined in 11.4.9.2. Present only at the HC and PCP.
TSInfo	TS Info field	As defined in 9.4.2.29	Specifies the TS to be deleted. Not present when DMG Allocation Info is present.
ReasonCode	Enumeration	STA_LEAVING , END_TS, UNKNOWN_TS, TIMEOUT, SERVICE_CHANGE_PRECLUDES_TS	Indicates the reason why the TS is being deleted.
STAAddress2	MAC address		Specifies the MAC address of the peer STA for the PTP TSPEC or MAC address of the STA to which the first DELTS frame is sent, as defined in 11.4.9.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DMG Allocation Info	DMG Allocation Info field	As defined in 9.4.2.133	Specifies the DMG allocation to be deleted. Not present when TSInfo is present.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the TS is to be deleted. The parameter is absent if the TS is intended to be deleted on the same frequency band and channel where the DELTS is transmitted.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.25.6.3 When generated

This primitive is generated by the SME to initiate deletion of a TS when a higher layer protocol or mechanism signals the STA to initiate such a deletion.

6.3.25.6.4 Effect of receipt

This primitive initiates a TS deletion procedure.

This primitive causes the local MAC entity to send out a DELTS frame containing the specified parameters. If this primitive was generated at the HC, the frame is sent to the specified STA's MAC address. If this primitive was generated at the non-AP STA that is a non-DMG STA, the frame is sent to its HC. A DMG STA sends the frame to the specified STA's MAC address. In any of these cases, the DELTS frame does not solicit a response from the recipient frame other than an acknowledgment to receipt of the frame.

6.3.25.7 MLME-DELTS.indication

6.3.25.7.1 Function

This primitive reports the deletion of a TS by a specified peer MAC entity or deletion of the TS due to an inactivity timeout (HC or PCP only).

6.3.25.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DELTS.indication(
                        STAAddress,
                        TSInfo,
                        ReasonCode,
                        DMG Allocation Info,
                        Multi-band,
                        VendorSpecificInfo
                        )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
STAAddress	MAC address		Specifies the MAC address of the STA for which the TS is being deleted. Present only at the HC.
TSInfo	TS Info field	As defined in 9.4.2.29	Specifies the TS information of the TS of concern. Not present when DMG Allocation Info is present.
ReasonCode	Enumeration	STA_LEAVING, END_TS, UNKNOWN_TS, TIMEOUT, SERVICE_CHANGE_PRECLUDES_TS	Indicates the reason why the TS is being deleted.
DMG Allocation Info	DMG Allocation Info field	As defined in 9.4.2.133	Specifies the DMG allocation under consideration. Not present when TSInfo is present.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number for the TS under consideration. The parameter is absent if the TS is intended to be deleted on the same frequency band and channel where the DELTS is transmitted.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.25.7.3 When generated

This primitive is generated by the MLME when it receives a DELTS frame from the specified peer MAC entity.

This primitive may also be generated by the MLME at the DMG STA or HC as a result of inactivity of a particular TS. Inactivity results when a period equal to the inactivity interval in the TSPEC for the TS elapses

— Without arrival of an MSDU belonging to that TS at the MAC entity of the DMG STA or HC via an MA-UNITDATA.request primitive when the DMG STA or HC is the source STA of that TS or

— Without reception of an MSDU belonging to that TS by the MAC entity of the DMG STA or HC when the DMG STA or HC is not the source STA of that TS.

This primitive is generated after any other state concerning the TSID/direction within the MAC has been deleted.

6.3.25.7.4 Effect of receipt

The SME is notified of the initiation of a TS deletion by a specified peer MAC entity.

6.3.25.8 MLME-ADDTSRESERVE.request

6.3.25.8.1 Function

This primitive request is used by the SME at the AP to start the AP-initiated TS setup procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.25.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTSRESERVE.request (
                                    TSPEC,
                                    HigherLayerStreamID,
                                    Schedule,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
TSPEC	TSPEC element	As defined in 9.4.2.29	Specifies the QoS parameters of the TS.
HigherLayerStreamID	Higher Layer Stream ID element	As defined in 9.4.2.124	Stream identifier assigned by a higher layer protocol.
Schedule	Schedule element	As defined in 9.4.2.33	Specifies the schedule information, service start time, SI, and the specification interval.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.25.8.3 When generated

This primitive is generated by the SME at the AP to start the AP-initiated TS setup procedure. If the parameter validation on the parameters used in this primitive succeeds, an ADDTS Reserve Request frame is transmitted from the AP to a non-AP STA.

6.3.25.8.4 Effect of receipt

The STA operates according to the procedures defined in 11.4.4.3.

6.3.25.9 MLME-ADDTSRESERVE.confirm

6.3.25.9.1 Function

This primitive is an indication to the SME that is generated by the MLME as a result of receiving an ADDTS Reserve Response frame from the non-AP STA to which the AP sent a corresponding ADDTS Reserve Request frame.

6.3.25.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTSRESERVE.confirm (
                                    ResultCode,
                                    HigherLayerStreamID,
                                    VendorSpecificInfo
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the results of the corresponding MLME-ADDTSRESERVE.request primitive.
HigherLayerStreamID	Higher Layer Stream ID element	As defined in 9.4.2.124	Stream identifier specified in the corresponding MLME-ADDTSRESERVE.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.25.9.3 When generated

This primitive is generated by the MLME as a result of receiving an ADDTS Reserve Response frame from the non-AP STA to which the AP sent a corresponding ADDTS Reserve Request action.

6.3.25.9.4 Effect of receipt

The SME is notified of the results of the AP-initiated TS setup procedure.

6.3.25.10 MLME-ADDTSRESERVE.indication

6.3.25.10.1 Function

This primitive reports to the non-AP STA's SME the initiation of AP-initiated TS setup procedure.

6.3.25.10.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTSRESERVE.indication (
                                    APAddress,
                                    TSPEC,
                                    Schedule,
                                    HigherLayerStreamID,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
APAddress	MAC address	—	The MAC address of the AP initiating the TS setup procedure.
TSPEC	TSPEC element	As defined in 9.4.2.29	Specifies the QoS parameters of the TS.
Schedule	Schedule element	As defined in 9.4.2.33	Specifies the schedule information, service start time, SI, and the specification interval.
HigherLayerStreamID	Higher Layer Stream ID element	As defined in 9.4.2.124	Stream identifier in the received ADDTS Reserve Request frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.25.10.3 When generated

This primitive is generated by the MLME at the non-AP STA as a result of the receipt of an ADDTS Reserve Request frame from the AP to which the non-AP STA is associated.

6.3.25.10.4 Effect of receipt

The SME is notified of the receipt of the ADDTS Reserve Request frame from the AP. This primitive solicits the SME to participate in the AP-initiated TS setup procedure.

The SME should operate according to the procedures defined in 11.4.4.3.

6.3.25.11 MLME-ADDTSRESERVE.response

6.3.25.11.1 Function

This primitive is used by a non-AP STA to indicate to the HC the completion of an AP-initiated TS setup procedure.

6.3.25.11.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTSRESERVE.response (
                                    HigherLayerStreamID,
                                    ResultCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
HigherLayerStreamID	Higher Layer Stream ID element	As defined in 9.4.2.124	Stream identifier specified in the corresponding MLME-ADDTSRESERVE.indication primitive.
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the AP-initiated TS setup procedure.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.25.11.3 When generated

This primitive is generated by the SME at the non-AP STA to indicate to an HC that the non-AP STA has setup a TS in response to a higher layer protocol.

6.3.25.11.4 Effect of receipt

The STA operates according to the procedures defined in 11.4.4.3.

6.3.26 Higher layer synchronization support

6.3.26.1 Introduction

This mechanism supports the process of synchronization among higher layer protocol entities residing within different wireless STAs. The actual synchronization mechanism in the higher layer is out of the scope

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

of this standard. In principle, the MLME indicates the transmission/reception of frames with a specific group address in the Address 1 field of a Data frame.

6.3.26.2 MLME-HL-SYNC.request

6.3.26.2.1 Function

This primitive requests activation of the synchronization support mechanism.

6.3.26.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-HL-SYNC.request(
                                    GroupAddress
                                    )
```

Name	Type	Valid range	Description
GroupAddress	MAC address	A group MAC address	Specifies the group MAC address to which the synchronization frames are addressed. A synchronization frame is a Data frame with higher layer synchronization information.

6.3.26.2.3 When generated

This primitive is generated by the SME when a higher layer protocol initiates a synchronization process.

6.3.26.2.4 Effect of receipt

This request activates the synchronization support mechanism at the STA. The MLME issues an MLME-HL-SYNC.indication primitive when a higher layer synchronization frame, which is a Data frame with the specified group address in Address 1 field, is received or transmitted.

6.3.26.3 MLME-HL-SYNC.indication

6.3.26.3.1 Function

This primitive indicates the last symbol on air of a higher layer synchronization frame, whether transmitted or received by the MAC.

6.3.26.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HL-SYNC.indication(
                                    SourceAddress,
                                    SequenceNumber
                                    )
```

Name	Type	Valid range	Description
SourceAddress	MAC address	Any valid individual MAC address	Specifies the SA of the STA that transmitted the higher layer synchronization frame.
SequenceNumber	Integer	As defined in 9.2.4.4.2	Specifies the sequence number of the higher layer synchronization frame received or transmitted.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.26.3.3 When generated

This primitive is generated by the MLME when the reception or transmission of a higher layer synchronization frame is detected, as indicated by the PHY-RXEND.indication or PHY-TXEND.confirm primitives generated by the PHY. The higher layer synchronization frame is identified by the group MAC address registered by an earlier MLME-HL-SYNC.request primitive in the Address 1 field of a Data frame.

6.3.26.3.4 Effect of receipt

The SME is notified of the reception or transmission of a higher layer synchronization frame.

6.3.27 Block Ack

6.3.27.1 General

This mechanism supports the initiation (or modification) and termination of block ack.

The primitives used for this mechanism are called *block ack primitives*, which include MLME-ADDBA.xxx and MLME-DELBA.xxx primitives, where xxx denotes request, confirm, indication, or response. Each primitive contains parameters that correspond to a Block Ack Action frame body. Requests and responses might cause these frames to be sent. Confirms and indications are emitted when an appropriate Block Ack Action frame is received.

6.3.27.2 MLME-ADDBA.request

6.3.27.2.1 Function

This primitive requests the initiation (or modification) of block ack with a peer MAC entity.

6.3.27.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDBA.request(
PeerSTAAddress,
DialogToken,
TID,
BlockAckPolicy,
BufferSize,
BlockAckTimeout,
BlockAckStartingSequenceControl,
GCRGroupAddress,
Multi-band,
TCLAS,
ADDBA Extension,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	N/A	Specifies the address of the peer MAC entity with which to perform the block ack initiation (or modification).
DialogToken	Integer	0–255	Identifies the ADDBA transaction.
TID	Integer	0–15	Specifies the TID of the data.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
BlockAckPolicy	Enumeration	Immediate, HT-delayed	Specifies the block ack policy.
BufferSize	Integer	0–1023	Specifies the number of MPDUs that can be held in its buffer.
BlockAckTimeout	Integer	0–65 535	Specifies the number of TUs without a frame exchange between peers after which the block ack agreement is considered to be torn down.
BlockAckStartingSequenceControl	Block Ack Starting Sequence Control subfield	As defined in 9.3.1.7	Specifies the value of the Block Ack Starting Sequence Control subfield.
GCRGroupAddress	GCR Group Address element	As defined in 9.4.2.125	Specifies the group address for which a block ack agreement is requested. If the element is present, a GCR Group Address element is included in the transmitted ADDBA Request frame.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the block ack agreement is to be established. The parameter is absent if the block ack agreement is intended to be established on the same frequency band and channel where the ADDBA Request frame is transmitted.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID.
ADDBA Extension	ADDBA Extension element	As defined in 9.4.2.139	Specifies additional parameters associated with the block ack agreement.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.27.2.3 When generated

This primitive is generated by the SME to request initiation (or modification) of block ack with the specified peer MAC entity.

6.3.27.2.4 Effect of receipt

The STA sends the ADDBA Request frame to the specified peer MAC entity.

6.3.27.3 MLME-ADDBA.confirm

6.3.27.3.1 Function

The primitive reports the results of initiation (or modification) of the block ack attempt with the specified peer MAC entity.

6.3.27.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDBA.confirm(
                                    PeerSTAAddress,
                                    DialogToken,
                                    TID,
                                    ResultCode,
                                    BlockAckPolicy,
```

BufferSize,
BlockAckTimeout,
GCRGroupAddress,
Multi-band,
TCLAS,
ADDBA Extension,
OriginatorPreferredMCS,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	N/A	Specifies the address of the peer MAC entity with which the block ack initiation (or modification) was attempted. This value matches the PeerSTAAddress parameter specified in MLME-ADDBA.request primitive.
DialogToken	Integer	0–255	Identifies the ADDBA transaction. This value matches the DialogToken parameter specified in MLME-ADDBA.request primitive.
TID	Integer	0–15	Specifies the TID of the data. This value matches the TID specified in MLME-ADDBA.request primitive.
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the result of the corresponding MLME-ADDBA.request primitive.
BlockAckPolicy	Enumeration	Immediate, HT-delayed	Specifies the block ack policy.
BufferSize	Integer	0–1023	Specifies the maximum number of MPDUs in the block for the specified TID.
BlockAckTimeout	Integer	0–65 535	Specifies the number of TUs without a frame exchange between peers after which the block ack agreement is considered to be torn down.
GCRGroupAddress	GCR Group Address element	As defined in 9.4.2.125	Specifies the group address for which a block ack agreement was requested.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the block ack initiation was attempted. The parameter is absent if the block ack agreement is intended was attempted to be established on the same frequency band and channel where the ADDBA Request frame is transmitted.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID.
ADDBA Extension	ADDBA Extension element	As defined in 9.4.2.139	Specifies additional parameters associated with the block ack agreement.
OriginatorPreferred MCS	Integer	0–10, 15	Indicates preferred MCS used for eliciting A-MPDUs. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.27.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDBA.request primitive to indicate the results of that request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.27.3.4 Effect of receipt

The SME is notified of the results of the block ack initiation (or modification).

6.3.27.4 MLME-ADDBA.indication

6.3.27.4.1 Function

This primitive reports the initiation (or modification) of block ack by a peer MAC entity.

6.3.27.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDBA.indication(
PeerSTAAddress,
DialogToken,
TID,
BlockAckPolicy,
BufferSize,
BlockAckTimeout,
GCRGroupAddress,
Multi-band,
TCLAS,
ADDBA Extension,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	N/A	Specifies the address of the peer MAC entity that requested the block ack initiation (or modification).
DialogToken	Integer	0–255	Identifies the ADDBA transaction.
TID	Integer	0–15	Specifies the TID of the data.
BlockAckPolicy	Enumeration	Immediate, HT-delayed	Specifies the block ack policy.
BufferSize	Integer	0–1023	Specifies the number of MPDUs that can be held in peerSTAAddress buffer.
BlockAckTimeout	Integer	0–65 535	Specifies the number of TUs without a frame exchange between peers after which the block ack agreement is considered to be torn down.
GCRGroupAddress	GCR Group Address element	As defined in 9.4.2.125	Specifies the group address for which a block ack agreement is requested. This element is present if a GCR Group Address element was included in the transmitted ADDBA Request frame.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the block ack agreement is to be established. The parameter is absent if the block ack agreement is intended to be established on the same frequency band and channel where the ADDBA Request frame is transmitted.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ADDBA Extension	ADDBA Extension element	As defined in 9.4.2.139	Specifies additional parameters associated with the block ack agreement.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.27.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a block ack initiation (or modification) by the specified peer MAC entity in the form of an ADDBA Request frame.

6.3.27.4.4 Effect of receipt

The SME is notified of the initiation (or modification) of the block ack by the specified peer MAC entity.

6.3.27.5 MLME-ADDBA.response

6.3.27.5.1 Function

The primitive responds to the initiation (or modification) by a specified peer MAC entity.

6.3.27.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDBA.response(
PeerSTAAddress,
DialogToken,
TID,
ResultCode,
BlockAckPolicy,
BufferSize,
BlockAckTimeout,
GCRGroupAddress,
Multi-band,
TCLAS,
ADDBA Extension,
OriginatorPreferredMCS,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	N/A	Specifies the address of the peer MAC entity that attempted the block ack initiation (or modification). This value matches the PeerSTAAddress parameter specified in MLME-ADDBA.indication primitive.
DialogToken	Integer	0–255	Identifies the ADDBA transaction. This value matches the DialogToken parameter specified in MLME-ADDBA.indication primitive.
TID	Integer	0–15	Specifies the TID of the data. This value matches the TID specified in MLME-ADDBA.indication primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the result of the corresponding MLME-ADDBA.indication primitive.
BlockAckPolicy	Enumeration	Immediate, HT-delayed	Specifies the block ack policy. Undefined when the result code is REFUSED.
BufferSize	Integer	0–1023	Specifies the maximum number of MPDUs in the block for the specified TID. Undefined when the result code is REFUSED.
BlockAckTimeout	Integer	0–65 535	Specifies the number of TUs without a frame exchange between peers after which the block ack agreement is considered to be torn down.
GCRGroupAddress	GCR Group Address element	As defined in 9.4.2.125	Specifies the group address for which a block ack agreement was requested.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the block ack agreement is intended to be established. The parameter is absent if the block ack agreement is intended to be established on the same frequency band and channel where the ADDBA Response frame is transmitted.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID.
ADDBA Extension	ADDBA Extension element	As defined in 9.4.2.139	Specifies additional parameters associated with the block ack agreement.
OriginatorPreferred MCS	Integer	0–10, 15	Indicates preferred MCS used for eliciting A-MPDUs. This parameter is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.27.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDBA.indication primitive to initiate block ack by the specified peer MAC entity.

6.3.27.5.4 Effect of receipt

The primitive causes the MAC entity to send an ADDBA Response frame to the specified peer MAC entity.

6.3.27.6 MLME-DELBA.request

6.3.27.6.1 Function

This primitive requests the deletion of block ack with a peer MAC entity.

6.3.27.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DELBA.request(
                                    PeerSTAAddress,
                                    Direction,
                                    TID,
                                    ReasonCode,
                                    Multi-band,
```

TCLAS,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	N/A	Specifies the address of the peer MAC entity with which to perform the block ack deletion.
Direction	Enumeration	Originator, Recipient	Specifies if the MAC entity initiating the MLME-DELBA.request primitive is the originator or the recipient of the data stream that uses the block ack agreement.
TID	Integer	0–15	Specifies the TID of the MSDUs for which this block ack agreement has been set up.
ReasonCode	Enumeration	STA_LEAVING, END_BA, UNKNOWN_BA, TIMEOUT	Indicates the reason why the block ack agreement is being deleted.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the block ack agreement is to be deleted. The parameter is absent if the block ack agreement to be deleted is established on the same frequency band and channel where the DELBA frame is transmitted.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.27.6.3 When generated

This primitive is generated by the SME to request deletion of block ack with the specified peer MAC entity.

6.3.27.6.4 Effect of receipt

The STA sends the DELBA frame to the specified peer MAC entity.

6.3.27.7 MLME-DELBA.indication

6.3.27.7.1 Function

This primitive reports the deletion of block ack by a peer MAC entity.

6.3.27.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DELBA.indication(
PeerSTAAddress,
Direction,
TID,
ReasonCode,
Multi-band,
TCLAS,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	N/A	Specifies the address of the peer MAC entity with which to perform the block ack deletion.
Direction	Enumeration	Originator, Recipient	Specifies if the MAC entity initiating the MLME-DELBA.request primitive is the originator or the recipient of the data stream that uses block ack.
TID	Integer	0–15	Specifies the TID of the MSDUs for which this block ack agreement has been set up.
ReasonCode	Enumeration	STA_LEAVING, END_BA, UNKNOWN_BA, TIMEOUT	Indicates the reason why the block ack agreement is being deleted.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where block ack agreement is to be deleted. The parameter is absent if the block ack deletion refers to the same frequency band and channel where the DELBA frame is transmitted.
TCLAS	TCLAS element	As defined in 9.4.2.30	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.27.7.3 When generated

This primitive is generated by the MLME as a result of receipt of a block ack deletion by the specified peer MAC entity in the form of a DELBA frame.

6.3.27.7.4 Effect of receipt

The SME is notified of the deletion of the block ack by the specified peer MAC entity.

6.3.28 Schedule element management

6.3.28.1 Introduction

This subclause describes the management procedures associated with the QoS Schedule element.

MLME-SCHEDULE.request and MLME-SCHEDULE.indication primitives are defined.

6.3.28.2 MLME-SCHEDULE.request

6.3.28.2.1 Function

This primitive requests transmission of a Schedule frame. It is valid at the HC.

6.3.28.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCHEDULE.request(
                        STAAddress,
                        Schedule,
                        VendorSpecificInfo
                        )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
STAAddress	MAC address	Any valid individual address	MAC address of the STA to which the Schedule frame shall be sent.
Schedule	Schedule element	As defined in 9.4.2.33	Specifies the schedule for the STA, including the SI (minimum and maximum), TXOP duration (minimum and maximum), and specification interval.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.28.2.3 When generated

This primitive is generated by the SME at the HC to send the schedule information, in the form of a Schedule frame, to a specified STA when the schedule information for the STA is changed.

6.3.28.2.4 Effect of receipt

This primitive causes the MAC entity at the HC to send a Schedule frame to the STA specified in the primitive containing the specified Schedule parameters.

6.3.28.3 MLME-SCHEDULE.indication

6.3.28.3.1 Function

This primitive reports the reception of a new schedule by the STA in the form of a Schedule frame.

6.3.28.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-SCHEDULE.indication(
                        Schedule,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
Schedule	Schedule element	As defined in 9.4.2.33	Specifies the schedule for the STA, including the SI (minimum and maximum), TXOP duration (minimum and maximum), and specification interval.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.28.3.3 When generated

This primitive is generated by the MLME as a result of receipt of a new schedule in the form of a Schedule frame.

6.3.28.3.4 Effect of receipt

The SME is notified of the receipt of QoS schedule in the form of a Schedule frame. The new Schedule parameters overwrite the previously stored values.

6.3.29 Vendor-specific action

6.3.29.1 Introduction

This set of primitives supports the signaling of (Protected) Vendor Specific frames among peer SMEs.

6.3.29.2 MLME-VSPECIFIC.request

6.3.29.2.1 Function

This primitive requests transmission of a Vendor Specific frame.

6.3.29.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-VSPECIFIC.request(
PeerMACAddress,
Protected,
Organization Identifier,
VendorSpecificContent
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address or any valid group MAC address	The address of the peer MAC entity or group of entities to which the Vendor Specific frame is sent.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using a Protected Vendor Specific frame. If false, the request is sent using a Vendor Specific frame.
Organization Identifier	As defined in 9.4.1.31	As defined in 9.4.1.31	A public value assigned by the IEEE to identify the organization that has defined the content of the particular vendor-specific action.
VendorSpecificContent	Determined by the entity to whom the Organization Identifier is registered	Determined by the entity to whom the Organization Identifier is registered	Vendor-specific content.

6.3.29.2.3 When generated

This primitive is generated by the SME to request that a Vendor Specific frame be sent.

6.3.29.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Vendor Specific frame containing the set of elements and vendor-specific fields. The STA then attempts to transmit the frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.29.3 MLME-VSPECIFIC.indication

6.3.29.3.1 Function

This primitive indicates that a Vendor Specific frame has been received from a peer entity.

6.3.29.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-VSPECIFIC.indication(
PeerMACAddress,
Protected,
Organization Identifier,
RCPI,
VendorSpecificContent
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Vendor Specific frame was received.
Protected	Boolean	true, false	Specifies whether the request was received using a protected robust Management frame. If true, the request was received using a Protected Vendor Specific frame. If false, the request was received using a Vendor Specific frame.
Organization Identifier	As defined in 9.4.1.31	As defined in 9.4.1.31	A public value assigned by the IEEE to identify the organization that has defined the content of the particular vendor-specific action.
RCPI	As defined in 9.4.2.37	As defined in 9.4.2.37	Present when dot11OCBActivated is true. RCPI is the measured value of received channel power on the received Vendor Specific frame.
VendorSpecificContent	Determined by the entity to whom the Organization Identifier is registered	Determined by the entity to whom the Organization Identifier is registered	Vendor-specific content.

6.3.29.3.3 When generated

This primitive is generated by the MLME when a Vendor Specific frame is received.

6.3.29.3.4 Effect of receipt

On receipt of this primitive, the vendor specific content can be made available for SME processes.

6.3.30 Neighbor report request

6.3.30.1 General

The following MLME primitives support the signaling of neighbor report requests.

6.3.30.2 MLME-NEIGHBORREPREQ.request

6.3.30.2.1 Function

This primitive requests that a Neighbor Report Request frame be sent to the AP with which the STA is associated. It is valid only at a radio measurement capable STA.

6.3.30.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-NEIGHBORREPREQ.request(
DialogToken,
SSID,
LCI requested,
LCI optional subelements,
Location Civic requested,
Civic Location Type,
Location Civic optional subelements,
VendorSpecificInfo
)

Name	Type	Valid range	Description
DialogToken	Integer	1–255	The dialog token to identify the neighbor report transaction.
SSID	As defined in the SSID element	As defined in the SSID element	Optional SSID element to request a list of neighbor reports for a specific SSID.
LCI requested	Boolean	true, false	Indicates whether an LCI Measurement Request field is to be included in the generated Neighbor Report Request frame.
LCI optional subelements	As defined in 9.4.2.20.10	As listed in Table 9-111	Optionally present if LCI requested is true. Zero or more subelements to include in the request.
Location Civic requested	Boolean	true, false	Indicates whether a Location Civic Measurement Request field is to be included in the generated Neighbor Report Request frame.
Civic Location Type	Enumeration	IETF_RFC_4776, VENDOR_SPECIFIC	Present if Location Civic requested is true. Indicates the format of the location information in the Location Civic optional subelements, if included.
Location Civic optional subelements	As defined in 9.4.2.20.14	As listed in Table 9-118	Optionally present if Location Civic requested is true. Zero or more subelements to include in the request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.30.2.3 When generated

This primitive is generated by the SME to request that a Neighbor Report Request frame be sent to the AP with which the STA is associated to request a neighbor report.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.30.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Neighbor Report Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.30.3 MLME-NEIGHBORREPREQ.indication

6.3.30.3.1 Function

This primitive indicates that a Neighbor Report Request frame was received. It is valid only at a radio measurement capable AP.

6.3.30.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-NEIGHBORREPREQ.indication(
PeerSTAAddress,
DialogToken,
SSID,
LCI requested,
LCI optional subelements,
Location Civic requested,
Civic Location Type,
Location Civic optional subelements,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the STA's MAC entity from which a Neighbor Report Request frame was received.
DialogToken	Integer	1–255	The dialog token in the Neighbor Report Request frame that was received.
SSID	As defined in the SSID element	As defined in the SSID element	Optional SSID element to request a list of neighbor reports for a specific SSID.
LCI requested	Boolean	true, false	Indicates whether an LCI Measurement Request field is included in the received Neighbor Report Request frame.
LCI optional subelements	As defined in 9.4.2.20.10	As listed in Table 9-111	Optionally present if LCI requested is true. Zero or more subelements to include in the request.
Location Civic requested	Boolean	true, false	Indicates whether a Location Civic Measurement Request field is included in the received Neighbor Report Request frame.
Civic Location Type	Enumeration	IETF_RFC_4776, VENDOR_SPECIFIC	Present if Location Civic requested is true. Indicates the format of the location information in the Location Civic optional subelements, if included.
Location Civic optional subelements	As defined in 9.4.2.20.14	As listed in Table 9-118	Optionally present if Location Civic requested is true. Zero or more subelements to include in the request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.30.3.3 When generated

This primitive is generated by the MLME when a Neighbor Report Request frame is received.

6.3.30.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.10.10.3.

6.3.31 Neighbor report response

6.3.31.1 General

The following MLME primitives support the signaling of neighbor report responses.

6.3.31.2 MLME-NEIGHBORREPRESP.request

6.3.31.2.1 Function

This primitive requests that a neighbor report response be sent. This may be in response to an MLME-NEIGHBORREPREQ.indication primitive or an autonomous request. It is valid only at a radio measurement capable AP.

6.3.31.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-NEIGHBORREPRESP.request(
PeerSTAAddress,
DialogToken,
NeighborListSet,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the STA's MAC entity to which a Neighbor Report Response frame is to be sent.
DialogToken	Integer	0–255	The dialog token to identify the neighbor report transaction. Set to the value received in the corresponding MLME-NEIGHBORREPREQ.indication primitive or to 0 for an autonomous report.
NeighborListSet	Set of Neighbor Report elements each as defined in the Neighbor Report element format	As defined in 9.4.2.36	A set of Neighbor Report elements, each representing a neighboring AP being reported.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.31.2.3 When generated

This primitive is generated by the SME to request a neighbor report be sent. This may be in response to an earlier MLME-NEIGHBORREPREQ.indication primitive or a request to transmit an autonomous report.

6.3.31.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Neighbor Report Response frame. The STA then attempts to transmit this to the STA indicated by the PeerSTAAddress parameter.

6.3.31.3 MLME-NEIGHBORREPRESP.indication

6.3.31.3.1 Function

This primitive indicates that a neighbor report response has been received. This may be in response to an earlier neighbor report request (MLME-NEIGHBORREPREQ.request primitive) or an autonomous report. It is valid only at a radio measurement capable STA.

6.3.31.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-NEIGHBORREPRESP.indication(
PeerSTAAddress,
DialogToken,
NeighborListSet,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the AP from which the Neighbor Report Response frame was received.
DialogToken	Integer	0–255	The Dialog Token received in the Neighbor Report Response frame to identify the neighbor report transaction.
NeighborListSet	Set of Neighbor Report elements each as defined in the Neighbor Report element format	As defined in 9.4.2.36	A set of Neighbor Report elements derived from the MIB table dot11RMNeighborReportTable, each representing a neighboring AP being reported.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.31.3.3 When generated

This primitive is generated by the MLME when a Neighbor Report Response frame is received.

6.3.31.3.4 Effect of receipt

The SME is notified of the receipt of the neighbor report.

6.3.32 Link Measure Request

6.3.32.1 General

The following primitives support the measurement of link path loss and the estimation of link margin between peer entities.

6.3.32.2 MLME-LINKMEASURE.request

6.3.32.2.1 Function

This primitive supports the measurement of link path loss and the estimation of link margin between peer entities.

NOTE—The layer management model used assumes that the handling of a received Link Measurement Request frame is entirely within the MLME. Correspondingly there are no MLME-SME primitives specified for the peer side of a link measurement request transaction.

6.3.32.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LINKMEASURE.request(
PeerMACAddress,
DialogToken,
Transmit Power,
Max Transmit Power,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Link Measure Request shall be sent.
DialogToken	Integer	1–255	The dialog token to identify the Link Measure transaction.
Transmit Power	Integer	As defined in 9.6.6.4	The transmit power to be used when transmitting the Link Measurement Request frame and included in the frame body. See 9.6.6.4.
Max Transmit Power	Integer	As defined in 9.6.6.4	The maximum transmit power to be used by the transmitting STA on its operating channel, as described in 9.4.1.20.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.32.2.3 When generated

This primitive is generated by the SME to request that a Link Measurement Request frame be sent to the peer entity to request that entity to report transmit power and link margin information.

6.3.32.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Link Measurement Request frame. The STA then attempts to transmit this to the STA indicated in the PeerMACAddress parameter.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.32.3 MLME-LINKMEASURE.confirm

6.3.32.3.1 Function

This primitive reports the result of a Link Measurement request.

6.3.32.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LINKMEASURE.confirm(
ResultCode,
DialogToken,
TransmitPower,
LinkMargin,
RCPI of Request,
RSNI of Request,
RCPI of Report,
RSNI of Report,
Receive Antenna ID,
Transmit Antenna ID,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, UNSPECIFIED_FAILURE	Indicates the result of the corresponding MLME-LINKMEASURE.request primitive.
DialogToken	Integer	As defined in the corresponding MLME-LINK-MEASURE.request primitive	The dialog token to identify the link measurement transaction.
TransmitPower	As defined in the TPC Report element	As defined in the TPC Report element	The contents of the Transmit Power field of the received Link Measurement Report frame. Present if ResultCode = SUCCESS; otherwise not present.
LinkMargin	As defined in the TPC Report element	As defined in the TPC Report element	The contents of the Link Margin field of the received Link Measurement Report frame. Present if ResultCode = SUCCESS; otherwise not present.
RCPI of Request	Integer	As defined in 9.4.2.37	Indicates the RCPI value contained in the corresponding Link Measurement Report frame received at the requesting STA. Present if ResultCode = SUCCESS; otherwise not present.
RSNI of Request	Integer	As defined in 9.4.2.40	Indicates the RSNI value contained in the corresponding Link Measurement Report frame received at the requesting STA. Present if ResultCode = SUCCESS; otherwise not present
RCPI of Report	Integer	As defined in 9.4.2.37	The RCPI level of the corresponding Link Measurement Report frame received at the requesting STA. Present if ResultCode = SUCCESS; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
RSNI of Report	Integer	As defined in 9.4.2.40	The RSNI of the corresponding Link Measurement Report frame received at the requesting STA. Present if ResultCode = SUCCESS; otherwise not present.
Receive Antenna ID	Integer	0–255	The antenna ID or DMG antenna ID corresponding to the antenna or DMG antenna on which the Link Measurement Request frame was received at the reporting STA. The antenna ID or DMG antenna ID is defined in 9.4.2.39.
Transmit Antenna ID	Integer	0–255	The antenna ID or DMG antenna ID corresponding to the antenna or DMG antenna used to transmit the Link Measurement Report frame. The antenna ID or DMG antenna ID is defined in 9.4.2.39.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.32.3.3 When generated

This primitive is generated by the MLME when a Link Measurement Report frame is received from the requested STA.

6.3.32.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the ResultCode and may use the reported data.

6.3.33 MLME SAP interface for resource request

6.3.33.1 MLME-RESOURCE-REQUEST.request

6.3.33.1.1 Function

This primitive is used to perform the over-the-air resource request of an FT resource request protocol. The over-the-air resource request is performed using Authentication frames, with an authentication algorithm number corresponding to FT authentication and an authentication algorithm sequence number of 3 or 4.

6.3.33.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST.request(
                                    PeerMACAddress,
                                    Contents of FT Authentication elements,
                                    VendorSpecificInfo
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the AP that is the intended immediate recipient of the resource request.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the FT Confirm frame, as described in 13.8.4.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.33.1.3 When generated

This primitive is generated by the SME to send the third frame of the over-the-air FT resource request protocol. The third frame is an Authentication frame, with an number corresponding to FT authentication and an Authentication algorithm sequence number of 3.

6.3.33.1.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the appropriate Authentication frame and causes it to be transmitted to the peer MAC address.

6.3.33.2 MLME-RESOURCE-REQUEST.indication

6.3.33.2.1 Function

This primitive is used to enact the security and QoS resource request with a specified peer MAC entity.

6.3.33.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST.indication(
                                    PeerMACAddress,
                                    Content of FT Authentication elements,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that was the sender of the resource request.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the FT Confirm frame, as described in 13.8.4.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.33.2.3 When generated

This primitive is generated by the MLME at an AP to indicate that the third frame of the over-the-air FT resource request protocol has been received. The third frame is an Authentication frame, with an authentication algorithm number corresponding to FT authentication and an authentication algorithm sequence number of 3.

6.3.33.2.4 Effect of receipt

Upon receipt of this primitive, the SME examines the Transition element and RSNE contents and responds to the peer MAC address using the MLME-RESOURCE-REQUEST.response primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.33.3 MLME-RESOURCE-REQUEST.response

6.3.33.3.1 Function

This primitive is used to enact the security and QoS resource request protocol with a specified peer MAC entity.

6.3.33.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RESOURCE-REQUEST.response(
PeerMACAddress,
Content of FT Authentication elements,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that is the intended immediate recipient of the resource response.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements to be included in the FT Ack frame, as described in 13.8.5. This includes an optional response to a resource request (RIC).
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.33.3.3 When generated

This primitive is generated by the SME at an AP to cause the transmission of the fourth frame in the over-the-air FT resource request protocol. The fourth frame is an Authentication frame, with an authentication algorithm number corresponding to FT authentication and an authentication algorithm sequence number of 4.

6.3.33.3.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the appropriate Authentication frame and causes it to be transmitted to the peer MAC address.

6.3.33.4 MLME-RESOURCE-REQUEST.confirm

6.3.33.4.1 Function

This primitive is used to enact the security and QoS resource request protocol with a specified peer MAC entity.

6.3.33.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RESOURCE-REQUEST.confirm(
PeerMACAddress,
Content of FT Authentication elements,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the AP that was the sender of the resource response.
Content of FT Authentication elements	Sequence of elements	As defined in 13.8	The set of elements included in the FT Ack frame, as described in 13.8.5. This includes an optional response to a resource request (RIC).
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.33.4.3 When generated

This primitive is generated by the MLME on receipt of the fourth frame in the FT resource request protocol.

6.3.33.4.4 Effect of receipt

Upon receipt of this primitive, the SME examines the content of the message and completes its processing of the resource request.

6.3.33.5 MLME-RESOURCE-REQUEST-LOCAL.request

6.3.33.5.1 Function

This primitive is used to enact the over-the-DS FT resource request protocol for a specified peer MAC entity. The over-the-DS FT resource request protocol is performed by communication between the STA and the SME of the target AP, bypassing the MAC of the target AP. This MLME function is used to allow the MAC of the target AP to process the resource requests.

6.3.33.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST-LOCAL.request(
                                    MACAddress,
                                    Content of Resource Descriptor(s)
                                    )
```

Name	Type	Valid range	Description
MACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that is making the resource request.
Content of Resource Descriptor(s)	Sequence of elements	As defined in 13.11.2	Specifies the resource(s) that are being requested.

6.3.33.5.3 When generated

This primitive is generated by the SME at a target AP upon receiving an over-the-DS resource request to request resources within the local MAC.

6.3.33.5.4 Effect of receipt

Upon receipt of this primitive, the MAC checks for resource availability and allocates resources as requested.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.33.6 MLME-RESOURCE-REQUEST-LOCAL.confirm

6.3.33.6.1 Function

This primitive is used to respond to a local resource request for resources from the SME.

6.3.33.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST-LOCAL.confirm(
                                    MACAddress,
                                    Content of Resource Descriptor(s),
                                    ResultCode
                                    )
```

Name	Type	Valid range	Description
MACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that is making the resource request.
Content of Resource Descriptor(s)	Sequence of elements	As defined in 13.11.2	Specifies the resource(s) that were allocated or could have been allocated.
ResultCode	Enumeration	SUCCESS, REFUSED, UNSPECIFIED_FAILURE	Indicates the result of the outcome of a resource request.

6.3.33.6.3 When generated

This primitive is generated by the MAC in response to a local resource request for resources via MLME-RESOURCE-REQUEST-LOCAL.request primitive.

6.3.33.6.4 Effect of receipt

Upon receipt of this primitive, the SME prepares a success or failure response to be sent to the STA via the current AP.

6.3.34 MLME SAP interface for remote requests

6.3.34.1 MLME-REMOTE-REQUEST.request

6.3.34.1.1 Function

This primitive is used by the SME of a non-AP STA (to send over-the-DS requests) and the SME of an AP (to send over-the-DS responses) to request the MAC to send an FT Action frame.

6.3.34.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REMOTE-REQUEST.request(
                                  PeerMACAddress,
                                  Content of FT Action Frame
                                  )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that is the destination of the Action frame
Content of FT Action Frame	Sequence of octets	As defined in 9.6.8	The Action frame to send to the STA.

6.3.34.1.3 When generated

This primitive is generated by the SME to send an FT Action frame to a specific peer MAC entity.

6.3.34.1.4 Effect of receipt

Upon receipt of this primitive, the MAC forwards the Action frame to the STA identified in the Action frame.

6.3.34.2 MLME-REMOTE-REQUEST.indication

6.3.34.2.1 Function

This primitive is used by the MAC to indicate to the SME the reception of an FT Action frame.

6.3.34.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REMOTE-REQUEST.indication(
                                    PeerMACAddress,
                                    Contents of FT Action Frame
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that issued the Action frame.
Content of FT Action Frame	Sequence of octets	As defined in 9.6.8	The Action frame received from the STA.

6.3.34.2.3 When generated

This primitive is generated by the MAC as a result of the receipt of an FT Action frame from a specific peer MAC entity.

6.3.34.2.4 Effect of receipt

Upon receipt of this primitive, the remote request broker (RRB) in the SME of the current AP forwards the Action frame to the target AP identified in the Action frame.

6.3.35 Extended channel switch announcement

6.3.35.1 General

The following MLME primitives support the signaling of extended channel switch announcement.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.35.2 MLME-EXTCHANNELSWITCH.request

6.3.35.2.1 Function

This primitive requests that a (Protected) Extended Channel Switch Announcement frame be sent by an AP or mesh STA.

6.3.35.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EXTCHANNELSWITCH.request(
Mode,
OperatingClass,
ChannelNumber,
ChannelSwitchCount,
Protected,
Mesh Channel Switch Parameters,
New Country,
Wide Bandwidth Channel Switch,
New Transmit Power Envelope,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Mode	Integer	0,1	Channel switch mode, as defined for the Extended Channel Switch Announcement element.
OperatingClass	Integer	As defined in Annex E	Specifies the new operating class.
ChannelNumber	Integer	As defined in Annex E	Specifies the new channel number.
ChannelSwitchCount	As defined in 9.4.2.52	As defined in 9.4.2.52	Specifies the time period until the channel switch event, as described in 9.4.2.52.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected Extended Channel Switch Announcement frame. If false, the request is sent using the Extended Channel Switch Announcement frame.
Mesh Channel Switch Parameters	As defined in 9.4.2.102	As defined in 9.4.2.102	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if dot11MeshActivated is true; otherwise, the parameter is not present.
New Country	As defined in 9.4.2.8	As defined in 9.4.2.8	Specifies the country, operating class table and operating classes used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
Wide Bandwidth Channel Switch	As defined in 9.4.2.160	As defined in 9.4.2.160	Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present.

Name	Type	Valid range	Description
New Transmit Power Envelope	Set of New Transmit Power Envelope elements	N/A	Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.35.2.3 When generated

This primitive is generated by the STA management entity (SME) to request that a (Protected) Extended Channel Switch Announcement frame be sent to a STA that is associated to the AP or to peer mesh STAs in the MBSS.

6.3.35.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs and transmits a (Protected) Extended Channel Switch Announcement frame.

6.3.35.3 MLME-EXTCHANNELSWITCH.confirm

6.3.35.3.1 Function

This primitive reports the result of a request to switch channel.

6.3.35.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EXTCHANNELSWITCH.confirm(
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.35.3.3 When generated

This primitive is generated by the MLME when an extended channel switch request completes. Possible unspecified failure causes include an inability to schedule an extended channel switch announcement.

6.3.35.3.4 Effect of receipt

The SME is notified of the results of the extended channel switching procedure.

6.3.35.4 MLME-EXTCHANNELSWITCH.indication

6.3.35.4.1 Function

This primitive indicates that a (Protected) Extended Channel Switch Announcement frame was received from an AP or from a peer mesh STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.35.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EXTCHANNELSWITCH.indication(
Peer MAC Address,
Mode,
OperatingClass,
ChannelNumber,
ChannelSwitchCount,
Protected,
Mesh Channel Switch Parameters,
New Country,
Wide Bandwidth Channel Switch,
New Transmit Power Envelope,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Extended Channel Switch Announcement frame was received.
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
OperatingClass	Integer	As defined in Annex E	Specifies the new operating class.
ChannelNumber	Integer	As defined in Annex E	Specifies the new channel number.
ChannelSwitchCount	As defined in 9.4.2.52	As defined in 9.4.2.52	Specifies the time period until the channel switch event, as described in 9.4.2.52.
Protected	Boolean	true, false	Specifies whether the request was received using a protected robust Management frame. If true, the request was received using the Protected Extended Channel Switch Announcement frame. If false, the request was received using the Extended Channel Switch Announcement frame.
Mesh Channel Switch Parameters	As defined in 9.4.2.102	As defined in 9.4.2.102	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if dot11MeshActivated is true; otherwise, the parameter is not present.
New Country	As defined in 9.4.2.8	As defined in 9.4.2.8	Specifies the country, operating class table and operating classes used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
Wide Bandwidth Channel Switch	As defined in 9.4.2.160	As defined in 9.4.2.160	Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present.
New Transmit Power Envelope	Set of New Transmit Power Envelope elements	N/A	Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.35.4.3 When generated

This primitive is generated by the MLME when a (Protected) Extended Channel Switch Announcement frame is received.

6.3.35.4.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the switch request.

6.3.35.5 MLME-EXTCHANNELSWITCH.response

6.3.35.5.1 Function

This primitive is used to schedule an accepted extended channel switch.

6.3.35.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EXTCHANNELSWITCH.response(
Mode,
OperatingClass,
ChannelNumber,
ChannelSwitchCount,
Mesh Channel Switch Parameters,
New Country,
Wide Bandwidth Channel Switch,
New Transmit Power Envelope,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
OperatingClass	Integer	As defined in Annex E	Specifies the new operating class.
ChannelNumber	Integer	As defined in Annex E	Specifies the new channel number.
ChannelSwitchCount	As defined in 9.4.2.52	As defined in 9.4.2.52	Specifies the time period until the channel switch event, as described in 9.4.2.52.
Mesh Channel Switch Parameters	As defined in 9.4.2.102	As defined in 9.4.2.102	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if dot11MeshActivated is true; otherwise, the parameter is not present.
New Country	As defined in 9.4.2.8	As defined in 9.4.2.8	Specifies the country, operating class table and operating classes used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
Wide Bandwidth Channel Switch	As defined in 9.4.2.160	As defined in 9.4.2.160	Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present.

Name	Type	Valid range	Description
New Transmit Power Envelope	Set of New Transmit Power Envelope elements	N/A	Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.35.5.3 When generated

This primitive is generated by the SME to schedule an accepted extended channel switch request.

6.3.35.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the extended channel switch.

6.3.36 DSE power constraint announcement

6.3.36.1 General

The following MLME primitives support the signaling of DSE power constraint to dependent STAs.

6.3.36.2 MLME-DSETPC.request

6.3.36.2.1 Function

This primitive requests that a (Protected) DSE Power Constraint frame be sent by an enabling STA.

6.3.36.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.request(
                    RequesterSTAAddress,
                    ResponderSTAAddress,
                    DSELocalPowerConstraint,
                    Protected,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity of the enabling STA.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity that initiates the enablement process.
DSELocalPowerConstraint	Integer	0–255	Specifies the local power constraint, as described in the DSE Power Constraint frame (see 9.6.7.10).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected DSE Power Constraint frame. If false, the request is sent using the DSE Power Constraint frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.36.2.3 When generated

This primitive is generated by the SME to request that a (Protected) DSE Power Constraint Announcement frame be sent to a dependent STA.

6.3.36.2.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs a (Protected) DSE Power Constraint Announcement frame. The enabling STA then schedules this frame for transmission.

6.3.36.3 MLME-DSETPC.confirm

6.3.36.3.1 Function

This primitive reports the results of a request to send a (Protected) DSE Power Constraint Announcement frame.

6.3.36.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.confirm(
                    ResultCode,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the result of MLME-DSETPC.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.36.3.3 When generated

This primitive is generated by the MLME when a DSE power constraint announcement completes.

6.3.36.3.4 Effect of receipt

The SME is notified of the results of the DSE power constraint procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.36.4 MLME-DSETPC.indication

6.3.36.4.1 Function

This primitive indicates that a DSE Power Constraint Announcement frame was received from an enabling STA.

6.3.36.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DSETPC.indication(
RequesterSTAAddress,
ResponderSTAAddress,
DSELocalPowerConstraint,
Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity that initiated the enablement process.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity that is the enabling STA.
DSELocalPowerConstraint	Integer	0–255	Specifies the local power constraint, as described in the DSE Power Constraint frame (see 9.6.7.10).
Protected	Boolean	true, false	Specifies whether the request was received using a protected robust Management frame. If true, the request was received using the Protected DSE Power Constraint frame. If false, the request was received using the DSE Power Constraint frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.36.4.3 When generated

This primitive is generated by the MLME when a (Protected) DSE Power Constraint Announcement frame is received.

6.3.36.4.4 Effect of receipt

On receipt of this primitive, the SME performs the DSE power constraint procedure (see 11.11.5).

6.3.36.5 MLME-DSETPC.response

6.3.36.5.1 Function

This primitive is used to report the result of the DSE power constraint procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.36.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DSETPC.response(
RequesterSTAAddress,
ResponderSTAAddress,
ResultCode,
Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity of the enabling STA.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity that initiates the enabling process.
ResultCode	Enumeration	SUCCESS, REFUSED	Reports the result of a DSE power constraint procedure.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected DSE Power Constraint frame. If false, the response is sent using the DSE Power Constraint frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.36.5.3 When generated

This primitive is generated by the SME to schedule a response to DSE power constraint announcement.

6.3.36.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the transmission of a (Protected) DSE power constraint result to the enabling STA that sent the DSE power constraint announcement.

6.3.37 Enablement

6.3.37.1 General

This mechanism supports the process of establishing an enablement relationship with a peer MAC entity.

6.3.37.2 MLME-ENABLEMENT.request

6.3.37.2.1 Function

This primitive requests enablement with a specified peer MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.37.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.request(
RequesterSTAAddress,
ResponderSTAAddress,
EnablementTimeLimit,
Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity that initiates the enablement process.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity of the enabling STA.
EnablementTimeLimit	Integer	> 0	Specifies a time limit (in TU) after which the enablement process is terminated.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected DSE Enablement frame. If false, the request is sent using the DSE Enablement frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.37.2.3 When generated

This primitive is generated by the SME for a STA to establish enablement with a specified peer MAC entity. During the enablement procedure, the SME can generate additional MLME-ENABLEMENT.request primitives.

6.3.37.2.4 Effect of receipt

This primitive initiates an enablement procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-ENABLEMENT.confirm primitive that reflects the results.

6.3.37.3 MLME-ENABLEMENT.confirm

6.3.37.3.1 Function

This primitive reports the results of an enablement attempt with a specified peer MAC entity.

6.3.37.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.confirm(
RequesterSTAAddress,
ResponderSTAAddress,

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

ResultCode,
Protected,
EnablementIdentifier,
VendorSpecificInfo
)

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity that initiated the enablement process. This value matches the RequesterSTAAddress parameter specified in the corresponding MLME-ENABLEMENT.request primitive.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the enablement process was attempted.This value matches the ResponderSTAAddress parameter specified in the corresponding MLME-ENABLEMENT.request primitive.
ResultCode	Enumeration	SUCCESS, REFUSED, TOO_MANY_SIMULTANEOUS_REQUESTS	Indicates the result of MLME-ENABLEMENT.request primitive.
EnablementIdentifier	Integer	0–65 535	Specifies the dependent enablement identifier.
Protected	Boolean	true, false	Specifies whether the response was received using a protected robust Management frame. If true, the response was received using the Protected DSE Enablement frame. If false, the response was received using the DSE Enablement frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.37.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ENABLEMENT.request primitive for enablement with a specified peer MAC entity.

6.3.37.3.4 Effect of receipt

The SME is notified of the results of the enablement procedure.

6.3.37.4 MLME-ENABLEMENT.indication

6.3.37.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an enablement relationship with the STA processing this primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.37.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.indication(
RequesterSTAAddress,
ResponderSTAAddress,
Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity that initiated the enablement process.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity that is the enabling STA.
Protected	Boolean	true, false	Specifies whether the request was sent using a protected robust Management frame. If true, the request was sent using the Protected DSE Enablement frame. If false, the request was sent using the DSE Enablement frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.37.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an enablement request from a specific peer MAC entity.

6.3.37.4.4 Effect of receipt

The SME is notified of the receipt of this enablement request.

6.3.37.5 MLME-ENABLEMENT.response

6.3.37.5.1 Function

This primitive is used to send a response to a specified peer MAC entity that requested enablement with the STA that issued this primitive.

6.3.37.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.response(
RequesterSTAAddress,
ResponderSTAAddress,
ResultCode,
EnablementIdentifier,
Protected,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity that initiated the enablement process.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity that is the enabling STA.
ResultCode	Enumeration	SUCCESS, REFUSED, TOO_MANY_SIMULTANEOUS_REQUESTS	Indicates the result response to the enablement request from the peer MAC entity.
EnablementIdentifier	Integer	0-65 535	Specifies the dependent enablement identifier.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected DSE Enablement frame. If false, the response is sent using the DSE Enablement frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.37.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-ENABLEMENT.indication primitive.

6.3.37.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested enablement.

6.3.38 Deenablement

6.3.38.1 MLME-DEENABLEMENT.request

6.3.38.1.1 Function

This primitive requests that the enablement relationship with a specified peer MAC entity be invalidated.

6.3.38.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEENABLEMENT.request(
                                    RequesterSTAAddress,
                                    ResponderSTAAddress,
                                    ReasonCode,
                                    Protected,
                                    VendorSpecificInfo
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity that requests the deenablement process.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity that becomes deenabled in the process.
ReasonCode	Reason Result Code field	As defined in 9.6.7.5	Specifies the reason code for initiating the deenablement process.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected DSE Deenablement frame. If false, the request is sent using the DSE Deenablement frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.38.1.3 When generated

This primitive is generated by the SME for a STA to invalidate enablement with a specified peer MAC entity in order to prevent the exchange of (Protected Dual of) Public Action frames between the two STAs. During the deenablement procedure, the SME can generate additional MLME-DEENABLEMENT.request primitives.

6.3.38.1.4 Effect of receipt

This primitive initiates a deenablement procedure.

6.3.38.2 MLME-DEENABLEMENT.indication

6.3.38.2.1 Function

This primitive reports the invalidation of an enablement relationship with a specified peer MAC entity.

6.3.38.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEENABLEMENT.indication(
                                    RequesterSTAAddress,
                                    ResponderSTAAddress,
                                    ReasonCode,
                                    Protected,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the enablement relationship was invalidated.
ResponderSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity with which the enablement relationship was invalidated.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ReasonCode	Reason Result Code field	As defined in 9.6.7.5	Specifies the reason the deenablement procedure was initiated.
Protected	Boolean	true, false	Specifies whether the request was received using a protected robust Management frame. If true, the request was received using the Protected DSE Deenablement frame. If false, the request was received using the DSE Deenablement frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.38.2.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an enablement relationship with a specific peer MAC entity.

6.3.38.2.4 Effect of receipt

The SME is notified of the invalidation of the specific enablement relationship.

6.3.39 SA Query support

6.3.39.1 MLME-SA-QUERY.request

6.3.39.1.1 Function

This primitive requests that an SA Query Request frame be sent to a specified peer STA to which the STA is associated.

6.3.39.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SA-QUERY.request(
                        PeerSTAAddress,
                        TransactionIdentifier,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity for the SA Query.
TransactionIdentifier	2 octets	As defined in 9.6.9.2	The Transaction Identifier to identify the SA Query Request and Response transaction.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.39.1.3 When generated

This primitive is generated by the SME to request that an SA Query Request frame be sent to a specified peer STA with which the STA is associated.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.39.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs an SA Query Request frame. The STA then attempts to transmit this to the peer STA with which it is associated.

6.3.39.2 MLME-SA-QUERY.confirm

6.3.39.2.1 Function

This primitive reports the result of an SA Query procedure.

6.3.39.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SA-QUERY.confirm(
                        PeerSTAAddress,
                        TransactionIdentifier,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid Range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity for the SA Query.
TransactionIdentifier	2 octets	As defined in 9.6.9.2	The Transaction Identifier to identify the SA Query Request and Response transaction.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.39.2.3 When generated

This primitive is generated by the MLME as a result of the receipt of a valid SA Query Response frame.

6.3.39.2.4 Effect of receipt

On receipt of this primitive, the SME may use the response as a sign of liveness of the peer STA.

6.3.39.3 MLME-SA-QUERY.indication

6.3.39.3.1 Function

This primitive indicates that an SA Query Request frame was received from a STA.

6.3.39.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SA-QUERY.indication(
                        PeerSTAAddress,
                        TransactionIdentifier,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity for the SA Query.
TransactionIdentifier	2 octets	As defined in 9.6.9.2	The Transaction Identifier to identify the SA Query Request and Response transaction.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.39.3.3 When generated

This primitive is generated by the MLME when a SA Query Request frame is received.

6.3.39.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.3.

6.3.39.4 MLME-SA-QUERY.response

6.3.39.4.1 Function

This primitive is generated in response to an MLME-SA-QUERY.indication primitive requesting an SA Query Response frame be sent to a STA.

6.3.39.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SA-QUERY.response(
                        PeerSTAAddress,
                        TransactionIdentifier,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity for the SA Query.
TransactionIdentifier	2 octets	As defined in 9.6.9.2	The Transaction Identifier to identify the SA Query Request and Response transaction.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.39.4.3 When generated

This primitive is generated by the SME, in response to an MLME-SA-QUERY.indication primitive, requesting an SA Query Response frame be sent to a STA.

6.3.39.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs an SA Query Response frame. The STA then attempts to transmit this to the STA indicated by the PeerSTAAddress parameter.

6.3.40 Get TSF timer

6.3.40.1 General

This mechanism is used to request the current value of the TSF timer that the STA maintains.

6.3.40.2 MLME-GETTSFTIME.request

6.3.40.2.1 Function

This primitive is generated by the SME to request that the MLME returns the value of its TSF timer. The value returned in TSFtime (as specified in 6.3.40.3.2) is the value of the TSF timer at the instant the MLME-GETTSFTIME.request primitive is received.

6.3.40.2.2 Semantics of the service primitive

This primitive has no parameters.

6.3.40.2.3 When generated

This primitive is generated by the SME to request the value of the TSF timer from the MLME.

6.3.40.2.4 Effect of receipt

The MLME issues an MLME-GETTSFTIME.confirm primitive.

6.3.40.3 MLME-GETTSFTIME.confirm

6.3.40.3.1 Function

This primitive is generated by the MLME to report to the SME the result of a request to get the value of the TSF timer.

6.3.40.3.2 Semantics of the service primitive

This primitive uses the following parameters:

```
MLME-GETTSFTIME.confirm(
                        ResultCode,
                        TSFtime
                        )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, FAILURE	Reports the outcome of an MLME-GETTSFTIME.request primitive.
TSFtime	Integer	$0 – (2^{64} – 1)$	The value of the TSF timer. Present if ResultCode is SUCCESS; otherwise not present.

6.3.40.3.3 When generated

This primitive is generated by the MLME to report to the SME the result of an MLME-GETTSFTIME.request primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.40.3.4 Effect of receipt

The SME is notified of the result of an MLME-GETTSFTIME.request primitive and, if successful, has the value of the TSF timer at the instant the MLME-GETTSFTIME.request primitive was received by the MLME. If the result of an MLME-GETTSFTIME.request primitive is failure, the TSFtime parameter is not included in the MLME-GETTSFTIME.confirm primitive.

NOTE—The TSF timer value can be used, along with other information, by the SME to compute an offset between an external time standard such as a version of Coordinated Universal Time (UTC) from a Global Positioning System (GPS) unit and the TSF timer.

6.3.41 Timing Advertisement

6.3.41.1 General

The Timing Advertisement primitives are used to communicate timing and other information from the higher layers or the SME of one STA to the higher layers or SME of other STAs.

6.3.41.2 MLME-TIMING-ADVERTISEMENT.request

6.3.41.2.1 Function

This primitive is generated by the SME to request that the MLME generate a Timing Advertisement frame to transmit timing and, optionally, higher layer information.

6.3.41.2.2 Semantics of the service primitive

This primitive provides the following parameters:

MLME-TIMING-ADVERTISEMENT.request(
PeerMACAddress,
Capability Information,
Country,
Power Constraint,
Time Advertisement,
Extended Capabilities,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual or group MAC address	The address of the peer MAC entity or group of entities to which the Timing Advertisement frame is sent.
Capability Information	As defined in 9.4.1.4	As defined in 9.4.1.4	The announced capabilities of the STA.
Country	As defined in 9.4.2.8	As defined in 9.4.2.8	The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only when TPC functionality is required, as specified in 11.7 or when dot11MultiDomainCapabilityActivated is true.
Power Constraint	As defined in 9.4.2.13	As defined in 9.4.2.13	Optional. The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Time Advertisement	As defined in 9.4.2.60	As defined in 9.4.2.60	Timing announced by the STA.
Extended Capabilities	As defined in 9.4.2.26	As defined in 9.4.2.26	The Extended Capabilities element is present if any of the fields in this element are nonzero.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.41.2.3 When generated

This primitive is generated by the SME to request that the MLME generates a Timing Advertisement frame for transmission.

6.3.41.2.4 Effect of receipt

Upon the receipt of this primitive, the MLME attempts to transmit a Timing Advertisement frame to the specified MAC address, using the procedures defined in 11.19.

6.3.41.3 MLME-TIMING-ADVERTISEMENT.indication

6.3.41.3.1 Function

This primitive is generated by the MLME to indicate to the SME the reception of a Timing Advertisement frame.

6.3.41.3.2 Semantics of the service primitive

This primitive provides the following parameters:

MLME-TIMING-ADVERTISEMENT.indication(
Timestamp,
Capability Information,
Local Time,
Country,
Power Constraint,
Time Advertisement,
Extended Capabilities,
RCPI,
Source MAC address,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Timestamp	Integer	N/A	The timestamp of the received frame.
Capability Information	As defined in 9.4.1.4	As defined in 9.4.1.4	The announced capabilities of the STA.
Local Time	Integer	N/A	Local Time is the value of a STA's TSF timer at the start of reception of the first octet of the timestamp field of the received Timing Advertisement frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Country	As defined in 9.4.2.8	As defined in 9.4.2.8	The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only when TPC functionality is required, as specified in 11.7 or when dot11MultiDomainCapabilityActivated is true.
Power Constraint	As defined in 9.4.2.13	As defined in 9.4.2.13	The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel.
Time Advertisement	As defined in 9.4.2.60	As defined in 9.4.2.60	Timing announced by the STA.
Extended Capabilities	As defined in 9.4.2.26	As defined in 9.4.2.26	The Extended Capabilities element is present if any of the fields in this element are nonzero.
RCPI	Integer as defined in 9.4.2.37	As defined in 9.4.2.37	RCPI is the measured value of received channel power on the received Timing Advertisement frame.
Source MAC Address	As defined in 9.2.4.3.6	As defined in 9.2.4.3.6	The SA field of the MAC header from the received Timing Advertisement frame.
VendorSpecific Info	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.41.3.3 When generated

This primitive is generated by the MLME when a Timing Advertisement frame is received.

6.3.41.3.4 Effect of receipt

Upon the receipt of this primitive, the SME is notified that a Timing Advertisement frame has been received.

6.3.42 TDLS Discovery

6.3.42.1 General

The following MLME primitives support the signaling of TDLS Discovery.

6.3.42.2 MLME-TDLSDISCOVERY.request

6.3.42.2.1 Function

This primitive requests that a TDLS Discovery Request frame be sent through the AP path.

6.3.42.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.request(
                                    DestinationAddress,
                                    TDLSDiscoveryRequest
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DestinationAddress	MAC address	Any valid individual MAC address	Specifies the DA to which a TDLS Discovery Request frame is transmitted.
TDLSDiscoveryRequest	Sequence of octets	As defined in TDLS Discovery Request frame	Specifies the proposed service parameters for the TDLS Discovery Request frame.

6.3.42.2.3 When generated

This primitive is generated by the SME to request that a TDLS Discovery Request frame be sent through the AP.

6.3.42.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Discovery Request frame. The STA then attempts to transmit this frame.

6.3.42.3 MLME-TDLSDISCOVERY.confirm

6.3.42.3.1 Function

This primitive is generated when a TDLS Discovery Response frame is received.

6.3.42.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.confirm(
                                    TDLSPeerSTAAddress,
                                    TDLSDiscoveryResponse
                                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA from which a TDLS Discovery Response frame was received.
TDLSDiscoveryResponse	Sequence of octets	As defined in TDLS Discovery Response frame	Specifies the service parameters contained in the received TDLS Discovery Response frame.

6.3.42.3.3 When generated

This primitive is generated when a TDLS Discovery Response frame is received.

6.3.42.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the MLME-TDLSDISCOVERY.confirm primitive and may use the reported data.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.42.4 MLME-TDLSDISCOVERY.indication

6.3.42.4.1 Function

This primitive indicates that a TDLS Discovery Request frame was received from a TDLS peer STA.

6.3.42.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.indication(
                                    TDLSPeerSTAAddress,
                                    TDLSDiscoveryRequest
                                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA from which a TDLS Discovery Request frame was received.
TDLSDiscoveryRequest	Sequence of octets	As defined in TDLS Discovery Request frame	Specifies the proposed service parameters of the TDLS Discovery Request frame.

6.3.42.4.3 When generated

This primitive is generated by the MLME when a TDLS Discovery Request frame is received.

6.3.42.4.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.20.

6.3.42.5 MLME-TDLSDISCOVERY.response

6.3.42.5.1 Function

This primitive requests that a TDLS Discovery Response frame be sent directly to the TDLS peer STA from which a TDLS Discovery Request frame was received.

6.3.42.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.response(
                                    TDLSPeerSTAAddress,
                                    TDLSDiscoveryResponse
                                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA to which a TDLS Discovery Response frame is transmitted.
TDLSDiscoveryResponse	Sequence of octets	As defined in TDLS Discovery Response frame	Specifies the proposed service parameters for the TDLS Discovery Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.42.5.3 When generated

This primitive is generated by the SME to request that a TDLS Discovery Response frame be sent to the TDLS peer STA from which a TDLS Discovery Request frame was received.

6.3.42.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Discovery Response frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.43 TDLS direct-link establishment

6.3.43.1 General

The following MLME primitives support the signaling of tunneled direct-link setup. Figure 6-7 depicts the TDLS direct-link establishment process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

6.3.43.2 MLME-TDLSSETUPREQUEST.request

6.3.43.2.1 Function

This primitive requests that a TDLS Setup Request frame be sent to a candidate TDLS responder STA.

6.3.43.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPREQUEST.request(
                                    TDLSResponderAddress,
                                    TDLSSetupRequest
                                    )
```

Name	Type	Valid range	Description
TDLSResponderAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA to which the TDLS Setup Request frame is transmitted.
TDLSSetupRequest	Sequence of octets	As defined in TDLS Setup Request frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.43.2.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Request frame be sent to a candidate TDLS responder STA.

6.3.43.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Request frame. The STA then attempts to transmit this frame to the candidate TDLS responder STA.

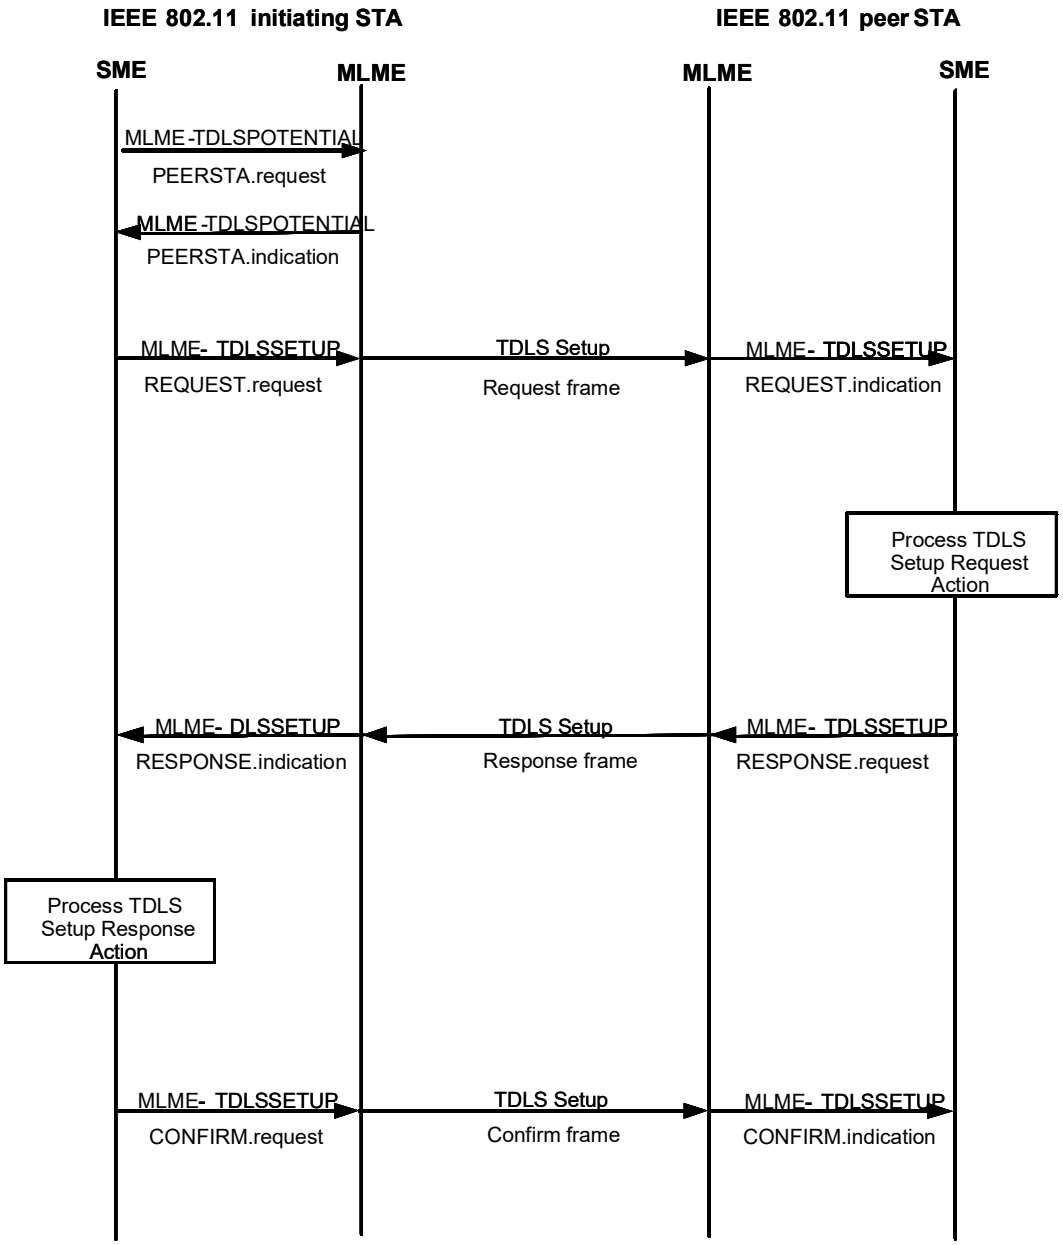

Figure 6-7—TDLS direct-link establishment

6.3.43.3 MLME-TDLSSETUPREQUEST.indication

6.3.43.3.1 Function

This primitive indicates that a TDLS Setup Request frame was received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.43.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TDLSSETUPREQUEST.indication(
TDLSInitiatorAddress,
TDLSSetupRequest
)

Name	Type	Valid range	Description
TDLSInitiatorAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS initiator STA from which a TDLS Setup Request frame was received.
TDLSSetupRequest	Sequence of octets	As defined in TDLS Setup Request frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.43.3.3 When generated

This primitive is generated by the MLME when a TDLS Setup Request frame is received.

6.3.43.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.20.

6.3.43.4 MLME-TDLSSETUPRESPONSE.request

6.3.43.4.1 Function

This primitive requests that a TDLS Setup Response frame be sent to the TDLS initiator STA.

6.3.43.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TDLSSETUPRESPONSE.request(
TDLSInitiatorAddress,
TDLSSetupResponse
)

Name	Type	Valid range	Description
TDLSInitiatorAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS initiator STA to which a TDLS Setup Response frame is transmitted.
TDLSSetupResponse	Sequence of octets	As defined in TDLS Setup Response frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.43.4.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Response frame be sent to the TDLS initiator STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.43.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Response frame. The STA then attempts to transmit this to the TDLS initiator STA.

6.3.43.5 MLME-TDLSSETUPRESPONSE.indication

6.3.43.5.1 Function

This primitive indicates that a TDLS Setup Response frame was received from the TDLS responder STA.

6.3.43.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPRESPONSE.indication(
                                    TDLSResponderAddress,
                                    TDLSSetupResponse
                                    )
```

Name	Type	Valid range	Description
TDLSResponderAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS responder STA from which a TDLS Setup Response frame was received.
TDLSSetupResponse	Sequence of octets	As defined in TDLS Setup Response frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.43.5.3 When generated

This primitive is generated by the MLME when a TDLS Setup Response frame is received.

6.3.43.5.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.20.

6.3.43.6 MLME-TDLSSETUPCONFIRM.request

6.3.43.6.1 Function

This primitive requests that a TDLS Setup Confirm frame be sent to the TDLS responder STA.

6.3.43.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPCONFIRM.request(
                                    TDLSResponderAddress,
                                    TDLSSetupConfirm
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TDLSResponderAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS responder STA to which a TDLS Setup Confirm frame is transmitted.
TDLSSetupConfirm	Sequence of octets	As defined in TDLS Setup Confirm frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.43.6.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Confirm frame be sent to the TDLS responder STA.

6.3.43.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Confirm frame. The STA then attempts to transmit this to the TDLS responder STA.

6.3.43.7 MLME-TDLSSETUPCONFIRM.indication

6.3.43.7.1 Function

This primitive indicates that a TDLS Setup Confirm frame was received from the TDLS initiator STA.

6.3.43.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPCONFIRM.indication(
                                    TDLSInitiatorAddress,
                                    TDLSSetupConfirm
                                    )
```

Name	Type	Valid range	Description
TDLSInitiatorAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS initiator STA from which a TDLS Setup Confirm frame was received.
TDLSSetupConfirm	Sequence of octets	As defined in TDLS Setup Confirm frame	Specifies the proposed service parameters for the TDLS setup.

6.3.43.7.3 When generated

This primitive is generated by the MLME when a TDLS Setup Confirm frame is received.

6.3.43.7.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.20.

6.3.43.8 MLME-TDLSPOTENTIALPEERSTA.request

6.3.43.8.1 Function

This primitive requests information about a potential TDLS peer STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.43.8.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-TDLSPOTENTIALPEERSTA.request(
                                    MACAddress
                                    )
```

Name	Type	Valid Range	Description
MACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the potential TDLS peer STA.

6.3.43.8.3 When generated

This primitive is generated by the SME to request the MLME to provide information about a potential TDLS peer STA.

6.3.43.8.4 Effect of receipt

On receipt of this primitive, the MLME responds with the requested information about the identified STA.

6.3.43.9 MLME-TDLSPOTENTIALPEERSTA.confirm

6.3.43.9.1 Function

This primitive informs the SME about a potential TDLS peer STA.

6.3.43.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPOTENTIALPEERSTA.confirm(
                                    MACAddress,
                                    RSSI
                                    )
```

Name	Type	Valid range	Description
MACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA for which information is requested.
RSSI	Integer	–1 to 255	Specifies the RSSI from the STA. –1 indicates that the STA is not present.

6.3.43.9.3 When generated

This primitive is generated by the MLME to indicate to the SME that a potential TDLS peer STA has been detected.

6.3.43.9.4 Effect of receipt

On receipt of this primitive, the SME may attempt to set up a TDLS direct link by issuing an MLME-TDLSSETUPREQUEST.request primitive to the MLME.

6.3.44 TDLS direct-link teardown

6.3.44.1 General

The following MLME primitives support the signaling of tunneled direct-link setup. Figure 6-8 depicts the TDLS direct-link teardown process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

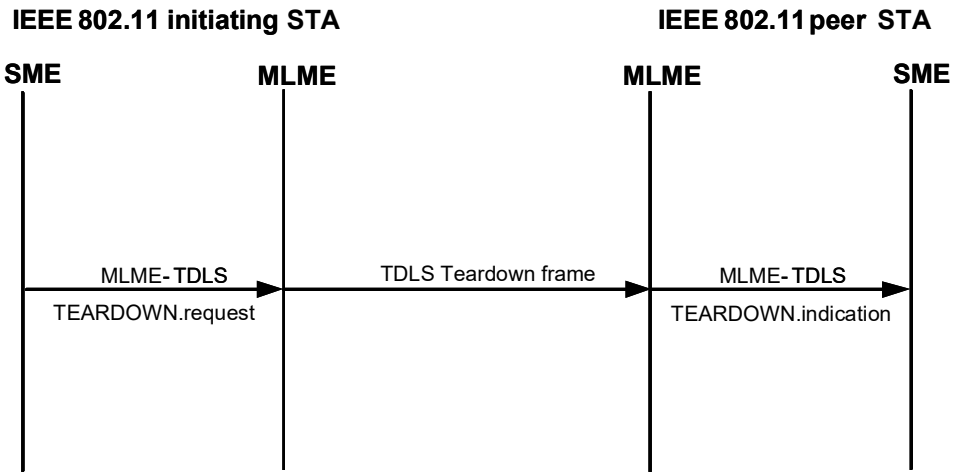

Figure 6-8—TDLS direct-link teardown

6.3.44.2 MLME-TDLSTEARDOWN.request

6.3.44.2.1 Function

This primitive requests that a TDLS Teardown frame be sent to the TDLS peer STA.

6.3.44.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSTEARDOWN.request(
                        TDLSPeerSTAAddress,
                        TDLSTeardown
                        )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA to which a TDLS Teardown frame is transmitted.
TDLSTeardown	Sequence of octets	As defined in TDLS Teardown frame	Specifies the proposed service parameters for the TDLS teardown.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.44.2.3 When generated

This primitive is generated by the SME to request that a TDLS Teardown frame be sent to the TDLS peer STA.

6.3.44.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Teardown frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.44.3 MLME-TDLSTEARDOWN.indication

6.3.44.3.1 Function

This primitive indicates that a TDLS Teardown frame was received from a TDLS peer STA.

6.3.44.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSTEARDOWN.indication(
                                    TDLSPeerSTAAddress,
                                    TDLSTeardown
                                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	The MAC address of the TDLS peer STA from which a TDLS Teardown frame was received.
TDLSTeardown	Sequence of octets	As defined in TDLS Teardown frame	Specifies the proposed service parameters for the TDLS teardown.

6.3.44.3.3 When generated

This primitive is generated by the MLME when a TDLS Teardown frame is received.

6.3.44.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.20.

6.3.45 TDLS peer U-APSD (TPU)

6.3.45.1 General

The following MLME primitives support the signaling of TPU. Figure 6-9 depicts the TPU process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

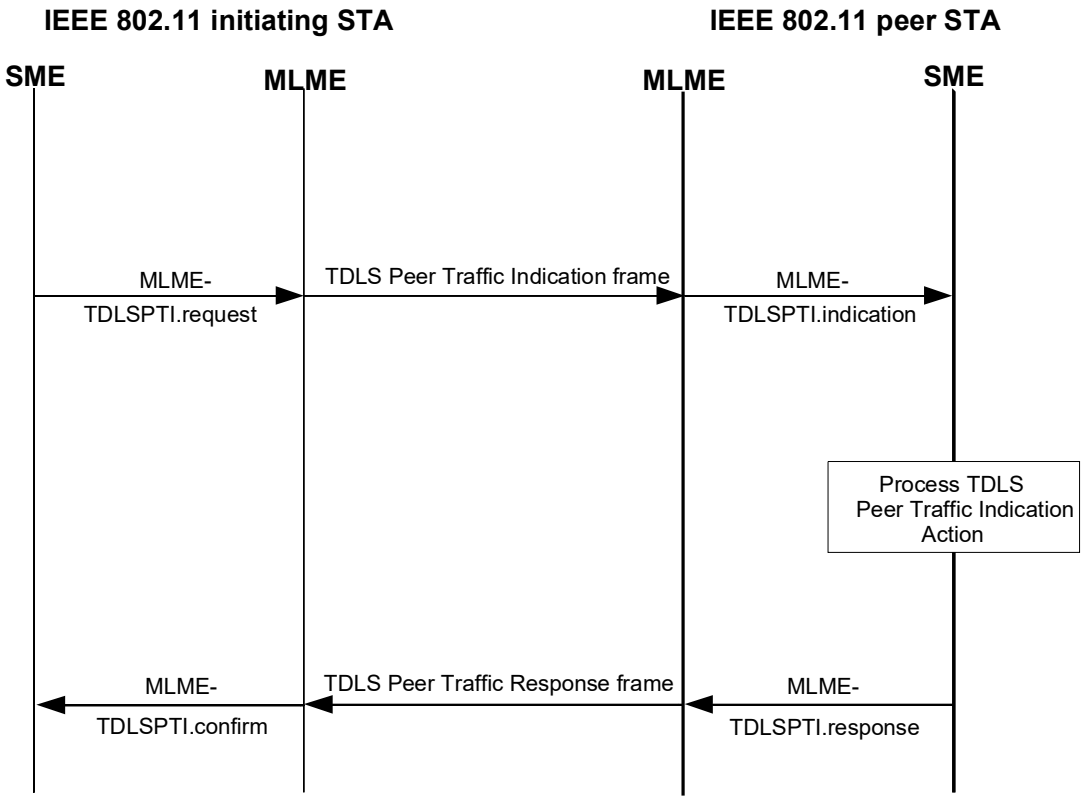

Figure 6-9—TPU

6.3.45.2 MLME-TDLSPTI.request

6.3.45.2.1 Function

This primitive requests that a TDLS Peer Traffic Indication frame be sent to a TDLS peer STA.

6.3.45.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPTI.request(
                    TDLSPeerSTAAddress,
                    TDLSPTI
                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the MAC entity with which to perform the TPU process.
TDLSPTI	Sequence of octets	As defined in TDLS Peer Traffic Indication frame	Specifies the proposed service parameters for the TPU.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.45.2.3 When generated

This primitive is generated by the SME to request that a TDLS Peer Traffic Indication frame be sent to the TDLS peer STA.

6.3.45.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer Traffic Indication frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.45.3 MLME-TDLSPTI.confirm

6.3.45.3.1 Function

This primitive reports the result of an MLME-TDLSPTI.request primitive to trigger an unscheduled SP from a candidate TDLS peer STA. This primitive is generated after transmitting a Peer Traffic Indication frame when this frame contains a PTI Control field, and after receiving a Peer Traffic Response frame otherwise.

6.3.45.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPTI.confirm(
                    TDLSPeerSTAAddress,
                    TDLSPTR
                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the peer MAC entity with which to perform the TPU process.
TDLSPTR	Sequence of octets	As defined in TDLS Peer Traffic Response frame	Specifies the proposed service parameters for the TPU.

6.3.45.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSPTI.request primitive and indicates the results of the request.

This primitive is generated when the STA receives a TDLS Peer Traffic Response frame from the TDLS peer STA or when an unspecified failure occurs.

6.3.45.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSPTI.request primitive and may use the reported data.

6.3.45.4 MLME-TDLSPTI.indication

6.3.45.4.1 Function

This primitive indicates that a TDLS Peer Traffic Indication frame was received from a TDLS peer STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.45.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPTI.indication(
                        TDLSPeerSTAAddress,
                        TDLSPTI
                        )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	The MAC address of the non-AP STA MAC entity from which a TDLS Peer Traffic Indication frame was received.
TDLSPTI	Sequence of octets	As defined in TDLS Peer Traffic Indication frame	Specifies the proposed service parameters for the TPU.

6.3.45.4.3 When generated

This primitive is generated by the MLME when a TDLS Peer Traffic Indication frame is received.

6.3.45.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure as specified in 11.2.3.13.

6.3.45.5 MLME-TDLSPTI.response

6.3.45.5.1 Function

This primitive requests that a TDLS Peer Traffic Response frame be sent to the TDLS peer STA.

6.3.45.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPTI.response(
                        PeerSTAAddress,
                        TDLSPTR
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the TPU.
TDLSPTR	Sequence of octets	As defined in TDLS Peer Traffic Response frame	Specifies the proposed service parameters for the TPU.

6.3.45.5.3 When generated

This primitive is generated by the SME to request that a TDLS Peer Traffic Response frame be sent to the TDLS peer STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.45.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer Traffic Response frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.46 TDLS channel switching

6.3.46.1 General

The following MLME primitives support the signaling of a TDLS channel switch. Figure 6-10 depicts the TDLS channel switching process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

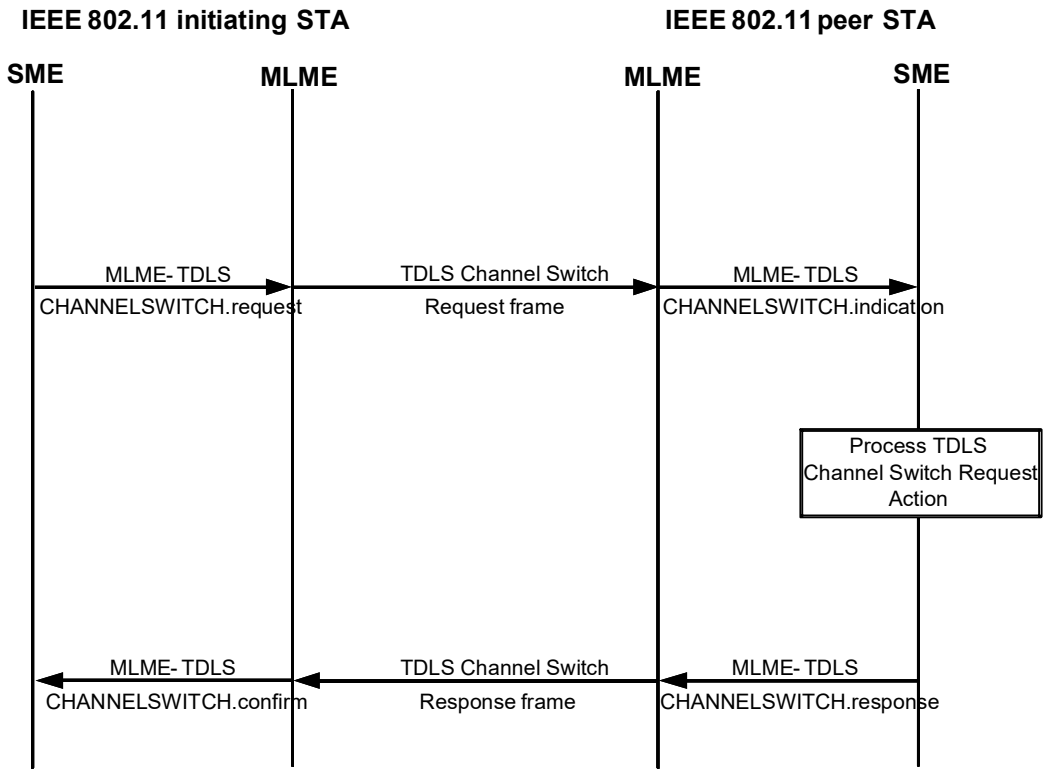

Figure 6-10—TDLS channel switching

6.3.46.2 MLME-TDLSCHANNELSWITCH.request

6.3.46.2.1 Function

This primitive requests that a TDLS Channel Switch Request frame be sent to the TDLS peer STA.

6.3.46.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSCHANNELSWITCH.request(
                                    TDLSPeerSTAAddress,
                                    TDLSChannelSwitchRequest
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the TDLS peer MAC entity to which a TDLS Channel Switch Request frame is transmitted.
TDLSChannelSwitchRequest	Sequence of octets	As defined in TDLS Channel Switch Request frame	Specifies the proposed service parameters for the TDLS Channel Switch.

6.3.46.2.3 When generated

This primitive is generated by the SME to request that a TDLS Channel Switch Request frame be sent to the TDLS peer STA.

6.3.46.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Channel Switch Request frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.46.3 MLME-TDLSCHANNELSWITCH.confirm

6.3.46.3.1 Function

This primitive reports the result of an MLME-TDLSCHANNELSWITCH.request primitive to switch a channel with a TDLS peer STA.

6.3.46.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSCHANNELSWITCH.confirm(
                                    TDLSPeerSTAAddress,
                                    TDLSChannelSwitchResponse
                                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA from which a TDLS Channel Switch Response frame was received.
TDLSChannelSwitchResponse	Sequence of octets	As defined in TDLS Channel Switch Response frame	Specifies the proposed service parameters for the TDLS Channel Switch.

6.3.46.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSCHANNELSWITCH.request primitive and indicates the results of the request.

This primitive is generated when the STA receives a TDLS Channel Switch Response frame from the TDLS peer STA.

6.3.46.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSCHANNELSWITCH.request primitive and may use the reported data.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.46.4 MLME-TDLSCHANNELSWITCH.indication

6.3.46.4.1 Function

This primitive indicates that a TDLS Channel Switch Request frame was received from a TDLS peer STA.

6.3.46.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSCHANNELSWITCH.indication(
                                    TDLSPeerSTAAddress,
                                    TDLSChannelSwitchRequest
                                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA from which a TDLS Channel Switch Request frame was received.
TDLSChannelSwitchRequest	Sequence of octets	As defined in TDLS Channel Switch Request frame	Specifies the proposed service parameters for the TDLS Channel Switch.

6.3.46.4.3 When generated

This primitive is generated by the MLME when a TDLS Channel Switch Request frame is received.

6.3.46.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.20.

6.3.46.5 MLME-TDLSCHANNELSWITCH.response

6.3.46.5.1 Function

This primitive requests that a TDLS Channel Switch Response frame be sent to the TDLS peer STA.

6.3.46.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSCHANNELSWITCH.response(
                                    TDLSPeerSTAAddress,
                                    TDLSChannelSwitchResponse
                                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA to which a TDLS Channel Switch Response frame is transmitted.
TDLSChannelSwitchResponse	Sequence of octets	As defined in TDLS Channel Switch Response frame	Specifies the proposed service parameters for the TDLS Channel Switch.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.46.5.3 When generated

This primitive is generated by the SME to request that a TDLS Channel Switch Response frame be sent to the TDLS peer STA.

6.3.46.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Channel Switch Response frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.47 TDLS peer PSM

6.3.47.1 General

The following MLME primitives support the management of TDLS peer PSM. Figure 6-11 depicts the TDLS peer PSM process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

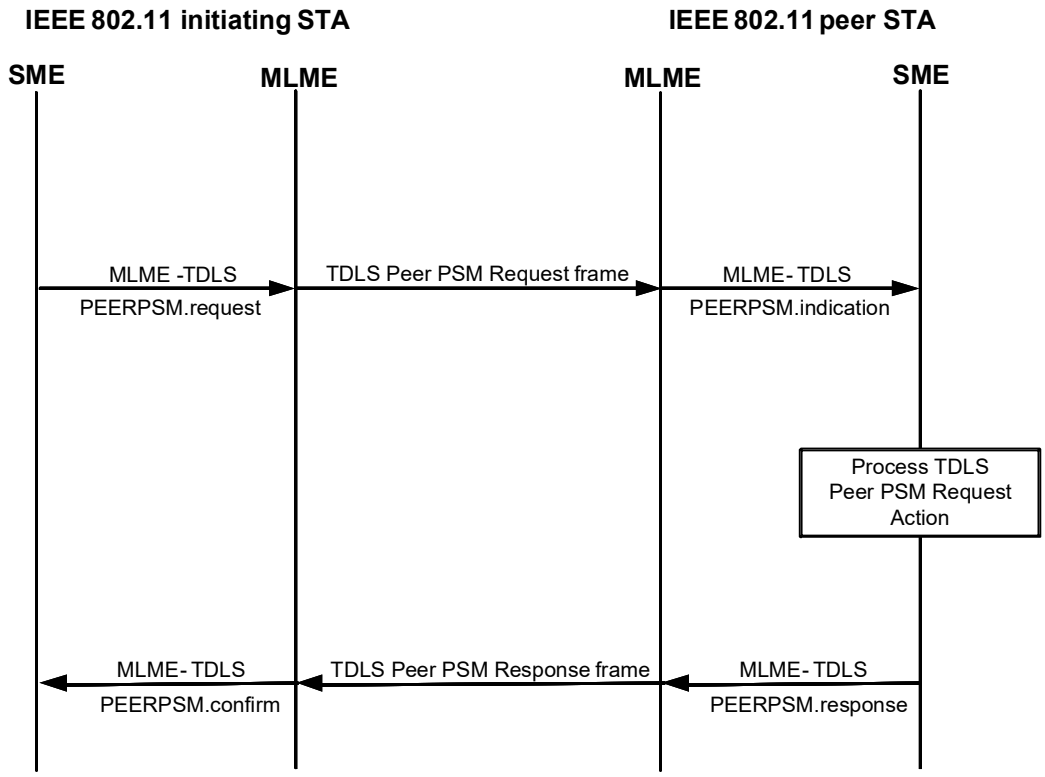

Figure 6-11—TDLS peer PSM

6.3.47.2 MLME-TDLSPEERPSM.request

6.3.47.2.1 Function

This primitive requests that a TDLS Peer PSM Request frame be sent to the TDLS peer STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.47.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TDLSPEERPSM.request(
TDLSPeerSTAAddress,
TDLSPeerPSMRequest
)

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA to which a TDLS Peer PSM Request frame is transmitted.
TDLSPeerPSMRequest	Sequence of octets	As defined in TDLS Peer PSM Request frame	Specifies the proposed service parameters for the TDLS peer PSM.

6.3.47.2.3 When generated

This primitive is generated by the SME to request that a TDLS Peer PSM Request frame be sent to the TDLS peer STA.

6.3.47.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer PSM Request frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.47.3 MLME-TDLSPEERPSM.confirm

6.3.47.3.1 Function

This primitive reports the result of an MLME-TDLSPEERPSM.request primitive to initiate power save mode based on scheduled service periods with a TDLS peer STA.

6.3.47.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TDLSPEERPSM.confirm(
TDLSPeerSTAAddress,
TDLSPeerPSMResponse
)

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA from which a TDLS Peer PSM Response frame was received.
TDLSPeerPSMResponse	Sequence of octets	As defined in TDLS Peer PSM Response frame	Specifies the proposed service parameters for the TDLS peer PSM.

6.3.47.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSPEERPSM.request primitive and indicates the results of the request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

This primitive is generated when the STA receives a TDLS Peer PSM Response frame from the TDLS peer STA or when an unspecified failure occurs.

6.3.47.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSPEERPSM.request primitive and may use the reported data.

6.3.47.4 MLME-TDLSPEERPSM.indication

6.3.47.4.1 Function

This primitive indicates that a TDLS Peer PSM Request frame was received from a TDLS peer STA.

6.3.47.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.indication(
                                TDLSPeerSTAAddress,
                                TDLSPeerPSMRequest
                                )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA MAC entity from which a TDLS Peer PSM Request frame was received.
TDLSPeerPSMRequest	Sequence of octets	As defined in TDLS Peer PSM Request frame	Specifies the proposed service parameters for the TDLS peer PSM.

6.3.47.4.3 When generated

This primitive is generated by the MLME when a TDLS Peer PSM Request frame is received.

6.3.47.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.12.

6.3.47.5 MLME-TDLSPEERPSM.response

6.3.47.5.1 Function

This primitive requests that a TDLS Peer PSM Response frame be sent to the TDLS peer STA.

6.3.47.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.response(
                                TDLSPeerSTAAddress,
                                TDLSPeerPSMResponse
                                )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the TDLS peer STA to which a TDLS Peer PSM Response frame is transmitted.
TDLSPeerPSMResponse	Sequence of octets	As defined in TDLS Peer PSM Response frame	Specifies the proposed service parameters for the TDLS peer PSM.

6.3.47.5.3 When generated

This primitive is generated by the SME to request that a TDLS Peer PSM Response frame be sent to the TDLS peer STA.

6.3.47.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer PSM Response frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.48 Event request

6.3.48.1 General

This set of primitives supports the exchange of Event Request and Event Report frames. The diagram in Figure 6-12 shows the Event Request and Event Report process.

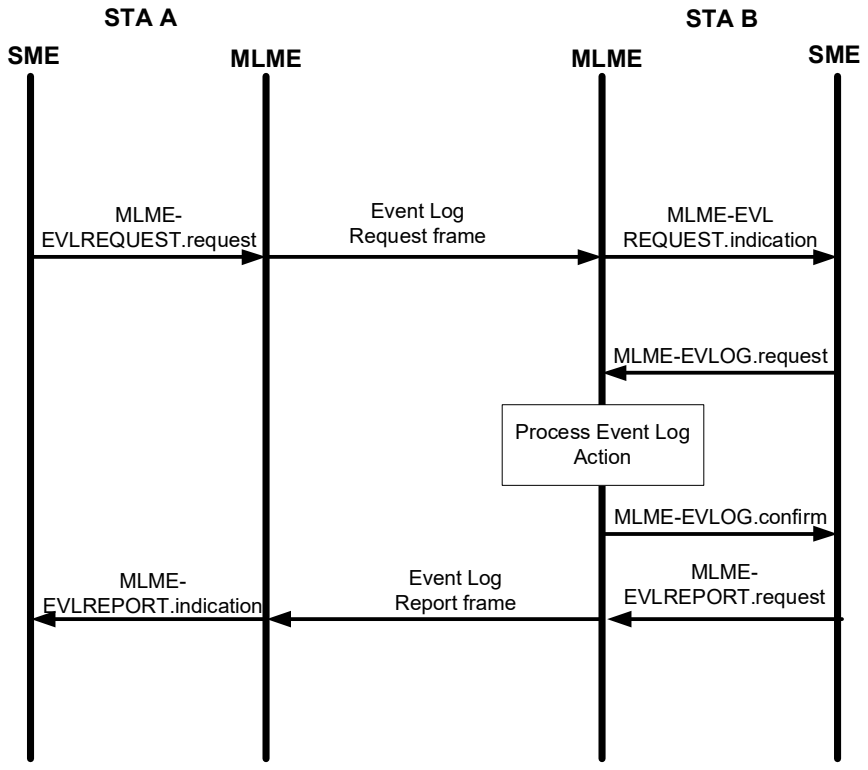

Figure 6-12—Event protocol exchange

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.48.2 MLME-EVLREQUEST.request

6.3.48.2.1 Function

This primitive requests the transmission of an event request to a peer entity.

6.3.48.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLREQUEST.request(
Peer MAC Address,
Dialog Token,
Event Request Set,
Destination URI,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the event request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the requested event.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 9.4.2.89.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.48.2.3 When generated

This primitive is generated by the SME to request that an Event Request frame be sent to a peer entity to initiate one or more transactions.

6.3.48.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Request frame containing the set of event elements specified. This frame is then scheduled for transmission.

6.3.48.3 MLME-EVLREQUEST.indication

6.3.48.3.1 Function

This primitive indicates that an Event Request frame requesting an event transaction has been received.

6.3.48.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLREQUEST.indication(
Peer MAC Address,
Dialog Token,
Event Request Set,

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Destination URI,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the event request was received.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the requested event.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 9.4.2.89.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.48.3.3 When generated

This primitive is generated by the MLME when an Event Request frame is received.

6.3.48.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the event transaction.

6.3.49 Event report

6.3.49.1 General

This set of primitives supports the signaling of event reports.

6.3.49.2 MLME-EVLREPORT.request

6.3.49.2.1 Function

This primitive supports the signaling of event reports between peer SMEs.

6.3.49.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLREPORT.request(
Peer MAC Address,
Dialog Token,
Event Report Set,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the event report is sent.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Report Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.49.2.3 When generated

This primitive is generated by the SME to request that an Event Report frame be sent to a peer entity to report the results of one or more transactions.

6.3.49.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Report frame containing the set of event elements. This frame is then scheduled for transmission.

6.3.49.3 MLME-EVLREPORT.indication

6.3.49.3.1 Function

This primitive indicates that an Event Report frame has been received from a peer entity.

6.3.49.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREPORT.indication(
                    Peer MAC Address,
                    Dialog Token,
                    Event Report Set,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the event report was received.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Report Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.49.3.3 When generated

This primitive is generated by the MLME when an Event Report frame is received.

6.3.49.3.4 Effect of receipt

On receipt of this primitive, the event data can be made available for SME processes.

6.3.50 Event

6.3.50.1 General

This set of primitives supports the requesting and reporting of event data.

6.3.50.2 MLME-EVLOG.request

6.3.50.2.1 Function

This primitive is generated by the SME to request that the MLME identify specific events.

6.3.50.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLOG.request(
Dialog Token,
Event Request Set
)

Name	Type	Valid range	Description
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.

6.3.50.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified event.

6.3.50.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the identification of events.

6.3.50.3 MLME-EVLOG.confirm

6.3.50.3.1 Function

This primitive reports the result of an event.

6.3.50.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLOG.confirm(
Dialog Token,
Event Report Set
)

Name	Type	Valid range	Description
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Report Set	Set of event report elements	Set of event report elements	A set of event report elements describing the reported event.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.50.3.3 When generated

This primitive is generated by the MLME to report the results when event identification completes.

6.3.50.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and, if appropriate, stores the events pending communication to the requesting entity or for local use.

6.3.51 Diagnostic request

6.3.51.1 General

This set of primitives supports the initiation of diagnostics between peer SMEs. The diagram in Figure 6-13 shows the diagnostic reporting process.

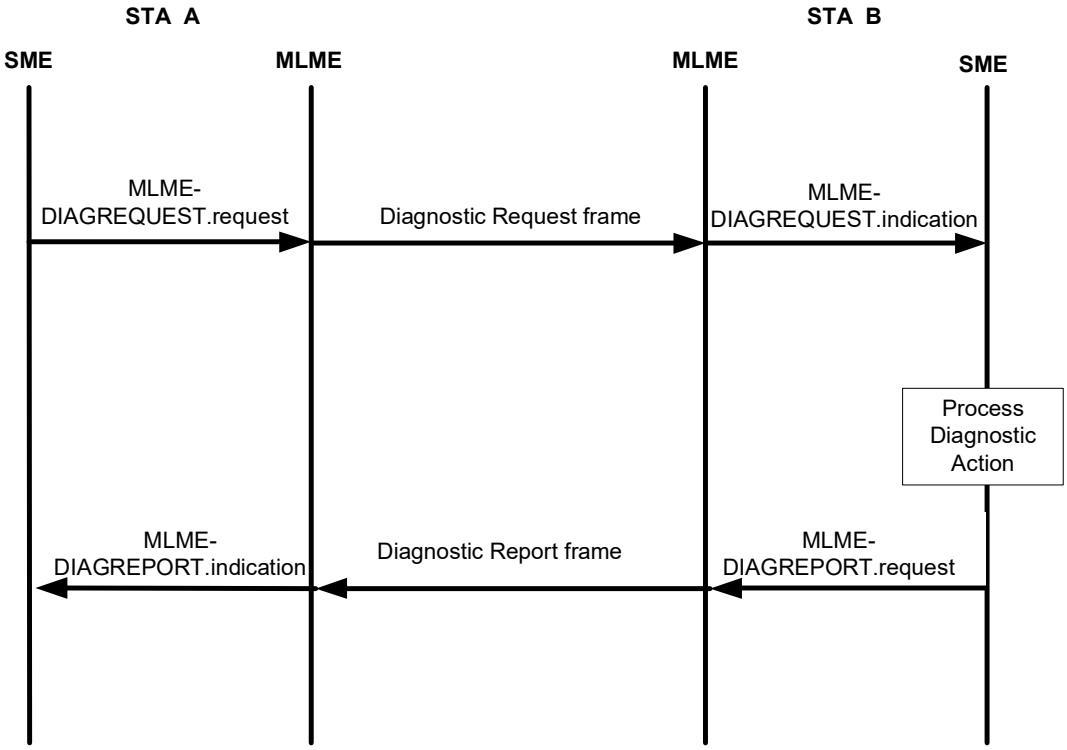

Figure 6-13—Diagnostic protocol exchange

6.3.51.2 MLME-DIAGREQUEST.request

6.3.51.2.1 Function

This primitive requests the transmission of a Diagnostic Request frame to a peer entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.51.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DIAGREQUEST.request(
Peer MAC Address,
Dialog Token,
Diagnostic Request Set,
Destination URI,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the diagnostic request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the diagnostic transaction.
Diagnostic Request Set	Set of diagnostic elements	Set of diagnostic elements	A set of diagnostic elements describing the requested diagnostics.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 9.4.2.89.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.51.2.3 When generated

This primitive is generated by the SME to request that a Diagnostic Request frame be sent to a peer entity to initiate one or more diagnostic transactions.

6.3.51.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Diagnostic Request frame containing the set of diagnostic elements specified. This frame is then scheduled for transmission.

6.3.51.3 MLME-DIAGREQUEST.indication

6.3.51.3.1 Function

This primitive indicates that a Diagnostic Request frame requesting a Diagnostic transaction has been received.

6.3.51.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DIAGREQUEST.indication(
Peer MAC Address,
Dialog Token,
Diagnostic Request Set,
Destination URI,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the diagnostic request was received.
Dialog Token	Integer	1–255	The dialog token to identify the diagnostic transaction.
Diagnostic Request Set	Set of diagnostic elements	Set of diagnostic elements	A set of diagnostic elements describing the requested diagnostics.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 9.4.2.89.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.51.3.3 When generated

This primitive is generated by the MLME when a Diagnostic Request frame is received.

6.3.51.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the diagnostic transaction.

6.3.52 Diagnostic report

6.3.52.1 MLME-DIAGREPORT.request

6.3.52.1.1 Function

This primitive supports the signaling of diagnostic reports between peer SMEs.

6.3.52.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DIAGREPORT.request(
                        Peer MAC Address,
                        Dialog Token,
                        Diagnostic Report Set,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the diagnostic report was received.
Dialog Token	Integer	1–255	The dialog token to identify the diagnostic transaction.
Diagnostic Report Set	Set of diagnostic elements	Set of diagnostic elements	A set of diagnostic elements describing the results of the requested diagnostics.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.52.1.3 When generated

This primitive is generated by the SME to request that a Diagnostic Report frame be sent to a peer entity to report the results of one or more diagnostic transactions.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.52.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Diagnostic Report frame containing the set of diagnostic elements. This frame is then scheduled for transmission.

6.3.52.2 MLME-DIAGREPORT.indication

6.3.52.2.1 Function

This primitive indicates that a Diagnostic Report frame has been received from a peer entity.

6.3.52.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DIAGREPORT.indication(
Peer MAC Address,
Dialog Token,
Diagnostic Report Set,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the diagnostic report is sent.
Dialog Token	Integer	1–255	The dialog token to identify the diagnostic transaction.
Diagnostic Report Set	Set of diagnostic elements	Set of diagnostic elements	A set of diagnostic elements describing the results of the requested diagnostics.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.52.2.3 When generated

This primitive is generated by the MLME when a Diagnostic Report frame is received.

6.3.52.2.4 Effect of receipt

On receipt of this primitive, the diagnostic data can be made available for SME processes.

6.3.53 Location configuration request

6.3.53.1 General

This set of primitives supports the exchange of location configuration parameter information between peer SMEs. The diagram in Figure 6-14 shows the location configuration request and response process.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

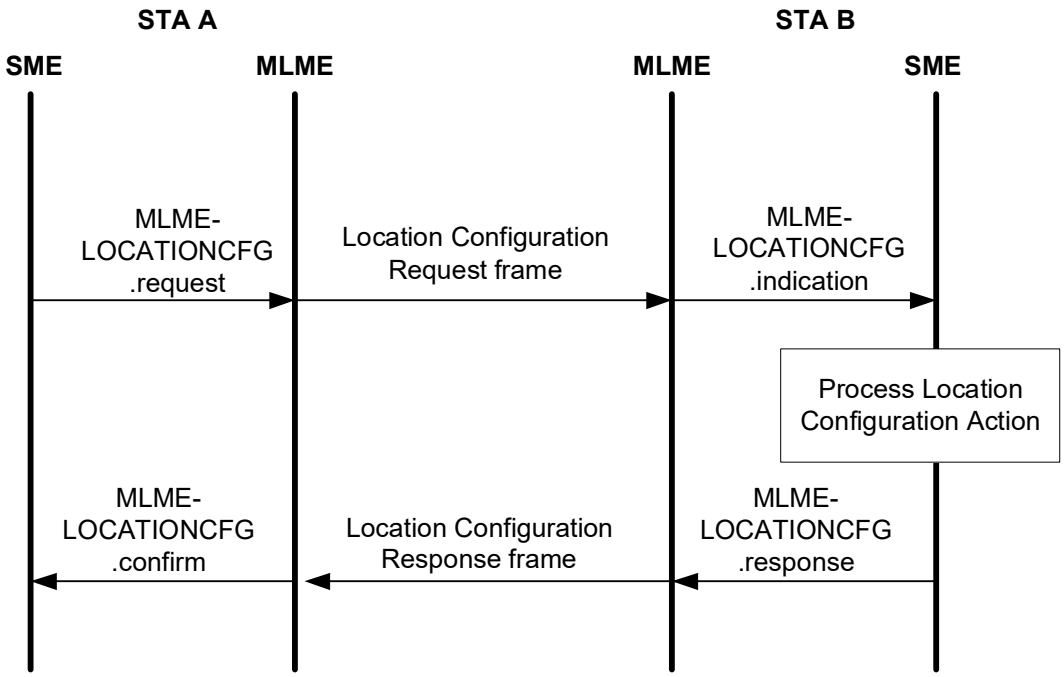

Figure 6-14—Location configuration request and response protocol exchange

6.3.53.2 MLME-LOCATIONCFG.request

6.3.53.2.1 Function

This primitive requests the transmission of a Location Configuration Request frame to a peer entity.

6.3.53.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LOCATIONCFG.request(
Peer MAC Address,
Dialog Token,
Location Parameters,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the location configuration request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Location Parameters	Location Parameters element	Location Parameters element	A Location Parameters element containing one or more subelements describing the STA location information. See 9.4.2.70.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.53.2.3 When generated

This primitive is generated by the SME to request that a Location Configuration Request frame be sent to a peer entity to convey location configuration information.

6.3.53.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Configuration Request frame containing the set of Location Parameters elements specified. This frame is then scheduled for transmission.

6.3.53.3 MLME-LOCATIONCFG.confirm

6.3.53.3.1 Function

This primitive reports the result of a location configuration request.

6.3.53.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LOCATIONCFG.confirm(
                    Dialog Token,
                    Peer MAC Address,
                    Location Parameters,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the location configuration response is sent.
Location Parameters	Location Parameters element	Location Parameters element	A Location Parameters element containing one or more subelements describing the STA location information. See 9.4.2.70.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.53.3.3 When generated

This primitive is generated by the MLME when transmission of the Location Configuration Request frame is acknowledged, when (re)transmission of the Location Configuration Request frame fails, or when a failure reason is unspecified.

6.3.53.3.4 Effect of receipt

No effect of receipt is specified.

6.3.53.4 MLME-LOCATIONCFG.indication

6.3.53.4.1 Function

This primitive indicates that a Location Configuration Request frame has been received requesting a location transaction.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.53.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LOCATIONCFG.indication(
Peer MAC Address,
Dialog Token,
Location Parameters,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the location configuration request was received.
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Location Parameters	Location Parameters element	Location Parameters element	A Location Parameters element containing one or more subelements describing the STA location information. See 9.4.2.70.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.53.4.3 When generated

This primitive is generated by the MLME when a Location Configuration Request frame is received.

6.3.53.4.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the location transaction.

6.3.53.5 MLME-LOCATIONCFG.response

6.3.53.5.1 Function

This primitive requests the transmission of location information to a peer entity, in response to a Location Configuration Request frame.

6.3.53.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LOCATIONCFG.response(
Peer MAC Address,
Dialog Token,
Location Parameters,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the location request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Location Parameters	Location Parameters element	Location Parameters element	A location parameters element containing one or more subelements describing the STA location information. See 9.4.2.70.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.53.5.3 When generated

This primitive is generated by the SME to request that a Location Configuration Response frame be sent to a peer entity to convey location configuration information.

6.3.53.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Configuration Response frame containing the set of location parameters elements specified. This frame is then scheduled for transmission.

6.3.54 Location track notification

6.3.54.1 General

This set of primitives supports the location track notification from one SME to one or more receiving SMEs. The diagram in Figure 6-15 shows the location track notification process.

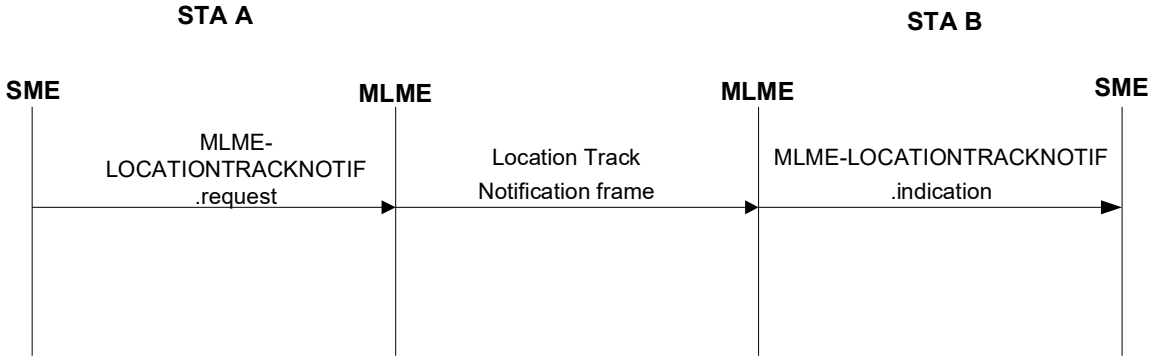

Figure 6-15—Location track notification protocol exchange

6.3.54.2 MLME-LOCATIONTRACKNOTIF.request

6.3.54.2.1 Function

This primitive requests the transmission of Location Configuration Request frame to a peer entity.

6.3.54.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LOCATIONTRACKNOTIF.request(
                                    Peer MAC Address,
                                    Location Parameters,
                                    Measurement Report,
                                    VendorSpecificInfo
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual or group addressed MAC address	The address of the peer MAC entity to which the location track notification is sent.
Location Parameters	Location Parameters element	Location Parameters element	A location parameters element containing one or more subelements describing the STA location information. See 9.4.2.70.
Measurement Report	Measurement Report element	Measurement Report element	A Measurement Report element contains the beacon measurement information. See 9.4.2.21.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.54.2.3 When generated

This primitive is generated by the SME to request that a Location Track Notification frame be sent to a peer entity to help convey location information.

6.3.54.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Track Notification frame containing the set of location parameters elements specified. This frame is then scheduled for transmission.

6.3.54.3 MLME-LOCATIONTRACKNOTIF.indication

6.3.54.3.1 Function

This primitive indicates that a Location Track Notification frame has been received.

6.3.54.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LOCATIONTRACKNOTIF.indication(
                                    Peer MAC Address,
                                    Location Parameters,
                                    Measurement Report,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual or group addressed MAC address	The address of the peer MAC entity from which the location track notification was received.
Location Parameters	Location Parameters element	Location Parameters element	A location parameters element containing one or more subelements describing the STA location information. See 9.4.2.70.
Measurement Report	Measurement Report element	Measurement Report element	A Measurement Report element contains the beacon measurement information. See 9.4.2.21.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.54.3.3 When generated

This primitive is generated by the MLME when a Location Track Notification frame is received.

6.3.54.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.55 Timing measurement

6.3.55.1 General

The following set of primitives supports triggering a Timing Measurement procedure or stopping an ongoing Timing Measurement procedure, and exchange of timing measurement information from one SME to another. Figure 6-16 shows the use of these primitives and various points in time that are of interest to the timing measurement procedure.

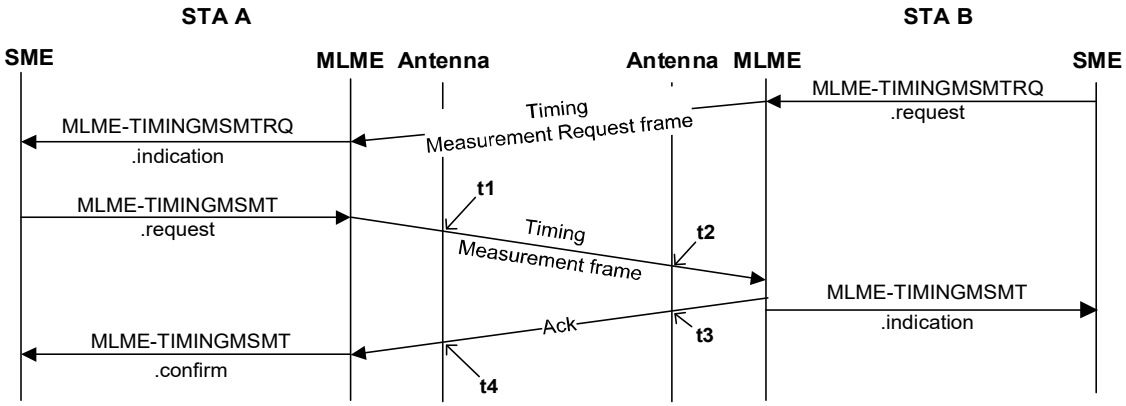

Figure 6-16—Timing measurement primitives and timestamps capture

NOTE 1—In Figure 6-16, t1 and t3 correspond to the point in time at which the start of the preamble for the transmitted frame appears at the transmit antenna connector. An implementation may capture a timestamp during the transmit processing earlier or later than the point at which it actually occurs and offset the value to compensate for the time difference.

NOTE 2—In Figure 6-16, t2 and t4 correspond to the point in time at which the start of the preamble for the incoming frame arrives at the receive antenna connector. Because time is needed to detect the frame and synchronize with its logical structure, an implementation determines when the start of the preamble for the incoming frame arrived at the receive antenna connector by capturing a timestamp some time after it occurred and compensating for the delay by subtracting an offset from the captured value.

6.3.55.2 MLME-TIMINGMSMTRQ.request

6.3.55.2.1 Function

This primitive requests the transmission of a Timing Measurement Request frame to a peer entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.55.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMTRQ.request(
                        Peer MAC Address,
                        Trigger,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Timing Measurement Request frame is sent.
Trigger	Integer	0–1	The trigger to identify the action.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.55.2.3 When generated

This primitive is generated by the SME to request that a Timing Measurement Request frame be sent to a peer entity.

6.3.55.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Timing Measurement Request frame with the specified parameters. This frame is then scheduled for transmission.

6.3.55.3 MLME-TIMINGMSMTRQ.indication

6.3.55.3.1 Function

This primitive indicates that a Timing Measurement Request frame has been received and the corresponding Ack frame has been transmitted.

6.3.55.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMTRQ.indication(
                        Peer MAC Address,
                        Trigger,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Timing Measurement Request frame is sent.
Trigger	Integer	0–1	The trigger to identify the action.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.55.3.3 When generated

This primitive is generated by the MLME when a Timing Measurement Request frame is received.

6.3.55.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.55.4 MLME-TIMINGMSMT.request

6.3.55.4.1 Function

This primitive requests the transmission of Timing Measurement frame to a peer entity.

6.3.55.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TIMINGMSMT.request(
Peer MAC Address,
Dialog Token,
Follow Up Dialog Token,
t1,
Max t1 Error,
t4,
Max t4 Error,
VendorSpecific
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual addressed MAC address	The address of the peer MAC entity to which the Timing Measurement frame is sent.
Dialog Token	Integer	1–255	The dialog token to identify the Timing Measurement frame.
Follow Up Dialog Token	Integer	0–255	The dialog token of a Timing Measurement frame which the current frame follows, or 0 if there is no such frame. See 11.21.5.
t1	Integer	0–(2^{32}–1)	The value of t1 (see Figure 6-16) for the Timing Measurement frame identified by the Follow Up Dialog Token, in units of 10 ns, or null if the Follow Up Dialog Token is 0.
Max t1 Error	Integer	0–255	The maximum error in the t1 value in units of 10 ns; see 9.6.14.3, or null if the Follow Up Dialog Token is 0.
t4	Integer	0–(2^{32}–1)	The value of t4 (see Figure 6-16) for the Timing Measurement frame identified by the Follow Up Dialog Token, in units of 10 ns, or null if the Follow Up Dialog Token is 0.
Max t4 Error	Integer	0–255	The maximum error in the t4 value in units of 10 ns, or null if the Follow Up Dialog Token is 0.
VendorSpecific	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.55.4.3 When generated

This primitive is generated by the SME to request that a Timing Measurement frame be sent to a peer entity.

6.3.55.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Timing Measurement frame with the specified parameters. This frame is then scheduled for transmission.

6.3.55.5 MLME-TIMINGMSMT.confirm

6.3.55.5.1 Function

This primitive indicates that a Timing Measurement frame has been received by the peer STA to which it was sent.

6.3.55.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TIMINGMSMT.confirm(
Peer MAC Address,
Dialog Token,
t1,
Max t1 Error,
t4,
Max t4 Error
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual addressed MAC address	The address of the peer MAC entity to which acknowledges the receipt of the Timing Measurement frame.
Dialog Token	Integer	1–255	The dialog token to identify the Timing Measurement frame.
t1	Integer	$0 – (2^{32}–1)$	The value of t1 (see Figure 6-16) for the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Dialog Token is 0.
Max t1 Error	Integer	0–255	The maximum error in the t1 value in units of 10 ns; see 9.6.14.3, or null if the Dialog Token is 0.
t4	Integer	$0 – (2^{32}–1)$	The value of t4 (see Figure 6-16) for the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Dialog Token is 0.
Max t4 Error	Integer	0–255	The maximum error in the t4 value in units of 10 ns, or null if the Dialog Token is 0.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.55.5.3 When generated

This primitive is generated by the MLME when an Ack frame corresponding to the Timing Measurement frame is received from the peer STA.

6.3.55.5.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.55.6 MLME-TIMINGMSMT.indication

6.3.55.6.1 Function

This primitive indicates that a Timing Measurement frame has been received and the corresponding Ack frame has been transmitted.

6.3.55.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TIMINGMSMT.indication(
Peer MAC Address,
Dialog Token,
Follow Up Dialog Token,
t1,
Max t1 Error,
t4,
Max t4 Error,
t2,
Max t2 Error,
t3,
Max t3 Error,
VendorSpecific
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual addressed MAC address	The address of the peer MAC entity from which the Timing Measurement frame was sent.
Dialog Token	Integer	1–255	The dialog token to identify the Timing Measurement frame.
Follow Up Dialog Token	Integer	1–255	The dialog token of a Timing Measurement frame which the current frame follows, or 0 if there is no such frame. See 11.21.5.
t1	Integer	$0 – (2^{32}–1)$	The value of t1 (see Figure 6-16) for the Timing Measurement frame identified by the Follow Up Dialog Token, contained in the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Follow Up Dialog Token is 0.
Max t1 Error	Integer	0–255	The maximum error in the t1 value in units of 10 ns; see 9.6.14.3, or null if the Follow Up Dialog Token is 0.

Name	Type	Valid range	Description
t4	Integer	$0 – (2^{32}–1)$	The value of t4 (see Figure 6-16) for the Timing Measurement frame identified by the Follow Up Dialog Token, contained in the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Follow Up Dialog Token is 0.
Max t4 Error	Integer	0–255	The maximum error in the t4 value in units of 10 ns, or null if the Follow Up Dialog Token is 0.
t2	Integer	$0 – (2^{32}–1)$	The value of t2 (see Figure 6-16) for the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Dialog Token is 0.
Max t2 Error	Integer	0–255	The maximum error in the t2 value in units of 10 ns, or null if the Dialog Token is 0.
t3	Integer	$0 – (2^{32}–1)$	The value of t3 (see Figure 6-16) for the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Dialog Token is 0.
Max t3 Error	Integer	0–255	The maximum error in the t3 value in units of 10 ns, or null if the Dialog Token is 0.
VendorSpecific	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.55.6.3 When generated

This primitive is generated by the MLME when a Timing Measurement frame is received.

6.3.55.6.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.56 Fine timing measurement (FTM)

6.3.56.1 General

The following set of primitives supports triggering an FTM procedure or stopping an ongoing FTM procedure, and exchange of FTM information from one SME to another. Figure 6-17 shows the use of these primitives and various points in time that are of interest to the FTM procedure.

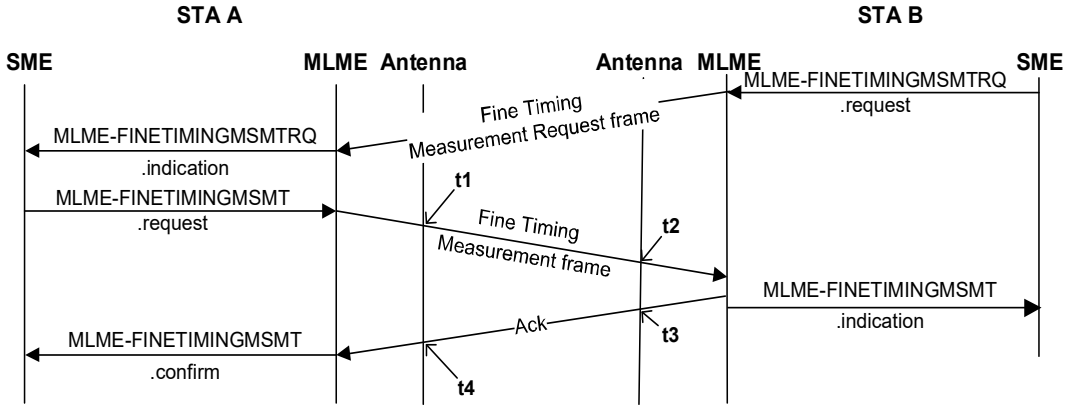

Figure 6-17—Fine timing measurement primitives and timestamps capture

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—In Figure 6-17, t1 and t3 correspond to the point in time at which the start of the preamble for the transmitted frame appears at the transmit antenna connector. An implementation may capture a timestamp during the transmit processing earlier or later than the point at which it actually occurs and offset the value to compensate for the time difference.

NOTE 2—In Figure 6-17, t2 and t4 correspond to the point in time at which the start of the preamble for the incoming frame arrives at the receive antenna connector. Because time is needed to detect the frame and synchronize with its logical structure, an implementation determines when the start of the preamble for the incoming frame arrived at the receive antenna connector by capturing a timestamp some time after it occurred and compensating for the delay by subtracting an offset from the captured value.

NOTE 3—In the MLME-FINETIMINGMSMT.request primitive the t1, Max t1 Error Exponent, t4 and Max t4 Error Exponent parameters are set to the values in the prior MLME-FINETIMINGMSMT.confirm primitive for that Peer MAC Address and with a Dialog Token parameter equal to the Follow Up Dialog Token parameter in the request, or 0 if there was none. In the MLME-FINETIMIMGMSMT.confirm primitive the t1, Max t1 Error Exponent, t4 and Max t4 Error Exponent parameters are set to the values determined for the Fine Timing Measurement frame and its acknowledgment. This primitive is not issued if no acknowledgment is received. In the MLME-FINETIMINGMSMT.indication primitive the t1, Max t1 Error Exponent, t4 and Max t4 Error Exponent parameters are set to the values in the Fine Timing Measurement frame and the t2, Max t2 Error Exponent, t3 and Max t3 Error Exponent parameters are set to the values determined for the Fine Timing Measurement frame and its acknowledgment.

6.3.56.2 MLME-FINETIMINGMSMTRQ.request

6.3.56.2.1 Function

This primitive requests the transmission of a Fine Timing Measurement Request frame to a peer entity.

6.3.56.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FINETIMINGMSMTRQ.request(
Peer MAC Address,
Trigger,
LCI requested,
LCI optional subelements,
Location Civic requested,
Civic Location Type,
Location Civic optional subelements,
Fine Timing Measurement Parameters,
Vendor Specific
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Fine Timing Measurement Request frame is sent.
Trigger	Integer	0–1	The trigger to identify the action.
LCI requested	Boolean	true, false	Indicates whether an LCI Measurement Request field is to be included in the generated Fine Timing Measurement Request frame.
LCI optional subelements	As defined in 9.4.2.20.10	As listed in Table 9-111	Optionally present if LCI requested is true. Zero or more subelements to include in the request.
Location Civic requested	Boolean	true, false	Indicates whether a Location Civic Measurement Request field is to be included in the generated Fine Timing Measurement Request frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Civic Location Type	Enumeration	IETF_RFC_4776, VENDOR_SPECIFIC	Present if Location Civic requested is true. Indicates the format of the location information in the Location Civic optional subelements, if included.
Location Civic optional subelements	As defined in 9.4.2.20.14	As listed in Table 9-118	Optionally present if Location Civic requested is true. Zero or more subelements to include in the request.
Fine Timing Measurement Parameters	As defined in 9.4.2.167	As defined in 9.4.2.167	Optional element containing the requested FTM configuration.
VendorSpecific	A set of elements	As defined by 9.4.2.25	Zero or more elements.

6.3.56.2.3 When generated

This primitive is generated by the SME to request that a Fine Timing Measurement Request frame be sent to a peer entity.

6.3.56.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Fine Timing Measurement Request frame with the specified parameters. This frame is then scheduled for transmission.

6.3.56.3 MLME-FINETIMINGMSMTRQ.indication

6.3.56.3.1 Function

This primitive indicates that a Fine Timing Measurement Request frame has been received and the corresponding Ack frame has been transmitted.

6.3.56.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FINETIMINGMSMTRQ.indication(
Peer MAC Address,
Trigger,
LCI requested,
LCI optional subelements,
Location Civic requested,
Civic Location Type,
Location Civic optional subelements,
Fine Timing Measurement Parameters,
Vendor Specific
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Fine Timing Measurement Request frame is sent.
Trigger	Integer	0–1	The trigger to identify the action.
LCI requested	Boolean	true, false	Indicates whether an LCI Measurement Request field is included in the received Fine Timing Measurement Request frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
LCI optional subelements	As defined in 9.4.2.20.10	As listed in Table 9-111	Optionally present if LCI requested is true. Zero or more subelements to include in the request.
Location Civic requested	Boolean	true, false	Indicates whether a Location Civic Measurement Request field is included in the received Fine Timing Measurement Request frame.
Civic Location Type	Enumeration	IETF_RFC_4776, VENDOR_SPECIFIC	Present if Location Civic requested is true. Indicates the format of the location information in the Location Civic optional subelements, if included.
Location Civic optional subelements	As defined in 9.4.2.20.14	As listed in Table 9-118	Optionally present if Location Civic requested is true. Zero or more subelements to include in the request.
Fine Timing Measurement Parameters	As defined in 9.4.2.167	As defined in 9.4.2.167	Optional element containing the requested FTM configuration.
VendorSpecific	A set of elements	As defined by 9.4.2.25	Zero or more elements.

6.3.56.3.3 When generated

This primitive is generated by the MLME when a Fine Timing Measurement Request frame is received.

6.3.56.3.4 1 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.56.4 MLME-FINETIMINGMSMT.request

6.3.56.4.1 Function

This primitive requests the transmission of a Fine Timing Measurement frame to a peer entity.

6.3.56.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FINETIMINGMSMT.request(
Peer MAC Address,
Dialog Token,
Follow Up Dialog Token,
t1,
Max t1 Error Exponent,
t4,
Max t4 Error Exponent,
LCI Report,
Location Civic Report,
Fine Timing Measurement Parameters,
VendorSpecific
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual addressed MAC address	The address of the peer MAC entity to which the Fine Timing Measurement frame is sent.
Dialog Token	Integer	0–255	The dialog token to identify the Fine Timing Measurement frame. A value of 0 indicates the end of the FTM session.
Follow Up Dialog Token	Integer	0–255	The dialog token of a Fine Timing Measurement frame which the current frame follows, or 0 if there is no such frame. See 11.21.6.
t1	Integer	$0–(2^{48}–1)$	The value of t1 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Follow Up Dialog Token, in units of picoseconds, or null if the Follow Up Dialog Token is 0.
Max t1 Error Exponent	Integer	0–31	The maximum error in the t1 value. This is represented using a function of the Max t1 Error Exponent parameter as defined in Equation (9-4), or is null if the Follow Up Dialog Token is 0.
t4	Integer	$0–(2^{48}–1)$	The value of t4 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Follow Up Dialog Token, in units of picoseconds, or null if the Follow Up Dialog Token is 0.
Max t4 Error Exponent	Integer	0–31	The maximum error in the t4 value. This is represented using a function of the Max t4 Error Exponent parameter as defined in Equation (9-4), or is null if the Follow Up Dialog Token is 0.
LCI Report	As defined in 9.6.7.33	As defined in 9.6.7.33	Optional element to report LCI information of sender.
Location Civic Report	As defined in 9.6.7.33	As defined in 9.6.7.33	Optional element to report location civic information of sender.
Fine Timing Measurement Parameters	As defined in 9.4.2.167	As defined in 9.4.2.167	Optional element containing the proposed FTM configuration.
VendorSpecific	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.56.4.3 When generated

This primitive is generated by the SME to request that a Fine Timing Measurement frame be sent to a peer entity.

6.3.56.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Fine Timing Measurement frame with the specified parameters. This frame is then scheduled for transmission.

6.3.56.5 MLME-FINETIMINGMSMT.confirm

6.3.56.5.1 Function

This primitive indicates that a Fine Timing Measurement frame has been received by the peer STA to which it was sent.

6.3.56.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FINETIMINGMSMT.confirm(
Peer MAC Address,
Dialog Token,
t1,
Max t1 Error Exponent,
t4,
Max t4 Error Exponent
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual addressed MAC address	The address of the peer MAC entity to which acknowledges the receipt of the Fine Timing Measurement frame.
Dialog Token	Integer	0–255	The dialog token to identify the Fine Timing Measurement frame. A value of 0 indicates the end of the FTM session.
t1	Integer	0–(2^{48}–1)	The value of t1 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Dialog Token is 0.
Max t1 Error Exponent	Integer	0–31	The maximum error in the t1 value. This is represented using a function of the Max t1 Error Exponent parameter as defined in Equation (9-4), or is null if the Dialog Token is 0.
t4	Integer	0–(2^{48}–1)	The value of t4 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Dialog Token is 0.
Max t4 Error Exponent	Integer	0–31	The maximum error in the t4 value. This is represented using a function of the Max t4 Error Exponent parameter as defined in Equation (9-4), or is null if the Dialog Token is 0.

6.3.56.5.3 When generated

This primitive is generated by the MLME when an Ack frame corresponding to the Fine Timing Measurement frame is received from the peer STA.

6.3.56.5.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

Copyright © 2021 IEEE. All rights reserved.

6.3.56.6 MLME-FINETIMINGMSMT.indication

6.3.56.6.1 Function

This primitive indicates that a Fine Timing Measurement frame has been received and the corresponding Ack frame has been transmitted.

6.3.56.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FINETIMINGMSMT.indication(
Peer MAC Address,
Dialog Token,
Follow Up Dialog Token,
t1,
Max t1 Error Exponent,
t4,
Max t4 Error Exponent,
t2,
Max t2 Error Exponent
t3,
Max t3 Error Exponent,
LCI Report,
Location Civic Report,
Fine Timing Measurement Parameters,
VendorSpecific
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual addressed MAC address	The address of the peer MAC entity from which the Fine Timing Measurement frame was sent.
Dialog Token	Integer	0–255	The dialog token to identify the Fine Timing Measurement frame. A value of 0 indicates the end of the FTM session.
Follow Up Dialog Token	Integer	0–255	The dialog token of a Fine Timing Measurement frame which the current frame follows, or 0 if there is no such frame. See 11.21.6.
t1	Integer	$0–(2^{48}–1)$	The value of t1 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Follow Up Dialog Token, contained in the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Follow Up Dialog Token is 0.
Max t1 Error Exponent	Integer	0–31	The maximum error in the t1 value. This is represented using a function of the Max t1 Error Exponent parameter as defined in Equation (9-4), or is null if the Follow Up Dialog Token is 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
t4	Integer	0–(2^{48}–1)	The value of t4 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Follow Up Dialog Token, contained in the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Follow Up Dialog Token is 0.
Max t4 Error Exponent	Integer	0–31	The maximum error in the t4 value. This is represented using a function of the Max t4 Error Exponent parameter as defined in Equation (9-4), or is null if the Follow Up Dialog Token is 0.
t2	Integer	0–(2^{48}–1)	The value of t2 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Dialog Token is 0.
Max t2 Error Exponent	Integer	0–31	The maximum error in the t2 value. This is represented using a function of the Max t2 Error Exponent parameter defined in Equation (9-4), or is null if the Dialog Token is 0.
t3	Integer	0–(2^{48}–1)	The value of t3 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Dialog Token is 0.
Max t3 Error Exponent	Integer	0–31	The maximum error in the t3 value. This is represented using a function of the Max t3 Error Exponent parameter defined in Equation (9-4), or is null if the Dialog Token is 0.
LCI Report	As defined in 9.6.7.33	As defined in 9.6.7.33	Optional element to report LCI information of sender.
Location Civic Report	As defined in 9.6.7.33	As defined in 9.6.7.33	Optional element to report location civic information of sender.
Fine Timing Measurement Parameters	As defined in 9.4.2.167	As defined in 9.4.2.167	Optional element containing the proposed FTM configuration.
VendorSpecific	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.56.6.3 When generated

This primitive is generated by the MLME when a Fine Timing Measurement frame is received.

6.3.56.6.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.57 BSS transition management

6.3.57.1 BSS transition management procedure

The diagram in Figure 6-18 shows the BSS transition management procedure.

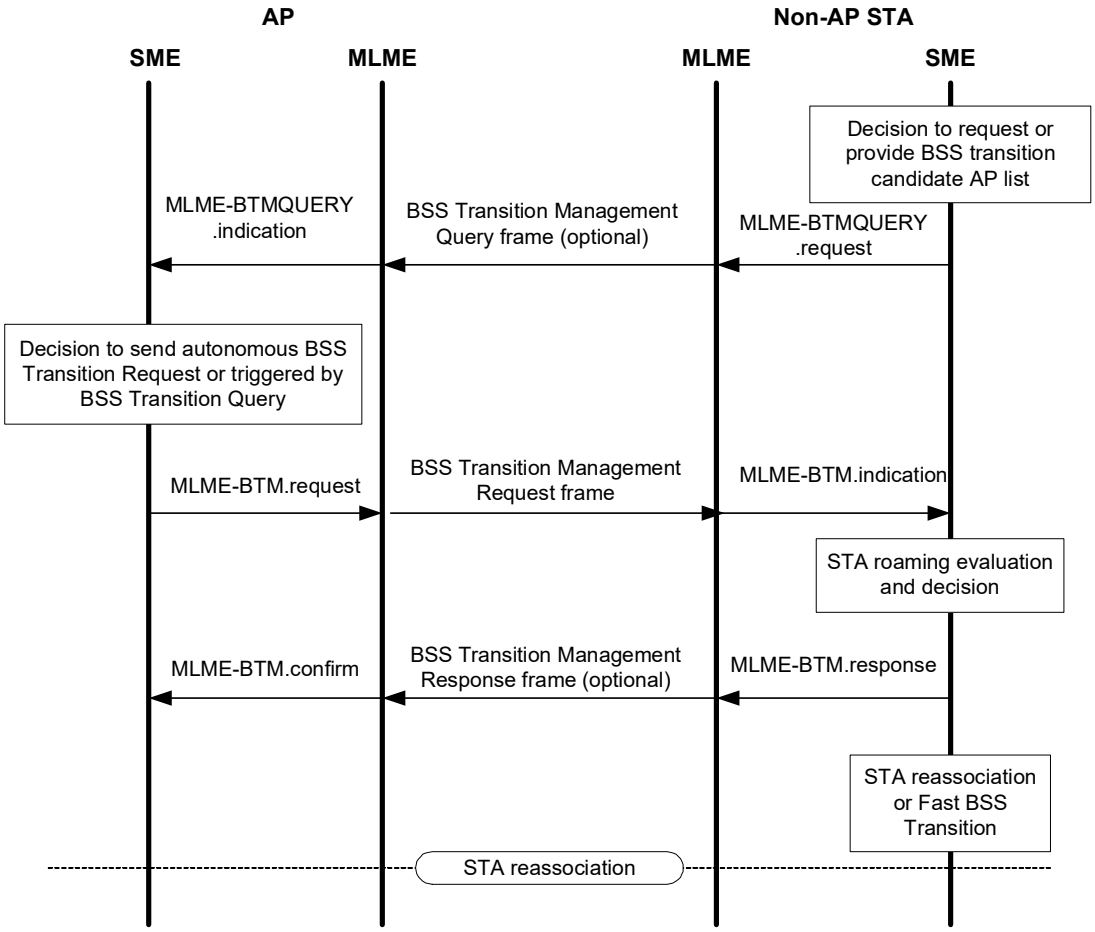

Figure 6-18—BSS transition management request—accepted

6.3.57.2 MLME-BTMQUERY.request

This set of primitives supports the signaling of BSS Transition Management Query frames between non-AP STAs and an AP.

6.3.57.2.1 Function

This primitive requests transmission of a BSS Transition Management Query frame to the AP with which the STA is associated.

6.3.57.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-BTMQUERY.request(
Peer MAC Address,
DialogToken,
BSSTransitionQueryReason,
BSSTransitionCandidateListEntries,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the BSS Transition Management Query frame is sent.
DialogToken	Integer	1–255	The dialog token to identify this BSS transition management transaction.
BSSTransitionQuery Reason	Integer	0–255	As defined in 9.6.13.8.
BSSTransitionCandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.36	The description of candidate BSS transition APs and their capabilities as described in 9.4.2.36.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.57.2.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Query frame be sent to the AP with which the STA is associated to initiate a BSS transition management procedure.

6.3.57.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Query frame. The STA then attempts to transmit the frame to the AP with which it is associated.

6.3.57.3 MLME-BTMQUERY.indication

6.3.57.3.1 Function

This primitive indicates that a BSS Transition Management Query frame was received from a non-AP STA.

6.3.57.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTMQUERY.indication(
                        Peer MAC Address,
                        DialogToken,
                        BSSTransitionQueryReason,
                        BSSTransitionCandidateListEntries,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a BSS Transition Management Query frame was received.
DialogToken	Integer	1–255	The dialog token to identify the BSS transition management transaction received in the BSS Transition Management Query frame.
BSSTransitionQuery Reason	Integer	0–255	The BSS Transition Query Reason Code in the BSS Transition Management Query frame that was received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
BSSTransitionCandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.36	The description of candidate BSS transition APs and their capabilities as described in 9.4.2.36.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.57.3.3 When generated

This primitive is generated by the MLME when a BSS Transition Management Query frame is received.

6.3.57.3.4 Effect of receipt

On receipt of this primitive, the SME shall operate according to the procedure in 11.21.7.

6.3.57.4 MLME-BTM.request

6.3.57.4.1 Function

This primitive requests transmission of a BSS Transition Management Request frame to a non-AP STA.

6.3.57.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTM.request(
                    Peer MAC Address
                    DialogToken,
                    RequestMode,
                    DisassociationTimer,
                    ValidityInterval,
                    BSSTerminationDuration,
                    SessionInformationURL,
                    BSSTransitionCandidateListEntries,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the BSS Transition Management Request frame is sent.
DialogToken	Integer	1–255	The dialog token to identify the BSS transition management transaction. Set to 0 for an autonomous BSS Transition Management Request frame.
RequestMode	Integer	As specified in 9.6.13.9	RequestMode for the BSS Transition Management Request frame.
DisassociationTimer	Integer	0–65 535	Specifies the number of TBTTs until the AP disassociates the non-AP STA. A value of 0 indicates time of disassociation has not yet been determined and a value of 1 indicates disassociation shall occur before the next TBTT.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ValidityInterval	Integer	1–255	Specifies the number of beacon transmission times (TBTTs) until this recommendation of this BSS transition candidate list is no longer valid.
BSSTerminationDuration	BSS Termination Duration subelement	BSS Termination Duration subelement	The BSS Termination Duration subelement (see 9.4.2.36) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field.
SessionInformationURL	URL	n/a	Optionally contains a URL formatted per IETF RFC 3986 where additional information pertaining to the user's accounting session is found.
BSSTransitionCandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.36	The description of candidate BSS transition APs and their capabilities as described in 9.4.2.36.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.57.4.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Request frame be sent to an associated non-AP STA. This request is sent either following the reception of an MLME-BTMQUERY.indication primitive or may be sent autonomously.

6.3.57.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Request frame. The STA then attempts to transmit this frame to the indicated non-AP STA.

6.3.57.5 MLME-BTM.indication

6.3.57.5.1 Function

This primitive indicates that a BSS Transition Management Request frame was received from the AP with which the STA is associated.

6.3.57.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTM.indication(
                    PeerMACAddress,
                    DialogToken,
                    RequestMode,
                    DisassociationTimer,
                    ValidityInterval,
                    BSSTerminationDuration,
                    SessionInformationURL,
                    BSSTransitionCandidateListEntries,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the MAC entity from which a BSS Transition Management Request frame was received.
DialogToken	Integer	1–255	The dialog token to identity the BSS transition management transaction as received in the BSS Transition Management Request frame.
RequestMode	Integer	As specified in 9.6.13.9	The RequestMode for the BSS Transition Management Request frame.
Disassociation Timer	Integer	0–65 535	Specifies the number of TBTTs until the AP disassociates the non-AP STA. A value of 0 indicates time of disassociation has not been determined yet and a value of 1 indicates disassociation shall occur before the next TBTT.
ValidityInterval	Integer	1–255	Specifies the number of beacon transmission times (TBTTs) until this recommendation of this BSS transition candidate list is no longer valid.
BSSTerminationDuration	BSS Termination Duration subelement	BSS Termination Duration subelement	The BSS Termination Duration subelement (see 9.4.2.36) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field.
SessionInformationURL	URL	n/a	Optionally contains a URL formatted per IETF RFC 3986 where additional information pertaining to the user's accounting session may be found.
BSSTransitionCandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.36	The description of candidate BSS transition APs and their capabilities as described in 9.4.2.36.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.57.5.3 When generated

This primitive is generated by the MLME when a BSS Transition Management Request frame is received.

6.3.57.5.4 Effect of receipt

On receipt of this primitive the SME shall operate according to the procedure in 11.21.7.

6.3.57.6 MLME-BTM.response

6.3.57.6.1 Function

This primitive requests transmission of a BSS Transition Management Response frame to the AP with which the STA is associated.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.57.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-BTM.response(
Peer MAC Address
DialogToken,
BTMStatusCode,
BSSTerminationDelay,
TargetBSSID,
BSSTransitionCandidateListEntries,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the BSS Transition Management Query frame is sent.
DialogToken	Integer	1–255	The dialog token to identify the BSS transition management transaction.
BTMStatusCode	Integer	0–255	As defined in 9.6.13.10.
BSSTerminationDelay	Integer	0–255	As defined in 9.6.13.10.
TargetBSSID	MAC address	Any valid individual MAC address	The BSSID of the BSS that the STA decided to transition to. Field shall be null if STA decided not to transition.
BSSTransitionCandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.36	The description of candidate BSS transition APs and their capabilities as described in 9.4.2.36.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.57.6.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Response frame be sent to the AP with which the STA is associated.

6.3.57.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Response frame. The non-AP STA then attempts to transmit this to the AP with which it is associated.

6.3.57.7 MLME-BTM.confirm

6.3.57.7.1 Function

This primitive reports the results of a BSS Transition Management attempt with a specified peer MAC entity that is within an AP.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.57.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-BTM.confirm(
Peer MAC Address,
DialogToken,
BSSTransitionQueryReason,
BTMStatusCode,
BSSTerminationDelay,
TargetBSSID,
BSSTransitionCandidateListEntries,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a BSS Transition Management Response frame was received.
DialogToken	Integer	1–255	The dialog token to identify the BSS transition management transaction as received in the BSS Transition Management Response frame.
BTMStatusCode	Integer	0–255	As defined in 9.6.13.10.
BSSTerminationDelay	Integer	0–255	As defined in 9.6.13.10.
TargetBSSID	MAC address	Any valid individual MAC address	The BSSID of the BSS that the STA indicated to transition to as received in the BSS Transition Management Response frame.
BSSTransitionCandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.36	The BSS Transition Candidate List Entries in the received BSS Transition Management Response frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.57.7.3 When generated

This primitive is generated by the MLME when transmission of the BSS Transition Management Request frame is acknowledged, when (re)transmission of the BSS Transition Management Request frame fails, or when a failure reason is unspecified.

6.3.57.7.4 Effect of receipt

On receipt of this primitive, the SME shall operate according to the procedure in 11.21.7.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.58 FMS setup

6.3.58.1 General

The following MLME primitives support the signaling of FMS setup. The diagram shown in Figure 6-19 shows the FMS setup process.

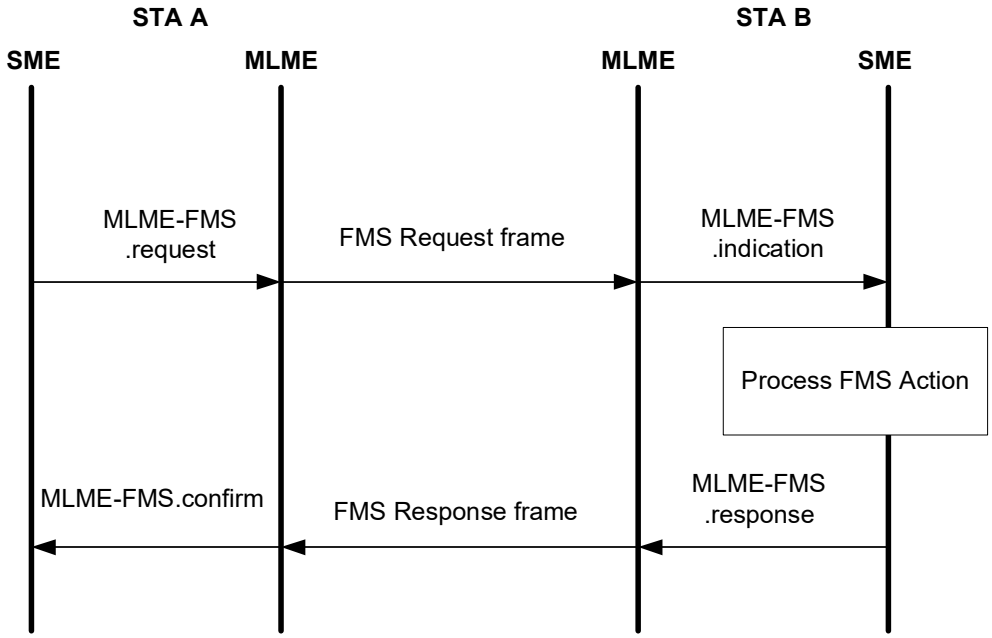

Figure 6-19—FMS setup protocol exchange

6.3.58.2 MLME-FMS.request

6.3.58.2.1 Function

This primitive requests that an FMS Request frame be sent to the AP with which the non-AP STA is associated.

6.3.58.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FMS.request(
                    PeerSTAAddress,
                    DialogToken,
                    FMSRequest,
                    VendorSpecificInfo
                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the FMS process.
Dialog Token	Integer	1–255	The dialog token to identify the FMS transaction.
FMSRequest	FMS Request element	As defined in 9.4.2.75	Specifies the proposed service parameters for the FMS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.58.2.3 When generated

This primitive is generated by the SME to request that an FMS Request frame be sent to the AP with which the STA is associated.

6.3.58.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an FMS Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.58.3 MLME-FMS.confirm

6.3.58.3.1 Function

This primitive reports the result of an FMS procedure.

6.3.58.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- FMS.confirm(
                    Peer MAC Address,
                    Dialog Token,
                    FMSResponse,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the location response is sent.
Dialog Token	Integer	0–255	The dialog token to identify the FMS transaction.
FMSResponse	FMS Response element	As defined in 9.4.2.76	Specifies service parameters for the FMS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.58.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-FMS.request primitive and indicates the results of the request. This primitive is generated when the STA receives an FMS Response frame from the AP.

6.3.58.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.14.

6.3.58.4 MLME-FMS.indication

6.3.58.4.1 Function

This primitive indicates that an FMS Request frame was received from a non-AP STA.

6.3.58.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME- FMS.indication(
PeerSTAAddress,
DialogToken,
FMSRequest,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which an FMS Request frame was received.
Dialog Token	Integer	1–255	The dialog token to identify the FMS transaction.
FMSRequest	FMS Request element	As defined in 9.4.2.75	Specifies the proposed service parameters for the FMS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.58.4.3 When generated

This primitive is generated by the MLME when an FMS Request frame is received.

6.3.58.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.14.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.58.5 MLME-FMS.response

6.3.58.5.1 Function

This primitive is either generated in response to an FMS Request frame or autonomously by the AP and requests the transmission of an FMS Response frame.

6.3.58.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FMS.response(

PeerSTAAddress,
FMSResponse,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which an FMS Request frame was received.
Dialog Token	Integer	0–255	The dialog token to identify the FMS transaction.
FMSResponse	FMS Response element	As defined in 9.4.2.76	Specifies service parameters for the FMS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.58.5.3 When generated

This primitive is generated by the SME to request that an FMS Response frame be sent to a peer entity to convey FMS information.

6.3.58.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an FMS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.59 Collocated Interference request

6.3.59.1 General

This set of primitives supports the exchange of collocated interference information between peer SMEs. The diagram in Figure 6-20 depicts the Collocated Interference request and response process.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

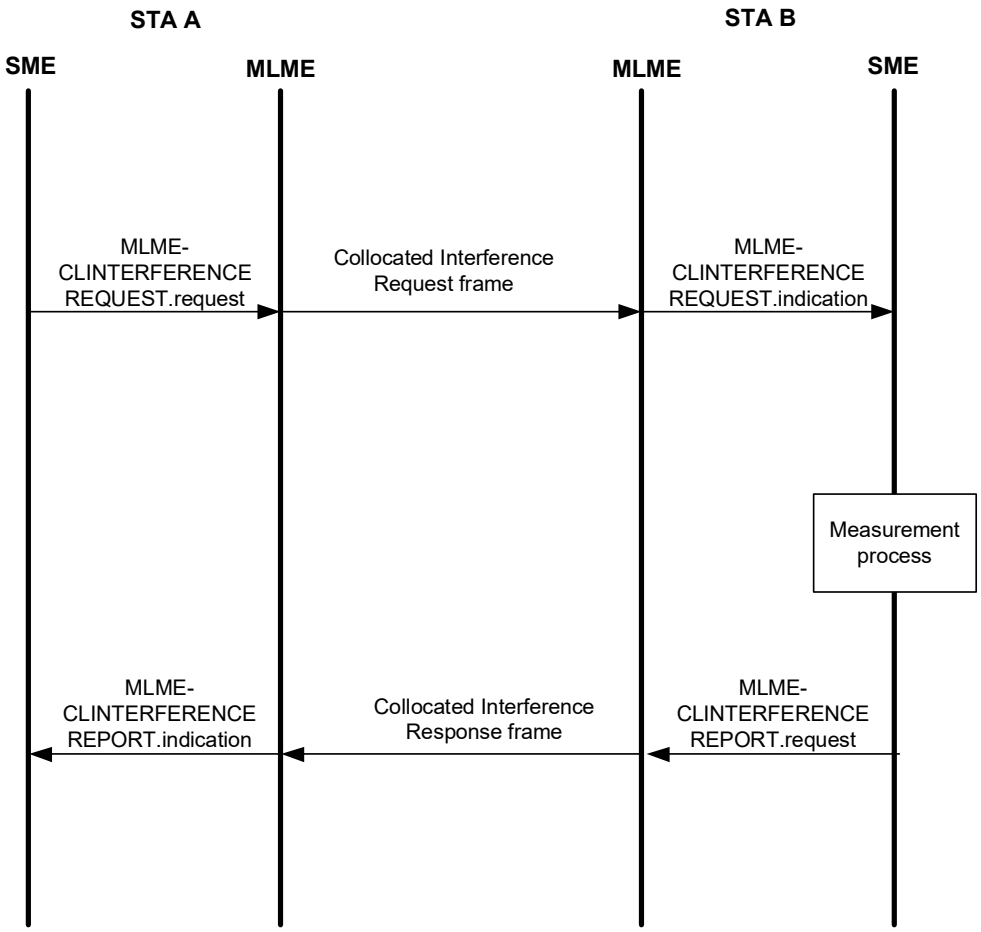

Figure 6-20—Collocated interference protocol exchange

6.3.59.2 MLME-CLINTERFERENCEREQUEST.request

6.3.59.2.1 Function

This primitive requests the transmission of Collocated Interference Request frame to a peer entity.

6.3.59.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CLINTERFERENCEREQUEST.request(
Peer MAC Address,
Dialog Token,
Automatic Report Enabled,
Report Timeout,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address, or the group MAC address	The address of the peer MAC entity to which the collocated interference request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the collocated interference transaction.
Automatic Report Enabled	Enumeration	CANCEL, CHANGES_ONLY, PERIODICALLY_ONLY, PERIODICALLY_AND_CHANGES	Indicates the requested interference reports, as defined in 9.6.13.13.
Report Timeout	Integer	0-63	Indicates minimum duration between reports, see 9.6.13.13.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.59.2.3 When generated

This primitive is generated by the SME to request that a Collocated Interference Request frame be sent to a peer entity.

6.3.59.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Collocated Interference Request frame. This frame is then scheduled for transmission.

6.3.59.3 MLME-CLINTERFERENCEREQUEST.indication

6.3.59.3.1 Function

This primitive indicates that a Collocated Interference Request frame has been received requesting a Collocated Interference report.

6.3.59.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CLINTERFERENCEREQUEST.indication(
Peer MAC Address,
Dialog Token,
Automatic Report Enabled,
Report Timeout,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address or the group MAC address	The address of the peer MAC entity from which the Collocated Interference request was received.
Dialog Token	Integer	1–255	The dialog token to identify the collocated interference transaction.
Automatic Report Enabled	Enumeration	CANCEL, CHANGES_ONLY, PERIODICALLY_ONLY, PERIODICALLY_AND_CHANGES	Indicates the requested interference resports, as defined in 9.6.13.13.
Report Timeout	Integer	0-63	Indicates minimum duration between reports, see 9.6.13.13.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.59.3.3 When generated

This primitive is generated by the MLME when a Collocated Interference Request frame is received.

6.3.59.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the Collocated Interference reporting procedure as described in 11.21.9.

6.3.60 Collocated Interference report

6.3.60.1 General

This set of primitives supports the exchange of collocated interference information between peer SMEs.

6.3.60.2 MLME-CLINTERFERENCEREPORT.request

6.3.60.2.1 Function

This primitive requests the transmission of Collocated Interference Report to a peer entity, in response to a Collocated Interference Request frame.

6.3.60.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREPORT.request(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Collocated Interference Report,
                                    VendorSpecificInfo
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Collocated Interference Report is sent.
Dialog Token	Integer	1–255	The dialog token to identify the collocated interference transaction.
Collocated Interference Report	Collocated Interference Report elements	As defined in 9.4.2.84	Specifies the collocated interference characteristics.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.60.2.3 When generated

This primitive is generated by the SME to request that a Collocated Interference Report frame be sent to a peer entity to convey collocated interference information.

6.3.60.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Collocated Interference Report frame. This frame is then scheduled for transmission.

6.3.60.3 MLME-CLINTERFERENCEREPORT.indication

6.3.60.3.1 Function

This primitive indicates that a Collocated Interference Report frame has been received.

6.3.60.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREPORT.indication(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Collocated Interference Report,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the location response was received.
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Collocated Interference Report	Collocated Interference Report elements	As defined in 9.4.2.84	Specifies the collocated interference characteristics.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.60.3.3 When generated

This primitive is generated by the MLME when a Collocated Interference Report frame is received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.61 TFS setup

6.3.61.1 General

This set of primitives supports the exchange of the signaling of TFS setup between peer SMEs. The diagram in Figure 6-21 depicts the TFS request and response process.

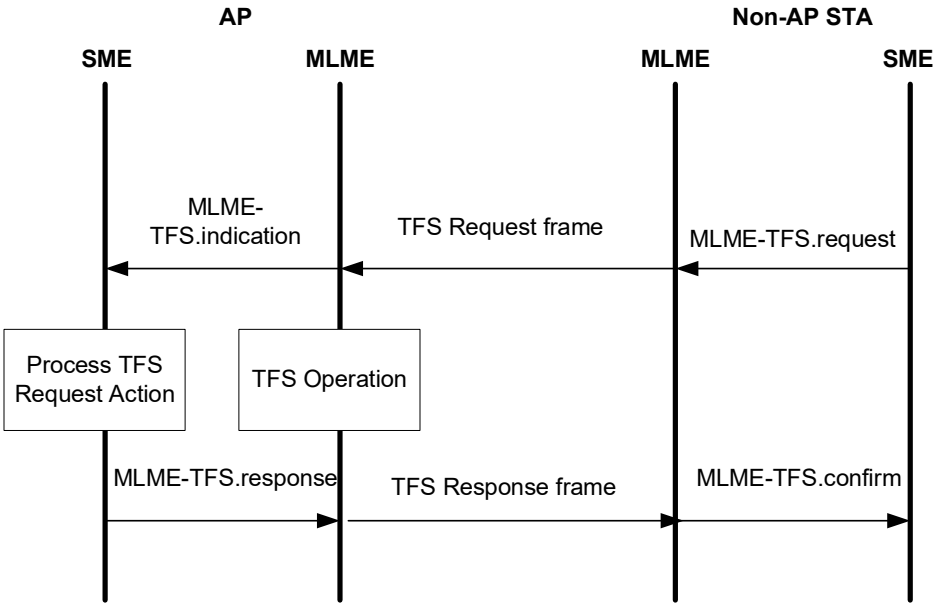

Figure 6-21—TFS request and response exchange

6.3.61.2 MLME-TFS.request

6.3.61.2.1 Function

This primitive requests that a TFS Request frame be sent to the AP with which the STA is associated.

6.3.61.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TFS.request(
                    PeerSTAAddress,
                    DialogToken,
                    TFSRequest,
                    VendorSpecific
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity for TFS.
DialogToken	Integer	0–255	The dialog token to identify the TFS Request and Response transaction.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TFSRequest	A set of TFS Request elements	As defined in the TFS Request element	Specifies the proposed service parameters for the TFS. One or more TFS Request elements.
VendorSpecific	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.61.2.3 When generated

This primitive is generated by the SME to request that a TFS Request frame be sent to the AP with which the STA is associated.

6.3.61.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TFS Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.61.3 MLME-TFS.confirm

6.3.61.3.1 Function

This primitive reports the result of a TFS procedure.

6.3.61.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TFS.confirm(
                    PeerSTAAddress,
                    DialogToken,
                    TFSResponse,
                    VendorSpecific
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the TFS Response frame is received.
DialogToken	Integer	0–255	The dialog token to identify the TFS Request and Response transaction.
TFSResponse	A set of TFS Response elements	As defined in the TFS Response element	Specifies service parameters for the TFS. One or more TFS Response elements.
VendorSpecific	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.61.3.3 When generated

This primitive is generated by the MLME when the STA receives a TFS Response frame from the AP.

6.3.61.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and may use the reported data. The SME should operate according to the procedure in 11.21.12.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.61.4 MLME-TFS.indication

6.3.61.4.1 Function

This primitive indicates that a TFS Request frame was received from a non-AP STA.

6.3.61.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TFS.indication(
PeerSTAAddress,
DialogToken,
TFSRequest,
VendorSpecific
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a TFS Request frame was received.
DialogToken	Integer	0–255	The dialog token to identify the TFS Request and Response transaction.
TFSRequest	A set of TFS Request elements	As defined in the TFS Request element	Specifies the proposed service parameters for the TFS. One or more TFS Request elements.
VendorSpecific	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.61.4.3 When generated

This primitive is generated by the MLME when a TFS Request frame is received.

6.3.61.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.21.12.

6.3.61.5 MLME-TFS.response

6.3.61.5.1 Function

This primitive is generated in response to an MLME-TFS.indication primitive requesting a TFS Response frame be sent to a non-AP STA.

6.3.61.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TFS.response(
PeerSTAAddress,
DialogToken,
TFSResponse,
VendorSpecific
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a TFS Request frame was received.
DialogToken	Integer	0–255	The dialog token to identify the TFS Request and Response transaction.
TFSResponse	A set of TFS Response elements	As defined in 9.4.2.80	Specifies service parameters for the TFS. One or more TFS Response elements.
VendorSpecific	A set of elements.	As defined in 9.4.2.25	Zero or more elements.

6.3.61.5.3 When generated

This primitive is generated by the SME in response to an MLME-TFS.indication primitive requesting a TFS Response be sent to a non-AP STA.

6.3.61.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TFS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.62 WNM sleep mode request

6.3.62.1 General

This set of primitives supports the exchange of sleep mode parameter information between peer SMEs. The diagram shown in Figure 6-22 shows the sleep mode request and response process.

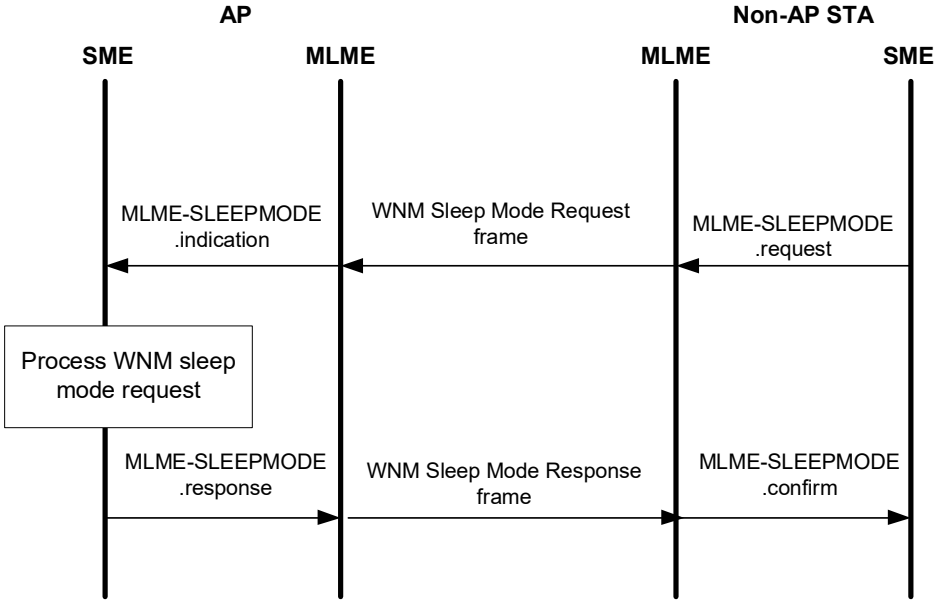

Figure 6-22—WNM sleep mode request and response exchange

Copyright © 2021 IEEE. All rights reserved.

6.3.62.2 MLME-SLEEPMODE.request

6.3.62.2.1 Function

This primitive requests that a WNM Sleep Mode Request frame be sent to the AP with which the STA is associated.

6.3.62.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SLEEPMODE.request(
                        PeerSTAAddress,
                        DialogToken,
                        SleepMode,
                        TFSRequest,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the WNM Sleep Mode Request frame is to be sent.
DialogToken	Integer	0–255	The dialog token to identify the WNM sleep mode request and response transaction.
SleepMode	As defined in the WNM Sleep Mode element	As defined in the WNM Sleep Mode element	Specifies the proposed WNM sleep mode service parameters for the WNM Sleep Mode Request frame.
TFSRequest	A set of TFS Request elements	As defined in 9.4.2.79	Specifies the proposed TFS service parameters for the WNM Sleep Mode Request frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.62.2.3 When generated

This primitive is generated by the SME to request that a WNM Sleep Mode Request frame be sent to the AP with which the STA is associated.

6.3.62.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM Sleep Mode Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.62.3 MLME-SLEEPMODE.indication

6.3.62.3.1 Function

This primitive indicates that a WNM Sleep Mode Request frame was received from a non-AP STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.62.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SLEEPMODE.indication(
PeerSTAAddress,
DialogToken,
SleepMode,
TFSRequest,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the WNM Sleep Mode Request frame is received.
DialogToken	Integer	0–255	The dialog token to identify the WNM sleep mode request and response transaction.
SleepMode	As defined in the WNM Sleep Mode element	As defined in the WNM Sleep Mode element	Specifies the proposed WNM sleep mode service parameters for the WNM Sleep Mode Request frame.
TFSRequest	A set of TFS Request elements	As defined in 9.4.2.79	Specifies the proposed TFS service parameters for the WNM Sleep Mode Request frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.62.3.3 When generated

This primitive is generated by the MLME when a WNM Sleep Mode Request frame is received.

6.3.62.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.16.

6.3.62.4 MLME-SLEEPMODE.response

6.3.62.4.1 Function

This primitive requests the transmission of sleep mode information to a peer entity, in response to a WNM Sleep Mode Request frame.

6.3.62.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SLEEPMODE.response(
PeerSTAAddress,
DialogToken,
SleepMode,
TFSResponse,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the WNM Sleep Mode Response frame is to be sent.
DialogToken	Integer	0–255	The dialog token to identify the WNM sleep mode request and response transaction.
SleepMode	As defined in the WNM Sleep Mode element	As defined in the WNM Sleep Mode element	Specifies the proposed WNM sleep mode service parameters for the WNM Sleep Mode Response frame.
TFSResponse	A set of TFS Request elements	As defined in 9.4.2.80	Specifies the proposed TFS service parameters for the WNM Sleep Mode Response frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.62.4.3 When generated

This primitive is generated by the SME to request that a WNM Sleep Mode Response frame be sent to a peer entity to convey WNM sleep mode information.

6.3.62.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM Sleep Mode Response frame containing the WNM Sleep Mode elements specified. This frame is then scheduled for transmission.

6.3.62.5 MLME-SLEEPMODE.confirm

6.3.62.5.1 Function

This primitive reports the result of a request to send a WNM Sleep Mode Response frame.

6.3.62.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SLEEPMODE.confirm(
                        PeerSTAAddress,
                        DialogToken,
                        SleepMode,
                        TFSResponse,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the WNM Sleep Mode Response frame is received.
DialogToken	Integer	0–255	The dialog token to identify the WNM sleep mode request and response transaction.
SleepMode	As defined in the WNM Sleep Mode element	As defined in the WNM Sleep Mode element	Specifies the proposed WNM sleep mode service parameters for the WNM Sleep Mode Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TFSResponse	A set of TFS Request elements	As defined in the TFS Response element	Specifies the proposed TFS service parameters for the WNM Sleep Mode Response frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.62.5.3 When generated

This primitive is generated by the MLME when the STA receives a WNM Sleep Mode Response frame from the AP.

6.3.62.5.4 Effect of receipt

No effect of receipt is specified.

6.3.63 TIM broadcast setup

6.3.63.1 General

The following MLME primitives support the signaling of TIM Broadcast Setup. The diagram in Figure 6-23 shows the TIM Broadcast setup process.

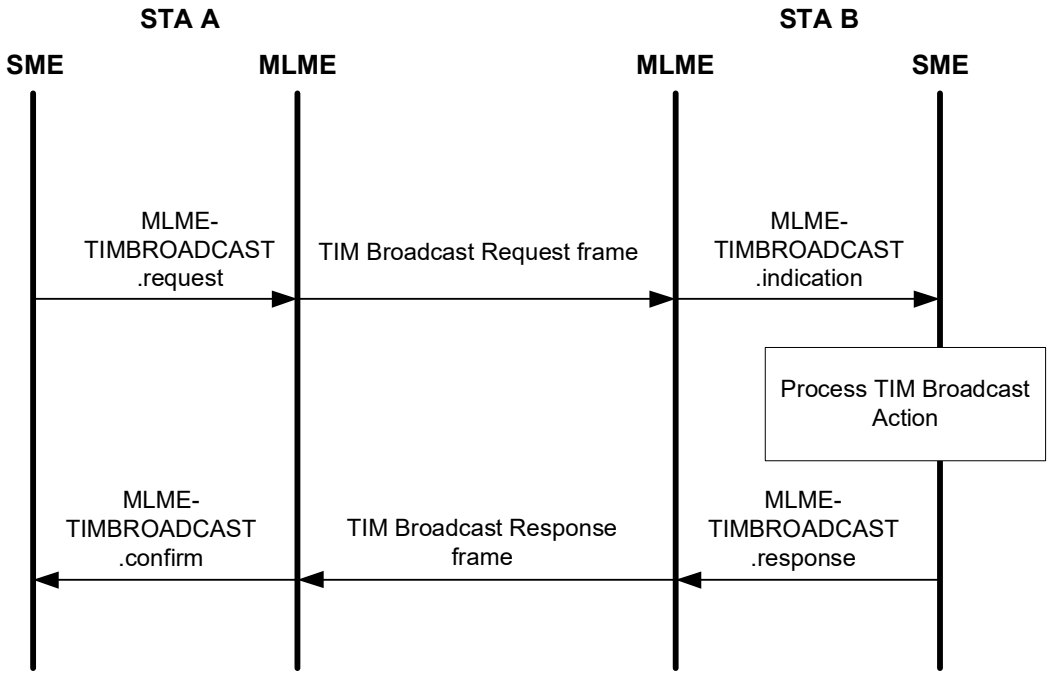

Figure 6-23—TIM broadcast setup protocol exchange

6.3.63.2 MLME-TIMBROADCAST.request

6.3.63.2.1 Function

This primitive requests that a TIM Broadcast Request frame be sent to the AP with which the non-AP STA is associated.

6.3.63.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.request(
                    PeerSTAAddress,
                    Dialog Token,
                    TIMBroadcastRequest,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the TIM Broadcast process.
Dialog Token	Integer	1–255	The dialog token to identify the TIM Broadcast request and response transaction.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 9.4.2.82	Specifies the proposed service parameters for the TIM Broadcast.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.63.2.3 When generated

This primitive is generated by the SME to request that a TIM Broadcast Request frame be sent to the AP with which the STA is associated.

6.3.63.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TIM Broadcast Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.63.3 MLME-TIMBROADCAST.confirm

6.3.63.3.1 Function

This primitive reports the result of a TIM Broadcast procedure.

6.3.63.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.confirm(
                    PeerSTAAddress,
                    Dialog Token,
                    TIMBroadcastResponse,
                    VendorSpecificInfo
                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the TIM Broadcast process.
Dialog Token	Integer	0–255	The dialog token to identify the TIM Broadcast request and response transaction.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 9.4.2.83	Specifies service parameters for the TIM Broadcast.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.63.3.3 When generated

This primitive is generated by the MLME when the STA receives a TIM Broadcast Response frame from the AP.

6.3.63.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results in the TIMBroadcastResponse element and may use the reported data.

6.3.63.4 MLME-TIMBROADCAST.indication

6.3.63.4.1 Function

This primitive indicates that a TIM Broadcast Request frame was received from a non-AP STA.

6.3.63.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.indication(
                                    PeerSTAAddress,
                                    Dialog Token,
                                    TIMBroadcastRequest,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a TIM Broadcast Request frame was received.
Dialog Token	Integer	1–255	The dialog token to identify the TIM Broadcast request and response transaction.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 9.4.2.82	Specifies the proposed service parameters for the TIM Broadcast.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.63.4.3 When generated

This primitive is generated by the MLME when a TIM Broadcast Request frame is received.

6.3.63.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.15.

6.3.63.5 MLME-TIMBROADCAST.response

6.3.63.5.1 Function

This primitive is generated in response to an MLME-TIMBROADCAST.indication primitive requesting a TIM Broadcast Response frame be sent to a non-AP STA.

6.3.63.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TIMBROADCAST.response(
PeerSTAAddress,
Dialog Token,
TIMBroadcastResponse,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a TIM Broadcast Request frame was received.
Dialog Token	Integer	0–255	The dialog token to identify the TIM Broadcast request and response transaction.
TIM Broadcast Response	As defined in TIM Broadcast Response element	As defined in 9.4.2.83	Specifies service parameters for the TIM Broadcast.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.63.5.3 When generated

This primitive is generated by the SME in response to an MLME-TIMBROADCAST.indication primitive requesting a TIM Broadcast Response be sent to a non-AP STA.

6.3.63.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TIM Broadcast Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.64 QoS traffic capability update

6.3.64.1 General

The MLME-QOSTRAFFICCAPUPDATE.request and MLME-QOSTRAFFICCAPUPDATE.indication primitives provide the transport of QoS Traffic Capability information from a non-AP STA to the AP with which the STA is associated. The diagram in Figure 6-24 shows the QoS traffic capability update process.

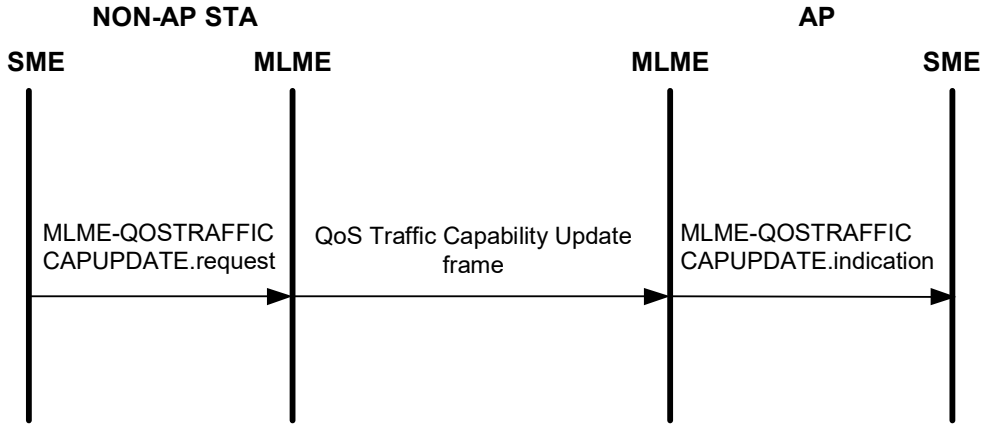

Figure 6-24—QoS traffic capability update protocol exchange

6.3.64.2 MLME-QOSTRAFFICCAPUPDATE.request

6.3.64.2.1 Function

This primitive requests that a QoS Traffic Capability Update frame be sent to the AP with which the STA is associated.

6.3.64.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-QOSTRAFFICCAPUPDATE.request(
                                    QoSTrafficCapability,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
QoS Traffic Capability	Bit field as defined in 9.6.13.23	As defined in 9.6.13.23	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is present if dot11WirelessManagementImplemented is true and dot11QoSTrafficCapabilityActivated is true, and it is not present otherwise.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.64.2.3 When generated

This primitive is generated by the SME to request that a QoS Traffic Capability Update frame be sent to the AP with which the STA is associated.

6.3.64.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QoS Traffic Capability Update frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.64.3 MLME-QOSTRAFFICCAPUPDATE.indication

6.3.64.3.1 Function

This primitive indicates that a QoS Traffic Capability Update frame was received from a non-AP STA.

6.3.64.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QOSTRAFFICCAPUPDATE.indication(
PeerSTAAddress,
QoS Traffic Capability,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a QoS Traffic Capability Update frame was received.
QoS Traffic Capability	Bit field as defined in 9.6.13.23	As defined in 9.6.13.23	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is present if dot11WirelessManagementImplemented is true and dot11QoSTrafficCapabilityActivated is true, and it is not present otherwise.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.64.3.3 When generated

This primitive is generated by the MLME when a QoS Traffic Capability Update frame is received.

6.3.64.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.21.10.

6.3.65 Channel Usage request

6.3.65.1 General

The following MLME primitives support the signaling of Channel Usage request. Figure 6-25 depicts the Channel Usage request process. The figure illustrates the basic protocol and is only an example and therefore is not meant to be exhaustive of all possible protocol uses.

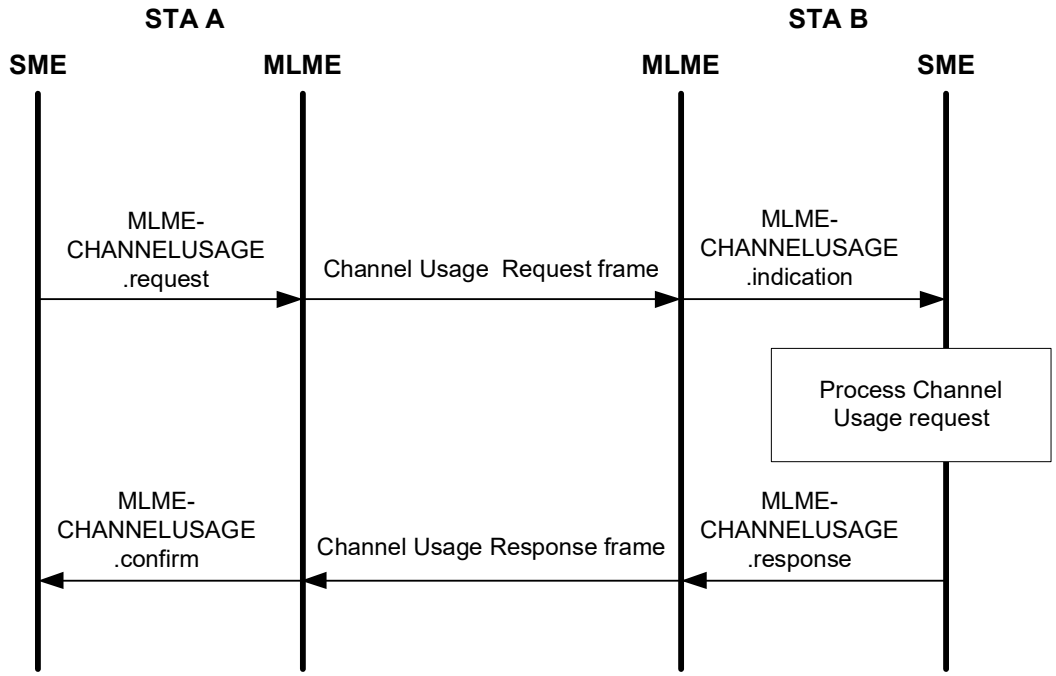

Figure 6-25—Channel usage request protocol exchange

6.3.65.2 MLME-CHANNELUSAGE.request

6.3.65.2.1 Function

This primitive requests the transmission of a Channel Usage Request frame be sent to an AP.

6.3.65.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELUSAGE.request(
                                    PeerSTAAddress,
                                    Dialog Token,
                                    ChannelUsage,
                                    SSID,
                                    SupportedOperatingClasses,
                                    VendorSpecificInfo
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the Channel Usage process.
Dialog Token	Integer	1–255	The dialog token to identify the Channel Usage request and response transaction.
ChannelUsage	A set of Channel Usage element	As defined in 9.4.2.85	Specifies request types for the Channel Usage request.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.
SupportedOperating Classes	As defined in Supported Operating Classes element	As defined in 9.4.2.53	Specifies the supported operating classes.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.65.2.3 When generated

This primitive is generated by the SME to request that a Channel Usage Request frame be sent to the BSS which is advertising the SSID passed down in this primitive.

6.3.65.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Channel Usage Request frame. The STA then attempts to transmit this to the BSS which is advertising the SSID included in this primitive request. When wild card SSID is passed down, the MLME-CHANNELREQUEST.request primitive shall be transmitted to all BSSs in the current scan list as determined by the most recent MLME-SCAN.request primitive.

6.3.65.3 MLME-CHANNELUSAGE.confirm

6.3.65.3.1 Function

This primitive reports the result of a Channel Usage procedure.

6.3.65.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELUSAGE.confirm(
                                    PeerSTAAddress,
                                    Dialog Token,
                                    ChannelUsage,
                                    SSID,
                                    Country String,
                                    Power Constraint,
                                    VendorSpecificInfo
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the Channel Usage process.
Dialog Token	Integer	1–255	The dialog token to identify the Channel Usage request and response transaction.
ChannelUsage	A set of Channel Usage element	As defined in 9.4.2.85	Specifies parameters for the Channel Usage.
SSID	Octet string	0–32 octets	Specifies the SSID or the wildcard SSID used in the request.
Country String	Octet string	3 octets	Specifies Country strings.
Power Constraint	An element	As defined in 9.4.2.13	Zero or one Power Constraint elements.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.65.3.3 When generated

This primitive is generated when the STA receives a Channel Usage Response frame from the AP.

6.3.65.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.21.15.

6.3.65.4 MLME-CHANNELUSAGE.indication

6.3.65.4.1 Function

This primitive indicates that a Channel Usage Request frame was received from a non-AP STA.

6.3.65.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELUSAGE.indication(
                                    PeerSTAAddress,
                                    Dialog Token,
                                    ChannelUsage,
                                    SSID,
                                    SupportedOperatingClasses,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a Channel Usage Request frame was received.
Dialog Token	Integer	0–255	The dialog token to identify the Channel Usage request and response transaction.
ChannelUsage	A set of Channel Usage element	As defined in 9.4.2.85	Specifies request types for the Channel Usage request.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
SupportedOperating Classes	As defined in Supported Operating Classes element	As defined in 9.4.2.53	Indicates the supported operating classes.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.65.4.3 When generated

This primitive is generated by the MLME when a Channel Usage Request frame is received.

6.3.65.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.21.15.

6.3.65.5 MLME-CHANNELUSAGE.response

6.3.65.5.1 Function

This primitive is generated in response to an MLME-CHANNELUSAGE.indication primitive requesting a Channel Usage Response frame be sent to a non-AP STA.

6.3.65.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELUSAGE.response(
PeerSTAAddress,
Dialog Token,
ChannelUsage,
SSID,
Country String,
Power Constraint,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a Channel Usage Request frame was received.
Dialog Token	Integer	0–255	The dialog token to identify the Channel Usage request and response transaction.
ChannelUsage	A set of Channel Usage elements	As defined in 9.4.2.85	Specifies parameters for the Channel Usage.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.
Country String	Octet string	3 octets	Specifies Country strings.
Power Constraint	An element	As defined in 9.4.2.13	Zero or one Power Constraint elements.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.65.5.3 When generated

This primitive is generated by the SME in response to an MLME-CHANNELUSAGE.indication primitive requesting a Channel Usage Response be sent to a non-AP STA.

6.3.65.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Channel Usage Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.66 DMS or GCR request and response procedure

6.3.66.1 General

The following MLME primitives support the signaling of DMS or GCR request and response procedure. The diagram in Figure 6-26 shows the DMS or GCR request and response process.

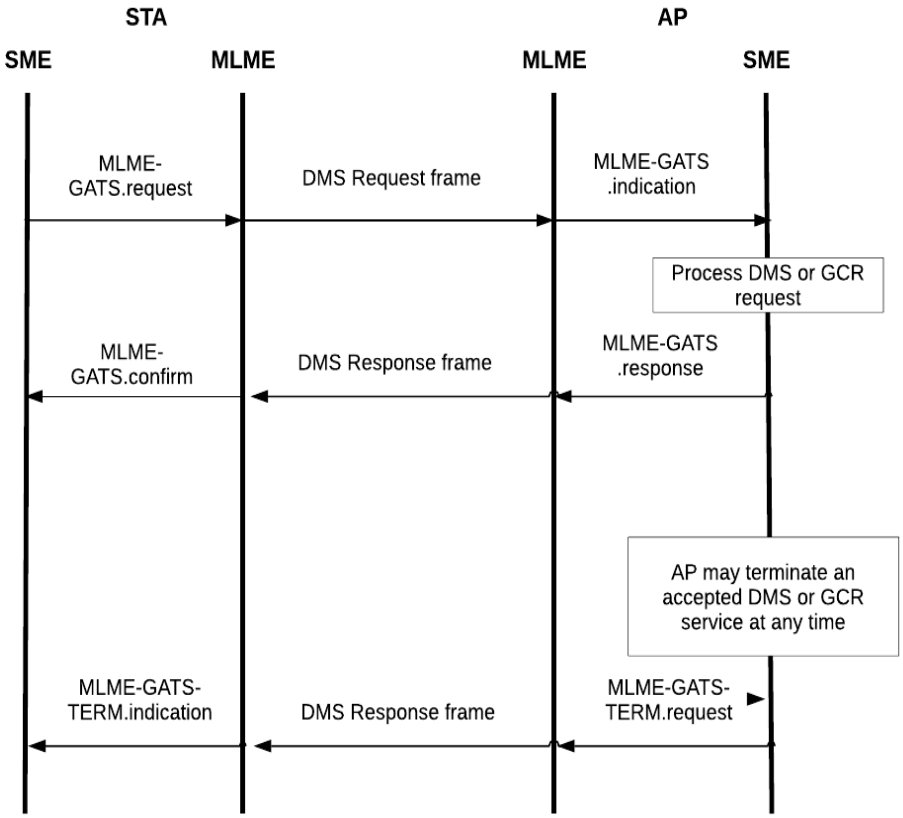

Figure 6-26—DMS or GCR setup protocol exchange

Copyright © 2021 IEEE. All rights reserved.

6.3.66.2 MLME-GATS.request

6.3.66.2.1 Function

This primitive requests the transmission of a DMS Request frame be sent to an AP or peer mesh STA.

6.3.66.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GATS.request(
PeerSTAAddress,
Dialog Token,
DMSRequest,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the DMS or GCR process.
Dialog Token	Integer	1–255	The dialog token to identify the DMS or GCR request and response transaction.
DMSRequest	Sequence of DMS Request elements	As defined in 9.4.2.87	Specifies group addressed frames and parameters for the requested DMS or GCR stream.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.66.2.3 When generated

This primitive is generated by the SME to request that a DMS Request frame be sent to the AP with which the STA is associated or peer mesh STA.

6.3.66.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Request frame. The STA then attempts to transmit this to the AP with which the STA is associated or peer mesh STA.

6.3.66.3 MLME-GATS.confirm

6.3.66.3.1 Function

This primitive reports the result of a DMS or GCR procedure.

6.3.66.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GATS.confirm(
PeerSTAAddress,
Dialog Token,
DMSResponse,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the DMS or GCR process.
Dialog Token	Integer	1–255	The dialog token to identify the DMS or GCR request and response transaction.
DMSResponse	Sequence of DMS Response elements	As defined in 9.4.2.88	Specifies the status returned by the AP or peer mesh STA responding to the STA's requested DMS or GCR stream.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.66.3.3 When generated

This primitive is generated when the STA receives a DMS Response frame from the AP or peer mesh STA.

6.3.66.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.21.16.

6.3.66.4 MLME-GATS.indication

6.3.66.4.1 Function

This primitive indicates that a DMS Request frame was received from a non-AP STA or peer mesh STA.

6.3.66.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GATS.indication(
                    PeerSTAAddress,
                    Dialog Token,
                    DMSRequest,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA or peer mesh STA MAC entity from which a DMS Request frame was received.
Dialog Token	Integer	1–255	The dialog token to identify the DMS or GCR request and response transaction.
DMSRequest	Sequence of DMS Request elements	As defined in 9.4.2.87	Specifies group addressed frames for the requested DMS or GCR stream.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.66.4.3 When generated

This primitive is generated by the MLME when a DMS Request frame is received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.66.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.21.16.

6.3.66.5 MLME-GATS.response

6.3.66.5.1 Function

This primitive is generated in response to an MLME-GATS.indication primitive requesting a DMS Response frame be sent to a non-AP STA or peer mesh STA.

6.3.66.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GATS.response(
                    PeerSTAAddress,
                    Dialog Token,
                    DMSResponse,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA or peer mesh STA MAC entity from which a DMS Request frame was received.
Dialog Token	Integer	1–255	The Dialog Token to identify the DMS or GCR request and response transaction.
DMSResponse	Sequence of DMS Response elements	As defined in 9.4.2.88	Specifies the status returned by the AP or peer mesh STA responding to the STA's requested DMS or GCR stream.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.66.5.3 When generated

This primitive is generated by the SME in response to an MLME-GATS.indication primitive requesting a DMS Response be sent to a non-AP STA or peer mesh STA.

6.3.66.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Response frame. The STA then attempts to transmit this to the non-AP STA or peer mesh STA indicated by the PeerSTAAddress parameter.

6.3.66.6 MLME-GATS-TERM.request

6.3.66.6.1 Function

This primitive requests the transmission of a DMS Response frame to terminate a granted DMS or GCR service.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.66.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GATS-TERM.request(
PeerSTAAddress,
Dialog Token,
DMSResponse,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA or peer mesh STA MAC entity from which a DMS Request frame was received.
Dialog Token	Integer	0	Set to 0 for an autonomous DMS Response frame.
DMSResponse	Sequence of DMS Response elements	As defined in 9.4.2.88	Specifies the requested DMS or GCR stream that is canceled by the AP or peer mesh STA.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.66.6.3 When generated

This primitive is generated by the SME to terminate DMS or GCR service.

6.3.66.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Response frame. The STA then attempts to transmit this to the non-AP STA or peer mesh STA indicated by the PeerSTAAddress parameter.

6.3.66.7 MLME-GATS-TERM.indication

6.3.66.7.1 Function

This primitive is generated by the MLME when an unsolicited DMS Response frame is received.

6.3.66.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GATS-TERM.indication(
PeerSTAAddress,
Dialog Token,
DMSResponse,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the DMS or GCR process.
Dialog Token	Integer	0	Set to 0 for an autonomous DMS Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DMSResponse	Sequence of DMS Response elements	As defined in 9.4.2.88	Specifies the requested DMS or GCR stream that is canceled by the AP or peer mesh STA.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.66.7.3 When generated

This primitive is generated when the STA receives an unsolicited DMS Response frame from the AP or peer mesh STA.

6.3.66.7.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.21.16.

6.3.67 WNM notification request

6.3.67.1 General

This set of primitives supports the exchange of WNM Notification Request and Response frames between peer SMEs.

6.3.67.2 MLME-WNMNOTIFICATIONREQUEST.request

6.3.67.2.1 Function

This primitive requests the transmission of a WNM Notification Request frame to a peer entity.

6.3.67.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WNMNOTIFICATIONREQUEST.request(
Peer MAC Address,
Dialog Token,
Type,
Optional Subelements,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the WNM Notification Request frame is sent.
Dialog Token	Integer	1–255	The dialog token to identify the WNM notification transaction.
Type	Integer	1–255	The type of WNM notification.
Optional Subelements	Set subelements	As defined in 9.6.13.29	A set of subelements describing the notification.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.67.2.3 When generated

This primitive is generated by the SME to request that a WNM Notification Request frame be sent to a peer entity to initiate a WNM notification.

6.3.67.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM Notification Request frame containing the elements specified. This frame is then scheduled for transmission.

6.3.67.3 MLME-WNMNOTIFICATIONREQUEST.indication

6.3.67.3.1 Function

This primitive indicates that a WNM Notification Request frame has been received.

6.3.67.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WNMNOTIFICATIONREQUEST.indication(
Peer MAC Address,
Dialog Token,
Type,
Optional Subelements,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the WNM notification request was received.
Dialog Token	Integer	1–255	The dialog token to identify the WNM notification transaction.
Type	Integer	1–255	The type of WNM notification request.
Optional Subelements	Set subelements	As defined in 9.6.13.29	A set of subelements describing the notification.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.67.3.3 When generated

This primitive is generated by the MLME when a WNM Notification Request frame is received.

6.3.67.3.4 Effect of receipt

On receipt of this primitive, the SME replies to the request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.68 WNM notification response

6.3.68.1 MLME-WNMNOTIFICATIONRESPONSE.request

6.3.68.1.1 Function

This primitive supports the signaling of the WNM Notification Response frame between peer SMEs.

6.3.68.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WNMNOTIFICATIONRESPONSE.request(
Peer MAC Address,
Dialog Token,
Response Status,
Optional Subelements,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the WNM Notification Response frame is sent.
Dialog Token	Integer	1–255	The dialog token to identify the WNM notification transaction.
Response Status	Integer	1–255	The response status of the WNM notification.
Optional Subelements	Set subelements	As defined in 9.6.13.30	A set of subelements describing the results of the WNM notification.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.68.1.3 When generated

This primitive is generated by the SME to request that a WNM Notification Response frame be sent to a peer entity to report the results of the WNM notification.

6.3.68.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM Notification Response frame containing the indicated fields. This frame is then scheduled for transmission.

6.3.68.2 MLME-WNMNOTIFICATIONRESPONSE.indication

6.3.68.2.1 Function

This primitive indicates that a WNM Notification Response frame has been received from a peer entity.

6.3.68.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WNMNOTIFICATIONRESPONSE.indication(
Peer MAC Address,
Dialog Token,
Response Status,

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Optional Subelements,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the WNM Notification Response frame was received.
Dialog Token	Integer	1–255	The dialog token to identify the WNM notification transaction.
Response Status	Integer	1–255	The response status of the WNM notification.
Optional Subelements	Set subelements	As defined in 9.6.13.30	A set of subelements describing the results of the WNM notification.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.68.2.3 When generated

This primitive is generated by the MLME when a WNM Notification Response frame is received.

6.3.68.2.4 Effect of receipt

On receipt of this primitive, the WNM notification can be made available for SME processes.

6.3.69 Network discovery and selection support

6.3.69.1 General

This set of primitives supports the process of GAS.

6.3.69.2 MLME-GAS.request

6.3.69.2.1 Function

This primitive requests the information of a specific advertisement service from another STA and requests the STA to provide GAS.

6.3.69.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GAS.request(
STAAddress,
DialogToken,
AdvertisementProtocolID,
Query,
QueryFailureTimeout,
Protected,
Multi-band,
GAMode,
GASExtension,
CAGNumber,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
STAAddress	MAC address	Any valid individual MAC address. For a group address GAS frame, this is the broadcast address.	Specifies the address of the peer MAC entity or the broadcast address to which query is transmitted.
DialogToken	Integer	0–255	The dialog token to identify the GAS transaction.
AdvertisementProtocolID	Integer	As defined in Table 9-237	An advertisement protocol ID (see 9.4.2.92), which might be IEEE 802.11 assigned or vendor specified.
Query	String	N/A	Query string formatted using protocol identified in AdvertisementProtocolID.
QueryFailureTimeout	Integer	> 1	The time limit, in units of beacon intervals, after which the GAS procedure is terminated.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using a Protected Dual of Public Action frame. Otherwise, the request is sent using a Public Action frame.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number to which the GAS transaction applies. The parameter is absent if the GAS transaction applies to the same frequency band and channel where the frame is transmitted.
GAMode	Boolean	true, false	If true, the request is sent using a group address GAS frame. Otherwise, the request is sent using an individually addressed GAS frame.
GASExtension	GAS Extension element	As defined in 9.4.2.239	Specifies GAS extensions information in the GAS frame to be transmitted. This parameter is optionally present if dot11GASExtensionImplemented is true; otherwise not present.
CAGNumber	CAG Number element	As defined in 9.4.2.176	One or more Common Advertisement Group (CAG) tuples. Each CAG Tuple specifies a pair of CAG Version and CAG Information Type cached by the transmitting STA. This parameter is optionally present when dot11FILSActivated is true or dot11SolicitedPADActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.69.2.3 When generated

This primitive is generated by the SME to request a specific Advertisement Service from another STA.

6.3.69.2.4 Effect of receipt

The STA operates according to the procedures defined in 11.22.3 and 11.23.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.69.3 MLME-GAS.confirm

6.3.69.3.1 Function

This primitive reports the status code and Query Response from an Advertisement Server to the requesting STA.

6.3.69.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GAS.confirm(
PeerSTAAddress,
DialogToken,
ResultCode,
ResponseInfo,
Protected,
Multi-band,
GASExtension,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which Query Response is received.
DialogToken	Integer	0–255	The dialog token to identify the GAS transaction.
ResultCode	Enumeration	SUCCESS, NO_OUTSTANDING_GAS_REQUEST, GAS_ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED, GAS_QUERY_RESPONSE_OUTSTANDING, GAS_QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, GAS_QUERY_TIMEOUT, GAS_RESPONSE_NOT_RECEIVED_FROM_SERVER, SUCCESS_CAG_VERSIONS_MATCH	Indicates the result response to the GAS request from the peer MAC entity.
ResponseInfo	String	N/A	Query Response string.
Protected	Boolean	true, false	Specifies whether the response was received in a protected robust Management frame. If true, the response was received using a Protected Dual of Public Action frame. Otherwise, the response was received using a Public Action frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number to which the GAS transaction applies. The parameter is absent if the GAS transaction applies to the same frequency band and channel where the frame is transmitted.
GASExtension	GAS Extension element	As defined in 9.4.2.239	Specifies GAS extensions information in the GAS frame received. The values from the GAS Extension element in the GAS response received, if present; else null.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

The mapping of Status Code received in the GAS Response frame is mapped to the corresponding Result Code in Table 9-50.

6.3.69.3.3 When generated

This primitive is generated by the MLME as a response to the MLME-GAS.request primitive indicating the result of that request.

The primitive is generated when the requesting STA receives a query response in a (Protected) GAS Initial Response frame or one or more (Protected) GAS Comeback Response frames, or a Group Addressed GAS Response frame.

6.3.69.3.4 Effect of receipt

The STA operates according to the procedures defined in 11.22.3, and 11.23.

6.3.69.4 MLME-GAS.indication

6.3.69.4.1 Function

This primitive reports to the STA's SME about the GAS Request.

6.3.69.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.indication(
                    PeerSTAAddress,
                    DialogToken,
                    AdvertisementProtocolID,
                    Query,
                    Protected,
                    Multi-band,
                    GAMode,
                    GASExtension,
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

CAGNumber,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the query message was received.
DialogToken	Integer	0–255	The dialog token to identify the GAS transaction.
AdvertisementProtocolID	Integer	As defined in Table 9-237	An advertisement protocol ID (see 9.4.2.92), which might be IEEE 802.11 assigned or vendor specified.
Query	String	N/A	Query string formatted using protocol identified in AdvertisementProtocolID.
Protected	Boolean	true, false	Specifies whether the request was received in a protected robust Management frame. If true, the request was received in a Protected Dual of Public Action frame. Otherwise, the request was received in a Public Action frame.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number to which the GAS transaction applies. The parameter is absent if the GAS transaction applies to the same frequency band and channel where the frame is transmitted.
GAMode	Boolean	true, false	Set to true if the request is received in a Group Addressed GAS Request frame; otherwise set to false.
GASExtension	GAS Extension element	As defined in 9.4.2.239	Specifies GAS extensions information in the GAS frame received. The values from the GAS Extension element in the GAS request received, if present; else null.
CAGNumber	CAG Number element	As defined in 9.4.2.176	One or more Common Advertisement Group (CAG) tuples. Each CAG Tuple specifies a pair of CAG Version and CAG Information Type received from a requesting STA.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.69.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a GAS request from STA.

6.3.69.4.4 Effect of receipt

The SME is notified of the request from the STA.

The SME operates according to the procedures defined in 11.22.3 and 11.23.

The SME generates an MLME-GAS.response primitive within a dot11GASResponseTimeout.

6.3.69.5 MLME-GAS.response

6.3.69.5.1 Function

This primitive responds to the request for an advertisement service by a specified STA MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.69.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GAS.response(
STAAddress,
DialogToken,
ResultCode,
ResponseInfo,
Protected,
Multi-band,
GAMode,
GASExtension,
VendorSpecificInfo
)

Name	Type	Valid range	Description
STAAddress	MAC address	Any valid individual MAC address. For a group address GAS frame, this is the broadcast address.	Specifies the address of the MAC entity or the broadcast address to which the query response information is transmitted.
DialogToken	Integer	0–255	The dialog token to identify the GAS transaction.
ResultCode	Enumeration	SUCCESS, NO_OUTSTANDING_GAS_REQUEST, GAS_ADVERTISEMENT_PROTOCOL_ NOT_SUPPORTED, GAS_QUERY_RESPONSE_ OUTSTANDING, GAS_QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, GAS_QUERY_TIMEOUT, GAS_RESPONSE_NOT_RECEIVED_ FROM_SERVER, SUCCESS_CAG_VERSIONS_MATCH	Indicates the result response to the GAS-request from the peer MAC entity. See Table 9-50.
ResponseInfo	String	N/A	Query Response string.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using a Protected Dual of Public Action frame. Otherwise, the response is sent using a Public Action frame.
Multi-band	Multi-band element	As defined in 9.4.2.138	Specifies the frequency band and channel number where the GAS transaction applies. The parameter is absent if the GAS transaction applies to the same frequency band and channel where the frame is transmitted.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
GAMode	Boolean	true, false	Specifies whether the response is sent using a group address GAS frame. If true, the response is sent using a group address GAS frame. Otherwise, the response is sent using an individually addressed GAS frame.
GASExtension	GAS Extension element	As defined in 9.4.2.239	Specifies GAS extensions information in the GAS frame to be transmitted. The parameter is present if GAMode is true, or if the STA is capable of retransmitting a GAS Query Response fragment upon request and the query response's length is larger than the maximum MMPDU size; else the parameter is null.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.69.5.3 When generated

This primitive is generated by the SME as a response to an MLME-GAS.indication primitive.

6.3.69.5.4 Effect of receipt

This primitive causes the MAC entity at the STA to send a (Protected) GAS Initial Response frame to the requesting STA and optionally one or more (Protected) GAS Comeback Response frames or one Group Addressed GAS Response frame.

6.3.70 QoS Map element management

6.3.70.1 General

The QoS Map element is provided to non-AP STAs in (Re)Association Response frames. However, if the SME of an AP detects a change of the QoS Map information while one or more non-AP STAs are associated to the BSS, then the AP may transmit an unsolicited QoS Map element to associated STAs. The AP's SME invokes the MLME-QOS-MAP.request primitive to cause individually addressed frames containing a QoS Map element to be transmitted to associated STAs. The AP's SME invokes the MLME-QOS-MAP.request primitive to transmit individually addressed frames containing a QoS Map element to associated STAs. When a non-AP STA receives such unsolicited QoS Map information, its MLME generates an MLME-QOS-MAP.indication primitive to the STA's SME. In turn, the SME should take appropriate action, e.g., initiate an ADDTS or DELTS if admission control changes are necessary.

6.3.70.2 MLME-QOS-MAP.request

6.3.70.2.1 Function

This primitive is used by an AP to transmit an unsolicited QoS Map Configure frame to a specified non-AP STA MAC entity. The specified non-AP STA MAC address is an individual MAC address.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.70.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QOS-MAP.request(
Non-APSTAAddress,
QoSMapSet,
IntraAccessCategoryPriority,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Non-APSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which query message is received.
QoSMapSet	As defined in frame format	As defined in 9.4.2.94	Specifies the QoS Map information the non-AP STA should use.
IntraAccessCategoryPriority	Intra-Access Category Priority element	As defined in 9.4.2.120	Specifies the intra-AC priorities the STA should use. The parameter is present if dot11SCSActivated is true; otherwise not present.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.70.2.3 When generated

This primitive is generated by the MLME at the AP as a result of any change in the AP QoS Map configurations.

6.3.70.2.4 Effect of receipt

This primitive causes the MAC entity at the AP to send a QoS Map element in a QoS Map Configure frame to the non-AP STA.

6.3.70.3 MLME-QOS-MAP.indication

6.3.70.3.1 Function

This primitive reports the QoS mapping information sent from the AP to the non-AP STA.

6.3.70.3.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-QOS-MAP.indication(
QoSMapSet,
IntraAccessCategoryPriority,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
QoSMapSet	As defined in frame format	As defined in 9.4.2.94	Specifies the QoS Map information to be used by the non-AP STA.
IntraAccessCategoryPriority	Intra-Access Category Priority element	As defined in 9.4.2.120	Specifies the intra-AC priorities the STA should use.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.70.3.3 When generated

This primitive is generated when the non-AP STA receives a QoS Map element in an unsolicited QoS Map Configure frame from the AP.

The SME of the non-AP STA should use the information to decide proper actions. For example, an ADDTS or DELTS procedure should be activated if the QoS Map information indicates a change in the admission control.

6.3.70.3.4 Effect of receipt

The non-AP STA operates according to the procedures defined in 11.22.9.

6.3.71 Mesh peering management

6.3.71.1 Introduction

The following primitives facilitate the mesh peering management protocol and authenticated mesh peering exchange protocol.

6.3.71.2 MLME-MESHPEERINGMANAGEMENT.request

6.3.71.2.1 Function

This primitive requests that the MAC entity establish, confirm, or close a mesh peering with the specified peer MAC entity by sending a mesh peering Management frame to the peer MAC entity. The mesh peering management procedures are specified in 14.3.

6.3.71.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.request(
                                    PeerMACAddress,
                                    MeshPeeringMgmtFrameContent,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the mesh peering Management frame is to be sent.
MeshPeeringMgmtFrameContent	Sequence of octets	As defined in 9.6.15.2, 9.6.15.3, or 9.6.15.4	The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame to send to the peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.71.2.3 When generated

This primitive is generated by the SME to request that a mesh peering Management frame be sent to the specified mesh STA.

6.3.71.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a mesh peering Management frame containing the information specified. The frame is scheduled for transmission.

6.3.71.3 MLME-MESHPEERINGMANAGEMENT.confirm

6.3.71.3.1 Function

This primitive reports the results of a request to send a mesh peering Management frame.

6.3.71.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.confirm(
                                    PeerMACAddress,
                                    MeshPeeringMgmtFrameContent,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the mesh peering Management frame was sent.
MeshPeeringMgmtFrameContent	Sequence of octets	As defined in 9.6.15.2, 9.6.15.3, or 9.6.15.4	The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame received from the peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.71.3.3 When generated

This primitive is generated as a result of an MLME-MESHPEERINGMANAGEMENT.request primitive with a specified MAC peer.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.71.3.4 Effect of receipt

The SME is notified of the results of the mesh peering management protocol request.

6.3.71.4 MLME-MESHPEERINGMANAGEMENT.indication

6.3.71.4.1 Function

This primitive indicates to the SME that the MLME has received a mesh peering Management frame from a peer MAC entity.

6.3.71.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.indication(
                                        PeerMACAddress,
                                        MeshPeeringMgmtFrameContent,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Valid individual MAC address	Specifies the address of the peer MAC entity from which the mesh peering Management frame was received.
MeshPeeringMgmtFrameContent	Sequence of octets	As defined in 9.6.15.2, 9.6.15.3, or 9.6.15.4	The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame received from the peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.71.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a mesh peering Management frame from a peer MAC entity.

6.3.71.4.4 Effect of receipt

The SME is notified of the reception of a mesh peering Management frame and is provided the contents of the frame.

6.3.71.5 MLME-MESHPEERINGMANAGEMENT.response

6.3.71.5.1 Function

This primitive is used to send a response to a mesh peering Management frame to the specified peer MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.71.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHPEERINGMANAGEMENT.response(
PeerMACAddress,
ResultCode,
MeshPeeringMgmtFrameContent,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the mesh peering Management frame is to be sent.
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS	Reports the result response to the mesh peering Management frame from the peer MAC entity.
MeshPeeringMgmtFrameContent	Sequence of octets	As defined in 9.6.15.2, 9.6.15.3, or 9.6.15.4	The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame to send to the peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.71.5.3 When generated

This primitive is generated by the SME as a response to an MLME-MESHPEERINGMANAGEMENT.indication primitive.

6.3.71.5.4 Effect of receipt

This primitive indicates scheduling for transmission of a Mesh Peering frame containing the indicated response.

6.3.72 Mesh power management

6.3.72.1 Introduction

The following primitives describe how a mesh entity changes its mesh power management mode for a mesh peering.

6.3.72.2 MLME-MESHPOWERMGT.request

6.3.72.2.1 Function

This primitive requests a change in the mesh STAs mesh power management mode for the mesh peering.

6.3.72.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHPOWERMGT.request(
PeerMACAddress,
Mesh Power Management Mode
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid Range	Description
PeerMACAd-dress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the mesh power management mode is changed.
Mesh Power Management Mode	Enumeration	ACTIVE_MODE, LIGHT_SLEEP_MODE, DEEP_SLEEP_MODE	Specifies the mesh power management mode that the local mesh STA is using for the mesh peering.

6.3.72.2.3 When generated

The primitive is generated when the mesh entity wishes to change the mesh power management mode of a mesh peering.

6.3.72.2.4 Effect of receipt

This primitive initiates the local mesh STA's mesh power management mode change of the mesh peering. The MLME subsequently issues an MLME-MESHPOWERMGT.confirm primitive that reflects the results.

6.3.72.3 MLME-MESHPOWERMGT.confirm

6.3.72.3.1 Function

This primitive reports the result of a mesh power management mode change attempt.

6.3.72.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHPOWERMGT.confirm(
                                    PeerMACAddress
                                    )
```

Name	Type	Valid Range	Description
PeerMAC Address	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the mesh power management mode is changed.

6.3.72.3.3 When generated

This primitive is generated as a result of an MLME-MESHPOWERMGT.request primitive.

6.3.72.3.4 Effect of receipt

The SME is notified of the results of the mesh power management mode change for a mesh peering procedure.

6.3.73 Mesh neighbor offset synchronization

6.3.73.1 Introduction

This mechanism manages the neighbor offset synchronization method with the specified neighbor STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.73.2 MLME-MESHNEIGHBOROFFSETSYNCSTART.request

6.3.73.2.1 Function

This primitive requests to start the neighbor offset synchronization method with the specified neighbor STA.

6.3.73.2.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-MESHNEIGHBOROFFSETSYNCSTART.request(
PeerMACAddress
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to start the neighbor offset synchronization method.

6.3.73.2.3 When generated

This primitive is generated by the SME to start the neighbor offset synchronization method with the specified neighbor STA.

6.3.73.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the neighbor offset synchronization method and the calculation of the TSF timer offset value. The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETSYNCSTART.confirm primitive that reflects the results of this request.

6.3.73.3 MLME-MESHNEIGHBOROFFSETSYNCSTART.confirm

6.3.73.3.1 Function

This primitive reports the results of a mesh neighbor offset synchronization request.

6.3.73.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHNEIGHBOROFFSETSYNCSTART.confirm(
PeerMACAddress,
TSFOffsetValue
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the neighbor offset synchronization is requested.
TSFOffsetValue	Integer	-2^{63} to $(2^{63}-1)$	Indicates the TSF offset value with the specified neighbor STA, expressed in 2s complement in μs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.73.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETSYNCSTART.request primitive and report the TSF offset value.

6.3.73.3.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset synchronization request.

6.3.73.4 MLME-MESHNEIGHBOROFFSETCALCULATE.request

6.3.73.4.1 Function

This primitive requests a calculation result of the TSF timer offset value for the specified neighbor STA.

6.3.73.4.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-MESHNEIGHBOROFFSETCALCULATE.request(
PeerMACAddress
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to report the TSF offset value.

6.3.73.4.3 When generated

This primitive is generated by the SME to order a calculation of the TSF timer offset value with the specified neighbor STA.

6.3.73.4.4 Effect of receipt

On receipt of this primitive, the MLME receives a Beacon or Probe Response frame and calculates the TSF timer offset value from the received frame. The MLME tries to receive a Beacon frame immediately after the issue of MLME-MESHNEIGHBOROFFSETCALCULATE.request primitive even if the mesh STA does not listen to the Beacon frame from the specified neighbor STA regularly (i.e., in deep sleep mode toward the specified neighbor STA). The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETCALCULATE.confirm primitive that reflects the results of this request.

6.3.73.5 MLME-MESHNEIGHBOROFFSETCALCULATE.confirm

6.3.73.5.1 Function

This primitive reports the results of a mesh neighbor offset calculation request.

6.3.73.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHNEIGHBOROFFSETCALCULATE.confirm(
PeerMACAddress,
TSFOffsetValue
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the Neighbor Offset Measure is requested.
TSFOffsetValue	Integer	-2^{63} to $(2^{63}-1)$	Indicates the TSF offset value with the specified neighbor STA, expressed in 2s complement in μs.

6.3.73.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETCALCULATE.request primitive to report a TSF offset value.

6.3.73.5.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset calculation request.

6.3.73.6 MLME-MESHNEIGHBOROFFSETSYNCSTOP.request

6.3.73.6.1 Function

This primitive requests to stop the neighbor offset synchronization method with the specified neighbor STA.

6.3.73.6.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETSYNCSTOP.request(
                                        PeerMACAddress
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to stop the neighbor offset synchronization method.

6.3.73.6.3 When generated

This primitive is generated by the SME to stop the maintenance of the neighbor offset synchronization method with the specified neighbor STA.

6.3.73.6.4 Effect of receipt

On receipt of this primitive, the MLME stops the neighbor offset synchronization method with the specified peer. The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETSYNCSTOP.confirm primitive that reflects the results of this request.

6.3.73.7 MLME-MESHNEIGHBOROFFSETSYNCSTOP.confirm

6.3.73.7.1 Function

This primitive reports the results of a neighbor offset synchronization method stop request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.73.7.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-MESHNEIGHBOROFFSETSYNCSTOP.confirm(
PeerMACAddress
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the Neighbor Offset Stop is requested.

6.3.73.7.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETSYNCSTOP.request primitive.

6.3.73.7.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset synchronization stop request.

6.3.74 Mesh TBTT adjustment

6.3.74.1 Introduction

The following primitives describe how a mesh STA requests a TBTT adjustment from a neighboring peer mesh STA.

6.3.74.2 MLME-MESHTBTTADJUSTMENT.request

6.3.74.2.1 Function

This primitive requests transmission of a TBTT Adjustment Request frame.

6.3.74.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHTBTTADJUSTMENT.request(
PeerMACAddress,
BeaconTiming,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the TBTT Adjustment Request is sent.
BeaconTiming	A set of Beacon Timing elements	As defined in 9.4.2.104	A set of Beacon Timing elements of the mesh STA.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.74.2.3 When generated

This primitive is generated by the SME to request that a TBTT Adjustment Request frame be sent to a peer entity to request the adjustment of the peer entity's TBTT.

6.3.74.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TBTT Adjustment Request frame containing the Beacon Timing elements. This frame is then scheduled for transmission. The MLME subsequently issues an MLME-MESHTBTTADJUSTMENT.confirm primitive that reflects the result of this request.

6.3.74.3 MLME-MESHTBTTADJUSTMENT.confirm

6.3.74.3.1 Function

This primitive reports the result of a mesh TBTT adjustment request.

6.3.74.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHTBTTADJUSTMENT.confirm(
                                    PeerMACAddress,
                                    ResultCode,
                                    BeaconTiming,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the TBTT Adjustment Response is received.
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_ UNSPECIFIED, CANNOT_FIND_ ALTERNATIVE_TBTT	Indicates the result of the TBTT adjustment request.
BeaconTiming	A set of Beacon Timing elements	As defined in 9.4.2.104	A set of Beacon Timing elements of the responding mesh STA. Present only when such an element was present in the TBTT Adjustment Response frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.74.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHTBTTADJUSTMENT.request primitive to indicate the result of that request.

6.3.74.3.4 Effect of receipt

The SME is notified of the result of the mesh TBTT adjustment request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.74.4 MLME-MESHTBTTADJUSTMENT.indication

6.3.74.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting adjustment of the TBTT.

6.3.74.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHTBTTADJUSTMENT.indication(
PeerMACAddress,
BeaconTiming,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the TBTT Adjustment request was received.
BeaconTiming	A set of Beacon Timing elements	As defined in 9.4.2.104	A set of Beacon Timing elements of the requesting mesh STA.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.74.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a TBTT Adjustment Request frame from the specified peer MAC entity.

6.3.74.4.4 Effect of receipt

The SME is notified of the receipt of the TBTT adjustment request by the specified peer MAC entity. The mesh STA that received this primitive subsequently processes the TBTT scanning and adjustment procedure described in 14.13.4.4.3, and responds with the MLME-MESHTBTTADJUSTMENT.response primitive.

6.3.74.5 MLME-MESHTBTTADJUSTMENT.response

6.3.74.5.1 Function

This primitive is used to send a response to the specified peer MAC entity that requested a TBTT adjustment from the mesh STA that issued this primitive.

6.3.74.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHTBTTADJUSTMENT.response(
PeerMACAddress,
Status Code,
BeaconTiming,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the TBTT Adjustment Response is sent.
Status Code	As defined in frame format	SUCCESS, REFUSED_REASON_ UNSPECIFIED, CANNOT_FIND_ ALTERNATIVE_TBTT	Indicates the result response to the TBTT adjustment request from the peer mesh STA.
BeaconTiming	A set of BeaconTiming elements	As defined in 9.4.2.104	A set of Beacon Timing elements of the mesh STA. Present only when the STA could not find an alternative TBTT.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.74.5.3 When generated

This primitive is generated by the SME of a mesh STA as response to an MLME-MESHTBTTADJUSTMENT.indication primitive.

6.3.74.5.4 Effect of receipt

This primitive initiates the transmission of a TBTT Adjustment Response frame to the peer MAC entity that requested the TBTT adjustment.

On receipt of this primitive, the MLME constructs a TBTT Adjustment Response frame. This frame is then scheduled for transmission.

6.3.75 MCCA management interface

6.3.75.1 Introduction

The following primitives describe how a mesh entity manages its MCCA operation.

6.3.75.2 MLME-ACTIVATEMCCA.request

6.3.75.2.1 Function

This primitive requests that the MAC entity activate MCCA.

6.3.75.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ACTIVATEMCCA.request(
                                    MCCAScanDuration,
                                    MAFLimit,
                                    MCCAAdvertPeriodMax,
                                    MCCAMaxTrackStates,
                                    MCCACWmin,
                                    MCCACWmax,
                                    MCCAAIFSN
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MCCAScanDuration	Integer	0–65 535	Specifies the duration in TUs that the mesh STA shall not initiate or accept MCCA Setup Request frames.
MAFLimit	Integer	0–255	Specifies the maximum MCCA access fraction allowed at the mesh STA. This number is always a multiple of (1/255) of the DTIM Interval.
MCCAAdvertPeriodMax	Integer	0–255	Specifies the maximum interval that a mesh STA with dot11MCCAActivated equal to true waits for an MCCAOP advertisement. It is expressed in number of DTIM intervals.
MCCAMaxTrackStates	Integer	83–dot11MCCATrackStatesCapable	Specifies the total number of MCCAOP reservations that the MAC entity is able to track.
MCCACWmin	Integer	0–15	Specifies the value of the minimum size of the contention window that the MAC entity uses for channel access during an MCCAOP.
MCCACWmax	Integer	0–63	Specifies the value of the maximum size of the contention that the MAC entity uses for channel access during an MCCAOP.
MCCAAIFSN	Integer	0–15	Specifies the value of the AIFSN that the MAC entity uses for channel access during an MCCAOP.

6.3.75.2.3 When generated

This primitive is generated by the SME to start the use of MCCA.

6.3.75.2.4 Effect of receipt

This primitive sets dot11MCCAActivated to true and initializes the MCCA parameters.

6.3.75.3 MLME-MCCASETUP.request

6.3.75.3.1 Function

This primitive requests that the MAC entity set up an MCCAOP reservation.

6.3.75.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.request(
                                    MCCAOPDuration,
                                    MCCAOPPeriodicity,
                                    MCCAOPOffset,
                                    MCCAOPResponder,
                                    VendorSpecificInfo
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MCCAOPDuration	Integer	0–65 535	Specifies the MCCAOP Duration of the needed MCCAOPs as described in 9.4.2.105.2.
MCCAOPPeriodicity	Integer	0–255	Specifies the MCCAOP Periodicity of the needed MCCAOPs as described in 9.4.2.105.2.
MCCAOPOffset	Integer	0–16 777 215	Specifies the MCCAOP offset of the needed MCCAOPs as described in 9.4.2.105.2.
MCCAOPResponder	MAC address	Any valid individual or group MAC address	Specifies the MAC address of the intended MCCAOP responder.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.3.3 When generated

This primitive is generated by the SME to start an MCCAOP setup procedure.

6.3.75.3.4 Effect of receipt

This primitive causes the transmission of an MCCA Setup Request frame to the MCCAOP responder provided that the conditions for the transmission are met. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-MCCASETUP.confirm primitive that reflects the results.

6.3.75.4 MLME-MCCASETUP.confirm

6.3.75.4.1 Function

This primitive is generated by the MLME to report the result of an MLME-MCCASETUP.request primitive, which was issued in order to establish an MCCAOP reservation with the peer MAC entity specified in MCCAOPResponder.

6.3.75.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.confirm(
                        MCCAOPParameters,
                        MCCAOPID,
                        MCCAOPResponder,
                        ResultCode,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
MCCAOPParameters	MCCAOP Reservation	See 9.4.2.105.2	The MCCAOP reservation parameters.
MCCAOPID	Integer	0–254	MCCAOP reservation ID of the MCCAOP reservation.
MCCAOPResponder	MAC address	Any valid individual or group MAC address	Specifies the MAC address of the intended MCCAOP responder.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, MCCAOP_RESERVATION_CONFLICT, MAF_LIMIT_EXCEEDED, MCCA_TRACK_LIMIT_EXCEEDED	Indicates the result of the MLME-MCCASETUP.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.4.3 When generated

This primitive is generated by the MLME as a result of an MLME-MCCASETUP.request primitive to establish an MCCAOP reservation with the peer mesh STA identified in MCCAOPResponder or upon receipt of an MCCA Setup Reply frame from the peer mesh STA identified in MCCAOPResponder.

6.3.75.4.4 Effect of receipt

The SME is notified of the results of the MCCAOP setup procedure.

6.3.75.5 MLME-MCCASETUP.indication

6.3.75.5.1 Function

This primitive indicates the receipt of an MCCA Setup Request frame from the peer MAC entity specified in MCCAOPOwner.

6.3.75.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.indication(
                                MCCAOPParameters,
                                MCCAOPID,
                                MCCAOPOwner,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
MCCAOPParameters	MCCAOP Reservation	See 9.4.2.105.2	The MCCAOP reservation parameters.
MCCAOPID	Integer	0–254	MCCAOP reservation ID of the MCCAOP reservation.
MCCAOPOwner	MAC address	Any valid individual MAC address	Specifies the MAC address of the MCCAOP owner.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.5.3 When generated

This primitive is generated by the MLME as result of the receipt of an MCCA Setup Request frame from the peer MAC entity specified in MCCAOPOwner.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.75.5.4 Effect of receipt

The SME is notified of the request to establish an MCCAOP reservation with the peer MAC entity specified in MCCAOPOwner.

6.3.75.6 MLME-MCCASETUP.response

6.3.75.6.1 Function

This primitive is used to send a response to the peer MAC entity specified in MCCAOPOwner that requested the set up of the MCCAOP reservation.

6.3.75.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.response(
                        MCCAOPParameters,
                        MCCAOPID,
                        MCCAOPOwner,
                        ResultCode,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
MCCAOPParameters	MCCAOP Reservation	See 9.4.2.105.2	The MCCAOP reservation parameters.
MCCAOPID	Integer	0–254	MCCAOP reservation ID of the MCCAOP reservation.
MCCAOPOwner	MAC address	Any valid individual MAC address	Specifies the MAC address of the MCCAOP owner.
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, MCCAOP_RESERVATION_CONFLICT, MAF_LIMIT_EXCEEDED, MCCA_TRACK_LIMIT_EXCEEDED	Indicates the result of the MLME-MCCASETUP.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.6.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MCCASETUP.indication primitive.

6.3.75.6.4 Effect of receipt

This primitive initiates transmission of a response to the peer MAC entity specified in the MCCAOPOwner that requested the set up of an MCCAOP reservation.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.75.7 MLME-MCCAADVERTISEMENT.request

6.3.75.7.1 Function

This primitive requests that the MAC entity request an MCCAOP advertisement from the specified peer MAC entity by sending an MCCA Advertisement Request frame to the peer MAC entity.

6.3.75.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MCCAADVERTISEMENT.request(
PeerMACAddress,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the peer MAC that sends the Advertisement.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.7.3 When generated

This primitive is generated by the SME to request an MCCAOP advertisement from the specified peer MAC entity.

6.3.75.7.4 Effect of receipt

This primitive causes the transmission of an MCCA Advertisement Request frame to the specified peer MAC entity. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-MCCAADVERTISEMENT.confirm primitive that reflects the results.

6.3.75.8 MLME-MCCAADVERTISEMENT.confirm

6.3.75.8.1 Function

This primitive reports the result of an MLME-MCCAADVERTISEMENT.request primitive.

6.3.75.8.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MCCAADVERTISEMENT.confirm(
MCCAOPAdvertisement,
PeerMACAddress,
ResultCode,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MCCAOPAdvertisement	MCCAOP Advertisement	See 9.4.2.108	One or more MCCAOP Advertisement elements.
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the transmitter of the MCCAOP advertisement.
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the result of the MLME-MCCAADVERTISEMENT.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.8.3 When generated

This primitive is generated by the MLME as a result of an MLME-MCCAADVERTISEMENT.request primitive.

6.3.75.8.4 Effect of receipt

The SME is notified of the results of the MCCA Advertisement Request frame.

6.3.75.9 MLME-MCCAADVERTISEMENT.indication

6.3.75.9.1 Function

This primitive reports that an MCCA Advertisement Request frame has been received from the specified peer MAC entity.

6.3.75.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.indication(
                                    PeerMACAddress,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the transmitter of the MCCA Advertisement Request frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.9.3 When generated

This primitive is generated by the MLME upon receipt of an MCCA Advertisement Request frame from the specified peer MAC entity.

6.3.75.9.4 Effect of receipt

The SME is notified of the request to advertise its MCCAOP reservations.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.75.10 MLME-MCCAADVERTISEMENT.response

6.3.75.10.1 Function

This primitive requests that the MAC entity respond to the MCCAOP advertisement request from the specified peer MAC entity by sending an MCCA Advertisement frame to the peer MAC entity.

6.3.75.10.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.response(
                                    MCCAOPAdvertisement,
                                    PeerMACAddress,
                                    ResultCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
MCCAOPAdvertisement	MCCAOP Advertisement	See 9.4.2.108	One or more MCCAOP Advertisement elements.
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the transmitter of the MCCA Advertisement frame.
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the result of the MLME-MCCAADVERTISEMENT.response primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.10.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MCCAADVERTISEMENT.indication procedure.

6.3.75.10.4 Effect of receipt

This primitive initiates transmission of a response to the specified peer MAC entity that requested advertisement of the MCCAOP reservations.

6.3.75.11 MLME-MCCATEARDOWN.request

6.3.75.11.1 Function

This primitive requests that the MAC entity tear down an MCCAOP reservation.

6.3.75.11.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCATEARDOWN.request(
                                MCCAOPID,
                                PeerMACAddress,
                                VendorSpecificInfo
                                )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MCCAOPID	Integer	0–255	Specifies the MCCAOP reservation ID of the MCCAOP reservation to be torn down.
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the peer MAC for the MCCAOP reservation.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.11.3 When generated

This primitive is generated by the SME to start an MCCAOP teardown procedure.

6.3.75.11.4 Effect of receipt

This primitive causes the teardown MCCAOP reservation identified by means of the MCCAOP reservation ID in MCCAOPID, and the transmission of an MCCA Teardown frame to the peer MAC entity in PeerMACAddress.

6.3.75.12 MLME-MCCATEARDOWN.indication

6.3.75.12.1 Function

This primitive reports that an MCCA Teardown frame has been received from the specified peer MAC entity.

6.3.75.12.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCATEARDOWN.indication(
                                    MCCAOPID,
                                    PeerMACAddress,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
MCCAOPID	Integer	0–255	MCCAOP reservation ID of the MCCAOP reservation to be torn down.
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the peer MAC for the MCCAOP reservation.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.75.12.3 When generated

This primitive is generated by the MLME as result of receipt of an MCCA Teardown frame.

6.3.75.12.4 Effect of receipt

The SME is notified of the request to start an MCCAOP teardown procedure.

6.3.76 MBSS congestion control

6.3.76.1 Introduction

The following primitives describe how a mesh STA manages its congestion control operation.

6.3.76.2 MLME-MBSSCONGESTIONCONTROL.request

6.3.76.2.1 Function

This primitive requests that the MAC entity notify the peer MAC entity on the congestion level or requests to traffic generation by transmitting a Congestion Control Notification frame to the specified peer MAC entity.

6.3.76.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSCONGESTIONCONTROL.request(
                    PeerMACAddress,
                    CongestionNotification,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the Congestion Control Notification frame is sent.
CongestionNotification	A set of Congestion Notification elements	As defined in 9.4.2.100	Congestion notification information generated by the mesh STA.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.76.2.3 When generated

The SME generates this primitive to request that the MAC notify its peer MAC about the current congestion level.

6.3.76.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Congestion Control Notification frame. This frame is then scheduled for transmission.

6.3.76.3 MLME-MBSSCONGESTIONCONTROL.indication

6.3.76.3.1 Function

This primitive indicates that a congestion notification has been received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.76.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME- MBSSCONGESTIONCONTROL.indication(
PeerMACAddress,
CongestionNotification,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the Congestion Control Notification frame was received.
CongestionNotification	A set of Congestion Notification elements	As defined in 9.4.2.100	Congestion notification information contained in the received Congestion Control Notification frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.76.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Congestion Control Notification frame from a specific peer MAC entity.

6.3.76.3.4 Effect of receipt

The SME is notified of the results of the receipt of the congestion control notification from the specified peer MAC entity. The mesh STA that received this primitive subsequently activates the local rate control as described in 14.12.

6.3.77 MBSS proxy update

6.3.77.1 Introduction

The following primitives describe how a mesh STA reports the proxy update information to another mesh STA in the MBSS.

6.3.77.2 MLME-MBSSPROXYUPDATE.request

6.3.77.2.1 Function

This primitive requests that the MAC entity inform a destination mesh STA about its proxy information by transmitting a Proxy Update frame to the specified peer MAC entity.

6.3.77.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME- MBSSPROXYUPDATE.request(
PeerMACAddress,
ProxyUpdate,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the Proxy Update frame is sent.
ProxyUpdate	A set of PXU elements	As defined in 9.4.2.115	A set of proxy information available at the mesh STA.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.77.2.3 When generated

This primitive is generated by the SME to request that a Proxy Update frame be sent to the specified peer MAC entity.

6.3.77.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Proxy Update frame containing the PXU element. This frame is then scheduled for transmission. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME- MBSSPROXYUPDATE.confirm primitive that reflects the results of this request.

6.3.77.3 MLME-MBSSPROXYUPDATE.confirm

6.3.77.3.1 Function

This primitive reports the results of a proxy update request.

6.3.77.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSPROXYUPDATE.confirm(
                        PeerMACAddress,
                        ProxyUpdateConfirmation,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the Proxy Update Confirmation frame is received.
ProxyUpdateConfirmation	A set of PXUC elements	As defined in 9.4.2.116	A set of proxy update confirmation information from the peer MAC entity to which the Proxy Update frame was sent.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.77.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MBSSPROXYUPDATE.request primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.77.3.4 Effect of receipt

The SME is notified of the results of the MBSS proxy update request.

6.3.77.4 MLME-MBSSPROXYUPDATE.indication

6.3.77.4.1 Function

This primitive indicates that an update of the proxy information has been received from a specific peer MAC entity.

6.3.77.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSPROXYUPDATE.indication(
                    PeerMACAddress,
                    ProxyUpdate,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the update of the proxy information was received.
ProxyUpdate	A set of PXU elements	As defined in 9.4.2.115	A set of proxy information received from the peer mesh STA.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.77.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Proxy Update frame from a specific peer MAC entity.

6.3.77.4.4 Effect of receipt

The SME is notified of the results of the receipt of the proxy update request by the specified peer MAC entity. The mesh STA that received this primitive subsequently updates the proxy information as described in 14.11.4.3.

6.3.77.5 MLME-MBSSPROXYUPDATE.response

6.3.77.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that sent an update of the proxy information to the mesh STA that issued this primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.77.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME- MBSSPROXYUPDATE.response(
PeerMACAddress,
ProxyUpdateConfirmation,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the Proxy Update Confirmation frame is sent.
ProxyUpdateConfirmation	A set of PXUC elements	As defined in 9.4.2.116	A set of proxy update confirmation information to be sent to the peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.77.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MBSSPROXYUPDATE.indication primitive.

6.3.77.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that sent an update of the proxy information.

On receipt of this primitive, the MLME constructs a Proxy Update Confirmation frame. The frame contains one or more PXUC elements. This frame is then scheduled for transmission.

6.3.78 MBSS mesh gate announcement

6.3.78.1 Introduction

The following primitives describe how a mesh STA announces mesh gate reachability.

6.3.78.2 MLME-MBSSGATEANNOUNCEMENT.request

6.3.78.2.1 Function

This primitive requests that the MAC entity update the mesh gate information by transmitting a Gate Announcement frame to the specified MAC entity.

6.3.78.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME- MBSSGATEANNOUNCEMENT.request(
PeerMACAddress,
GateAnnouncement,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid group MAC address	Specifies the address of the MAC entity to which the Gate announcement frame is sent.
GateAnnouncement	GANN element	As defined in 9.4.2.110	A set of gate announcement information to be sent through a Gate Announcement frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.78.2.3 When generated

This primitive is generated by the SME to request that a Gate Announcement frame be sent to the specified MAC entity.

6.3.78.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Gate Announcement frame containing the GANN element. This frame is then scheduled for transmission following the interval specified by dot11MeshGateAnnouncementInterval.

6.3.78.3 MLME-MBSSGATEANNOUNCEMENT.indication

6.3.78.3.1 Function

This primitive indicates that a mesh gate announcement has been received from the specific peer MAC entity.

6.3.78.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSGATEANNOUNCEMENT.indication(
                    PeerMACAddress,
                    GateAnnouncement,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the gate announcement was received.
GateAnnouncement	GANN element	As defined in 9.4.2.110	A set of gate announcement information contained in the received Gate Announcement frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.78.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Gate Announcement frame from a specific peer MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.78.3.4 Effect of receipt

The SME is notified of the reachability to a mesh gate in the mesh BSS. The mesh STA received this primitive subsequently triggers an MBSSGATEANNOUNCEMENT.request primitive as described in 14.11.2.

6.3.79 Mesh link metric

6.3.79.1 Introduction

Subclause 6.3.79 describes the management procedures associated with mesh link metric reporting.

6.3.79.2 MLME-MESHLINKMETRICREAD.request

6.3.79.2.1 Function

This primitive requests to read a link metric value between the local MAC entity and a specific peer MAC entity.

6.3.79.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHLINKMETRICREAD.request(
                                PeerMACAddress
                                )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity for which the link metric value is read.

6.3.79.2.3 When generated

This primitive is generated by the SME to read the link metric value for the mesh link to the specified peer MAC entity.

6.3.79.2.4 Effect of receipt

On receipt of this primitive, the MLME reports the link metric value. The MLME subsequently issues an MLME-MESHLINKMETRICREAD.confirm primitive that reflects the results of this request.

6.3.79.3 MLME-MESHLINKMETRICREAD.confirm

6.3.79.3.1 Function

This primitive reports the results of a link metric read request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.79.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME- MESHLINKMETRICREAD.confirm(
LinkMetricValue,
VendorSpecificInfo
)

Name	Type	Valid range	Description
LinkMetricValue	Mesh Link Metric Report element	As defined in 9.4.2.99	The link metric value for the mesh link to the specified peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.79.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHLINKMETRICREAD.request primitive to request a link metric value.

6.3.79.3.4 Effect of receipt

The SME is notified of the results of the link metric read request.

6.3.79.4 MLME-MESHLINKMETRICREPORT.request

6.3.79.4.1 Function

This primitive requests that the MAC entity either transmit a link metric to or request a link metric from the specified peer MAC entity.

6.3.79.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHLINKMETRICREPORT.request(
PeerMACAddress,
LinkMetricRequestFlag,
MeshLinkMetricReport,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the Mesh Link Metric Report is sent.
LinkMetricRequestFlag	Enumeration	REPORT_ONLY, REPORT_AND_REQUEST	Indicates whether the mesh STA requests a link metric report from the peer MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
MeshLinkMetricReport	Mesh Link Metric Report element	As defined in 9.4.2.99	A metric value computed for the corresponding link.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.79.4.3 When generated

This primitive is generated by the SME to request that a Mesh Link Metric Report frame be sent to a peer MAC entity in order to report a link metric value and to request a mesh link metric report from the peer MAC entity if LinkMetricRequestFlag is equal to REPORT_AND_REQUEST.

6.3.79.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Mesh Link Metric Report frame.The Request subfield in the Flags field of the Mesh Link Metric Report element is set depending on the parameter given by the LinkMetricRequestFlag. If LinkMetricRequestFlag is equal to REPORT_ONLY, the Request subfield is set to 0. If LinkMetricRequestFlag is equal to REPORT_AND_REQUEST, the Request subfield is set to 1. This frame is then scheduled for transmission.

6.3.79.5 MLME-MESHLINKMETRICREPORT.indication

6.3.79.5.1 Function

This primitive indicates that a Mesh Link Metric Report frame has been received from a peer MAC entity. This Mesh Link Metric Request Report can be in response to an earlier MLME-MESHLINKMETRICREPORT.request primitive with LinkMetricRequestFlag equal to REPORT_AND_REQUEST.

6.3.79.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MESHLINKMETRICREPORT.indication(
                    PeerMACAddress,
                    LinkMetricRequestFlag,
                    MeshLinkMetricReport,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the Mesh Link Metric Report frame was received.
LinkMetricRequestFlag	Enumeration	REPORT_ONLY, REPORT_AND_ REQUEST	Indicates whether the peer MAC entity requests a link metric report.
MeshLinkMetricReport	Mesh Link Metric Report element	As defined in 9.4.2.99	A metric value reported from the specified peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.79.5.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Mesh Link Metric Report frame from a specific peer MAC entity.

6.3.79.5.4 Effect of receipt

The SME is notified of the receipt of the link metric report from the specified peer MAC entity. When LinkMetricRequestFlag is equal to REPORT_AND_REQUEST, the mesh STA responds with a Mesh Link Metric Report frame.

6.3.80 HWMP mesh path selection

6.3.80.1 Introduction

The following primitives describe how a mesh STA establishes and maintains a mesh path to a specified peer MAC entity.

6.3.80.2 MLME-HWMPMESHPATHSELECTION.request

6.3.80.2.1 Function

This primitive requests that the MAC entity establish or maintain a mesh path to the specified peer MAC entity by transmitting an HWMP Mesh Path Selection frame to the specified peer MAC entity.

6.3.80.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-HWMPMESHPATHSELECTION.request(
PeerMACAddress,
RootAnnouncement,
PathRequest,
PathReply,
PathError,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual or group MAC address	Specifies the address of the peer MAC entity to which the HWMP Mesh Path Selection frame is sent.
RootAnnouncement	RANN element	As defined in 9.4.2.111	A set of RANN elements generated by the mesh STA. Present if the mesh STA is configured as a root mesh STA using the proactive RANN mechanism [dot11MeshHWMProotMode = rann (4)], and as described in 14.10.12; otherwise not present.
PathRequest	PREQ element	As defined in 9.4.2.112	A set of PREQ elements generated by the mesh STA. Present as described in 14.10.9.
PathReply	PREP element	As defined in 9.4.2.113	A set of PREP elements generated by the mesh STA. Present as described in 14.10.10.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PathError	PERR element	As defined in 9.4.2.114	A set of PERR elements generated by the mesh STA. Present as described in 14.10.11.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.80.2.3 When generated

This primitive is generated by the SME to request that an HWMP Mesh Path Selection frame be sent to a specified peer entity.

6.3.80.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an HWMP Mesh Path Selection frame. This frame is then scheduled for transmission.

6.3.80.3 MLME-HWMPMESHPATHSELECTION.indication

6.3.80.3.1 Function

This primitive indicates that an HWMP Mesh Path Selection frame has been received from the specified peer MAC entity.

6.3.80.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HWMPMESHPATHSELECTION.indication(
                                    PeerMACAddress,
                                    RootAnnouncement,
                                    PathRequest,
                                    PathReply,
                                    PathError,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the HWMP Mesh Path Selection frame was received.
RootAnnouncement	RANN element	As defined in 9.4.2.111	A set of RANN elements contained in the received frame. Present only when such an element was present in the received frame.
PathRequest	PREQ element	As defined in 9.4.2.112	A set of PREQ elements contained in the received frame. Present only when such an element was present in the received frame.
PathReply	PREP element	As defined in 9.4.2.113	A set of PREP elements contained in the received frame. Present only when such an element was present in the received frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PathError	PERR element	As defined in 9.4.2.114	A set of PERR elements contained in the received frame. Present only when such an element was present in the received frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.80.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of an HWMP Mesh Path Selection frame from a specific peer MAC entity.

6.3.80.3.4 Effect of receipt

The SME is notified of the results of the receipt of the HWMP Mesh Path Selection from the specified peer MAC entity. The mesh STA received this primitive subsequently activates path selection procedures described in 14.10.

6.3.81 QMF policy

6.3.81.1 Introduction

The following MLME primitives support the signaling of QMF policy.

6.3.81.2 MLME-QMFPOLICY.request

6.3.81.2.1 Function

This primitive requests the transmission of an unsolicited QMF Policy frame to a peer entity.

6.3.81.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMFPOLICY.request (
                        Peer STA Address,
                        QMFPolicy,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
Peer STA Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the QMF policy is sent.
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	This parameter describes the QMF policy the peer STA is required to use.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.81.2.3 When generated

This primitive is generated by the SME to request that a QMF Policy frame be sent to a peer entity to communicate QMF policy information.

6.3.81.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QMF Policy frame. This frame is then scheduled for transmission.

6.3.81.3 MLME-QMFPOLICY.indication

6.3.81.3.1 Function

This primitive indicates that an unsolicited QMF Policy frame has been received from a peer entity.

6.3.81.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMFPOLICY.indication (
                                    Peer STA Address,
                                    QMFPolicy,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
Peer STA Address	MAC address	Any valid individual MAC address	The address of the peer MAC from which the QMF policy was received.
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	This parameter describes the QMF policy the peer STA is requiring to be used.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.81.3.3 When generated

This primitive is generated by the MLME when a QMF Policy frame with dialog token equal to 0 is received from a peer entity.

6.3.81.3.4 Effect of receipt

The SME is notified of the receipt of a QMF policy.

6.3.81.4 MLME-QMFPOLICYCHANGE.request

6.3.81.4.1 Function

This primitive supports the change of QMF Policy between peer STAs. The SME requests the transmission of a QMF Policy Change frame in order to request a change in the QMF policy the STA uses to transmit to the peer STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.81.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QMFPOLICYCHANGE.request (
Peer STA Address,
Dialog Token,
QMFPolicy,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer STA Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the QMF policy change request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the QMF policy change transaction.
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	This parameters describes the QMF policy the STA is requesting to use.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.81.4.3 When generated

This primitive is generated by the SME when a STA wishes to request a change of the QMF policy it uses to transmit Management frames to a peer entity.

6.3.81.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QMF Policy Change frame containing the set of QMF policy parameters. This frame is then scheduled for transmission.

6.3.81.5 MLME-QMFPOLICYCHANGE.confirm

6.3.81.5.1 Function

This primitive reports the results of a policy change attempt with a peer QMF STA.

6.3.81.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QMFPOLICYCHANGE.confirm (
Peer STA Address,
Dialog Token,
Result Code,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer STA Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the QMF policy was received.
Dialog Token	Integer	1–255	The dialog token to identify the QMF policy change transaction.
Result Code	Enumeration	SUCCESS, REJECT	Reports the receipt of a QMF Policy frame and the result of the QMF policy change at the peer SME or if no matching response is received within dot11QMFPolicyChangeTimeout TU.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.81.5.3 When generated

This primitive is generated by the MLME as a result of receipt of a QMF Policy frame with a dialog token that matches the dialog token from the MLME-QMFPOLICYCHANGE.request primitive.

6.3.81.5.4 Effect of receipt

The SME is notified of the results of the QMF policy change procedure.

6.3.81.6 MLME-QMFPOLICYCHANGE.indication

6.3.81.6.1 Function

This primitive indicates that a QMF Policy Change frame has been received from a peer entity.

6.3.81.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMFPOLICYCHANGE.indication (
                                    Peer STA Address,
                                    Dialog Token,
                                    QMFPolicy,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
Peer STA Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the QMF policy change request was received.
Dialog Token	Integer	1–255	The dialog token to identify the QMF policy change transaction.
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	This parameter describes the QMF policy the peer STA is requesting to use.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.81.6.3 When generated

This primitive is generated by the MLME when a QMF Policy Change frame is received from a peer entity.

6.3.81.6.4 Effect of receipt

On receipt of this primitive, the parameters of the QMF Policy Change frame are provided to the SME to be processed.

6.3.81.7 MLME-QMFPOLICYCHANGE.response

6.3.81.7.1 Function

This primitive requests the transmission of a QMF Policy frame with no QMF Policy field to a peer entity, in response to a QMF Policy Change frame.

6.3.81.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QMFPOLICYCHANGE.response (
Peer STA Address,
Dialog Token,
Result Code,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer STA Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the QMF Policy frame is sent in response to a QMF policy change request.
Dialog Token	Integer	1–255	The dialog token identifying the QMF policy change transaction.
Result Code	Enumeration	SUCCESS, REJECT	Reports the outcome of the transaction.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.81.7.3 When generated

This primitive is generated by the SME to request that a QMF Policy frame be transmitted to a peer entity to convey the results of the QMF policy change procedure.

6.3.81.7.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QMF Policy frame containing the set of QMF Policy elements specified. This frame is then scheduled for transmission.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.81.8 MLME-QMFPOLICYSET.request

6.3.81.8.1 Function

This primitive directs the setting of a specific QMF policy in the local MLM.

6.3.81.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMFPOLICYSET.request (
                                    Peer STA address,
                                    QMFPolicy
                                    )
```

Name	Type	Valid range	Description
Peer STA Address	MAC address	Any valid individual MAC address	The address of the peer STA for which the QMF policy is to be used. If this parameter is null, the QMF policy applies to all transmissions.
QMFPolicy	QMF Policy element	As defined in 9.4.2.119	This parameter describes the QMF policy the MLME is directed to use for all QMFs transmitted to the Peer STA Address.

6.3.81.8.3 When generated

This primitive is generated by the SME to set the MLME's QMF policy for a peer STA.

6.3.81.8.4 Effect of receipt

On receipt of this primitive, the MLME uses the supplied set of QMF policy parameters in future transmissions to the peer.

6.3.82 SCS request and response procedure

6.3.82.1 General

The following MLME primitives support the signaling of the SCS request and response procedure. The diagram in Figure 6-27 shows the SCS request and response process.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

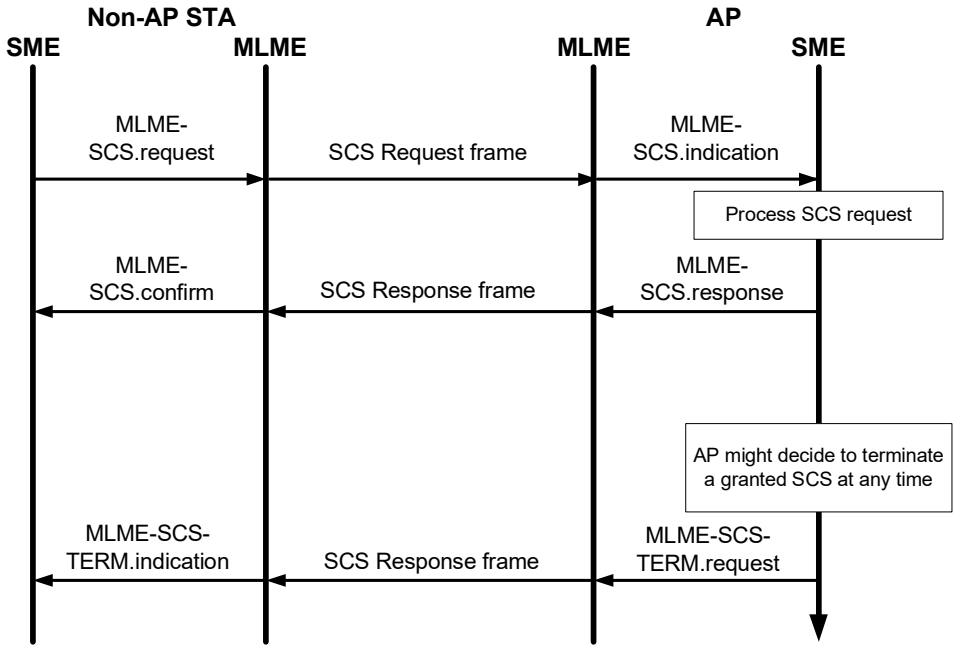

Figure 6-27—Example SCS setup and termination protocol exchange

6.3.82.2 MLME-SCS.request

6.3.82.2.1 Function

This primitive requests transmission of an SCS Request frame to an AP.

6.3.82.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCS.request(
                    PeerSTAAddress,
                    DialogToken,
                    SCSRequest,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the SCS process.
DialogToken	Integer	1–255	The dialog token to identify the SCS request and response transaction.
SCSRequest	SCS Descriptor element	SCS Descriptor element, as defined in 9.4.2.121	Specifies frame classifiers and priority for the requested SCS stream.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.82.2.3 When generated

This primitive is generated by the SME to request that a SCS Request frame be sent to the AP with which the STA is associated.

6.3.82.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SCS Request frame. The STA then attempts to transmit this frame to the AP with which the STA is associated.

6.3.82.3 MLME-SCS.confirm

6.3.82.3.1 Function

This primitive reports the result of a SCS procedure.

6.3.82.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCS.confirm(
                    PeerSTAAddress,
                    DialogToken,
                    SCSID,
                    Status,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the SCS process.
DialogToken	Integer	1–255	The dialog token to identify the SCS request and response transaction.
SCSID	Integer	1–255	Identifies the SCS stream that is being classified.
Status	Enumeration	See Table 9-50	Indicates the result response of the requested SCSID. See Table 9-50.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.82.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-SCS.request primitive and indicates the results of the request.

This primitive is generated when the STA receives a SCS Response frame from the AP.

6.3.82.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.25.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.82.4 MLME-SCS.indication

6.3.82.4.1 Function

This primitive indicates that an SCS Request frame was received from a non-AP STA.

6.3.82.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCS.indication(
                    PeerSTAAddress,
                    DialogToken,
                    SCSRequest,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which an SCS Request frame was received.
DialogToken	Integer	1–255	The dialog token to identify the SCS request and response transaction.
SCSRequest	SCS Descriptor element	SCS Descriptor element, as defined in 9.4.2.121	Specifies frame classifiers and priority for the requested SCS stream.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.82.4.3 When generated

This primitive is generated by the MLME when an SCS Request frame is received.

6.3.82.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.25.2.

6.3.82.5 MLME-SCS.response

6.3.82.5.1 Function

This primitive is generated in response to an MLME-SCS.indication primitive requesting an SCS Response frame be sent to a non-AP STA.

6.3.82.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCS.response(
                  PeerSTAAddress,
                  DialogToken,
                  SCSID,
                  Status,
                  VendorSpecificInfo
                  )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a SCS Request frame was received.
DialogToken	Integer	1–255	The dialog token to identify the SCS request and response transaction.
SCSID	Integer	1–255	Identifies the SCS stream that is being classified.
Status	Enumeration	See Table 9-50	Indicates the result response of the requested SCSID. See Table 9-50.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.82.5.3 When generated

This primitive is generated by the SME in response to an MLME-SCS.indication primitive requesting an SCS Response frame be sent to a non-AP STA.

6.3.82.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SCS Response frame. The STA then attempts to transmit this frame to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.82.6 MLME-SCS-TERM.request

6.3.82.6.1 Function

This primitive requests the transmission of a SCS Response frame to a non-AP STA to terminate an established SCS stream.

6.3.82.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCS-TERM.request(
                        PeerSTAAddress,
                        DialogToken,
                        SCSID,
                        Status,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity to which the SCS Response frame is to be sent.
DialogToken	Integer	0	Set to 0 for an autonomous SCS Response frame.
SCSID	Integer	1–255	Identifies the SCS stream that is being classified.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Status	Enumeration	See Table 9-50	Indicates the result response of the requested SCSID. See Table 9-50.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.82.6.3 When generated

This primitive is generated by the SME to terminate an SCS stream.

6.3.82.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs an SCS Response frame. The STA then attempts to transmit this frame to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.82.7 MLME-SCS-TERM.indication

6.3.82.7.1 Function

This primitive is generated by the MLME when an unsolicited SCS Response frame is received.

6.3.82.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCS-TERM.indication(
ResultCode,
DialogToken,
SCSID,
Status,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the MLME-SCS-TERM.request primitive.
DialogToken	Integer	0	Set to 0 for an autonomous SCS Response frame.
SCSID	Integer	1–255	Identifies the SCS stream that is being classified.
Status	Enumeration	See Table 9-50	Indicates the result response of the requested SCSID. See Table 9-50.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.82.7.3 When generated

This primitive is generated when the STA receives an unsolicited SCS Response frame from the AP.

6.3.82.7.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.25.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.83 QLoad report management

6.3.83.1 General

The QLoad report management primitives support the process of QLoad reporting between APs as described in 11.26.2.

6.3.83.2 MLME-QLOAD.request

6.3.83.2.1 Function

This primitive is used by an AP to transmit a QLoad Request frame to a specified AP.

6.3.83.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QLOAD.request(
                    PeerMACAddress,
                    DialogToken,
                    Protected,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the QLoad Request frame is sent.
DialogToken	Integer	1–255	Specifies a number unique to the MLME-QLOAD.request primitive.
Protected	Boolean	true, false	If true, the request is sent using the Protected QLoad Request frame. If false, the request is sent using the QLoad Request frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.83.2.3 When generated

This primitive is generated by the SME at an AP to request the transmission of a QLoad Request frame to the AP indicated by the PeerMACAddress parameter.

6.3.83.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QLoad Request frame if the Protected parameter is false or a Protected QLoad Request frame if the Protected parameter is true. The AP then attempts to transmit this frame to the AP indicated by the PeerMACAddress parameter.

6.3.83.3 MLME-QLOAD.confirm

6.3.83.3.1 Function

This primitive reports the result of a request to send a QLoad Request frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.83.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QLOAD.confirm(
PeerMACAddress,
DialogToken,
Protected,
QLoadReport,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the QLoad Request frame was sent.
DialogToken	Integer	0–255	Specifies a number unique to the QLoad Report request and response transaction or 0 when an unsolicited report was sent.
Protected	Boolean	true, false	If true, the response was sent using the Protected QLoad Report frame. If false, the response was sent using the QLoad Report frame.
QLoadReport	Set of QLoad Report elements	Set of reports, each as defined in the QLoad Report element	Set of reports, each as defined in the QLoad Report element.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.83.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-QLOAD.request primitive indicating the results of that request. This primitive is generated when the STA receives a response in the form of a QLoad Report frame in the corresponding Robust AV Streaming Action frame.

6.3.83.3.4 Effect of receipt

The SME is notified of the results of the QLoad request procedure.

The SME should operate according to the procedures defined in 11.26.2.

6.3.83.4 MLME-QLOAD.indication

6.3.83.4.1 Function

This primitive indicates that a QLoad Request frame has been received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.83.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QLOAD.indication(
PeerMACAddress,
DialogToken,
Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the QLoad Request frame was received.
DialogToken	Integer	1–255	Specifies a number unique to the MLME-QLOAD.request primitive.
Protected	Boolean	true, false	If true, the request was sent using the Protected QLoad Request frame. If false, the request was sent using the QLoad Request frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.83.4.3 When generated

This primitive is generated by the MLME when a (Protected) QLoad Request frame is received.

6.3.83.4.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the transaction as described in 11.26.2.

6.3.83.5 MLME-QLOAD.response

6.3.83.5.1 Function

This primitive is used by an AP to transmit a QLoad Report frame to a specified AP in response to a QLoad Request frame.

6.3.83.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QLOAD.response(
PeerMACAddress,
DialogToken,
Protected,
QLoadReport,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the QLoad Report frame is sent.
DialogToken	Integer	0–255	The dialog token of the matching MLME-QLOAD.indication primitive or 0 when sending an unsolicited report.
Protected	Boolean	true, false	If true, the response is sent using the Protected QLoad Report frame. If false, the response is sent using the QLoad Report frame.
QLoadReport	Set of QLoad Report elements	Set of reports, each as defined in the QLoad Report element	Set of reports, each as defined in the QLoad Report element.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.83.5.3 When generated

This primitive is generated by the SME at an AP in response to a QLoad Request frame from the AP indicated by the PeerMACAddress parameter.

6.3.83.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QLoad Report frame if the Protected parameter is false or a Protected QLoad Report frame if the Protected parameter is true. The AP then attempts to transmit this frame to the other AP indicated by the PeerMACAddress parameter.

6.3.84 HCCA TXOP advertisement management

6.3.84.1 General

The TXOP advertisement management primitives support the process of TSPEC schedule negotiation between APs, as described in 11.26.

6.3.84.2 MLME-TXOPADVERTISEMENT.request

6.3.84.2.1 Function

This primitive is used by an AP to transmit an HCCA TXOP advertisement to a specified AP.

6.3.84.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TXOPADVERTISEMENT.request(
                                        PeerMACAddress,
                                        DialogToken,
                                        Protected,
                                        ActiveTXOPReservations,
                                        PendingTXOPReservations,
                                        VendorSpecificInfo
                                        )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the TXOP Advertisement frame is sent.
DialogToken	Integer	0–255	Specifies a number unique to the TXOPAdvertisement.request primitive.
Protected	Boolean	true, false	If true, the request is sent using the Protected HCCA TXOP Advertisement frame. If false, the request is sent using the HCCA TXOP Advertisement frame.
ActiveTXOPReservations	TXOP Reservation	As defined in 9.4.1.43	Specifies the HCCA TXOPs that have been created.
PendingTXOPReservations	TXOP Reservation	As defined in 9.4.1.43	Specifies the HCCA TXOPs that are in the process of being created.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.84.2.3 When generated

This primitive is generated by the SME at an AP to request a (Protected) HCCA TXOP Advertisement frame be sent to the AP indicated by the PeerMACAddress parameter.

6.3.84.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an HCCA TXOP Advertisement frame if the Protected parameter is false or constructs a Protected HCCA TXOP Advertisement frame if the Protected parameter is true. This frame is then scheduled for transmission.

6.3.84.3 MLME-TXOPADVERTISEMENT.confirm

6.3.84.3.1 Function

This primitive reports the result of a request to perform HCCA TXOP negotiation.

6.3.84.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TXOPADVERTISEMENT.confirm(
                                    ResultCode,
                                    PeerMACAddress,
                                    DialogToken,
                                    Protected,
                                    AlternateSchedule,
                                    AvoidanceRequest,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, TS_SCHEDULE_ CONFLICT	Reports the outcome of a request to send a TXOP advertisement. Indicates the results of the corresponding MLME-TXOPADVERTISE.request primitive.
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Scheduled TXOP Response frame was received.
DialogToken	Integer	0–255	The dialog token to identify the scheduled TXOP advertisement and scheduled TXOP response transaction.
Protected	Boolean	true, false	If true, the response was sent using the Protected HCCA TXOP Response frame. If false, the response was sent using the HCCA TXOP Response frame.
AlternateSchedule	TXOP Reservation	As defined in 9.4.1.43	Specifies an alternate TXOP when status code is not SUCCESS.
AvoidanceRequest	TXOP Reservation	As defined in 9.4.1.43	Specifies a TXOP to avoid when status code is not SUCCESS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.84.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TXOPADVERTISEMENT.request primitive indicating the results of that request. This primitive is generated when the STA receives a response in the form of an HCCA TXOP Response frame in the corresponding Public Action frame, or when the STA receives a response in the form of a Protected HCCA TXOP Response frame in the corresponding frame.

6.3.84.3.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 11.26.3.

6.3.84.4 MLME-TXOPADVERTISEMENT.indication

6.3.84.4.1 Function

This primitive indicates that an HCCA TXOP Advertisement frame has been received from a peer entity.

6.3.84.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TXOPADVERTISEMENT.indication(
                                    PeerMACAddress,
                                    DialogToken,
                                    Protected,
                                    ActiveTXOPReservations,
```

PendingTXOPReservations,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the HCCA TXOP Advertisement frame was sent.
DialogToken	Integer	0–255	Specifies a number unique to the MLME-TXOPADVERTISEMENT.request primitive.
Protected	Boolean	true, false	If true, the request was sent using the Protected HCCA TXOP Request frame. If false, the request was sent using the HCCA TXOP Request frame.
ActiveTXOPReservations	TXOP Reservation	As defined in 9.4.1.43	Specifies the HCCA TXOPs that have been created.
PendingTXOPReservations	TXOP Reservation	As defined in 9.4.1.43	Specifies the HCCA TXOPs that are in the process of being created.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.84.4.3 When generated

This primitive is generated by the MLME when an HCCA TXOP Advertisement frame is received.

6.3.84.4.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 11.26.3.

6.3.84.5 MLME-TXOPADVERTISEMENT.response

6.3.84.5.1 Function

This primitive is used by an AP to transmit an HCCA TXOP Response frame to a specified AP.

6.3.84.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TXOPADVERTISEMENT.response(
PeerMACAddress,
DialogToken,
Protected,
StatusCode,
ScheduleConflict,
AlternateSchedule,
AvoidanceRequest,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the HCCA TXOP Response frame is sent.
DialogToken	Integer	0–255	The dialog token to identify the TXOP advertisement and TXOP response transaction.
Protected	Boolean	true, false	If true, the response is sent using the Protected HCCA TXOP Response frame. If false, the response is sent using the HCCA TXOP Response frame.
StatusCode	Enumeration	SUCCESS, TS_SCHEDULE_CONFLICT (as defined in 9.4.1.9)	The result of checking the TXOP reservation from the corresponding TXOP advertisement.
ScheduleConflict	Integer	1–number of TXOP reservations	The TXOP reservation from the HCCA TXOP Advertisement frame that conflicts with an existing or in-progress schedule.
AlternateSchedule	TXOP Reservation	As defined in 9.4.1.43	Specifies an alternate TXOP when status code is not SUCCESS.
AvoidanceRequest	TXOP Reservation	As defined in 9.4.1.43	Specifies a TXOP to avoid when status code is not SUCCESS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.84.5.3 When generated

This primitive is generated by the SME at an AP to request the sending of an HCCA TXOP Response frame to another AP indicated by the PeerMACAddress parameter.

6.3.84.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an HCCA TXOP Response frame if the Protected parameter is false or constructs a Protected HCCA TXOP Response frame if the Protected parameter is true. The AP then attempts to transmit this frame to the AP indicated by the PeerMACAddress parameter.

6.3.85 GCR group membership management

6.3.85.1 General

The group membership primitives support the process of group membership requesting and reporting between an AP and its associated STAs as described in 11.21.16.3.2.

6.3.85.2 MLME-GROUP-MEMBERSHIP.request

6.3.85.2.1 Function

This primitive is used by an AP to initiate a Group Membership Request frame to a specified associated STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.85.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GROUP-MEMBERSHIP.request(
PeerMACAddress,
DialogToken,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Group Membership Request frame is to be sent.
DialogToken	Integer	0–255	Specifies a number unique to the MLME-GROUP-MEMBERSHIP.request primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.85.2.3 When generated

This primitive is generated by the SME at an AP to request the sending of a Group Membership Request frame to the associated STA indicated by the PeerMACAddress parameter.

6.3.85.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Group Membership Request frame. The AP then attempts to transmit this frame to the STA indicated by the PeerMACAddress parameter.

6.3.85.3 MLME-GROUP-MEMBERSHIP.confirm

6.3.85.3.1 Function

This primitive reports the result of a request for a STA’s group membership.

6.3.85.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GROUP-MEMBERSHIP.confirm(
GroupAddress,
VendorSpecificInfo
)

Name	Type	Valid range	Description
GroupAddress	MAC address	Any valid MAC address that has the Individual/Group Address bit set	Zero or more MAC addresses that correspond to the contents of the dot11GroupAddressesTable of the STA that responded to the group address request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.85.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-GROUP-MEMBERSHIP.request primitive indicating the results of that request.

This primitive is generated when the STA receives a response in the form of a Group Membership Response frame in the corresponding robust Action frame from the associated STA.

6.3.85.3.4 Effect of receipt

The SME is notified of the results of the group membership request procedure.

The SME should operate according to the procedures defined in 11.21.16.3.2.

6.3.85.4 MLME-GROUP-MEMBERSHIP.indication

6.3.85.4.1 Function

This primitive indicates that a Group Membership Request frame has been received from a peer entity.

6.3.85.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GROUP-MEMBERSHIP.indication(
                                    PeerMACAddress,
                                    DialogToken,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Group Membership Request frame was sent.
DialogToken	Integer	0–255	Specifies a number unique to the MLME-GROUP-MEMBERSHIP primitive.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.85.4.3 When generated

This primitive is generated by the MLME when a Group Membership Request frame is received.

6.3.85.4.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 11.21.16.3.2.

6.3.85.5 MLME-GROUP-MEMBERSHIP.response

6.3.85.5.1 Function

This primitive responds to the request for the contents of the group address table by a specified STA's MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.85.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GROUP-MEMBERSHIP.response(
PeerMACAddress,
DialogToken,
GroupAddress,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Group Membership Response frame is sent.
DialogToken	Integer	0–255	Specifies a number unique to the MLME-GROUP-MEMBERSHIP primitive.
GroupAddress	MAC address	Any valid MAC address that has the Individual/ Group Address bit set	Zero or more MAC addresses that correspond to the contents of the dot11GroupAddressesTable of the STA that is responding to the group address request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.85.5.3 When generated

This primitive is generated by the SME as a response to an MLME-GROUP-MEMBERSHIP.indication primitive.

6.3.85.5.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 11.21.16.3.2.

6.3.86 AP PeerKey management

6.3.86.1 General

The AP PeerKey management primitives support the AP PeerKey protocol to provide session identification and data confidentiality for an AP-to-AP connection, as described in 12.10.

6.3.86.2 MLME-APPEERKEY.request

6.3.86.2.1 Function

This primitive is used by an AP to transmit a public key to a specified AP and to request the peer's public key.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.86.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-APPEERKEY.request(
PeerMACAddress,
RequestType,
Group,
PublicKey,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Public Key frame is sent.
RequestType	Integer	As defined in Table 9-378	Specifies the type of request.
Group	Finite Cyclic Group field	As defined in 9.4.1.40	Specifies cyclic group from which the public key was generated.
PublicKey	Scalar field	As defined 9.4.1.39	The public key of the AP sending this Public Key frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.86.2.3 When generated

This primitive is generated by the SME at an AP to request the sending of a Public Key frame to another AP indicated by the PeerMACAddress parameter.

6.3.86.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Public Key frame. The AP then attempts to transmit this frame to the AP indicated by the PeerMACAddress parameter.

6.3.86.3 MLME-APPEERKEY.indication

6.3.86.3.1 Function

This primitive indicates that a Public Key frame has been received from a peer entity.

6.3.86.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-APPEERKEY.indication(
PeerMACAddress,
RequestType,
Group,
PublicKey,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Public Key frame has been received.
RequestType	Integer	As defined in Table 9-378	Specifies the type of request.
Group	Finite Cyclic Group field	As defined in 9.4.1.40	Specifies cyclic group from which the public key was generated.
PublicKey	Scalar field	As defined in 9.4.1.39	The public key of the AP that sent this Public Key frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.86.3.3 When generated

This primitive is generated by the MLME when a Public Key frame is received.

6.3.86.3.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 12.10.

6.3.87 On-channel Tunneling operation

6.3.87.1 General

On-channel tunneling (OCT) primitives are used as part of multi-band operation (see 11.31). OCT frames are used to transport Management frames between peer MLME entities of multi-band capable devices.

The operation of the OCT is illustrated in Figure 6-28.

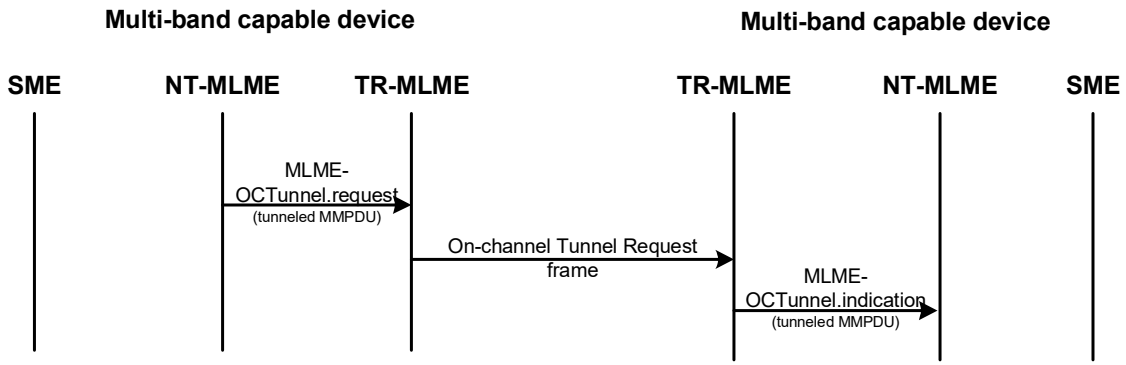

Figure 6-28—Operation of OCT

An initiator MLME of a STA that might not be currently enabled to transmit generates an MLME-OCTunnel.request primitive to a local MLME entity of a STA that is enabled to transmit. This request carries the contents of a Management frame and replaces transmission over the WM of that frame.

The recipient MLME generates the MLME-OCTunnel.indication primitive to the local MLME entity identified in the On-channel Tunnel Request frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The direct MLME-to-MLME primitive exchange should be viewed as shorthand for an exchange through the SMEs and multi-band entity, i.e., an MLME addresses another local MLME entity by sending that primitive through its SME and the multi-band entity to the SME of the MLME entity of a STA that is enabled to transmit, which reflects that primitive to the appropriate recipient.

6.3.87.2 MLME-OCTunnel.request

6.3.87.2.1 Function

This primitive requests transmission of an On-channel Tunnel Request frame.

6.3.87.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-OCTunnel.request(
                        PeerSTAAddress,
                        OCT MMPDU,
                        Multi-band peer,
                        OCT source
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA to which the On-channel Tunnel Request frame is transmitted.
OCT MMPDU	OCT MMPDU Descriptor field	As defined in the On-channel Tunnel Request frame format (see 9.6.20.7)	The OCT MMPDU carries the MMPDU to be tunneled to the specified MLME entity of the specified STA.
Multi-band peer	Multi-band element	As defined in the Multi-band element format (see 9.4.2.138)	The Multi-band element identifies the peer MLME entity that should receive the OCT MMPDU.
OCT source	OCT Source element	As defined in the OCT Source element format (see 9.4.2.245)	The OCT Source element identifies the MLME entity that generated (i.e., is the source) of the OCT MMPDU.

6.3.87.2.3 When generated

This primitive is generated by another MLME to request that an On-channel Tunnel Request frame be sent to another STA.

6.3.87.2.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an On-channel Tunnel Request frame.

6.3.87.3 MLME-OCTunnel.indication

6.3.87.3.1 Function

This primitive indicates that an On-channel Tunnel Request frame was received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.87.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-OCTunnel.indication(
PeerSTAAddress,
OCT MMPDU,
Multi-band local,
OCT source,
Tunneled RXVECTOR
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA from which the On-channel Tunnel Request frame was received.
OCT MMPDU	OCT MMPDU Descriptor field	As defined in the On-channel Tunnel Request frame format (see 9.6.20.7)	The OCT MMPDU carries the MMPDU that is being tunneled to the local MLME entity.
Multi-band local	Multi-band element	As defined in the Multi-band element format (see 9.4.2.138)	The Multi-band element identifies the local MLME entity that should receive the OCT MMPDU.
OCT source	OCT Source element	As defined in the OCT Source element format (see 9.4.2.245)	The OCT Source element identifies the MLME entity that generated (i.e., is the source) of the OCT MMPDU.
Tunneled RXVECTOR	RXVECTOR	As defined by the PHY of the STA	A copy of the RXVECTOR that the PHY passes to the MAC upon reception of the On-channel Tunnel Request frame.

6.3.87.3.3 When generated

This primitive is generated by the MLME to notify another MLME when an On-channel Tunnel Request frame is received.

6.3.87.3.4 Effect on receipt

The recipient of this primitive is an MLME entity in a multi-band device.

On receipt of this primitive, the MLME retrieves the tunneled frame and processes it as though it were received over the WM.

6.3.87.4 MLME-OCTunnel.confirm

6.3.87.4.1 Function

This primitive reports the results of a request to transmit an On-channel Tunnel Request frame.

6.3.87.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-OCTunnel.confirm(
ResultCode
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the OCTunnel.request primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.87.4.3 When generated

This primitive is generated by the MLME as a result of an MLME-OCTunnel.request primitive to transmit an On-channel Tunnel Request frame.

6.3.87.4.4 Effect of receipt

The MLME is notified of the results of the frame transmission.

6.3.88 Multi-band operation

6.3.88.1 General

This subclause describes the management procedures associated with the multi-band operation mechanism.

6.3.88.2 MLME-FST-SETUP.request

6.3.88.2.1 Function

This primitive requests transmission of an FST Setup Request frame.

6.3.88.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-SETUP.request(
                        FSTResponderAddress,
                        FSTSetupRequest
                        )
```

Name	Type	Valid range	Description
FSTResponderAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA to which the FST Setup Request frame is transmitted.
FSTSetupRequest	FST Setup Request Action field	As defined in the FST Setup Request frame format	Specifies the parameters of the FST Setup.

6.3.88.2.3 When generated

This primitive is generated by the SME to request that an FST Setup Request frame be sent to another STA.

6.3.88.2.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Setup Request frame.

6.3.88.3 MLME-FST-SETUP.indication

6.3.88.3.1 Function

This primitive indicates that an FST Setup Request frame was received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.88.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FST-SETUP.indication(
FSTInitiatorAddress,
FSTSetupRequest
)

Name	Type	Valid range	Description
FSTInitiatorAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA from which the FST Setup Request frame was received.
FSTSetupRequest	FST Setup Request Action field	As defined in FST Setup Request frame	Specifies the parameters of the FST Setup.

6.3.88.3.3 When generated

This primitive is generated by the MLME when an FST Setup Request frame is received.

6.3.88.3.4 Effect on receipt

On receipt of this primitive, the SME operates according to the procedure in 11.31.

6.3.88.4 MLME-FST-SETUP.response

6.3.88.4.1 Function

This primitive requests that an FST Setup Response frame be transmitted to the FST initiator STA.

6.3.88.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FST-SETUP.response(
FSTInitiatorAddress,
FSTSetupResponse
)

Name	Type	Valid range	Description
FSTInitiatorAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA to which the FST Setup Response frame is transmitted.
FSTSetupResponse	FST Setup Response Action field	As defined in FST Setup Response frame	Specifies the parameters of the FST Setup.

6.3.88.4.3 When generated

This primitive is generated by the SME to request that an FST Setup Response frame is be transmitted to the FST initiator STA.

6.3.88.4.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Setup Response frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.88.5 MLME-FST-SETUP.confirm

6.3.88.5.1 Function

This primitive indicates that an FST Setup Response frame was received.

6.3.88.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-SETUP.confirm(
                        FSTResponderAddress,
                        FSTSetupResponse
                        )
```

Name	Type	Valid range	Description
FSTResponderAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA from which the FST Setup Response frame was received.
FSTSetupResponse	FST Setup Response Action field	As defined in FST Setup Response frame	Specifies the parameters of the FST Setup.

6.3.88.5.3 When generated

This primitive is generated by the MLME when an FST Setup Response frame is received.

6.3.88.5.4 Effect on receipt

On receipt of this primitive, the SME operates according to the procedure in 11.31.

6.3.88.6 MLME-FST-ACK.request

6.3.88.6.1 Function

This primitive requests transmission of an FST Ack Request frame.

6.3.88.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-ACK.request(
                      FSTResponderAddress,
                      FSTAckRequest
                      )
```

Name	Type	Valid range	Description
FSTResponderAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA to which the FST Ack Request frame is transmitted.
FSTAckRequest	FST Ack Request Action field	As defined in FST Ack Request frame	Specifies the parameters of the FST Ack Request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.88.6.3 When generated

This primitive is generated by the SME to request that an FST Ack Request frame be sent to another STA.

6.3.88.6.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Ack Request frame.

6.3.88.7 MLME-FST-ACK.indication

6.3.88.7.1 Function

This primitive indicates that an FST Ack Request frame was received.

6.3.88.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-ACK.indication(
                        FSTInitiatorAddress,
                        FSTAckRequest
                        )
```

Name	Type	Valid range	Description
FSTInitiatorAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA from which the FST Ack Request frame was received.
FSTAckRequest	FST Ack Request Action field	As defined in FST Ack Request frame	Specifies the parameters of the FST Ack Request.

6.3.88.7.3 When generated

This primitive is generated by the MLME when an FST Ack Request frame is received.

6.3.88.7.4 Effect on receipt

On receipt of this primitive, the MLME operates according to the procedure in 11.31.

6.3.88.8 MLME-FST-ACK.response

6.3.88.8.1 Function

This primitive requests that an FST Ack Response frame be transmitted to the FST initiator STA.

6.3.88.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-ACK.response(
                      FSTInitiatorAddress,
                      FSTAckResponse
                      )
```

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
FSTInitiatorAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA to which the FST Ack Response frame is transmitted.
FSTAckResponse	FST Ack Response Action field	As defined in FST Ack Response frame	Specifies the parameters of the FST Ack Response.

6.3.88.8.3 When generated

This primitive is generated by the SME to request that an FST Ack Response frame be transmitted to the FST initiator STA.

6.3.88.8.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Ack Response frame.

6.3.88.9 MLME-FST-ACK.confirm

6.3.88.9.1 Function

This primitive indicates that an FST Ack Response frame was received.

6.3.88.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-ACK.confirm(
                    FSTResponderAddress,
                    FSTAckResponse
                    )
```

Name	Type	Valid range	Description
FSTResponderAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA from which the FST Ack Response frame was received.
FSTAckResponse	FST Ack Response Action field	As defined in FST Ack Response frame	Specifies the parameters of the FST Ack Response.

6.3.88.9.3 When generated

This primitive is generated by the MLME when an FST Ack Response frame is received.

6.3.88.9.4 Effect on receipt

On receipt of this primitive, the MLME operates according to the procedure in 11.31.

6.3.88.10 MLME-FST-TEARDOWN.request

6.3.88.10.1 Function

This primitive requests that an FST Teardown frame be transmitted to the FST initiator STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.88.10.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-TEARDOWN.request(
                        FSTPeerSTAAddress,
                        FSTTeardown
                        )
```

Name	Type	Valid range	Description
FSTPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA to which the FST Teardown frame is transmitted.
FSTTeardown	FST Teardown Action field	As defined in FST Teardown frame	Specifies the parameters of the FST teardown.

6.3.88.10.3 When generated

This primitive is generated by the SME to request that an FST Teardown frame be transmitted to the FST peer STA.

6.3.88.10.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Teardown frame.

6.3.88.11 MLME-FST-TEARDOWN.indication

6.3.88.11.1 Function

This primitive indicates that an FST Teardown frame was received.

6.3.88.11.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-TEARDOWN.indication(
                        FSTPeerSTAAddress,
                        FSTAckResponse
                        )
```

Name	Type	Valid range	Description
FSTPeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA from which the FST Teardown frame was received.
FSTTeardown	FST Teardown Action field	As defined in FST Teardown frame	Specifies the parameters of the FST teardown.

6.3.88.11.3 When generated

This primitive is generated by the MLME when an FST Teardown frame is received.

6.3.88.11.4 Effect on receipt

On receipt of this primitive, the MLME operates according to the procedure in 11.31.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.88.12 MLME-FST-INCOMING.request

6.3.88.12.1 Function

This primitive announces an incoming FST from another band/channel. This primitive does not result in the transmission of a frame.

6.3.88.12.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-INCOMING.request(
                    FSTInitiatorAddress,
                    FSTResponderAddress,
                    FSTSetupRequest,
                    FSTSetupResponse,
                    FSTIsInitiator
                    )
```

Name	Type	Valid range	Description
FSTInitiatorAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that is the FST initiator.
FSTResponderAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that is the FST responder.
FSTSetupRequest	FST Setup Request Action field	As defined in FST Setup Request frame	Specifies the parameters of the last FST Setup Request frame exchanged between the initiator and responder.
FSTSetupResponse	FST Setup Response Action field	As defined in FST Setup Response frame	Specifies the parameters of the last FST Setup Response frame exchanged between the initiator and responder.
FSTIsInitiator	Boolean	true, false	Indicates the role that the STA performs in the FST. Set to true if the STA performs in the role of initiator STA, and set to false otherwise.

6.3.88.12.3 When generated

This primitive is generated by the SME to announce that an FST session is being transferred from another band/channel.

6.3.88.12.4 Effect on receipt

On receipt of this primitive, the MLME is notified of an incoming FST session. The MLME does not transmit a frame as a result of this primitive.

6.3.89 DMG relay operation

6.3.89.1 General

This subclause describes the management procedures associated with DMG relay.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.89.2 MLME-RELAY-SEARCH.request

6.3.89.2.1 Function

This primitive requests a list of relay DMG STAs (RDSs) in the BSS.

6.3.89.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RELAY-SEARCH.request(
                    DestinationMACAddress
                    )
```

Name	Type	Valid range	Description
DestinationMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow.

6.3.89.2.3 When generated

This primitive is generated by the SME at a non-AP and non-PCP STA to transmit a request to the AP or PCP for a list of RDSs in the BSS.

6.3.89.2.4 Effect on receipt

This primitive initiates a relay search procedure. The MLME subsequently issues an MLME-RELAY-SEARCH.confirm primitive that reflects the results.

6.3.89.3 MLME-RELAY-SEARCH.confirm

6.3.89.3.1 Function

This primitive reports a list of RDSs in the BSS.

6.3.89.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RELAY-SEARCH.confirm(
                    RelayCapableSTAInfo,
                    ResultCode
                    )
```

Name	Type	Valid range	Description
RelayCapableSTAInfo (zero or more)	As defined in frame format	As defined in 9.4.1.44	As described in 9.4.1.44.
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the results of the corresponding MLME-RELAY-SEARCH.request primitive.

6.3.89.3.3 When generated

This primitive is generated when a Relay Search Response frame is received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.89.3.4 Effect on receipt

The SME is notified of the results of the relay search procedure.

6.3.89.4 MLME-RELAY-SEARCH.indication

6.3.89.4.1 Function

This primitive reports to the SME the request for obtaining a list of RDSs in the BSS.

6.3.89.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RELAY-SEARCH.indication(
                                    SourceMACAddress
                                    )
```

Name	Type	Valid range	Description
SourceMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow.

6.3.89.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a request to obtain a list of RDSs in the BSS. The receipt of the request resulted from a relay search procedure that was initiated by the STA indicated by the source MAC address specified in the primitive.

6.3.89.4.4 Effect on receipt

The SME is notified of a request by a specified non-AP and non-PCP STA to obtain a list of RDSs in the BSS.

6.3.89.5 MLME-RELAY-SEARCH.response

6.3.89.5.1 Function

This primitive is used to provide the results of a Relay Search Request.

6.3.89.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RELAY-SEARCH.response(
                                    PeerMACAddress,
                                    RelayCapableSTAInfo,
                                    StatusCode
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the MAC entity to which the Relay Search Response frame was sent.
RelayCapableSTAInfo (zero or more)	As defined in frame format	As defined in 9.4.1.44	As described in 9.4.1.44.
StatusCode	As defined in frame format	As defined in 9.4.1.9	As described in 9.4.1.9.

6.3.89.5.3 When generated

This primitive is generated by the SME to provide the results of a Relay Search Request.

6.3.89.5.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit a Relay Search Response frame.

6.3.89.6 MLME-RLS.request

6.3.89.6.1 Function

This primitive requests the set up of a relay link with a specified peer MAC entity via a specified relay MAC entity.

6.3.89.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS.request(
                    DestinationMACAddress,
                    RelayMACAddress,
                    DestinationCapabilityInformation,
                    RelayCapabilityInformation,
                    RelayTransferParameterSet
                    )
```

Name	Type	Valid range	Description
DestinationMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow.
RelayMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the selected RDS.
DestinationCapabilityInformation	As defined in frame format	As defined in frame format	Indicates the Relay Capability Information field within the Relay Capabilities element of the target destination relay endpoint DMG STA (REDS).
RelayCapabilityInformation	As defined in frame format	As defined in frame format	Indicates the Relay Capability Information field within the Relay Capabilities element of the selected RDS.
RelayTransferParameterSet	As defined in frame format	As defined in frame format	Specifies the parameters for the relay operation.

6.3.89.6.3 When generated

This primitive is generated by the SME at a non-AP and non-PCP STA to set up a relay link with another non-AP and non-PCP STA.

6.3.89.6.4 Effect on receipt

This primitive initiates a relay link setup procedure.

6.3.89.7 MLME-RLS.confirm

6.3.89.7.1 Function

This primitive reports the results of a relay link setup attempt with a specified peer MAC entity.

6.3.89.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS.confirm(
                    PeerMACAddress,
                    RelayMACAddress,
                    ResultCode
                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the non-AP and non-PCP STA from which the frame was received.
RelayMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the selected RDS.
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the results of the corresponding MLME-RLS.request primitive.

6.3.89.7.3 When generated

This primitive is generated when a RLS Response frame is received.

6.3.89.7.4 Effect on receipt

The SME is notified of the results of the relay link setup procedure.

6.3.89.8 MLME-RLS.indication

6.3.89.8.1 Function

This primitive reports the establishment of a relay link with a specified peer MAC entity.

6.3.89.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS.indication(
                    SourceMACAddress,
                    RelayMACAddress,
                    SourceCapabilityInformation,
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

RelayCapabilityInformation,
RelayTransferParameterSet
)

Name	Type	Valid range	Description
SourceMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA that is the intended immediate recipient of the data flow.
RelayMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the selected RDS.
SourceCapabilityInformation	As defined in frame format	As defined in frame format	Specifies the operational capability definitions to be used by the peer MAC entity.
RelayCapabilityInformation	As defined in frame format	As defined in frame format	Indicates the Relay Capability Information field within the Relay Capabilities element of the selected RDS.
RelayTransferParameterSet	As defined in frame format	As defined in frame format	Specifies the parameters for the relay operation.

6.3.89.8.3 When generated

This primitive is generated by the MLME as a result of the establishment of a relay link with a specific peer MAC entity, and that resulted from a relay link setup procedure that was initiated by that specific source MAC entity.

6.3.89.8.4 Effect on receipt

The SME is notified of the establishment of the relay link setup.

6.3.89.9 MLME-RLS.response

6.3.89.9.1 Function

This primitive is used to provide the results of an RLS Request.

6.3.89.9.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RLS.response(
PeerMACAddress,
DestinationStatusCode,
RelayStatusCode
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the peer STA.
DestinationStatusCode	As defined in frame format	As defined in 9.4.1.9	As described in 9.4.1.9.
RelayStatusCode	As defined in frame format	As defined in 9.4.1.9	As described in 9.4.1.9.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.89.9.3 When generated

This primitive is generated by the SME to provide the results of a RLS Request.

6.3.89.9.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an RLS Response frame.

6.3.89.10 MLME-RLS-TEARDOWN.request

6.3.89.10.1 Function

This primitive requests the teardown of the relay link with a specified peer MAC entity.

6.3.89.10.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RLS-TEARDOWN.request(
DestinationMACAddress,
RelayMACAddress,
Reason
)

Name	Type	Valid range	Description
DestinationMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow.
RelayMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the selected RDS.
Reason	Enumeration	REQUESTED	Indicates the reason why the relay link is being torn down.

6.3.89.10.3 When generated

This primitive is generated by the SME for tearing down a relay link with another non-AP and non-PCP STA.

6.3.89.10.4 Effect on receipt

This primitive initiates a relay link teardown procedure. The MLME subsequently issues an MLME-RLS-TEARDOWN.confirm primitive that reflects the results.

6.3.89.11 MLME-RLS-TEARDOWN.indication

6.3.89.11.1 Function

This primitive indicates the teardown of an already established relay link with a specific peer MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.89.11.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RLS-TEARDOWN.indication(
SourceMACAddress,
Reason
)

Name	Type	Valid range	Description
SourceMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow.
Reason	Enumeration	REQUESTED	Indicates the reason why the relay link is being torn down.

6.3.89.11.3 When generated

This primitive is generated by the MLME as result of the teardown of a relay link with a specific peer MAC entity, and that resulted from a relay link teardown procedure that was initiated either by that specific peer MAC entity or by the local MAC entity.

6.3.89.11.4 Effect on receipt

The SME is notified of the relay link teardown.

6.3.90 Quieting adjacent BSS operation

6.3.90.1 General

This subclause describes the management procedure associated with the QAB operation.

The primitives defined are MLME-QAB.request, MLME-QAB.confirm, MLME-QAB.indication, and MLME-QAB.response primitive.

6.3.90.2 MLME-QAB.request

6.3.90.2.1 Function

This primitive requests transmission of a (protected) QAB Request frame.

6.3.90.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QAB.request(
DialogToken,
RequesterAP Address,
ResponderAP Address,
QuietPeriodRequest,
Protected,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DialogToken	Integer	1–255	The dialog token to identify the QAB transaction.
RequesterAP Address	MAC address	Any valid individual MAC address	The address of the MAC entity from which the (protected) QAB Request frame was sent.
ResponderAP Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the (protected) QAB request was sent.
QuietPeriodRequest	A set of information subfields	As described in 9.4.2.149	As described in 9.4.2.149.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected QAB Request frame. If false, the request is sent using the QAB Request frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.90.2.3 When generated

This primitive is generated by the STA management entity (SME) to request that a (Protected) QAB frame be sent by a STA.

6.3.90.2.4 Effect on receipt

On receipt of this primitive, the MLME constructs and transmits a (Protected) QAB Request frame.

6.3.90.3 MLME-QAB.confirm

6.3.90.3.1 Function

This primitive reports the result of a transmission of a QAB Request frame.

6.3.90.3.2 Semantics of the service primitive

The primitive parameters as follows:

```
MLME-QAB.confirm(
                    DialogToken,
                    RequesterAP Address,
                    ResponderAP Address,
                    QuietPeriodResponse,
                    ResultCode,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
DialogToken	Integer	1–255	The dialog token to identify the QAB transaction.
RequesterAP Address	MAC address	Any valid individual MAC address	The address of the MAC entity to which the (protected) QAB Response frame was addressed.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ResponderAP Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the (protected) QAB Response was received.
QuietPeriodResponse	A set of information subfields	As described in 9.4.2.150	As described in 9.4.2.150.
ResultCode	Enumeration	SUCCESS	Reports the result of an QAB request.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.90.3.3 When generated

This primitive is generated by the MLME when a QAB request completes. Possible unspecified failure causes include an inability to provide the Quiet Period Request element.

6.3.90.3.4 Effect on receipt

The SME is notified of the results of the QAB request procedure.

6.3.90.4 MLME-QAB.indication

6.3.90.4.1 Function

This primitive indicates that a (Protected) QAB Request frame was received.

6.3.90.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QAB.indication(
                    DialogToken
                    PeerMACAddress,
                    QuietPeriodRequest,
                    Protected,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
DialogToken	Integer	1–255	The dialog token to identify the QAB transaction.
PeerMACAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the QAB Request frame was received.
QuietPeriodRequest	A set of information subfields	As described in 9.4.2.149	As described in 9.4.2.149.
Protected	Boolean	true, false	Specifies whether the request was received using a protected robust Management frame. If true, the request was received using the Protected QAB Request frame. If false, the request was received using the QAB Request frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.90.4.3 When generated

This primitive is generated by the MLME when a (Protected) QAB Request frame is received.

6.3.90.4.4 Effect on receipt

On receipt of this primitive, the SME decides whether to schedule quiet periods as requested.

6.3.90.5 MLME-QAB.response

6.3.90.5.1 Function

This primitive is used to provide the results of a QAB Request.

6.3.90.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QAB.response(
                    DialogToken,
                    RequesterAP Address,
                    ResponderAP Address,
                    QuietPeriodResponse,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
DialogToken	Integer	1–255	The dialog token to identify the QAB transaction.
RequesterAP Address	MAC address	Any valid individual MAC address	The address of the MAC entity to which the (protected) QAB Response frame was sent.
ResponderAP Address	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the (protected) QAB Response was sent.
QuietPeriodResponse	A set of information subfields	As described in 9.4.2.150	As described in 9.4.2.150.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.90.5.3 When generated

This primitive is generated by the SME to provide the results of a QAB Request.

6.3.90.5.4 Effect on receipt

On receipt of this primitive, the MLME provides the results of a QAB Request.

6.3.91 DMG beamforming

6.3.91.1 General

This subclause describes the management procedures associated with DMG beamforming.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.91.2 MLME-BF-TRAINING.request

6.3.91.2.1 Function

This primitive requests that beamforming training occur with a peer STA.

6.3.91.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BF-TRAINING.request(
                        PeerSTAAddress,
                        RequestBRP
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform beamforming training.
RequestBRP	Boolean	true, false	If true, the beam refinement protocol (BRP) is performed as part of the beamforming training. If false, only sector-level sweep (SLS) is performed.

6.3.91.2.3 When generated

This primitive is generated by the SME to request that beamforming training be performed with a peer STA.

6.3.91.2.4 Effect on receipt

On receipt of this primitive, the MLME invokes the MAC sublayer beamforming training procedures defined in 10.42.

6.3.91.3 MLME-BF-TRAINING.confirm

6.3.91.3.1 Function

This primitive reports the outcome of a requested beamforming training procedure.

6.3.91.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BF-TRAINING.confirm(
                        PeerSTAAddress,
                        ResultCode
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which beamforming training was performed or attempted.
ResultCode	Enumeration	SUCCESS, BF_TIMEOUT	Indicates the result of the beamforming procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.91.3.3 When generated

This primitive is generated by the MLME to report the result of beamforming training with a peer STA.

6.3.91.3.4 Effect on receipt

The SME is notified of the result of the procedure.

6.3.91.4 MLME-BF-TRAINING.indication

6.3.91.4.1 Function

This primitive indicates that beamforming training with a peer STA, and at the request of that peer, has completed.

6.3.91.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BF-TRAINING.indication(
                                    PeerSTAAddress,
                                    ResultCode
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which beamforming training was performed.
ResultCode	Enumeration	SUCCESS, BF_TIMEOUT	Indicates the result of the beamforming procedure.

6.3.91.4.3 When generated

This primitive is generated by the MLME to indicate successful completion of a beamforming training procedure requested by a peer STA.

6.3.91.4.4 Effect on receipt

The SME is notified of the result of the procedure.

6.3.92 PN event report

6.3.92.1 General

This subclause describes the management procedures associated with PN event report.

6.3.92.2 MLME-PN-EXHAUSTION.indication

6.3.92.2.1 Function

This primitive indicates that the PN associated with a temporal key exceeds the threshold that is defined in dot11PNExhaustionThresholdLow and dot11PNExhaustionThresholdHigh.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.92.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-PN-EXHAUSTION.indication(
Key ID,
Key Type,
Address
)

Name	Type	Valid range	Description
Key ID	Integer	0-3 shall be used with CCMP and GCMP; 4-5 with BIP for IGTK; 6-7 with BIP for BIGTK; and 8-4095 are reserved	Key identifier.
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BITGK	Defines whether this key is a group key, pairwise key, PeerKey, integrity group key, or beacon protection key.
Address	MAC address	Any valid individual MAC address	This parameter is valid only when the Key Type value is Pairwise, or when the Key Type value is Group and is from an IBSS STA, or when the Key Type value is PeerKey.

6.3.92.2.3 When generated

This primitive is generated by the MLME when the PN associated with a temporal key exceeds the threshold that is defined in dot11PNExhaustionThresholdLow and dot11PNExhaustionThresholdHigh.

6.3.92.2.4 Effect of receipt

On receipt of this primitive, the SME deletes the temporal key associated with the PN.

6.3.92.3 MLME-PN-WARNING.indication

6.3.92.3.1 Function

This primitive indicates that the PN associated with a temporal key exceeds the threshold that is defined in dot11PNWarningThresholdLow and dot11PNWarningThresholdHigh.

6.3.92.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-PN-WARNING.indication(
Key ID,
Key Type,
Address
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Key ID	Integer	0-3 shall be used with CCMP and GCMP; 4-5 with BIP for IGTK; 6-7 with BIP for BIGTK; and 8-4095 are reserved	Key identifier.
Key Type	Enumeration	Group, Pairwise, PeerKey, IGTK, BIGTK	Defines whether this key is a group key, pairwise key, PeerKey, integrity group key, or beacon protection key.
Address	MAC address	Any valid individual MAC address	This parameter is valid only when the Key Type value is Pairwise, or when the Key Type value is Group and is from an IBSS STA, or when the Key Type value is PeerKey.

6.3.92.3.3 When generated

This primitive is generated by the MLME when the PN associated with a temporal key exceeds the threshold that is defined in dot11PNWarningThresholdLow and dot11PNWarningThresholdHigh.

6.3.92.3.4 Effect of receipt

On receipt of this primitive, the SME can create a new temporal key before the PN space is exhausted.

6.3.93 Channel Availability Query

6.3.93.1 Introduction

The following MLME primitives support the signaling of channel availability query process for the channel query requests and responses.

6.3.93.2 MLME-CHANNELAVAILABILITYQUERY.request

6.3.93.2.1 Function

This primitive requests that a (Protected) Channel Availability Query frame be sent to a specified peer MAC entity.

6.3.93.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELAVAILABILITYQUERY.request (
                                        PeerSTAAddress,
                                        ChannelAvailabilityQuery,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Channel Availability Query frame is sent.
ChannelAvailabilityQuery	A set of information subfields	As defined in 9.6.7.25	Specifies the parameters of channel query.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected Channel Availability Query frame. If false, the request is sent using the Channel Availability Query frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.93.2.3 When generated

This primitive is generated by the SME to request channel query procedure with a specified peer MAC entity.

6.3.93.2.4 Effect of receipt

This primitive initiates a channel query procedure. The MLME subsequently issues an MLME-CHANNELAVAILABILITYQUERY.confirm primitive that reflects the results.

6.3.93.3 MLME-CHANNELAVAILABILITYQUERY.confirm

6.3.93.3.1 Function

This primitive reports the results of a channel query attempt with a specified peer MAC entity.

6.3.93.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELAVAILABILITYQUERY.confirm (
                                        PeerSTAAddress,
                                        ResultCode,
                                        ChannelAvailabilityQuery,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the response to the Channel Availability Query frame was received.
ResultCode	Enumeration	SUCCESS, SUCCESS_MULTIPLE, REFUSED, DEVICE_VERIFICATION_FAILURE	Indicates the result of MLME-CHANNELAVAILABILITYQUERY.request primitive.
ChannelAvailabilityQuery	A set of information fields	As defined in 9.6.7.25	Specifies the parameters of channel query.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Protected	Boolean	true, false	Specifies whether the response was received using a protected robust Management frame. If true, the response was received using the Protected Channel Availability Query frame. If false, the response was received using the Channel Availability Query frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.93.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-CHANNELAVAILABILITYQUERY.request primitive and indicates the results of a channel availability query procedure.

6.3.93.3.4 Effect of receipt

The SME is notified of the results of the channel query procedure.

6.3.93.4 MLME-CHANNELAVAILABILITYQUERY.indication

6.3.93.4.1 Function

This primitive indicates that a (Protected) Channel Availability Query frame was received from a peer STA.

6.3.93.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELAVAILABILITYQUERY.indication (
                                        PeerSTAAddress,
                                        ChannelAvailabilityQuery,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Channel Availability Query frame was received.
ChannelAvailabilityQuery	A set of information subfields	As defined in 9.6.7.25	Specifies the parameters of channel query.
Protected	Boolean	true, false	Specifies whether the request was received using a protected robust Management frame. If true, the request was received using the Protected Channel Availability Query frame. If false, the request was received using the Channel Availability Query frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.93.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a channel query request from a specific peer MAC entity.

6.3.93.4.4 Effect of receipt

The SME is notified of the receipt of this channel query request.

6.3.93.5 MLME-CHANNELAVAILABILITYQUERY.response

6.3.93.5.1 Function

This primitive is used to send a response to a specified peer MAC entity that requested channel query with the STA that issued this primitive.

6.3.93.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELAVAILABILITYQUERY.response (
                                        PeerSTAAddress,
                                        ResultCode,
                                        ChannelAvailabilityQuery,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Channel Availability Query frame with the response is sent.
ResultCode	Enumeration	SUCCESS, SUCCESS_MULTIPLE, REFUSED, DEVICE_VERIFICATION_FAILURE	Indicates the result response of the channel availability query from the peer MAC entity.
ChannelAvailabilityQuery	A set of information subfields	As defined in 9.6.7.25	Specifies the parameters of channel query.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected Channel Availability Query frame. If false, the response is sent using the Channel Availability Query frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.93.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-CHANNELAVAILABILITYQUERY.indication primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.93.5.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the Channel Availability Query frame as the response. This frame is then scheduled for transmission to the peer MAC address.

6.3.94 Channel schedule management

6.3.94.1 Introduction

The following MLME primitives support the signaling of channel schedule management.

6.3.94.2 MLME-CHANNELSCHEDULEMANAGEMENT.request

6.3.94.2.1 Function

This primitive requests that a (Protected) Channel Schedule Management frame be sent.

6.3.94.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELSCHEDULEMANAGEMENT.request (
PeerSTAAddress,
ReasonResultCode,
ChannelScheduleManagementMode,
DeviceIdentification,
ChannelSchedule,
Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Channel Schedule Management frame is sent.
ReasonResultCode	An enumerated value	As defined in 9.6.7.26 for the Reason Result Code field	
ChannelScheduleManagementMode	An enumerated value	As defined in 9.6.7.26 for the Channel Schedule Management Mode field	
DeviceIdentification	Device Identification Information	As defined in 9.4.4.2.3	The Device Identification Information parameter indicates the regulatory identification of the STA that is requesting the schedule information.
ChannelSchedule	A set of Channel Schedule Descriptors	As defined in 9.4.4.2.5	The Channel Schedule parameter indicates the channels for which the schedule information is requested.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected Channel Schedule Management frame. If false, the request is sent using the Channel Schedule Management frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.94.2.3 When generated

This primitive is generated by the SME to request that a (Protected) Channel Schedule Management frame be sent by a STA.

6.3.94.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs and schedules transmission of a (Protected) Channel Schedule Management frame.

6.3.94.3 MLME-CHANNELSCHEDULEMANAGEMENT.confirm

6.3.94.3.1 Function

This primitive reports the result of a channel schedule management query.

6.3.94.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSCHEDULEMANAGEMENT.confirm (
                                        PeerSTAAddress,
                                        ReasonResultCode,
                                        ChannelScheduleManagementMode,
                                        DeviceIdentification,
                                        ChannelSchedule,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Channel Schedule Management frame was received.
ReasonResultCode	An enumerated value	As defined in 9.6.7.26 for the Reason Result Code field	
ChannelScheduleManagementMode	An enumerated value	As defined in 9.6.7.26 for the Channel Schedule Management Mode field	
DeviceIdentification	Device Identification Information	As defined in 9.4.4.2.3	The Device Identification Information parameter indicates the regulatory identification of the STA that is requesting the schedule information.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ChannelSchedule	A set of Channel Schedule Descriptors	As defined in 9.4.4.2.5	The Channel Schedule parameter indicates the channels for which the schedule information is provided.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected Channel Schedule Management frame. If false, the response is sent using the Channel Schedule Management Public Action frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.94.3.3 When generated

This primitive is generated by the MLME when a channel schedule request completes. Possible unspecified failure causes include an inability to provide the channel schedule information.

6.3.94.3.4 Effect of receipt

The SME is notified of the results of the channel schedule management procedure.

6.3.94.4 MLME-CHANNELSCHEDULEMANAGEMENT.indication

6.3.94.4.1 Function

This primitive indicates that a (Protected) Channel Schedule Management frame was received from a peer STA.

6.3.94.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSCHEDULEMANAGEMENT.indication (
                                        PeerSTAAddress,
                                        ReasonResultCode,
                                        ChannelScheduleManagementMode,
                                        DeviceIdentification,
                                        ChannelSchedule,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Channel Schedule Management frame was received.
ReasonResultCode	An enumerated value	As defined in 9.6.7.26 for the Reason Result Code field	
ChannelScheduleManagementMode	An enumerated value	As defined in 9.6.7.26 for the Channel Schedule Management Mode field	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DeviceIdentification	Device Identification Information	As defined in 9.4.4.2.3	The Device Identification Information parameter indicates the regulatory identification of the STA that is requesting the schedule information.
ChannelSchedule	A set of Channel Schedule Descriptors	As defined in 9.4.4.2.5	The Channel Schedule parameter indicates the channels for which the schedule information is requested.
Protected	Boolean	true, false	Specifies whether the request was received using a protected robust Management frame. If true, the request was received using the Protected Channel Schedule Management frame. If false, the request was received using the Channel Schedule Management frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.94.4.3 When generated

This primitive is generated by the MLME when a (Protected) Channel Schedule Management frame is received.

6.3.94.4.4 Effect of receipt

On receipt of this primitive, the SME decides whether to provide the channel schedule information.

6.3.94.5 MLME-CHANNELSCHEDULEMANAGEMENT.response

6.3.94.5.1 Function

This primitive is used to provide channel schedule information on channel availability.

6.3.94.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSCHEDULEMANAGEMENT.response (
                                        PeerSTAAddress,
                                        ReasonResultCode,
                                        ChannelScheduleManagementMode,
                                        DeviceIdentification,
                                        ChannelSchedule,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity to which the Channel Schedule Management frame is sent.
ReasonResultCode	An enumerated value	As defined in 9.6.7.26 for the Reason Result Code field	

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ChannelScheduleManagementMode	An enumerated value	As defined in 9.6.7.26 for the Channel Schedule Management Mode field	
DeviceIdentification	Device Identification Information	As defined in 9.4.4.2.3	The Device Identification Information parameter indicates the regulatory identification of the STA that is requesting the schedule information.
ChannelSchedule	A set of Channel Schedule Descriptors	As defined in 9.4.4.2.5	The Channel Schedule parameter indicates the channels for which the schedule information is provided.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected Channel Schedule Management Public Action frame. If false, the response is sent using the Channel Schedule Management Public Action frame.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.94.5.3 When generated

This primitive is generated by the SME to provide the channel schedule information.

6.3.94.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an appropriate response in a (Protected) Channel Schedule Management frame and schedules the transmission of the frame to the peer MAC entity.

6.3.95 Contact verification signal

6.3.95.1 Introduction

The following MLME primitives support the signaling of the contact verification signal (CVS).

6.3.95.2 MLME-CVS.request

6.3.95.2.1 Function

This primitive requests that a Contact Verification Signal frame be sent by a STA to a specified peer MAC entity in order to validate a WSM.

6.3.95.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CVS.request (
                    PeerSTAAddress,
                    Protected,
                    MapID
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the contact verification signal process.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected Contact Verification Signal frame. If false, the request is sent using the Contact Verification Signal frame.
MapID	Integer	0-255	Map ID is set to the Map ID field of the recently transmitted WSM, which is being verified.

6.3.95.2.3 When generated

This primitive is generated by the SME to request that a Protected Contact Verification Signal frame be sent by a STA to a specified peer MAC entity.

6.3.95.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Protected Contact Verification Signal frame. This frame is then scheduled for transmission.

6.3.95.3 MLME-CVS.indication

6.3.95.3.1 Function

This primitive indicates that a Contact Verification Signal frame was received from a specific peer MAC entity.

6.3.95.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CVS.indication (
                        PeerSTAAddress,
                        Protected,
                        MapID
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which a Contact Verification Signal frame was received.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected Contact Verification Signal frame. If false, the request is sent using the Contact Verification Signal frame.
MapID	Integer	0-255	Map ID field is the Map ID field of the received Contact Verification Signal frame, and identifies the WSM that is being verified.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.95.3.3 When generated

This primitive is generated by the MLME when a Protected Contact Verification Signal frame is received.

6.3.95.3.4 Effect of receipt

On receipt of this primitive, the SME is notified of the receipt of the Contact Verification Signal frame.

6.3.96 GDD Enablement

6.3.96.1 Introduction

The following MLME primitives support the signaling of GDD enablement.

6.3.96.2 MLME-GDDENABLEMENT.request

6.3.96.2.1 Function

This primitive requests that a (Protected) GDD Enablement Request frame be sent to a peer entity.

6.3.96.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GDDENABLEMENT.request (
                                    PeerSTAAddress,
                                    DialogToken,
                                    Protected,
                                    DeviceClass,
                                    DeviceID
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any individual valid MAC address	Specifies the address of the peer MAC entity with which to perform the GDD enablement process.
DialogToken	Integer	1–255	The dialog token to identify the event transaction.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected GDD Enablement Request frame. If false, the request is sent using the GDD Enablement Request frame.
DeviceClass	DeviceClass	As defined in 9.4.4.2.2	Specifies the service parameters for the GDD Enablement Request frame.
DeviceID	Device Identification Information	As defined in 9.4.4.2.3	Specifies the service parameters for the GDD Enablement Request frame.

6.3.96.2.3 When generated

This primitive is generated by the SME to request that a (Protected) GDD Enablement Request frame be sent to the peer entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.96.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a (Protected) GDD Enablement Request frame. This frame is then scheduled for transmission.

6.3.96.3 MLME-GDDENABLEMENT.confirm

6.3.96.3.1 Function

This primitive reports the result of an MLME-GDDENABLEMENT.request primitive to initiate GDD enablement.

6.3.96.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GDDENABLEMENT.confirm (
PeerSTAAddress,
DialogToken,
Protected,
ResultCode,
WSM
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any individual valid MAC address	Specifies the address of the peer MAC entity with which to perform the GDD enablement process.
DialogToken	Integer	1–255	The dialog token to identify the event transaction.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected GDD Enablement Response frame. If false, the response is sent using the GDD Enablement Response frame.
ResultCode	Enumeration	SUCCESS, REFUSED, ENABLEMENT_DENIED.	Indicates the result response to the GDD Enablement Request frame from the peer entity. ENABLEMENT_DENIED is used to indicate denial due to restriction from GDD.
WSM	Tuple of WSM Type field and WSM Information field	As defined in 9.4.1.57	Specifies the service parameters for the white space map.

6.3.96.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-GDDENABLEMENT.request primitive and indicates the results of the request.

This primitive is generated when the STA receives a GDD Enablement Response frame from the peer entity or when an unspecified failure occurs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.96.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-GDDENABLEMENT.request primitive and may use the reported data.

6.3.96.4 MLME-GDDENABLEMENT.indication

6.3.96.4.1 Function

This primitive indicates that a (Protected) GDD Enablement Request frame was received from a peer entity.

6.3.96.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GDDENABLEMENT.indication (
                                    PeerSTAAddress,
                                    DialogToken,
                                    Protected,
                                    DeviceClass,
                                    DeviceID
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any individual valid MAC address	The address of the peer entity from which a GDD Enablement Request frame was received.
DialogToken	Integer	1–255	The dialog token to identify the event transaction.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected GDD Enablement Request frame. If false, the request is sent using the GDD Enablement Request frame.
DeviceClass	DeviceClass	As defined in 9.4.4.2.2	Specifies the service parameters for the GDD Enablement Request frame.
DeviceID	Device Identification Information	As defined in 9.4.4.2.3	Specifies the service parameters for the GDD Enablement Request frame.

6.3.96.4.3 When generated

This primitive is generated by the MLME when a (Protected) GDD Enablement Request frame is received.

6.3.96.4.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.42.1.

6.3.96.5 MLME-GDDENABLEMENT.response

6.3.96.5.1 Function

This primitive indicates that a (Protected) GDD Enablement Response frame be sent to the peer entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.96.5.2 Semantics of the service primitive

MLME-GDDENABLEMENT.response (
PeerSTAAddress,
DialogToken,
Protected,
ResultCode,
WSM
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any individual valid MAC address	The address of the peer entity from which a GDD Enablement Request frame was received.
DialogToken	Integer	1–255	The dialog token to identify the event transaction.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected GDD Enablement Response frame. If false, the response is sent using the GDD Enablement Response frame.
ResultCode	Enumeration	SUCCESS, REFUSED, ENABLEMENT_DENIED.	Indicates the result response to the GDD Enablement Request frame from the peer entity. ENABLEMENT_DENIED is used to indicate denial due to restriction from GDD.
WSM	Tuple of WSM Type field and WSM Information field	As defined in 9.4.1.57	Specifies the service parameters for the white space map.

6.3.96.5.3 When generated

This primitive is generated by the SME to request that a GDD Enablement Response frame be sent to the peer entity.

6.3.96.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a GDD Enablement Response frame. This frame is then scheduled for transmission.

6.3.97 Network channel control management

6.3.97.1 Introduction

The following MLME primitives support the signaling of network channel control management.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.97.2 MLME-NETWORKCHANNELCONTROL.request

6.3.97.2.1 Function

This primitive requests that a (Protected) Network Channel Control Public Action frame be sent by a STA to a specified peer MAC entity.

6.3.97.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NETWORKCHANNELCONTROL.request (
                                    PeerSTAAddress,
                                    DialogToken,
                                    NetworkChannelControl,
                                    Protected,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual or group MAC address	The address of the peer MAC entity to which the Network Channel Control frame is transmitted.
DialogToken	Integer	0–255	The dialog token to identify the network channel control transaction.
NetworkChannelControl	A set of information subfields	As defined in 9.6.7.30	Specifies the parameters of network channel control.
Protected	Boolean	true, false	Specifies whether the request is sent using a protected robust Management frame. If true, the request is sent using the Protected Network Channel Control frame. If false, the request is sent using the Network Channel Control frame.
VendorSpecificInfo	A set of vendor specific elements	As defined in 9.4.2.25	Zero or more elements.

6.3.97.2.3 When generated

This primitive is generated by the SME to request that a (Protected) Network Channel Control Public Action frame be sent by a STA to the specified peer MAC entity.

6.3.97.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a (Protected) Network Channel Control Public Action frame. This frame is then scheduled for transmission.

6.3.97.3 MLME-NETWORKCHANNELCONTROL.confirm

6.3.97.3.1 Function

This primitive reports the result of a request to network channel control.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.97.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-NETWORKCHANNELCONTROL.confirm (
PeerSTAAddress,
DialogToken,
NetworkChannelControl,
Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the response in a Network Channel Control frame is received.
DialogToken	Integer	0–255	The dialog token to identify the network channel control transaction.
NetworkChannelControl	A set of information subfields	As defined in 9.6.7.30	Specifies the parameters of network channel control.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected Network Channel Control Public Action frame. If false, the response is sent using the Network Channel Control Public Action frame.
VendorSpecificInfo	A set of vendor specific elements	As defined in 9.4.2.25	Zero or more elements.

6.3.97.3.3 When generated

This primitive is generated by the MLME when a network channel control request completes. Possible unspecified failure causes include an inability to schedule a Network Channel Control Public Action frame.

6.3.97.3.4 Effect of receipt

The SME is notified of the results of the network channel control procedure.

6.3.97.4 MLME-NETWORKCHANNELCONTROL.indication

6.3.97.4.1 Function

This primitive indicates that a (Protected) Network Channel Control Public Action frame was received from a STA.

6.3.97.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-NETWORKCHANNELCONTROL.indication (
PeerSTAAddress,
DialogToken,
NetworkChannelControl,

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which the Network Channel Control frame was received.
DialogToken	Integer	0–255	The dialog token to identify the network channel control transaction.
NetworkChannelControl	A set of information subfields	As defined in 9.6.7.30	Specifies the parameters of network channel control.
Protected	Boolean	true, false	Specifies whether the request was received using a protected robust Management frame. If true, the request was received using the Protected Network Channel Control Public Action frame. If false, the request was received using the Network Channel Control Public Action frame.
VendorSpecificInfo	A set of vendor specific elements	As defined in 9.4.2.25	Zero or more elements.

6.3.97.4.3 When generated

This primitive is generated by the MLME when a (Protected) Network Channel Control Public Action frame is received.

6.3.97.4.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the network channel control request.

6.3.97.5 MLME-NETWORKCHANNELCONTROL.response

6.3.97.5.1 Function

This primitive is generated by the SME to schedule the transmission of a network channel control response.

6.3.97.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-NETWORKCHANNELCONTROL.response (
PeerSTAAddress,
DialogToken,
NetworkChannelControl,
Protected,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual or group MAC address	The address of the peer MAC entity to which the response in a Network Channel Control frame is transmitted.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DialogToken	Integer	0–255	The dialog token to identify the network channel control transaction.
NetworkChannelControl	A set of information subfields	As defined in 9.6.7.30	Specifies the parameters of network channel control.
Protected	Boolean	true, false	Specifies whether the response is sent using a protected robust Management frame. If true, the response is sent using the Protected Network Channel Control Public Action frame. If false, the response is sent using the Network Channel Control Public Action frame.
VendorSpecificInfo	A set of vendor specific elements	As defined in 9.4.2.25	Zero or more elements.

6.3.97.5.3 When generated

This primitive is generated by the SME to request that a network channel control response be sent to the peer entity.

6.3.97.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the response to the specific peer MAC entity that has requested a network channel control response.

6.3.98 White space map (WSM)

6.3.98.1 Introduction

The following MLME primitives support the signaling of the WSM.

6.3.98.2 MLME-WSM.request

6.3.98.2.1 Function

This primitive requests that a White Space Map Announcement frame be sent by a GDD enabling STA in order to provide a WSM to a GDD dependent STA.

6.3.98.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WSM.request (
                    PeerSTAAddress,
                    WhiteSpaceMap
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the WSM process.
WhiteSpaceMap	White Space Map element	As defined in 9.4.2.169	Specifies the service parameters for the WSM.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.98.2.3 When generated

This primitive is generated by the SME to request that a White Space Map Announcement frame be sent by a GDD enabling STA to a specified peer MAC entity.

6.3.98.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a White Space Map Announcement frame. This frame is then scheduled for transmission.

6.3.98.3 MLME-WSM.indication

6.3.98.3.1 Function

This primitive indicates receipt of a request of a White Space Map Announcement frame.

6.3.98.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WSM.indication (
                        PeerSTAAddress,
                        WhiteSpaceMap
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which a WSM was received.
WhiteSpaceMap	White Space Map element	As defined in 9.4.2.169	Specifies the service parameters for the WSM.

6.3.98.3.3 When generated

This primitive is generated by the MLME when a White Space Map Announcement frame is received.

6.3.98.3.4 Effect of receipt

On receipt of this primitive, the SME is notified of the receipt of White Space Map Announcement frame.

6.3.99 Estimated Throughput

6.3.99.1 General

The following set of MLME primitives support the transport of an estimate of the achievable throughput for a potential or an existing link between two STAs.

6.3.99.2 MLME-ESTIMATED-THROUGHPUT.request

6.3.99.2.1 Function

This primitive is generated by the SME to request that the MLME provide an estimate of the achievable throughput for a potential or an existing link between two STAs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.99.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ESTIMATED-THROUGHPUT.request (
PeerSTAAddress,
AverageMSDUSizeOutbound,
AverageMSDUSizeInbound
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA for which throughput is to be estimated assuming an association to that STA if an association with that STA does not currently exist.
AverageMSDUSizeInbound	An ordered set of integers	–1 to 7920, for each member of the set	A set of integers providing an estimate of the average number of octets per MSDU expected to be delivered over the wireless medium to this STA by the STA corresponding to the PeerMACAddress to this STA, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of –1 means that the size is unspecified, a value of 0 means that no MSDUs are expected to be delivered for this access category.
AverageMSDUSizeOutbound	An ordered set of integers	–1 to 7920, for each member of the set	A set of integers providing an estimate of the average number of octets per MSDU expected to be delivered over the wireless medium by this STA to the STA corresponding to the PeerMACAddress, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of –1 means that the size is unspecified, a value of 0 means that no MSDUs are expected to be delivered for this access category.

6.3.99.2.3 When generated

This primitive is generated by the SME to request that the MLME provide an estimate of throughput for MSDUs sent between this STA and the STA which corresponds to the PeerMACAddress provided in the parameter list.

6.3.99.2.4 Effect of receipt

On receipt of this primitive, the MLME generates a set of estimates of throughput for MSDUs sent between the STA which corresponds to the PeerMACAddress provided in the parameter list and this STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.99.3 MLME-ESTIMATED-THROUGHPUT.confirm

6.3.99.3.1 Function

This primitive reports the result of a request to provide a set of estimated throughput values for a potential or existing link.

6.3.99.3.2 Semantics of the service primitive

The primitive uses the following parameters:

```
MLME-ESTIMATED-THROUGHPUT.confirm (
                                    PeerSTAAddress,
                                    EstimatedThroughputOutbound,
                                    EstimatedThroughputInbound
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the STA for which throughput is to be estimated assuming a link with that STA if a link with that STA does not currently exist.
EstimatedThroughputOutbound	An ordered set of Real Numbers	Non-negative real numbers	The estimated throughput in the direction from this STA to the STA corresponding to the PeerMACAddress with units of MSDU bits per second, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of 0 means no estimate is available.
EstimatedThroughputInbound	An ordered set of Real Numbers	Non-negative real numbers	The estimated throughput in the direction from the STA corresponding to the PeerMACAddress to this STA with units of MSDU bits per second, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of 0 means no estimate is available.

6.3.99.3.3 When generated

This primitive is generated by the MLME to provide a set of estimates of throughput for MSDUs sent between the STA which corresponds to the PeerMACAddress indicated in the parameter list and this STA.

6.3.99.3.4 Effect of receipt

On receipt of this primitive, the SME may use the reported estimates to make link, association, and forwarding decisions.

6.3.100 Get authentication and association state

6.3.100.1 General

This mechanism is used to obtain authentication and association state.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.100.2 MLME-GETAUTHASSOCSTATE.request

6.3.100.2.1 Function

This primitive is generated by the SME to request that the MLME return the authentication and association state with respect to a given peer STA.

6.3.100.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GETAUTHASSOCSTATE.request (
                                PeerSTAAddress,
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity whose authentication and association state is requested

6.3.100.2.3 When generated

This primitive is generated by the SME to request the authentication and association state from the MLME.

6.3.100.2.4 Effect of receipt

The MLME issues an MLME-GETAUTHASSOCSTATE.confirm primitive.

6.3.100.3 MLME-GETAUTHASSOCSTATE.confirm

6.3.100.3.1 Function

This primitive is generated by the MLME to report to the SME the result of a request to get the authentication and association state.

6.3.100.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GETAUTHASSOCSTATE.confirm (
                                PeerSTAAddress,
                                AuthAssocState
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity whose authentication and association state was requested.
AuthAssocState	Integer	1–4	See 11.3.1 and 14.3.2.

6.3.100.3.3 When generated

This primitive is generated by the MLME to report the authentication and association state to the SME.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.100.3.4 Effect of receipt

The SME is notified of the result of an MLME-GETAUTHASSOCSTATE.request primitive.

6.3.101 FILS Container

6.3.101.1 General

This mechanism supports the process of IP address setup with a peer MAC entity.

6.3.101.2 MLME-FILSContainer.request

6.3.101.2.1 Function

This primitive requests transmission of the FILS Container frame with a specified peer MAC entity.

6.3.101.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FILSContainer.request(
                    Peer MAC Address,
                    FILSIPAddressAssignment,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity.
FILSIPAddressAssign-ment	FILS IP Address Assign-ment element	As defined in 9.4.2.184	The request may be for a new IP address or a speci-fied IP address.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.101.2.3 When generated

This primitive is generated by the SME for a STA to request IP address setup from the AP.

6.3.101.2.4 Effect of receipt

This primitive requests IP address setup. In the case that a response is received from the AP, the MLME subsequently issues an MLME-FILSContainer.confirm primitive that reflects the results.

6.3.101.3 MLME-FILSContainer.confirm

6.3.101.3.1 Function

This primitive reports the results of an IP address setup with an AP.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.101.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FILSContainer.confirm(
Peer MAC Address,
FILSIPAddressAssignment,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity.
FILSIPAddressAssign-ment	FILS IP Address Assign-ment element	As defined in 9.4.2.184	IP address information.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.101.4 MLME-FILSContainer.indication

6.3.101.4.1 Function

This primitive indicates receipt of a request of IP address setup.

6.3.101.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FILSContainer.indication(
Peer MAC Address,
FILSIPAddressAssignment,
VendorSpecificInfo
)

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity.
FILSIPAddressAssign-ment	FILS IP Address Assign-ment element	As defined in 9.4.2.184	An explicit request for an IP address. The request may be for a new IP address or a specified IP address.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.101.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a request to setup IP addresses from a specific peer MAC entity.

6.3.101.4.4 Effect of receipt

The SME is notified of the received IP address setup request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.101.5 MLME-FILSContainer.response

6.3.101.5.1 Function

This primitive is used to send a response to a specified peer MAC entity that requested IP address setup with the STA that issued this primitive.

6.3.101.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FILSContainer.response(
                    Peer MAC Address,
                    FILSIPAddressAssignment,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity.
FILSIPAddressAssign-ment	FILS IP Address Assign-ment element	As defined in 9.4.2.184	IP address information.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.101.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-FILSContainer.indication primitive.

6.3.101.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested IP address setup.

6.3.102 Dynamic AID assignment operation

6.3.102.1 General

The following MLME primitives support the signaling of AID switch request/response procedure described in 10.19.

6.3.102.2 MLME-AIDSWITCH.request

6.3.102.2.1 Function

This primitive requests that an AID Switch Request frame be sent to the AP with which the non-AP STA is associated.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.102.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AIDSWITCH.request(
PeerSTAAddress,
DialogToken,
AIDRequest
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the AID switch request/response procedure.
DialogToken	Integer	1–255	The dialog token to identify the AID switch request/response transaction.
AIDRequest	AID Request element	As defined in 9.4.2.193	Specifies the proposed service parameters for the AID request.

6.3.102.2.3 When generated

This primitive is generated by the SME to request that an AID Switch Request frame be sent to the AP with which the non-AP STA is associated.

6.3.102.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an AID Switch Request frame. The STA then attempts to transmit this frame to the AP with which it is associated.

6.3.102.3 MLME-AIDSWITCH.confirm

6.3.102.3.1 Function

This primitive reports the result of an AID switch request/response procedure.

6.3.102.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AIDSWITCH.confirm(
PeerMACAddress,
DialogToken,
AIDResponse
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
Peer MAC Address	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the AID switch request/response procedure.
DialogToken	Integer	0–255	The dialog token to identify the AID switch request/response transaction.
AIDResponse	AID Response element	As defined in 9.4.2.194	Specifies service parameters for the AID response.

6.3.102.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-AIDSWITCH.request primitive and indicates the results of the request. This primitive is generated when the STA receives an AID Switch Response frame from the AP.

6.3.102.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.19.

6.3.102.4 MLME-AIDSWITCH.indication

6.3.102.4.1 Function

This primitive indicates that an AID Switch Request frame was received from a non-AP STA.

6.3.102.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-AIDSWITCH.indication(
                                    PeerSTAAddress,
                                    DialogToken,
                                    AIDRequest
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which an AID Switch Request frame was received.
DialogToken	Integer	1–255	The dialog token to identify the AID switch request/response transaction.
AIDRequest	AID Request element	As defined in 9.4.2.193	Specifies the proposed service parameters for the AID request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.102.4.3 When generated

This primitive is generated by the MLME when an AID Switch Request frame is received.

6.3.102.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.19.

6.3.102.5 MLME-AIDSWITCH.response

6.3.102.5.1 Function

This primitive is used to send an AID Switch Response frame, in response to an AID Switch Request frame or autonomously by the AP.

6.3.102.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-AIDSWITCH.response(
                        PeerSTAAddress,
                        DialogToken,
                        AIDResponse
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which an AID Switch Request frame was received.
DialogToken	Integer	0–255	The dialog token to identify the AID switch request/response transaction. Value is 0 for an autonomous AID Switch Response frame.
AIDResponse	AID Response element	As defined in 9.4.2.194	Specifies service parameters for the AID response.

6.3.102.5.3 When generated

This primitive is generated by the SME to request that an AID Switch Response frame be sent to a peer entity to convey AID assignment information.

6.3.102.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an AID Switch Response frame. The STA then attempts to transmit this frame to the non-AP STA indicated by the PeerSTAAddress parameter.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.103 Sync Control

6.3.103.1 General

The following MLME primitives support the signaling of a sync control procedure described in 10.49.

6.3.103.2 MLME-SYNCCONTROL.request

6.3.103.2.1 Function

This primitive requests that a Sync Control frame be sent to the AP with which the non-AP STA is associated.

6.3.103.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SYNCCONTROL.request(
PeerSTAAddress,
SyncControl
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the sync control procedure.
SyncControl	Sequence of octets	As defined in 9.4.1.57	Specifies the proposed service parameters for the sync control.

6.3.103.2.3 When generated

This primitive is generated by the SME to request that a Sync Control frame be sent to the AP with which the non-AP STA is associated.

6.3.103.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Sync Control frame. The STA then attempts to transmit this frame to the AP with which it is associated.

6.3.103.3 MLME-SYNCCONTROL.indication

6.3.103.3.1 Function

This primitive indicates that a Sync Control frame was received from a non-AP STA.

6.3.103.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SYNCCONTROL.indication(
PeerSTAAddress,
SyncControl
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a Sync Control frame was received.
SyncControl	Sequence of octets	As defined in 9.4.1.57	Specifies the proposed service parameters for the sync control.

6.3.103.3.3 When generated

This primitive is generated by the MLME when a Sync Control frame is received.

6.3.103.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.49.

6.3.104 STA Information Announcement

6.3.104.1 General

The following MLME primitives support the signaling of a STA information announcement procedure described in 10.19.

6.3.104.2 MLME-STAINFORMATION.request

6.3.104.2.1 Function

This primitive requests that a STA Information Announcement frame be sent to the AP with which the non-AP STA is associated.

6.3.104.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-STAINFORMATION.request(
                                    PeerSTAAddress,
                                    AIDAnnouncement
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the STA information announcement procedure.
AIDAnnouncement	AID Announcement element	As defined in 9.4.2.208	Specifies service parameters for the AID Announcement.

6.3.104.2.3 When generated

This primitive is generated by the SME to request that a STA Information Announcement frame be sent to the AP with which the non-AP STA is associated.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.104.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a STA Information Announcement frame. The STA then attempts to transmit this frame to the AP with which it is associated.

6.3.104.3 MLME-STAINFORMATION.indication

6.3.104.3.1 Function

This primitive indicates that a STA Information Announcement frame was received from a non-AP STA.

6.3.104.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-STAINFORMATION.indication(
                                    PeerSTAAddress,
                                    AIDAnnouncement
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a STA Information Announcement frame was received.
AIDAnnouncement	AID Announcement element	As defined in 9.4.2.208	Specifies service parameters for the AID Announcement.

6.3.104.3.3 When generated

This primitive is generated by the MLME when a STA Information Announcement frame is received.

6.3.104.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.54.5.4 and 10.19.

6.3.105 EDCA Parameter Set update

6.3.105.1 General

The following MLME primitives support the signaling of an EDCA Parameter Set update procedure described in 10.2.3.2.

6.3.105.2 MLME-EDCAPARAMETERSET.request

6.3.105.2.1 Function

This primitive requests that an EDCA Parameter Set frame be sent to the non-AP STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.105.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EDCAPARAMETERSET.request(
PeerSTAAddress,
EDCAParameterSet
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the EDCA Parameter Set update.
EDCAParameterSet	EDCA Parameter Set element	As defined in 9.4.2.28	Specifies service parameters for the updated EDCA Parameter Set.

6.3.105.2.3 When generated

This primitive is generated by the SME to request that an EDCA Parameter Set frame be sent to the non-AP STA.

6.3.105.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an EDCA Parameter Set frame. The AP then attempts to transmit this frame to the non-AP STA that is associated with it.

6.3.105.3 MLME-EDCAPARAMETERSET.indication

6.3.105.3.1 Function

This primitive indicates that an EDCA Parameter Set frame was received from an AP.

6.3.105.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EDCAPARAMETERSET.indication(
PeerSTAAddress,
EDCAParameterSet
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the EDCA Parameter Set update.
EDCAParameterSet	EDCA Parameter Set element	As defined in 9.4.2.28	Specifies service parameters for the updated EDCA Parameter Set.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.105.3.3 When generated

This primitive is generated by the MLME when an EDCA Parameter Set frame is received.

6.3.105.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.3.2.

6.3.106 EL Operation

6.3.106.1 General

The following MLME primitives support the signaling of an EL operation procedure described in 11.46.

6.3.106.2 MLME-ELOPERATION.request

6.3.106.2.1 Function

This primitive requests that an EL Operation frame be sent to the AP with which the non-AP STA is associated.

6.3.106.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ELOPERATION.request(
PeerSTAAddress,
ELOperation
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the EL operation procedure.
ELOperation	EL Operation element	As defined in 9.4.2.210	Specifies the proposed service parameters for the EL operation.

6.3.106.2.3 When generated

This primitive is generated by the SME to request that an EL Operation frame be sent to the AP with which the non-AP STA is associated.

6.3.106.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an EL Operation frame. The STA then attempts to transmit this frame to the AP with which it is associated.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.106.3 MLME-ELOPERATION.indication

6.3.106.3.1 Function

This primitive indicates that an EL Operation frame was received from a non-AP STA.

6.3.106.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ELOPERATION.indication(
                                    PeerSTAAddress,
                                    ELOperation
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which an EL Operation frame was received.
ELOperation	EL Operation element	As defined in 9.4.2.210	Specifies the proposed service parameters for the EL operation.

6.3.106.3.3 When generated

This primitive is generated by the MLME when an EL Operation frame is received.

6.3.106.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.46.

6.3.107 TWT Setup

6.3.107.1 General

The following MLME primitives support the signaling of TWT Setup procedure described in 10.47.

6.3.107.2 MLME-TWTSETUP.request

6.3.107.2.1 Function

This primitive requests that a TWT Setup frame be sent as specified in 10.47.

6.3.107.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TWTSETUP.request(
                                    PeerSTAAddress,
                                    DialogToken,
                                    TWT
                                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the TWT Setup request/ response procedure.
DialogToken	Integer	0–255	The dialog token to identify the TWT Setup request/response transaction.
TWT	TWT element	As defined in 9.4.2.199	Specifies the proposed service parameters for the TWT Setup request.

6.3.107.2.3 When generated

This primitive is generated by the SME to request that a TWT Setup frame be sent.

6.3.107.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TWT Setup frame. The STA then attempts to transmit this TWT Setup frame.

6.3.107.3 MLME-TWTSETUP.confirm

6.3.107.3.1 Function

This primitive reports the result of a TWT Setup request/response procedure.

6.3.107.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TWTSETUP.confirm(
                        PeerMACAddress,
                        DialogToken,
                        TWT
                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the TWT Setup request/ response procedure.
DialogToken	Integer	0–255	The dialog token to identify the TWT Setup request/response transaction.
TWT	TWT element	As defined in 9.4.2.199	Specifies the proposed service parameters for the TWT Setup response.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.107.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TWTSETUP.request primitive and indicates the results of the request. This primitive is generated when the STA receives a TWT Setup frame from another STA.

6.3.107.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.47.

6.3.107.4 MLME-TWTSETUP.indication

6.3.107.4.1 Function

This primitive indicates that a TWT Setup frame was received from another STA.

6.3.107.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TWTSETUP.indication(
                        PeerSTAAddress,
                        DialogToken,
                        TWT
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a TWT Setup frame was received.
DialogToken	Integer	0–255	The dialog token to identify the TWT Setup request/response transaction.
TWT	TWT element	As defined in 9.4.2.199	Specifies the proposed service parameters for the TWT Setup request.

6.3.107.4.3 When generated

This primitive is generated by the MLME when a TWT Setup frame is received.

6.3.107.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.47.

6.3.107.5 MLME-TWTSETUP.response

6.3.107.5.1 Function

This primitive is used to send a TWT Setup frame, in response to a TWT Setup frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.107.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TWTSETUP.response(
PeerSTAAddress,
DialogToken,
TWT
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a TWT Setup frame was received.
DialogToken	Integer	0–255	The dialog token to identify the TWT Setup request/response transaction.
TWT	TWT element	As defined in 9.4.2.199	Specifies service parameters for the TWT Setup response.

6.3.107.5.3 When generated

This primitive is generated by the SME to request that a TWT Setup frame be sent to a peer entity to convey TWT assignment information.

6.3.107.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TWT Setup frame. The STA then attempts to transmit this frame to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.108 TWT Teardown

6.3.108.1 General

The following MLME primitives support the signaling of a TWT Teardown procedure described in 10.47.8.

6.3.108.2 MLME-TWTTEARDOWN.request

6.3.108.2.1 Function

This primitive requests that a TWT Teardown frame be sent to the AP with which the non-AP STA is associated.

6.3.108.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TWTTEARDOWN.request(
PeerSTAAddress,
TWT Flow Identifier
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the TWT Teardown procedure.
TWT Flow Identifier	Integer	0-7	Set to the value of the TWT Flow Identifier field of the TWT element in the frame that successfully concluded the setup of the TWT that is the subject of the teardown request.

6.3.108.2.3 When generated

This primitive is generated by the SME to request that a TWT Teardown frame be sent to the AP with which the non-AP STA is associated.

6.3.108.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TWT Teardown frame. The STA then attempts to transmit this frame to the AP with which it is associated.

6.3.108.3 MLME-TWTTEARDOWN.indication

6.3.108.3.1 Function

This primitive indicates that a TWT Teardown frame was received from a non-AP STA.

6.3.108.3.2 Semantics of the service primitive

The primitive parameters are as follows:

The primitive parameters are as follows:

```
MLME-TWTTEARDOWN.indication(
                                    PeerSTAAddress,
                                    TWT Flow Identifier
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the TWT Teardown procedure.
TWT Flow Identifier	Integer	0-7	Set to the value of the TWT Flow Identifier field of the TWT element in the frame that successfully concluded the setup of the TWT that is the subject of the teardown request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.108.3.3 When generated

This primitive is generated by the MLME when a TWT Teardown frame is received.

6.3.108.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.47.8.

6.3.109 Sectorized Group ID List management

6.3.109.1 General

The following MLME primitives support the signaling of a Sectorized Group ID List management described in 10.53.

6.3.109.2 MLME-SECTORIZEDGROUPID.request

6.3.109.2.1 Function

This primitive requests that a Sectorized Group ID List frame be sent to the non-AP STA.

6.3.109.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SECTORIZEDGROUPID.request(
                                    PeerSTAAddress,
                                    SectorizedGroupIDList
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the Sectorized Group ID List management.
SectorizedGroupIDList	Sectorized Group ID List element	As defined in 9.4.2.211	Specifies service parameters for the updated Sectorized Group ID List.

6.3.109.2.3 When generated

This primitive is generated by the SME to request that a Sectorized Group ID List frame be sent to the non-AP STA.

6.3.109.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Sectorized Group ID List frame. The AP then attempts to transmit this frame to the non-AP STA that is associated with it.

6.3.109.3 LME-SECTORIZEDGROUPID.indication

6.3.109.3.1 Function

This primitive indicates that a Sectorized Group ID List frame was received from an AP.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.109.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SECTORIZEDGROUPID.indication(
PeerSTAAddress,
SectorizedGroupIDList
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the Sectorized Group ID List management.
SectorizedGroupIDList	Sectorized Group ID List element	As defined in 9.4.2.211	Specifies service parameters for the updated Sectorized Group ID List.

6.3.109.3.3 When generated

This primitive is generated by the MLME when a Sectorized Group ID List frame is received.

6.3.109.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.53.

6.3.110 Header Compression procedure

6.3.110.1 General

The following MLME primitives support the signaling of Header Compression procedure described in 10.58.

6.3.110.2 MLME-HEADERCOMPRESSION.request

6.3.110.2.1 Function

This primitive requests that a Header Compression frame be sent to a peer MAC entity.

6.3.110.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-HEADERCOMPRESSION.request(
PeerSTAAddress,
DialogToken,
HeaderCompression
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the Header Compression request/response procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DialogToken	Integer	0–255	The dialog token to identify the header compression request/ response transaction.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	Specifies the proposed service parameters for the header compression request.

6.3.110.2.3 When generated

This primitive is generated by the SME to request that a Header Compression frame be sent to a peer MAC entity.

6.3.110.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Header Compression frame. The STA then attempts to transmit this frame to the peer MAC entity.

6.3.110.3 MLME-HEADERCOMPRESSION.confirm

6.3.110.3.1 Function

This primitive reports the result of a Header Compression request/response procedure.

6.3.110.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HEADERCOMPRESSION.confirm(
                                    PeerMACAddress,
                                    DialogToken,
                                    HeaderCompression
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the header compression request/response procedure.
DialogToken	Integer	0–255	The dialog token to identify the header compression request/ response transaction.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	Specifies the proposed service parameters for the header compression response.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.110.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-HEADERCOMPRESSION.request primitive and indicates the results of the request. This primitive is generated when the STA receives a Header Compression frame from the peer MAC entity.

6.3.110.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.58.

6.3.110.4 MLME-HEADERCOMPRESSION.indication

6.3.110.4.1 Function

This primitive indicates that a Header Compression frame was received from a STA.

6.3.110.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HEADERCOMPRESSION.indication(
                                    PeerSTAAddress,
                                    DialogToken,
                                    HeaderCompression
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the STA MAC entity from which a Header Compression frame was received.
DialogToken	Integer	0–255	The dialog token to identify the header compression request/ response transaction.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	Specifies the proposed service parameters for the header compression request.

6.3.110.4.3 When generated

This primitive is generated by the MLME when a Header Compression frame is received.

6.3.110.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.58.

6.3.110.5 MLME-HEADERCOMPRESSION.response

6.3.110.5.1 Function

This primitive is used to send a Header Compression frame, in response to a Header Compression frame.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.110.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-HEADERCOMPRESSION.response(
PeerSTAAddress,
DialogToken,
HeaderCompression
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the STA MAC entity from which a Header Compression frame was received.
DialogToken	Integer	0–255	The dialog token to identify the header compression request/ response transaction.
HeaderCompression	Header Compression element	As defined in 9.4.2.213	Specifies service parameters for the header compression response.

6.3.110.5.3 When generated

This primitive is generated by the SME to request that a Header Compression frame be sent to a peer entity to convey Header Compression information.

6.3.110.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Header Compression frame. The STA then attempts to transmit this frame to the peer MAC entity indicated by the PeerSTAAddress parameter.

6.3.111 Reachable Address Update

6.3.111.1 General

The following MLME primitives support the signaling of a reachable address update procedure described in 10.54.

6.3.111.2 MLME-REACHABLEADDRESSUPDATE.request

6.3.111.2.1 Function

This primitive requests that a Reachable Address Update frame be sent to the AP with which the non-AP STA is associated.

6.3.111.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REACHABLEADDRESSUPDATE.request(
PeerSTAAddress,
ReachableAddress
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the reachable address update procedure.
ReachableAddress	Reachable Address element	As defined in 9.4.2.205	Specifies the proposed service parameters for the reachable address update.

6.3.111.2.3 When generated

This primitive is generated by the SME to request that a Reachable Address Update frame be sent to the AP with which the non-AP STA is associated.

6.3.111.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Reachable Address Update frame. The STA then attempts to transmit this frame to the AP with which it is associated.

6.3.111.3 MLME-REACHABLEADDRESSUPDATE.indication

6.3.111.3.1 Function

This primitive indicates that a Reachable Address Update frame was received from a non-AP STA.

6.3.111.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REACHABLEADDRESSUPDATE.indication(
                                    PeerSTAAddress,
                                    ReachableAddress
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a Reachable Address Update frame was received.
ReachableAddress	Reachable Address element	As defined in 9.4.2.205	Specifies the proposed service parameters for the reachable address update.

6.3.111.3.3 When generated

This primitive is generated by the MLME when a Reachable Address Update frame is received.

6.3.111.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.54.

6.3.112 Control response MCS negotiation operation

6.3.112.1 General

The following MLME primitives support the signaling of control response MCS negotiation procedure described in 10.6.6.5.6.

6.3.112.2 MLME-CONTROLRESPONSEMCS.request

6.3.112.2.1 Function

This primitive requests that a Control Response MCS Negotiation Request frame be sent to a peer entity.

6.3.112.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CONTROLRESPONSEMCS.request(
                                    PeerSTAAddress,
                                    MCSDifference
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the control response MCS negotiation procedure.
MCSDifference	Integer	0–255	The MCS difference between the index of the primary MCS and the index of the MCS that is preferred for use by the STA to transmit control response frame as described in 10.6.6.5.6.

6.3.112.2.3 When generated

This primitive is generated by the SME to request that a Control Response MCS Negotiation Request frame be sent to the peer entity.

6.3.112.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Control Response MCS Negotiation Request frame. The STA then attempts to transmit this frame to the peer entity.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.112.3 MLME-CONTROLRESPONSEMCS.confirm

6.3.112.3.1 Function

This primitive reports the result of an control response MCS negotiation request/response procedure.

6.3.112.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CONTROLRESPONSEMCS.confirm(
                                PeerMACAddress,
                                Command
                                )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the control response MCS negotiation request/ response procedure.
Command	As defined in frame format	As defined in 9.6.27.3	Specifies service parameters for the Control Response MCS Negotiation Response frame.

6.3.112.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-CONTROLRESPONSEMCS.request primitive and indicates the results of the request. This primitive is generated when the STA receives a Control Response MCS Negotiation Response frame from the peer entity.

6.3.112.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.6.6.5.6.

6.3.112.4 MLME-CONTROLRESPONSEMCS.indication

6.3.112.4.1 Function

This primitive indicates that a Control Response MCS Negotiation Request frame was received from a peer entity.

6.3.112.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CONTROLRESPONSEMCS.indication(
                                PeerSTAAddress,
                                MCSDifference
                                )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which a Control Response MCS Negotiation Request frame was received.
MCSDifference	As defined in frame format	As defined in 9.6.27.2	The MCS difference between the index of the primary MCS and the index of the MCS that is preferred for use by the STA to transmit control response frame as described in 10.6.6.5.6.

6.3.112.4.3 When generated

This primitive is generated by the MLME when a Control Response MCS Negotiation Request frame is received.

6.3.112.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.6.6.5.6.

6.3.112.5 MLME-CONTROLRESPONSEMCS.response

6.3.112.5.1 Function

This primitive is used to send a Control Response MCS Negotiation frame, in response to a Control Response MCS Negotiation Request frame.

6.3.112.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CONTROLRESPONSEMCS.response(
                                    PeerSTAAddress,
                                    Command
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which an Control Response MCS Negotiation Response frame was received.
Command	As defined in frame format	As defined in 9.6.27.3	Specifies service parameters for the Control Response MCS Negotiation Response frame.

6.3.112.5.3 When generated

This primitive is generated by the SME to request that a Control Response MCS Negotiation Response frame be sent to a peer entity to convey control response MCS negotiation information.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.112.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Control Response MCS Negotiation Response frame. The STA then attempts to transmit this frame to the peer entity indicated by the PeerSTAAddress parameter.

6.3.113 S1G relay (de)activation

6.3.113.1 General

The following MLME primitives support the signaling of relay activation and deactivation procedure described in 10.54.

6.3.113.2 MLME-S1GRELAYACTIVATE.request

6.3.113.2.1 Function

This primitive requests that a Relay Activation Request frame be sent to a peer entity.

6.3.113.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-S1GRELAYACTIVATE.request(
                                PeerSTAAddress,
                                S1GRelayActivation
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the relay (de)activation procedure.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Specifies the proposed service parameters for the relay activation request.

6.3.113.2.3 When generated

This primitive is generated by the SME to request that a Relay Activation Request frame be sent to the peer entity.

6.3.113.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Relay Activation Request frame. The STA then attempts to transmit this frame to the peer entity.

6.3.113.3 MLME-S1GRELAYACTIVATE.confirm

6.3.113.3.1 Function

This primitive reports the result of a relay (de)activation request/response procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.113.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-S1GRELAYACTIVATE.confirm(
                                    PeerMACAddress,
                                    S1GRelayActivation
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the relay (de)activation procedure.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Specifies service parameters for the relay activation response.

6.3.113.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-S1GRELAYACTIVATE.request primitive and indicates the results of the request. This primitive is generated when the STA receives a Relay Activation Response frame from the peer entity.

6.3.113.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.54.

6.3.113.4 MLME-S1GRELAYACTIVATE.indication

6.3.113.4.1 Function

This primitive indicates that a Relay Activation Request frame was received from a peer entity.

6.3.113.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-S1GRELAYACTIVATE.indication(
                                    PeerSTAAddress,
                                    S1GRelayActivation
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the peer MAC entity from which a Relay Activation Request frame was received.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Specifies the proposed service parameters for relay activation request.

6.3.113.4.3 When generated

This primitive is generated by the MLME when a Relay Activation Request frame is received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.113.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.54.

6.3.113.5 MLME-S1GRELAYACTIVATE.response

6.3.113.5.1 Function

This primitive is used to send a Relay Activation Response frame, in response to a Relay Activation Request frame.

6.3.113.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-S1GRELAYACTIVATE.response(
                                    PeerSTAAddress,
                                    S1GRelayActivation
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a Relay Activation Response frame was received.
S1GRelayActivation	S1G Relay Activation element	As defined in 9.4.2.206	Specifies service parameters for the relay activation response.

6.3.113.5.3 When generated

This primitive is generated by the SME to request that a Relay Activation Response frame be sent to a peer entity to convey relay activation information.

6.3.113.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Relay Activation Response frame. The STA then attempts to transmit this frame to the peer entity indicated by the PeerSTAAddress parameter.

6.3.114 DCS procedure

6.3.114.1 General

This subclause describes the management procedures associated with the dynamic channel selection mechanism.

6.3.114.2 MLME-DCSMEASUREMENT.request

6.3.114.2.1 Function

This primitive requests transmission of a DCS Measurement Request frame to the DCS responder AP or PCP with which to perform the DCS procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.114.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DCSMEASUREMENT.request (
DCSResponderAddress,
DCSMeasurementRequest
)

Name	Type	Valid range	Description
DCSResponderAddress	MAC address	Any valid individual MAC address.	Specifies the MAC address of the AP or PCP to which the DCS Measurement Request frame is transmitted.
DCSMeasurementRequest	DCS Measurement Request Action field	As defined in 9.6.7.37.	Specifies the parameters of the DCS measurement request.

6.3.114.2.3 When generated

This primitive is generated by the SME to request that a DCS Measurement Request frame be sent to the DCS responder AP or PCP with which to perform the DCS procedure.

6.3.114.2.4 Effect on receipt

On receipt of this primitive, the MLME indicates the MAC sublayer to construct and attempt to transmit a DCS Measurement Request frame.

6.3.114.3 MLME-DCSMEASUREMENT.indication

6.3.114.3.1 Function

This primitive indicates that a DCS Measurement Request frame is received.

6.3.114.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DCSMEASUREMENT.indication (
DCSRequesterAddress,
DCSMeasurementRequest
)

Name	Type	Valid range	Description
DCSRequesterAddress	MAC address	Any valid individual MAC address.	Specifies the MAC address of the AP or PCP from which the DCS Measurement Request frame is received.
DCSMeasurementRequest	DCS Measurement Request Action field	As defined in 9.6.7.37.	Specifies the parameters of the DCS measurement request.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.114.3.3 When generated

This primitive is generated by the MLME when a valid DCS Measurement Request frame is received.

6.3.114.3.4 Effect on receipt

Once the SME receives this primitive, the STA operates according to the procedure defined in 11.47.

6.3.114.4 MLME-DCSMEASUREMENT.response

6.3.114.4.1 Function

This primitive requests transmission of a DCS Measurement Report frame to the DCS requester AP or PCP with which to perform the DCS procedure.

6.3.114.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DCSMEASUREMENT.response (
                                DCSRequesterAddress,
                                DCSMeasurementReport
                                )
```

Name	Type	Valid range	Description
DCSRequesterAddress	MAC address	Any valid individual MAC address.	Specifies the MAC address of the AP or PCP to which the DCS Measurement Report frame is transmitted.
DCSMeasurementReport	DCS Measurement Report Action field	As defined in 9.6.7.37.	Specifies the parameters of the DCS measurement response.

6.3.114.4.3 When generated

This primitive is generated by the SME to request that a DCS Measurement Report frame be sent to the DCS requester AP or PCP with which to perform the DCS procedure.

6.3.114.4.4 Effect on receipt

On receipt of this primitive, the MLME indicates the MAC sublayer to construct and attempt to transmit a DCS Measurement Report frame.

6.3.114.5 MLME-DCSMEASUREMENT.confirm

6.3.114.5.1 Function

This primitive indicates that a DCS Measurement Report frame was received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.114.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DCSMEASUREMENT.confirm (
                                    DCSResponderAddress,
                                    DCSMeasurementReport
                                    )
```

Name	Type	Valid range	Description
DCSResponderAddress	MAC address	Any valid individual MAC address.	Specifies the MAC address of the AP or PCP from which the DCS Measurement Report frame was received.
DCSMeasurementReport	DCS Measurement Report Action field	As defined in 9.6.7.37.	Specifies the parameters of the DCS measurement response.

6.3.114.5.3 When generated

This primitive is generated by the MLME when a valid DCS Measurement Report frame is received.

6.3.114.5.4 Effect on receipt

Once the SME receives this primitive, the STA operates according to the procedure defined in 11.47.

6.3.114.6 MLME-DCS.request

6.3.114.6.1 Function

This primitive requests transmission of a DCS Request frame to the DCS responder AP or PCP with which to perform the DCS procedure.

6.3.114.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DCS.request (
                        DCSResponderAddress,
                        DCSRequest
                        )
```

Name	Type	Valid range	Description
DCSResponderAddress	MAC address	Any valid individual MAC address.	Specifies the MAC address of the AP or PCP to which the DCS Request frame is transmitted.
DCSRequest	DCS Request Action field	As defined in 9.6.7.39.	Specifies the parameters of the DCS request.

6.3.114.6.3 When generated

This primitive is generated by the SME to request that a DCS Request frame be sent to the DCS responder AP or PCP with which to perform the DCS procedure.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.114.6.4 Effect on receipt

On receipt of this primitive, the MLME indicates the MAC sublayer to construct and attempt to transmit a DCS Request frame.

6.3.114.7 MLME-DCS.indication

6.3.114.7.1 Function

This primitive indicates that a DCS Request frame is received.

6.3.114.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DCS.indication (
                    DCSRequesterAddress,
                    DCSRequest
                    )
```

Name	Type	Valid range	Description
DCSRequesterAddress	MAC address	Any valid individual MAC address.	Specifies the MAC address of the AP or PCP from which the DCS Request frame is received.
DCSRequest	DCS Request Action field	As defined in 9.6.7.39.	Specifies the parameters of the DCS request.

6.3.114.7.3 When generated

This primitive is generated by the MLME when a valid DCS Request frame is received.

6.3.114.7.4 Effect on receipt

Once the SME receives this primitive, the STA operates according to the procedure defined in 11.47.

6.3.114.8 MLME-DCS.response

6.3.114.8.1 Function

This primitive requests transmission of a DCS Response frame to the DCS requester AP or PCP with which to perform the DCS procedure.

6.3.114.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DCS. Response (
                    DCSRequesterAddress,
                    DCSResponse
                    )
```

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
DCSRequesterAddress	MAC address	Any valid individual MAC address.	Specifies the MAC address of the AP or PCP to which the DCS Measurement Report frame is transmitted.
DCS Response	DCS Response Action field	As defined in 9.6.7.39.	Specifies the parameters of the DCS response.

6.3.114.8.3 When generated

This primitive is generated by the SME to provide the results of a DCS request.

6.3.114.8.4 Effect on receipt

On receipt of this primitive, the MLME indicates the MAC layer to construct and attempt to transmit a DCS Response frame.

6.3.114.9 MLME-DCS.confirm

6.3.114.9.1 Function

This primitive indicates that a DCS Response frame was received.

6.3.114.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DCS.confirm (
                    DCSResponderAddress,
                    DCSResponse
                    )
```

Name	Type	Valid range	Description
DCSResponderAddress	MAC address	Any valid individual MAC address.	Specifies the MAC address of the AP or PCP from which the DCS Measurement Report frame was received.
DCSResponse	DCS Response Action field	As defined in 9.6.7.40.	Specifies the parameters of the DCS response.

6.3.114.9.3 When generated

This primitive is generated by the MLME when a valid DCS Measurement Report frame is received.

6.3.114.9.4 Effect on receipt

Once the SME receives this primitive, the STA operates according to the procedure defined in 11.47.

6.3.115 Update

6.3.115.1 Introduction

This mechanism supports the process of updating one or more parameters used in the BSS without restarting the BSS.

6.3.115.2 MLME-UPDATE.request

6.3.115.2.1 Function

This primitive requests that the MAC entity to initiate a BSS update procedure to update one or more parameters used in the BSS without restarting the BSS.

6.3.115.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-UPDATE.request(
ServiceHint,
ServiceHash,
VendorSpecificInfo)

Name	Type	Valid range	Description
ServiceHint	Service Hint element	As defined in 9.4.2.237	If null, requests that Service Hint element be removed from Beacon and Probe Response frames. Otherwise, provides an indication of the services advertised in Beacon and Probe Response frames. The parameter is optionally present if dot11UnsolicitedPADActivated is true and absent otherwise.
ServiceHash	Service Hash element	As defined in 9.4.2.238	If null, requests that Service Hash element be removed from Beacon and Probe Response frames. Otherwise, specifies services advertised in Beacon and Probe Response frames. The parameter is optionally present if dot11UnsolicitedPADActivated is true and absent otherwise.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.26	Zero or more elements.

6.3.115.2.3 When generated

This primitive is generated by the SME of an AP or PCP STA when one or more parameters used in the BSS are to be changed without restarting the BSS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.115.2.4 Effect of receipt

If the MLME of an AP or PCP STA receives an MLME-UPDATE.request primitive with ServiceHint and or ServiceHash parameters, the AP or PCP STA shall use these parameters to update or remove the Service Hint element and/or Service Hash element in Beacon and Probe Response frames that the AP transmits or in DMG Beacon, Announce, and Probe Response frames that the PCP STA transmits.

6.3.115.3 MLME-UPDATE.confirm

6.3.115.3.1 Function

This primitive reports the results of a BSS update procedure.

6.3.115.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-UPDATE.confirm(
                                    ResultCode
                                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, BSS_NOT_STARTED, NOT_SUPPORTED, UPDATE_FAILED	Indicates the result of the MLME-UPDATE.request primitive.

6.3.115.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-UPDATE.request primitive to update one or more parameters used in the BSS without restarting the BSS.

6.3.115.3.4 Effect of receipt

The SME is notified of the results of the BSS update procedure.

6.3.116 MSCS request and response procedure

6.3.116.1 General

The following MLME primitives support the signaling of the MSCS request and response procedure.

6.3.116.2 MLME-MSCS.request

6.3.116.2.1 Function

This primitive requests transmission of an MSCS Request frame to an AP.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.116.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MSCS.request(
PeerSTAAddress,
DialogToken,
MSCSDescriptor,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the MSCS process.
DialogToken	Integer	1–255	The dialog token to identify the MSCS request and response transaction.
MSCSDescriptor	MSCS Descriptor element	MSCS Descriptor element, as defined in 9.4.2.243	Specifies classifiers and parameters for the MSCS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.116.2.3 When generated

This primitive is generated by the SME to request that a MSCS Request frame be sent to the AP with which the STA is associated

6.3.116.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a MSCS Request frame. The STA then attempts to transmit this frame to the AP with which the STA is associated.

6.3.116.3 MLME-MSCS.confirm

6.3.116.3.1 Function

This primitive reports the result of a MSCS procedure.

6.3.116.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MSCS.confirm(
PeerSTAAddress,
DialogToken,
Status,
MSCSDescriptor,
VendorSpecificInfo
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the MSCS process.
DialogToken	Integer	1–255	The dialog token to identify the MSCS request and response transaction.
Status	Enumeration	See Table 9-50	Indicates the result response. See Table 9-50.
MSCSDescriptor	MSCS Descriptor element	MSCS Descriptor element, as defined in 9.4.2.243	Zero or more elements. Specifies suggested classifiers and parameters for the MSCS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.116.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MSCS.request primitive and indicates the results of the request.

This primitive is generated when the STA receives a MSCS Response frame from the AP.

6.3.116.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.25.3.

6.3.116.4 MLME-MSCS.indication

6.3.116.4.1 Function

This primitive indicates that an MSCS Request frame was received from a non-AP STA.

6.3.116.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MSCS.indication(
                        PeerSTAAddress,
                        DialogToken,
                        MSCSDescriptor,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which an MSCS Request frame was received.
DialogToken	Integer	1–255	The dialog token to identify the MSCS request and response transaction.
MSCSDescriptor	MSCS Descriptor element	MSCS Descriptor element, as defined in 9.4.2.243	Specifies classifiers and parameters for the MSCS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.116.4.3 When generated

This primitive is generated by the MLME when an MSCS Request frame is received.

6.3.116.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.25.3.

6.3.116.5 MLME-MSCS.response

6.3.116.5.1 Function

This primitive is generated in response to an MLME-MSCS.indication primitive requesting an MSCS Response frame be sent to a non-AP STA.

6.3.116.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MSCS.response(
                    PeerSTAAddress,
                    DialogToken,
                    Status,
                    MSCSDescriptor,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which a MSCS Request frame was received.
DialogToken	Integer	1–255	The dialog token to identify the MSCS request and response transaction.
Status	Enumeration	See Table 9-50	Indicates the result response. See Table 9-50.
MSCSDescriptor	MSCS Descriptor element	MSCS Descriptor element, as defined in 9.4.2.243	Zero or more elements. Specifies suggested classifiers and parameters for the MSCS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.116.5.3 When generated

This primitive is generated by the SME in response to an MLME-MSCS.indication primitive requesting an MSCS Response frame be sent to a non-AP STA.

6.3.116.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a MSCS Response frame. The STA then attempts to transmit this frame to the non-AP STA indicated by the PeerSTAAddress parameter.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.116.6 MLME-MSCS-TERM.request

6.3.116.6.1 Function

This primitive requests the transmission of an MSCS Response frame to a non-AP STA to terminate an active MSCS.

6.3.116.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MSCS-TERM.request(
                        PeerSTAAddress,
                        DialogToken,
                        Status,
                        MSCSDescriptor,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC address	Any valid individual MAC address	The address of the non-AP STA MAC entity from which the MSCS Response frame is to be sent.
DialogToken	Integer	0	Set to 0 for an autonomous MSCS Response frame.
Status	Enumeration	See Table 9-50	Indicates the result response. See Table 9-50.
MSCSDescriptor	MSCS Descriptor element	MSCS Descriptor element, as defined in 9.4.2.243	Zero or more elements. Specifies suggested classifiers and parameters for the MSCS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.116.6.3 When generated

This primitive is generated by the SME to terminate an active MSCS.

6.3.116.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs an MSCS Response frame. The STA then attempts to transmit this frame to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.116.7 MLME-MSCS-TERM.indication

6.3.116.7.1 Function

This primitive is generated by the MLME when an unsolicited MSCS Response frame is received.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.116.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MSCS-TERM.indication(
ResultCode,
DialogToken,
Status,
MSCSDescriptor,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the MLME-MSCS-TERM.request primitive.
DialogToken	Integer	0	Set to 0 for an autonomous MSCS Response frame.
Status	Enumeration	See Table 9-50	Indicates the result response. See Table 9-50.
MSCSDescriptor	MSCS Descriptor element	MSCS Descriptor element, as defined in 9.4.2.243	Zero or more elements. Specifies suggested classifiers and parameters for the MSCS.
VendorSpecificInfo	A set of elements	As defined in 9.4.2.25	Zero or more elements.

6.3.116.7.3 When generated

This primitive is generated when the STA receives an unsolicited MSCS Response frame from the AP.

6.3.116.7.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.25.3.

6.3.117 MAC Address Update

6.3.117.1 MLME-UPDATEMACADDRESS.request

6.3.117.1.1 Function

The primitive indicates that a MAC address change is required.

6.3.117.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-UPDATEMACADDRESS.request(
STAAddress
)

Name	Type	Valid range	Description
STAAddress	MAC address	Any valid individual MAC address	Specifies the MAC address that is to be used by the MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.3.117.1.3 When generated

This primitive is generated by the SME when a MAC address change is needed.

6.3.117.1.4 Effect of receipt

Receipt of this primitive causes the MAC to change the MAC address.

6.3.117.2 MLME-UPDATEMACADDRESS.confirm

6.3.117.2.1 Function

The primitive is generated by the MAC to indicate the result of a MAC address change.

6.3.117.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-UPDATEMACADDRESS.confirm(
                                    ResultCode
                                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, FAILURE	Indicates the result of the MAC address change.

6.3.117.2.3 When generated

This primitive is generated by the MLME in response to a request to change the MAC address. If the result of the MLME-UPDATEMACADDRESS.request primitive is FAILURE, either changing the MAC address is not supported, or the MAC address specified was not accepted.

6.3.117.2.4 Effect of receipt

The SME is notified of the result of the MAC address change.

6.4 MAC state generic convergence function (MSGCF)

6.4.1 Overview of the convergence function

The MSGCF provides an abstraction of a link between a non-AP STA and an ESS (an ESS link) to its higher layer entity. The MSGCF provides control of an ESS link and generates events based on the state of an ESS link. A non-AP STA that transitions between two APs in the same ESS can operate transparently to the LLC sublayer, and does not change state in the state machine defined within 6.4.

This clause defines interactions between the MSGCF and MLME and PLME through the MLME SAP and PLME SAP respectively, as well as with the SME via the MSGCF-SME SAP. The detailed manner in which the SAPs are implemented is not specified within this standard.

6.4.2 Overview of convergence function state machine

The convergence function maintains information on the state of the ESS, using the state machine shown in Figure 6-29. Because Figure 6-29 is defined in terms of ESS connectivity, it is not affected by changes in association provided that the transition was an intra-ESS transition.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

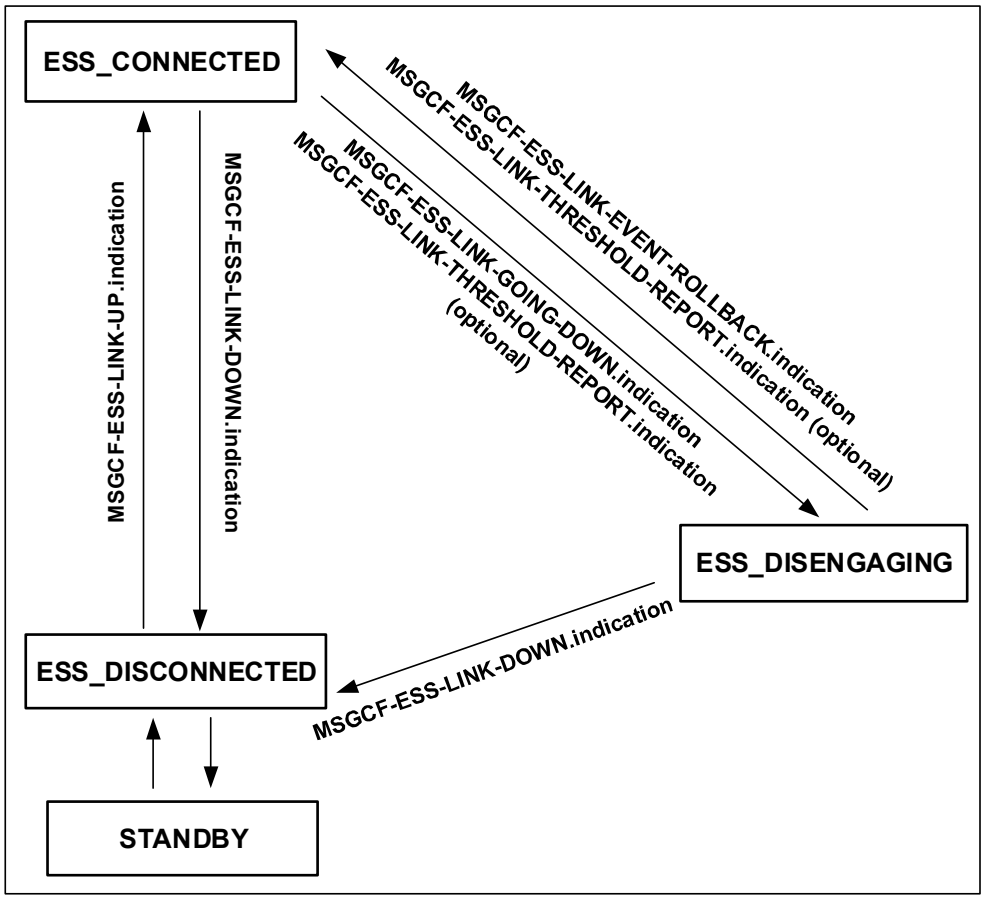

Figure 6-29—MSGCF state machine

6.4.3 Convergence function state list

6.4.3.1 ESS_CONNECTED

In the ESS_CONNECTED state, a non-AP STA has completed all layer 2 setup activities and is able to send Class 3 frames to peer LLC entities. A non-AP STA remains in this state as long as it is possible to send Class 3 frames through any AP within an ESS. A non-AP STA does not leave this state upon successful intra-ESS transitions.

6.4.3.2 ESS_DISCONNECTED

In the ESS_DISCONNECTED state, a non-AP STA is unable to send Class 3 frames to peer LLC entities. Higher layer network protocols are unavailable. In this state, a non-AP STA may use GAS to perform network discovery and selection.

6.4.3.3 ESS_DISENGAGING

In the ESS_DISENGAGING state, the non-AP STA's SME anticipates that links to all APs within the ESS will be lost in a defined time interval, but the non-AP STA is still able to send Class 3 frames to peer LLC entities. The predictive failure of the link might be due to explicit disassociation by the peer, the imminent

invalidation of cryptographic keys because of usage limits (such as sequence counter exhaustion), or predictive signal strength algorithms. In this state, it is recommended that a non-AP STA also initiate a search to find a new ESS.

6.4.3.4 STANDBY

In the STANDBY state, the non-AP STA is powered down and unable to communicate with any other STAs.

6.4.4 Convergence function state transitions

6.4.4.1 Transitions to ESS_CONNECTED

6.4.4.1.1 From ESS_DISCONNECTED

To make this transition, a non-AP STA will have completed the network selection process and the relevant procedures to attach to the ESS, including IEEE 802.11 authentication, IEEE 802.11 association, and, if required, IEEE 802.11 RSN procedures. When this transition is completed, the MSGCF sends an MSGCF-ESS-LINK-UP.indication primitive to higher layers.

6.4.4.1.2 From ESS_DISENGAGING

To make this transition, the SME cancels a previous event that predicted an ESS link failure. This might be due to network parameters indicating renewed link strength or a successful renewal of an expiring RSN SA. When this transition is complete, the MSGCF sends an MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive to indicate that a prior link failure predictive event is no longer valid. If the transition was due to network parameters crossing a threshold, the MSGCF also sends an MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive to higher layers.

6.4.4.2 Transitions to ESS_ DISCONNECTED

6.4.4.2.1 From ESS_CONNECTED

This transition indicates that administrative action was taken to shut down the link, a sudden loss of signal strength or that RSN keys expired and could not be renewed. At the conclusion of this transition, the MSGCF sends an MSGCF-ESS-LINK-DOWN.indication primitive to higher layer protocols.

6.4.4.2.2 From ESS_DISENGAGING

This transition indicates that the predictive link failure event has occurred. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-LINK-DOWN.indication primitive to higher layer protocols.

6.4.4.2.3 From STANDBY

This transition occurs when the non-AP STA is powered on and initialized. No event is issued by the MSGCF.

6.4.4.3 Transitions to ESS_DISENGAGING

6.4.4.3.1 From ESS_CONNECTED

When the parameters as defined in Table 6-7 change or imminent action is taken to bring down the link, the SME may predict an imminent link failure and initiate a transition. Upon completion of this transition, the MSGCF issues an MSGCF-ESS-LINK-GOING-DOWN event. If the cause of the transition was the degradation of network parameters beyond the thresholds stored in the MIB, an MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive is also issued to higher layers.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.4.4.4 Transitions to STANDBY

6.4.4.4.1 From ESS_DISCONNECTED

When the non-AP STA has disconnected from an ESS, it may be administratively powered off to extend battery life. No events are issued by the MSGCF upon completion of this transition.

6.4.5 Convergence function informational events

Informational events may occur in any state. When they occur, the SME updates the convergence function MIB with new parameters. Informational events do not cause state changes in the MSGCF state machine (see Figure 6-29). Informational events are generated when new potential ESS links are discovered, when the network parameter thresholds are set or read, and when higher layer protocols issue commands to the non-AP STA through the MSGCF-ESS-LINK-COMMAND.request primitive.

6.4.6 MAC state generic convergence SAP

The MAC state generic convergence SAP is the interface between the convergence function and higher layer protocols. It presents a standardized interface for higher layer protocols to access the state of the MAC, whether that state information is available in the MLME, PLME, or SME.

Some events on the MAC state generic convergence SAP require event identifiers for use as a dialog token in event sequencing and rollback. The EventID is an unsigned integer that is initialized to 1 when the non-AP STA leaves the STANDBY state.

6.4.7 ESS status reporting

6.4.7.1 MSGCF-ESS-LINK-UP.indication

6.4.7.1.1 Function

This event is triggered when a new ESS has been made available for sending frames.

6.4.7.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-UP.indication(
                                    ESSIdentifier
                                    )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use. The HESSID is encoded in upper-case ASCII characters with the octet values separated by dash characters, as described in IETF RFC 3580 [B39].

6.4.7.1.3 When generated

This primitive is generated when the ESS link to a network of APs is available to exchange Data frames. The generation of this primitive may vary depending on the contents of dot11WEPDefaultKeysTable and dot11WEPKeyMappingsTable and the setting of dot11RSNAOptionImplemented.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If there are no entries in the dot11WEPDefaultKeysTable, no entry for the current AP in dot11WEPKeyMappingsTable, and dot11RSNAOptionImplemented is false, then the network does not use encryption. This event is generated upon receipt of an MLME-ASSOCIATE.confirm primitive with a result code of success.

If there are entries in the dot11WEPDefaultKeysTable, or an entry for the current AP in dot11WEPKeyMappingsTable, or dot11RSNAOptionImplemented is true, then the network requires the use of encryption on the link. Before declaring that the link is ready to exchange Data frames, the convergence function receives an MLME-ASSOCIATE.confirm primitive with a result code of success and the SME emits an MLME-SETKEYS.request primitive. The latter primitive is used to determine that a WEP key is available, or that the RSN 4-way handshake has completed.

This event is not triggered by MLME-REASSOCIATE.confirm primitives because MLME-REASSOCIATE.confirm primitives are defined as transitions within the same ESS.

The MLME-ASSOCIATE.confirm primitive may be issued upon AP transitions. It is the objective of the MSGCF to generate this event only upon the initial connection to an IEEE 802.11 network, when the MSGCF state machine moves into the ESS_CONNECTED state.

6.4.7.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by higher layers are outside of scope of this standard, but may include router discovery, IP configuration, and other higher layer protocol operations.

6.4.7.2 MSGCF-ESS-LINK-DOWN.indication

6.4.7.2.1 Function

This event is triggered to indicate that the connection to an ESS is no longer available for sending frames.

6.4.7.2.2 Semantics of the service primitive

The event's parameters are as follows:

```
MSGCF-ESS-LINK-DOWN.indication (
                                ESSIdentifier,
                                ReasonCode
                                )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use.
ReasonCode	Enumerated	EXPLICT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC	Reason code, drawn from Table 6-2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 6-2—Reason codes for network down

Name	Description
EXPLICIT_DISCONNECT	An explicit disconnection operation (disassociation or deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP (the AP with which the STA is associated) and the non-AP STA was unable to (re)associate with an alternate AP in the same ESS.
KEY_EXPIRATION	Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.
LOW_POWER	If the SME reports that the interface was shut down to conserve power, that event may be reported to higher level protocols.
VENDOR_SPECIFIC	Vendor-specific usage.

6.4.7.2.3 When generated

This event is generated when the SME declares that connectivity to an ESS is lost. It may be generated in the case of an explicit disconnection from the link peer, received as an MLME-DEAUTHENTICATE.indication or an MLME-DISASSOCIATE.indication primitive. The SME should wait for a period of dot11ESSDisconnectFilterInterval before declaring connectivity lost to confirm that a non-AP STA is unable to (re)associate with any alternate AP within the ESS.

6.4.7.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include removing entries from routing and forwarding tables, and attempting to initiate handover of open application connections to network interfaces that are still active.

6.4.7.3 MSGCF-ESS-LINK-GOING-DOWN.indication

6.4.7.3.1 Function

This event is triggered to indicate the expectation that the connection to an ESS will no longer be available for sending frames in the near future.

6.4.7.3.2 Semantics of the service primitive

The event parameters are as follows:

```
MSGCF-ESS-LINK-GOING-DOWN.indication(
                                    ESSIdentifier,
                                    EventID,
                                    TimeInterval,
                                    ReasonCode
                                    )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use.
EventID	Integer	N/A	An integer used to identify the event that is used in the case of event rollback.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
TimeInterval	Integer	N/A	Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by TimeInterval.
Reason Code	Enumerated	EXPLICT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC	Indicates the reason the link is expected to go down, drawn from Table 6-3.

Table 6-3—Reason codes for ESS link down

Name	Description
EXPLICIT_DISCONNECT	An explicit disconnection operation (Disassociation or Deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP.
KEY_EXPIRATION	Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.
LOW_POWER	If the SME reports that the interface is going to be shut down to conserve power, that event may be reported to higher level protocols.
VENDOR_SPECIFIC	Vendor-specific usage.

6.4.7.3.3 When generated

This notification is generated by the MSGCF when the ESS link is currently established and is expected to go down within the specified time interval. The network can be expected to go down because of an event whose timing is well understood, such as an explicit disconnection event observed on the MLME SAP. It can also be expected as the result of a predictive algorithm that monitors link quality. The details of such a predictive algorithm used are beyond the scope of this standard.

The convergence function should attempt to deliver this event at least dot11ESSLinkDownTimeInterval time units before the link is predicted to go down. Different higher layer network protocols might need different levels of advance notice, and might configure dot11ESSLinkDownTimeInterval accordingly.

Not all thresholds in the dot11MACStateParameterTable are supported by every PHY. In the case when a threshold parameter is not supported it is not applied.

6.4.7.3.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include beginning preparations for handover.

6.4.7.4 MSGCF-ESS-LINK-EVENT-ROLLBACK.indication

6.4.7.4.1 Function

This event is used to indicate that specific previous reports or events are no longer valid and should be disregarded.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.4.7.4.2 Semantics of the service primitive

The event parameters are as follows:

MSGCF-ESS-LINK-EVENT-ROLLBACK.indication(
ESSIdentifier,
EventID
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventID	Integer	N/A	An integer used to identify the event that is used in the case of event rollback.

6.4.7.4.3 When generated

This event is generated when a previous predictive event is no longer valid within its expiration time.

The MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive is used in conjunction with the MSGCF-ESS-LINK-GOING-DOWN.indication primitive. The MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive is issued when the prediction of link failure is no longer valid. Algorithms used to determine that link failure predictions are beyond the scope of this standard.

6.4.7.4.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function to cancel any actions begun by the previous event. Actions taken by those higher layers are outside the scope of this standard, but may include canceling any handover procedures started by the MSGCF-ESS-LINK-GOING-DOWN event.

6.4.7.5 MSGCF-ESS-LINK-DETECTED.indication

6.4.7.5.1 Function

This event reports on the presence of a new ESS.

6.4.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-DETECTED.indication(
ESSIdentifier,
ESSDescription
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSDescription	As defined in Table 6-4	N/A	A set of information about the ESS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 6-4—ESS description

Name	Syntax	Description
SSID	String	The SSID used by the ESS.
InformationServiceSupport	As described in Table 6-5	A set of values indicating the type of information services supported on this network.
TriggerSupport	As described in Table 6-5	A set of values indicating the support for the types of triggers that can be used to propose that the station take action.
RSN	As defined in 9.4.2.24	The RSN configuration of the ESS.
Interworking	As defined in 9.4.2.91	Interworking configuration of the ESS.

Table 6-5—Trigger support values

Name	Description
MIS_CS_ES_Support	This network supports the IEEE 802.21 MIS Command Service and Event Service.
Vendor_Specific_Trigger_Support	This network supports a vendor-specific trigger service.

6.4.7.5.3 When generated

Support for MIS is indicated by the presence or absence of the relevant advertisement protocol IDs in the Advertisement Protocol element.To maintain the list of detected networks, the SME issues recurring MLME-SCAN.request primitives to the MLME. The SME may schedule these requests to avoid interruption of user traffic. Responses to these requests, received in the MLME-SCAN.confirm primitives, contain a list of detected networks. Each network is stored in dot11MACStateESSLinkDetectedTable. This table holds a list of networks, organized by Network Identifier. Each entry in the table contains a list of BSSIDs within the network, as well as indications of support for MIS. Support for MIS is indicated by the presence or absence of the relevant advertisement protocol IDs in the Advertisement Protocol element. Each entry in the table is held for at least dot11ESSLinkDetectionHoldInterval time units. When a non-AP STA has not observed an ESS for longer than dot11ESSLinkDetectionHoldInterval, it may be removed from the table.

This event is generated when a new entry is made into the dot11MACStateESSLinkDetectedTable. Modifications to existing entries in the list, such as an update to the BSSID list, do not trigger this event.

6.4.7.5.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.4.7.6 MSGCF-ESS-LINK-SCAN.request

6.4.7.6.1 Function

This function is used by higher layer protocols to request that the SME perform a scan operation for available ESSs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.4.7.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-SCAN.request(
                                    SSID,
                                    HESSID,
                                    AccessNetworkType
                                    )
```

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	Specific or wildcard.
HESSID	As defined in 9.4.2.91	As defined in 9.4.2.91	The HESSID to search for. It can be set to all 1s for use as a wildcard to match all available HESSID values.
AccessNetworkType	As defined in 9.4.2.91	As defined in 9.4.2.91	This may be a specific value to match one type of networks, or all 1s to match all access network types.

6.4.7.6.3 When generated

This request is generated when higher protocol layers request a list of available ESSs.

6.4.7.6.4 Effect of receipt

The SME generates a corresponding MLME-SCAN.request primitive to find available networks.

6.4.7.7 MSGCF-ESS-LINK-SCAN.confirm

6.4.7.7.1 Function

This function reports information on available ESSs to higher protocol layers.

6.4.7.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-SCAN.confirm(
                                    ESSIdentifiers,
                                    ESSDescriptions
                                    )
```

Name	Type	Valid range	Description
ESSIdentifiers	Set of Strings	N/A	An identifier for the network composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSDescriptions	Set of ESSDescriptions, as defined in Table 6-4	N/A	A set of information about each discovered ESS.

6.4.7.7.3 When generated

This primitive is generated when scan results are available for reporting to higher protocol layers, in response to an MSGCF-ESS-LINK-SCAN.request primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.4.7.7.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.4.8 Network configuration

6.4.8.1 MSGCF-ESS-LINK-CAPABILITY.request

6.4.8.1.1 Function

This primitive requests a list of the capabilities supported by a network.

6.4.8.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-CAPABILITY.request(
ESSIdentifier
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.

6.4.8.1.3 When generated

This primitive is issued to service higher layer protocols by reporting on the capabilities of a particular network.

6.4.8.1.4 Effect of receipt

The convergence function retrieves the capabilities and reports them via the MSGCF-ESS-LINK-CAPABILITY.confirm primitive.

6.4.8.2 MSGCF-ESS-LINK-CAPABILITY.confirm

6.4.8.2.1 Function

This primitive reports the convergence function capabilities of the network to higher layer protocols.

6.4.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-CAPABILITY.confirm(
ESSIdentifier,
EssLinkParameterSet,
ReasonCode
)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventCapability Set	As defined in Table 6-6	N/A	list of supported events.
ReasonCode	Enumerated	SUCCESS, UNKNOWN_NETWORK, UNKNOWN_CAPABILITIES	An error code, if applicable.

Table 6-6—Event Capability Set

Name	Type	Valid range	Description
NonAPSTAMacAddress	MAC address	Any valid individual MAC address	The MAC address of the non-AP STA that is reporting the new network.
ESS-Link-Up	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-UP.indication primitive as defined in 6.4.7.1 is supported.
ESS-Link-Down	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-DOWN.indication primitive as defined in 6.4.7.2 is supported.
ESS-Link-Going-Down	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-GOING-DOWN primitive as defined in 6.4.7.3 is supported.
ESS-Link-Event-Rollback	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive as defined in 6.4.7.4 is supported.
ESS-Link-Detected	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-DETECTED.indication primitive as defined in 6.4.7.5 is supported.
ESS-Link-Threshold-Report	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive as defined in 6.4.9.1 is supported.
ESS-Link-Command	Boolean	true, false	Indicates whether the MSGCF-ESS-LINK-COMMAND.request primitive as defined in 6.4.10.1 is supported.

6.4.8.2.3 When generated

This primitive is generated in response to the MSGCF-ESS-LINK-CAPABILITY.request primitive to report whether specific events are supported.

6.4.8.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.4.8.3 MSGCF-ESS-LINK-PARAMETERS.request

6.4.8.3.1 Function

This primitive sets thresholds for reporting of network events.

6.4.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-PARAMETERS.request(
ESSIdentifier,
EssLinkParameterSet
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSLinkParameterSet	As defined in Table 6-7	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

The ESSLinkParameterSet parameter is defined in Table 6-7. It may include any or all of the parameters in Table 6-7.

Table 6-7—ESS Link Parameter Set

Name	Type	Valid range	Description
PeakOperationalRate	Integer	As defined in 9.4.2.3	The integer representing the target peak modulation data rate used for Data frame transmission.
MinimumOperationalRate	Integer	As defined in 9.4.2.3	The integer encoding of the target minimum modulation data rate used in Data frame transmission.
NetworkDowntimeInterval	Integer	0–65 535	Target advance warning time interval, in TUs, for MSGCF-ESS-LINK-GOING-DOWN events.
DataFrameRSSI	Integer	–100 to 40	The received signal strength in dBm of received Data frames from the network. This may be time-averaged over recent history by a vendor-specific smoothing function.
BeaconRSSI	Integer	–100 to 40	The received signal strength in dBm of Beacon frames received on the channel. This may be time-averaged over recent history by a vendor-specific smoothing function.
BeaconSNR	Integer	0–100	The signal-to-noise ratio of the received Data frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function.
DataFrameSNR	Integer	0–100	The signal-to-noise ratio of the received Beacon frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function.
DataThroughput	Integer	0–65 535	The data throughput in megabits per second, rounded to the nearest megabit. This may be time-averaged over recent history by a vendor-specific smoothing function.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 6-7—ESS Link Parameter Set *(continued)*

Name	Type	Valid range	Description
MissedBeaconRate	Real	N/A	The rate at which beacons have not been received in missed beacons per second. This may be time-averaged over recent history by a vendor-specific smoothing function.
FrameErrorRate	Real	N/A	The frame error rate of the network in errors per second. This may be time-averaged over recent history by a vendor-specific smoothing function.
VendorSpecific	Vendor Specific	As defined by 9.4.2.25	Additional vendor-specific parameters may be included in this event.

6.4.8.3.3 When generated

This event is generated when higher protocol layers wish to set the performance parameters for a network. Higher protocol layers are responsible for ensuring that the set of configured network parameters is consistent with all subscribers to those higher layer protocols.

6.4.8.3.4 Effect of receipt

Parameters supplied in the event are stored in the MIB, either in the dot11MACStateConfigTable or the dot11MACStateParameterTable.

6.4.8.4 MSGCF-ESS-LINK-PARAMETERS.confirm

6.4.8.4.1 Function

This primitive indicates whether network parameters were accepted.

6.4.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-PARAMETERS.confirm(
                                    ESSIdentifier,
                                    EssLinkParameterSet,
                                    )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParameterSet	As defined in Table 6-7	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

6.4.8.4.3 When generated

This primitive is generated in response to the MSGCF-ESS-LINK-PARAMETERS.request primitive and is used to indicate whether the parameter set was accepted.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.4.8.4.4 Effect of receipt

The SME is notified of the new parameter set.

6.4.8.5 MSGCF-GET-ESS-LINK-PARAMETERS.request

6.4.8.5.1 Function

This primitive retrieves the current network parameters for a specific network.

6.4.8.5.2 Semantics of the service primitive

The primitive parameter is as follows:

MSGCF-GET-ESS-LINK-PARAMETERS.request(
ESSIdentifier
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.

6.4.8.5.3 When generated

This primitive is used by higher layers to retrieve the currently stored parameters for a network.

6.4.8.5.4 Effect of receipt

The SME retrieves the network parameters and makes them available through the MSGCF-GET-ESS-LINK-PARAMETERS.confirm primitive.

6.4.8.6 MSGCF-GET-ESS-LINK-PARAMETERS.confirm

6.4.8.6.1 Function

This primitive reports the current network parameters.

6.4.8.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-GET-ESS-LINK-PARAMETERS.confirm(
ESSIdentifier,
EssLinkParameterSet,
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParameterSet	As defined 6.4.8.3	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.4.8.6.3 When generated

This primitive is generated by the MSGCF as a result of the MSGCF-GET-ESS-LINK-PARAMETERS.request primitive.

6.4.8.6.4 Effect of receipt

The higher layer protocols are notified of the current network parameters.

6.4.9 Network events

6.4.9.1 MSGCF-ESS-LINK-THRESHOLD-REPORT.indication

6.4.9.1.1 Function

This event reports that the layer 2 network performance has crossed a threshold set by the operations described in Table 6-5.

6.4.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-THRESHOLD-REPORT.indication(
ESSIdentifier,
EssLinkParameterSet,
ThresholdCrossingDirectionSet
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParameterSet	As defined in Table 6-7	N/A	A list of EssLinkParameterSets and their current values that have crossed preset thresholds for alerts.
ThresholdCrossingDirectionSet	Set of ThresholdCrossing Directions, one for each value in the EssLinkParameterSet	UPWARD, DOWNWARD	Whether the parameter has crossed the threshold while rising or falling.

6.4.9.1.3 When generated

The convergence function is responsible for monitoring network performance. If the monitored parameters cross the configured threshold, this event is generated to inform higher layer protocols.

6.4.9.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include preparations for handover or assessing whether handover should be imminent.

6.4.10 Network command interface

6.4.10.1 MSGCF-ESS-LINK-COMMAND.request

6.4.10.1.1 Function

This primitive requests that a STA take action for a network.

6.4.10.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSGCF-ESS-LINK-COMMAND.request(
ESSIdentifier,
CommandType
)

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
CommandType	Enumerated	DISCONNECT, LOW_POWER, POWER_UP, POWER_DOWN, SCAN	Type of command to perform on the link as described in the following subclauses.

6.4.10.1.3 When generated

This primitive is generated by a higher layer protocol.

6.4.10.1.4 Effect of receipt

The convergence function issues commands to the SME to implement the requested action on behalf of higher layers.

When the DISCONNECT command type is specified, the higher layer is requesting that the STA disconnect from its peer. When the SME on a non-AP STA receives this command, the SME issues an MLME-DEAUTHENTICATE.request primitive to disconnect from the network, and the SME refrains from reconnecting to that network.

When the POWER_DOWN command type is specified, the SME powers down the non-AP STA. Before doing so, it may choose to notify the AP.

When the POWER_UP command type is specified, the SME starts the non-AP STA.

When the LOW_POWER command type is specified, the higher layer is requesting that the interface be placed in a low power mode. This action is accomplished by issuing an MLME-POWERMGT.request primitive with the PowerManagementMode parameter set to POWER_SAVE.

When the SCAN command type is specified, the higher layer is requesting that the STA search for networks. This action is accomplished by issuing an MLME-SCAN.request primitive. Detected networks are made available in the dot11MACStateESSLinkDetectedTable, as well as through the MSGCF-ESS-LINK-DETECTED.indication primitive.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.4.11 MAC state SME SAP—mobility management

6.4.11.1 MSSME-ESS-LINK-GOING-DOWN.indication

6.4.11.1.1 Function

This primitive indicates that the SME is predicting a link failure.

6.4.11.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSSME-ESS-LINK-GOING-DOWN.indication(
ESSIdentifier,
TimeInterval,
ReasonCode
)

Name	Type	Valid range	Description
NonAPSTAMac Address	MAC address	Any valid individual MAC address	The MAC address of the non-AP STA that is reporting that an ESS is expected to go down.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
TimeInterval	Integer	N/A	Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by *TimeInterval*.
Reason Code	Enumerated	EXPLICIT_DISCONNECT, LINK_PARAMETER_DEGRADATION, KEY_EXPIRATION, LOW_POWER, QOS_UNAVAILABLE, VENDOR_SPECIFIC	Indicates the reason the link is expected to go down.

6.4.11.1.3 When generated

This notification is generated by the SME when the network connection is currently established and is expected to go down. The details of the predictive algorithm used are beyond the scope of this standard. One method of implementing this function would be to generate this indication when link quality is fading and no better AP can be found.

6.4.11.1.4 Effect of receipt

This indication is received by the MSGCF and is used to generate the MSGCF-ESS-LINK-DOWN.indication primitive due to link parameter degradation.

6.5 PLME SAP interface

6.5.1 General

The PHY management service interface consists of the generic PLMEGET and PLMESET primitives on PHY MIB attributes, as described previously, together with the PLME-RESET and PLME-CHARACTERISTICS primitives and the following specific primitives.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.5.2 PLME-RESET.request

6.5.2.1 Function

This primitive is a request by the SME to reset the PHY. The PHY is always reset to the receive state to avoid accidental data transmission.

6.5.2.2 Semantics of the service primitive

This primitive has no parameters.

6.5.2.3 When generated

This primitive is generated at any time to reset the PHY.

6.5.2.4 Effect of receipt

Receipt of this primitive by the PHY causes the PHY entity to reset both the transmit and the receive state machines and places the PHY into the receive state.

6.5.3 PLME-CHARACTERISTICS.request

6.5.3.1 Function

This primitive is a request by the SME to provide the PHY operational characteristics.

6.5.3.2 Semantics of the service primitive

This primitive has no parameters.

6.5.3.3 When generated

This primitive is generated by the SME, at initialization time, to request the PHY entity to provide its operational characteristics.

6.5.3.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is the generation of a PLME-CHARACTERISTICS.confirm primitive that conveys its operational characteristics.

6.5.4 PLME-CHARACTERISTICS.confirm

6.5.4.1 Function

This primitive provides the PHY operational parameters.

6.5.4.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PLME-CHARACTERISTICS.confirm(
                                    aSlotTime,
                                    aSIFSTime,
                                    aSignalExtension,
                                    aCCATime,
```

Copyright © 2021 IEEE. All rights reserved.

aCCAMidTime,
aRxPHYStartDelay,
aRxTxTurnaroundTime,
aTxPHYDelay,
aRxPHYDelay,
aRxTxSwitchTime,
aTxRampOnTime,
aAirPropagationTime,
aMACProcessingDelay,
aRIFSTime,
aSymbolLength,
aPSDUMaxLength,
aPSDUMaxLengthWithNoAggregation,
aPPDUMaxTime,
aIUSTime,
aDTT2UTTTime,
aCWmin,
aCWmax,
aMaxCSIMatricesReportDelay
aMaxTODError,
aMaxTOAError,
aTxPHYTxStartRFDelay,
aTxPHYTxStartRMS,
aMaxTODFineError,
aMaxTOAFineError,
aAPEPMaxLengthVHTMU20,
aAPEPMaxLengthVHTMU40,
aAPEPMaxLengthVHTMU80orMore
)

The values assigned to the parameters are as specified in the PLME SAP interface specification contained within each PHY subclass of this standard. Not all parameters are used by all PHYs defined within this standard.

Name	Type	Description
aSlotTime	Integer	The slot time (in microseconds) that the MAC uses for defining IFSs. See 10.3.7.
aSIFSTime	Integer	The nominal time (in microseconds) that the MAC and PHY require in order to receive the last symbol of a frame on the WM, process the frame, and respond with the first symbol on the WM of the earliest possible response frame. See 10.3.7.
aSignalExtension	Integer	Duration (in microseconds) of the signal extension (i.e., a period of no transmission) that is included at the end of certain PPDU formats; see 19.3.2 and 10.3.8.
aCCATime	Integer	For Clause 15 to Clause 18 PHYs and Clause 20 PHYs, the maximum time (in microseconds) the CCA mechanism has available to assess the medium to determine whether the medium is busy or idle. For Clause 19 and Clause 21 PHYs, the maximum time (in microseconds) that the CCA mechanism has available to detect the start of an IEEE 802.11 transmission within the primary channel and to assess the energy on the medium within the primary, secondary, secondary40 (Clause 21 PHY only), and secondary80 (Clause 21 PHY only) channels that fall inside the operating channel, in order to determine the values of the STATE and channel-list parameters of the PHY-CCA.indication primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Description
aCCAMidTime	Integer	For Clause 21 PHYs, the maximum time (in microseconds) the CCA mechanism has available to assess the medium to determine whether an IEEE 802.11 transmission is present on a nonprimary channel.
aRxPHYStartDelay	Integer	The delay, in microseconds, from the start of the PPDU at the receiver's antenna to the issuance of the PHY-RXSTART.indication primitive.
aRxTxTurnaroundTime	Integer	The maximum time (in microseconds) that the PHY requires to change from receiving to transmitting the start of the first symbol. See 10.3.7.
aTxPHYDelay	Integer	The nominal time (in microseconds) that the PHY uses to deliver a symbol from the MAC interface to the air interface.
aRxPHYDelay	Integer	The nominal time (in microseconds) that the PHY uses to deliver the last bit of a received frame from end of the last symbol on the WM to the MAC.
aRxTxSwitchTime	Integer	The nominal time (in microseconds) that the PHY takes to switch from Receive to Transmit.
aTxRampOnTime	Integer	The maximum time (in microseconds) that the PHY takes to turn the Transmitter on.
aAirPropagationTime	Integer	Twice the propagation time (in microseconds) for a signal to cross the maximum distance between the most distant allowable STAs that are slot synchronized.
aMACProcessingDelay	Integer	The maximum time (in microseconds) available for the MAC to issue a PHY-TXSTART.request primitive pursuant to a PHY-RXEND.indication primitive (for response after SIFS) or PHY-CCA.indication(IDLE) primitive (for response at any slot boundary following a SIFS). This constraint on MAC performance is defined as a PHY-specific parameter because of its use, along with other PHY-specific time delays, in calculating the two PHY characteristics of primary concern to the MAC: aSlotTime and aSIFSTime. See 10.3.7.
aRIFSTime	Integer	Value of the reduced interframe space (in microseconds), which is the time by which multiple transmissions from a single transmitter may be separated, when no SIFS-separated response transmission is expected. See 10.3.2.3.2.
aSymbolLength	Integer	The current PHY's Symbol length (in microseconds). If the actual value of the length is not an integer number of μs, the value is rounded up to the next higher value.
aPSDUMaxLength	Integer	The maximum number of octets in a PSDU that can be conveyed by a PPDU.
aPSDUMaxLengthWithNoAggregation	Integer	The maximum number of octets in a PSDU that can be conveyed by an S1G PPDU when the Aggregation field is 0.
aPPDUMaxTime	Integer	The maximum duration of a PPDU in milliseconds.
aIUSTime	Integer	The minimum time between the end of a PSMP-UTT and the start of the following PSMP-UTT in the same PSMP sequence.
aDTT2UTTTime	Integer	The minimum time between the end of a PSMP-DTT and the start of the PSMP-UTT addressed to the same STA.
aCWmin	Integer	The minimum size of the CW, in units of aSlotTime.
aCWmax	Integer	The maximum size of the CW, in units of aSlotTime.
aMaxCSIMatricesReportDelay	Integer	The maximum time (in milliseconds) between the reception of a frame containing a CSI Feedback Request or an HT NDP announcement and the transmission of the first CSI frame containing channel state information measured from the received Sounding Complete frame. See 10.34.2.4.4.
aMaxTODError	Integer	An estimate of the maximum error (in 10 ns units) in the TX_START_OF_FRAME_OFFSET value in the PHY-TXSTART.confirm primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.
aMaxTOAError	Integer	An estimate of the maximum error (in 10 ns units) in the RX_START_OF_FRAME_OFFSET value in the PHY-RXSTART.indication primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Name	Type	Description
aTxPHYTxStartRFDelay	Integer	The delay (in units of 0.5 ns) between a PHY-TXSTART.request primitive being issued and the first frame energy sent by the transmitting port, for the current channel.
aTxPHYTxStartRMS	Integer	The RMS time of departure error (in units of 0.5 ns), where the time of departure error equals the difference between TIME_OF_DEPARTURE and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock.
aMaxTODFineError	Integer	An estimate of the maximum error (in units of picoseconds) in the TX_START_OF_FRAME_OFFSET value in the PHY-TXSTART.confirm primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.
aMaxTOAFineError	Integer	An estimate of the maximum error (in units of picoseconds) in the RX_START_OF_FRAME_OFFSET value in the PHY-RXSTART.indication primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.
aAPEPMaxLengthVHTMU20	Integer	Maximum APEP_LENGTH value allowed for 20 MHz VHT MU PPDUs.
aAPEPMaxLengthVHTMU40	Integer	Maximum APEP_LENGTH value allowed for 40 MHz VHT MU PPDUs.
aAPEPMaxLengthVHTMU80orMore	Integer	Maximum APEP_LENGTH value allowed for 80 MHz, 160 MHz, and 80+80 MHz VHT MU PPDUs.

6.5.4.3 When generated

This primitive is issued by the PHY entity in response to a PLME-CHARACTERISTICS.request primitive.

6.5.4.4 Effect of receipt

The receipt of this primitive provides the operational characteristics of the PHY entity.

6.5.5 PLME-TXTIME.request

6.5.5.1 Function

This primitive is a request for the PHY to calculate the time required to transmit onto the WM a PPDU containing a specified length PSDU, and using a specified format, data rate, and signaling.

6.5.5.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-TXTIME.request(
                                    TXVECTOR
                                    )
```

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU. The minimum required PHY parameters are listed in 8.3.4.4.

6.5.5.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to determine the time required to transmit a particular PSDU.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

6.5.5.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to generate a PHY-TXTIME.confirm primitive that conveys the required transmission time.

6.5.6 PLME-TXTIME.confirm

6.5.6.1 Function

This primitive indicates the time required to transmit the PPDU described in the corresponding PLME-TXTIME.request primitive.

When the TXVECTOR parameter FORMAT in the corresponding PLME-TXTIME.request primitive is VHT, the primitive also provides the number of octets, per user, required to fill the PPDU.

6.5.6.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-TXTIME.confirm(
                        TXTIME
                        PSDU_LENGTH[]
                        )
```

The TXTIME represents the time, in microseconds, required to transmit the PPDU described in the corresponding PLME-TXTIME.request primitive. If the calculated time includes a fractional microsecond, a non-DMG STA rounds the TXTIME value to the next higher integer. A DMG STA does not round the TXTIME value up or down (see 20.11.3).

The PSDU_LENGTH[] parameter is an array of size TXVECTOR parameter NUM_USERS. Each value in the array indicates the number of octets required to fill the PPDU for the user represented by that array index. The parameter is present only when the TXVECTOR FORMAT parameter is VHT.

6.5.6.3 When generated

This primitive is issued by the local PHY entity in response to a PLME-TXTIME.request primitive.

6.5.6.4 Effect of receipt

The receipt of this primitive provides the MAC sublayer with the PPDU transmission time.

7. DS SAP specification

7.1 Introduction

The DS SAP is the interface between the DS SAP service users and the DS SAP service provider. The DS SAP service users are the connected APs, mesh gates, and the portal. The DS SAP service provider is the DS. Figure 7-1 shows the location of the DS in the IEEE 802.11 architecture. The DS SAP is indicated in this Figure by the lines connecting the DS to its service users. In Figure 7-1, the DS has four users, two APs, a mesh gate, and a portal, so the DS is shown passing behind the MAC/PHYs of the STAs.

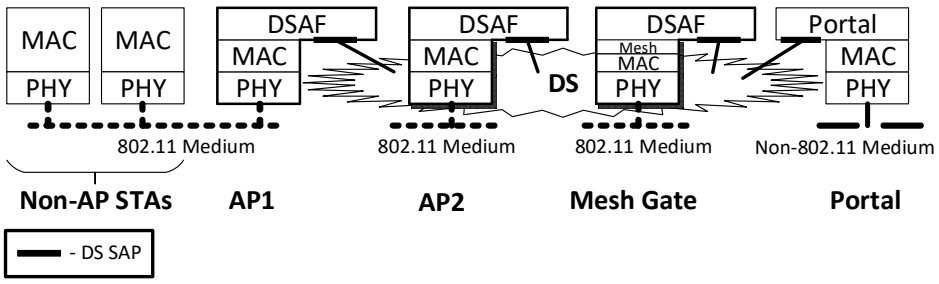

Figure 7-1—DS architecture

The DS SAP interface specification describes the primitives required to get MAC service tuples in and out of the DS and update the DS's mapping of STAs to APs or to mesh gates. Describing the DS itself or the functions thereof is out of scope of this standard.

The DS SAP actions are as follows:

a) Accept MSDUs (as part of MAC service tuples) from APs, mesh gates, and the portal.
b) Deliver MSDUs (as part of MAC service tuples) to APs, mesh gates, or the portal.
c) Accept STA-to-AP mapping updates from the APs.
d) Accept STA-to-mesh gate mapping updates from the mesh gates.

When the DS delivers the MAC service tuples to an AP, the AP then determines when and how to deliver the MAC service tuples to the AP's MAC (via the MAC SAP). When the DS delivers the MAC service tuples to a mesh gate, the mesh gate then determines when and how to deliver the MAC service tuples to the mesh gate's MAC (via the MAC SAP).

7.2 SAP primitives

7.2.1 General

The DS SAP service interface primitives are as follows:

a) DS-UNITDATA.request
b) DS-UNITDATA.indication
c) DS-STA-NOTIFY.request

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

7.2.2 MSDU transfer

7.2.2.1 General

The DS-UNITDATA primitives accept and deliver IEEE 802.11 MAC service tuples, including all of the parameters and data as defined in 5.2.3.2.

7.2.2.2 DS-UNITDATA.request

7.2.2.2.1 Function

This primitive requests distribution of a MAC service tuple across the DS.

7.2.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

DS-UNITDATA.request(
MAC service tuple,
SourceType
)

Name	Type	Valid range	Description
MAC service tuple	IEEE 802.11 MSDU	Any valid data unit according to 5.2.3.2, including data and all parameters	Specifies the MAC service tuple to be distributed via the DS.
SourceType	Enumeration	SRC_AP, SRC_MESH_GATE, SRC_PORTAL	Specifies the type of entity that is requesting distribution of a MAC service tuple.

7.2.2.2.3 When generated

This primitive is generated by an AP, mesh gate, or portal to submit a MAC service tuple to the DS for distribution.

7.2.2.2.4 Effect of receipt

This primitive initiates distribution of the MAC service tuple through the DS. An individually addressed MAC service tuple from an AP, mesh gate, or portal is distributed through the DS to the corresponding AP, mesh gate, or portal. A group addressed MAC service tuple from an AP is distributed to all APs, mesh gates, and the portal, including the originating entity. A group addressed MAC service tuple from a portal is distributed to all APs and mesh gates.

7.2.2.3 DS-UNITDATA.indication

7.2.2.3.1 Function

This primitive indicates delivery of a MAC service tuple from the DS to an AP, mesh gate, or portal.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

7.2.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

DS-UNITDATA.indication(
MAC service tuple
)

Name	Type	Valid range	Description
MAC service tuple	IEEE 802.11 MSDU	Any valid data unit according to 5.2.3.2, including data and all parameters	Specifies the MAC service tuple that is being delivered by the DS.

7.2.2.3.3 When generated

This primitive is generated by the DS to deliver a MAC service tuple to an AP, mesh gate, or portal.

7.2.2.3.4 Effect of receipt

This primitive delivers a MAC service tuple to an AP, mesh gate, or portal.

7.2.3 Mapping updates

7.2.3.1 General

The DS-STA-NOTIFY primitive is used to maintain the STA-to-AP and mesh STA-to-mesh gate mapping data of the DS.

7.2.3.2 DS-STA-NOTIFY.request

7.2.3.2.1 Function

This primitive requests an update to the DS's STA-to-AP map or mesh STA-to-mesh gate map.

7.2.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

DS-STA-NOTIFY.request(
STAAddress,
UpdateType
)

Name	Type	Valid range	Description
STAAddress	MACAddress	Any valid individual MAC address	When generated by an AP, specifies the address of the STA whose association status with the AP has changed. When generated by a mesh gate, specifies the address of the mesh STA whose reachability status through the mesh gate has changed.
UpdateType	Enumeration	ADD, MOVE, DELETE	Specifies the DS mapping update operation to be performed.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

7.2.3.2.3 When generated

This primitive is generated by an AP or mesh gate to update the DS's STA-to-AP map or mesh STA-to-mesh gate map.

7.2.3.2.4 Effect of receipt

When generated by an AP, this primitive updates the DS's STA-to-AP map, which controls to which AP the DS delivers MAC service tuples that are destined for a given STA.

When generated by a mesh gate, this primitive updates the DS's mesh STA-to-mesh gate map, which controls to which mesh gate the DS delivers MAC service tuples that are destined for a given mesh STA. The mesh STA-to-mesh gate map can be incomplete.

There are many mechanisms to implement this mapping update for the cases of ADD and MOVE. One example mechanism, in the case where the DS is an IEEE 802 LAN, is to use an IEEE 802.2™ XID null frame.

8. PHY service specification

8.1 Scope of PHY services

The PHY services provided to the MAC are described in this clause. Different PHYs are defined as part of this standard. Each PHY can consist of the following protocol functions:

a) A function that defines a method of mapping the MPDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs.

b) A function that defines the characteristics of, and method of transmitting and receiving data through, a WM between two or more STAs.

8.2 PHY functions

The protocol reference model for the IEEE 802.11 architecture is shown in Figure 4-24 (in 4.9). Most PHY definitions contain two functional entities: the PHY function and the layer management function.

The PHY service is provided to the MAC entity at the STA through a SAP, called the *PHY SAP*, as shown in Figure 4-24.

8.3 Detailed PHY service specifications

8.3.1 Scope and field of application

The services provided by the PHY to the MAC are specified in this subclause. These services are described in an abstract way and do not imply any particular implementation or exposed interface.

8.3.2 Overview of the service

The function of the PHY is to provide a mechanism for transferring MPDUs between two or more STAs.

8.3.3 Overview of interactions

The primitives associated with communication between the MAC sublayer and the PHY fall into two basic categories:

a) Service primitives that support MAC peer-to-peer interactions

b) Service primitives that have local significance and support sublayer-to-sublayer interactions

8.3.4 Basic service and options

8.3.4.1 PHY SAP peer-to-peer service primitives

Table 8-1 indicates the primitives for peer-to-peer interactions.

Table 8-1—PHY SAP peer-to-peer service primitives

Primitive	Request	Indication	Confirm
PHY-DATA	X	X	X

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

8.3.4.2 PHY SAP inter-(sub)layer service primitives

Table 8-2 indicates the primitives for sublayer-to-sublayer interactions.

Table 8-2—PHY SAP inter-(sub)layer service primitives

Primitive	Request	Indication	Confirm
PHY-TXSTART	X		X
PHY-TXEND	X		X
PHY-CCARESET	X		X
PHY-CCA		X	
PHY-RXSTART		X	
PHY-RXEND		X	
PHY-CONFIG	X		X
PHY-TXHEADEREND		X	

8.3.4.3 PHY SAP service primitives parameters

Table 8-3 shows the parameters used by one or more of the PHY SAP service primitives.

Table 8-3—PHY SAP service primitive parameters

Parameter	Associated primitive	Value
DATA	PHY-DATA.request PHY-DATA.indication	Octet value X'00'–X'FF'
TXVECTOR	PHY-TXSTART.request	A set of parameters
STATE	PHY-CCA.indication	(BUSY, [channel-list]) (IDLE)
RXVECTOR	PHY-RXSTART.indication	A set of parameters
RCPI	PHY-RXEND.indication	Clauses 15–19 and 21–23: 0–255; Clauses 20, 24, and 25: not present
RXERROR	PHY-RXEND.indication	NoError, FormatViolation, CarrierLost, UnsupportedRate, Filtered
IPI-STATE	PHY-CCARESET.request PHY-CCARESET.confirm	IPI-ON, IPI-OFF
IPI-REPORT	PHY-CCA.indication PHY-CCARESET.confirm	A set of IPI values for the preceding time interval

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 8-3—PHY SAP service primitive parameters *(continued)*

Parameter	Associated primitive	Value
PHYCONFIG_VECTOR	PHY-CONFIG	A set of parameters
TXSTATUS	PHY-TXSTART.confirm	A set of parameters
USER_INDEX	PHY-DATA.request	0 to TXVECTOR parameter NUM_USERS – 1

8.3.4.4 Vector descriptions

Several service primitives include a parameter vector. This vector is a list of parameters that may vary depending on the PHY type. Table 8-4 lists the minimum parameter values required by the MAC or PHY in each of the parameter vectors.

Table 8-4—Vector descriptions

Parameter	Associated vector	Value
DATARATE	TXVECTOR, RXVECTOR	PHY dependent. The name of the field used to specify the Tx data rate and report the Rx data rate may vary for different PHYs.
LENGTH	TXVECTOR, RXVECTOR	PHY dependent.
ACTIVE_RXCHAIN_SET	PHYCONFIG_VECTOR	The ACTIVE_RXCHAIN_SET parameter indicates which receive chains of the available receive chains are active.
OPERATING_CHANNEL	PHYCONFIG_VECTOR	The operating channel the PHY is configured use.
SECONDARY_CHANNEL_OFFSET	PHYCONFIG_VECTOR	Enumerated type: SECONDARY_CHANNEL_NONE indicates operation in 20 MHz HT STAs. SECONDARY_CHANNEL_ABOVE indicates operation in 40 MHz with the secondary channel above the primary. SECONDARY_CHANNEL_BELOW indicates operation in 40 MHz with the secondary channel below the primary.
ANT_CONFIG	PHYCONFIG_VECTOR	Indicates which antenna configuration(s) is to be used when receiving PPDUs and which configuration is to be used when switching configurations during the reception of a PPDU. Values are implementation dependent.
GROUP_ID_MANAGEMENT	PHYCONFIG_VECTOR	Specifies membership status and STA position for each of the group IDs as described in 9.6.22.3.
PARTIAL_AID_LIST_GID00	PHYCONFIG_VECTOR	For a non-S1G STA, includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 0. The settings of the PARTIAL_AID are specified in 10.19). For an S1G STA, includes the list of partial AIDs, of which the S1G STA is an intended recipient, in which a frame is addressed to an AP. The settings of the PARTIAL_AID are specified in 10.21.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 8-4—Vector descriptions *(continued)*

Parameter	Associated vector	Value
PARTIAL_AID_LIST_GID63	PHYCONFIG_VECTOR	For a non-S1G STA, includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 63. The settings of the PARTIAL_AID are specified in 10.19). For an S1G STA, includes the list of partial AIDs, of which the S1G STA is an intended recipient, in which a frame is addressed to a non-AP STA. The settings of the PARTIAL_AID are specified in 10.21.
LISTEN_TO_GID00	PHYCONFIG_VECTOR	When true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to the value 0.
LISTEN_TO_GID63	PHYCONFIG_VECTOR	When true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to the value 63.
CCA_SENSITIVITY_TYPE	PHYCONFIG_VECTOR	Enumerated type: CCA_SENSITIVITY_TYPE_1 indicates that the PHY issues a PHY-CCA.indication primitive based on the CCA conditions listed in Table 23-36 and 23.3.18.5.5. CCA_SENSITIVITY_TYPE_2 indicates that the PHY issues a PHY-CCA.indication primitive based on the CCA conditions listed in Table 23-37 and 23.3.18.5.5. CCA_SENSITIVITY_TYPE_2_WIDEBAND indicates that the PHY issues a PHY-CCA.indication primitive based on the CCA conditions listed in Table 23-36 and 23.3.18.5.5.

The Clause 19 PHY TXVECTOR and RXVECTOR contain additional parameters related to the operation of the Clause 19 PHY modes of operation as described in 19.2. In certain modes of operation, the DATARATE parameter is replaced by MCS, CH_BANDWIDTH and GI_TYPE parameters. The mapping from these values to data rate is defined in 19.5.

The Clause 21 PHY TXVECTOR and RXVECTOR contain additional parameters related to the operation of the Clause 21 PHY modes of operation as described in 21.2. In certain modes of operation, the DATARATE parameter is replaced by MCS, CH_BANDWIDTH, NUM_STS, STBC and GI_TYPE parameters. The mapping from these values to data rate is defined in 21.5, where VHT-MCS is MCS and N_{SS} is NUM_STS / (STBC + 1).

8.3.5 PHY SAP detailed service specification

8.3.5.1 Introduction

Subclause 8.3.5 describes the services provided by each PHY primitive.

8.3.5.2 PHY-DATA.request

8.3.5.2.1 Function

This primitive defines the transfer of an octet of data from the MAC sublayer to the local PHY entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

8.3.5.2.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-DATA.request(
                    DATA,
                    USER_INDEX
                    )
```

The DATA parameter is an octet of value X'00' to X'FF'.

The USER_INDEX parameter (typically identified as *u* for a VHT STA; see NOTE for MU usage at the end of Table 21-1) is present for a VHT MU PPDU and indicates the index of the user in the TXVECTOR to which the accompanying DATA octet applies; otherwise, this parameter is not present.

8.3.5.2.3 When generated

This primitive is generated by the MAC sublayer to transfer an octet of data to the PHY entity. This primitive can be issued only following a transmit initialization response (a PHY-TXSTART.confirm primitive) from the PHY.

8.3.5.2.4 Effect of receipt

The receipt of this primitive by the PHY entity causes the PHY transmit state machine to transmit an octet of data. When the PHY entity receives the octet, it issues a PHY-DATA.confirm primitive to the MAC sublayer.

8.3.5.3 PHY-DATA.indication

8.3.5.3.1 Function

This primitive indicates the transfer of data from the PHY to the local MAC entity.

8.3.5.3.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-DATA.indication(
                    DATA
                    )
```

The DATA parameter is an octet of value X'00' to X'FF'.

8.3.5.3.3 When generated

The PHY-DATA.indication primitive is generated by a receiving PHY entity to transfer the received octet of data to the local MAC entity. The time between receipt of the last bit of the last provided octet from the WM and the receipt of this primitive by the MAC entity is aRxPHYDelay.

8.3.5.3.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to collect the data octet provided by the PHY in the current receive flow (see Figure 5-1).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

8.3.5.4 PHY-DATA.confirm

8.3.5.4.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the transfer of data from the MAC entity to the PHY.

8.3.5.4.2 Semantics of the service primitive

The semantics of the primitive are as follows:
PHY-DATA.confirm

This primitive has no parameters.

8.3.5.4.3 When generated

This primitive is issued by the PHY to the MAC entity when the transfer of data from the MAC entity to the PHY has completed. The PHY issues this primitive in response to every PHY-DATA.request primitive issued by the MAC sublayer.

8.3.5.4.4 Effect of receipt

The receipt of this primitive by the MAC causes the MAC to start the next MAC entity request.

8.3.5.5 PHY-TXSTART.request

8.3.5.5.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to start the transmission of a PSDU.

8.3.5.5.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-TXSTART.request(
                    TXVECTOR
                    )
```

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU. The minimum required PHY parameters are listed in 8.3.4.4.

See 1.4 for interpretation of references to frames, MPDUs, A-MPDUs and PPDUs being transmitted with a certain TXVECTOR.

8.3.5.5.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to begin the transmission of a PSDU.

8.3.5.5.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to start the local transmit state machine.

The behavior expected by the MAC pursuant to the issuance of PHY-TXSTART.request primitive is shown in Figure 10-21 (in 10.3.7) and Figure 10-25.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

8.3.5.6 PHY-TXSTART.confirm

8.3.5.6.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the start of a transmission and to indicate parameters related to the start of the transmission. The PHY issues this primitive in response to every PHY-TXSTART.request primitive issued by the MAC sublayer.

8.3.5.6.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXSTART.confirm(
                    TXSTATUS
                    )
```

The TXSTATUS represents a list of parameters that the local PHY entity provides to the MAC sublayer related to the transmission of a PPDU. The list of parameters is PHY-dependent.

8.3.5.6.3 When generated

This primitive is issued by the PHY to the MAC entity once all of the following conditions are met:

— The PHY has received a PHY-TXSTART.request primitive from the MAC entity.
— The PHY is ready to begin accepting outgoing data octets from the MAC.

If dot11TODImplemented and dot11TODActivated are both true or dot11TimingMsmtActivated is true; and the parameter TIME_OF_DEPARTURE_REQUESTED in the TXVECTOR specified in the PHY-TXSTART.request primitive is true, then the PHY shall include the TIME_OF_DEPARTURE corresponding to the time when the first frame energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameters in the TXSTATUS, if the PHY includes these parameters in the TXSTATUS.

If dot11TimingMsmtActivated is true, then the PHY shall include TX_START_OF_FRAME_OFFSET in the TXSTATUS, if the PHY includes this parameter in the TXSTATUS.

8.3.5.6.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to start the transfer of data octets. Parameters in the TXSTATUS can be included in transmitted MPDUs. See Annex P for use of TXSTATUS parameters for timing.

8.3.5.7 PHY-TXEND.request

8.3.5.7.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity that the current transmission of the PSDU be completed.

8.3.5.7.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXEND.request
```

This primitive has no parameters.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

8.3.5.7.3 When generated

This primitive is generated when the MAC sublayer has received the last PHY-DATA.confirm primitive from the local PHY entity for the PSDU currently being transferred.

8.3.5.7.4 Effect of receipt

The effect of receipt of this primitive by the local PHY entity is to stop the transmit state machine.

8.3.5.8 PHY-TXEND.confirm

8.3.5.8.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the completion of a transmission. The PHY issues this primitive in response to every PHY-TXEND.request primitive issued by the MAC sublayer.

8.3.5.8.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXEND.confirm(
                        SCRAMBLER_OR_CRC
                        )
```

The SCRAMBLER_OR_CRC parameter is present if dot11S1GOptionImplemented is true. The value of SCRAMBLER_OR_CRC parameter depends on the type of the transmitted frame:

- When transmitting a PPDU that is not an NDP CMAC PPDU, the value of the SCRAMBLER_OR_CRC parameter is the Scrambler Initialization value in the Service field after scrambling (i.e., [B0:B6] of the Service field]) (as defined in 23.3.9.2) of the frame.
- When transmitting an NDP CMAC PPDU, the value of the SCRAMBLER_OR_CRC parameter is the calculated CRC value in the SIG/SIG-A field (as defined in 23.3.8.2.2.6) as follows:
  - When the frame is an NDP_1M CMAC frame, the value of SCRAMBLER_OR_CRC parameter is equal to [B26:B29] of the SIG field.
  - When the frame is an NDP_2M CMAC frame, the value of SCRAMBLER_OR_CRC parameter is equal to [B38:B41] of the ≥2 MHz SIG-A field.

8.3.5.8.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received a PHY-TXEND.request primitive immediately after transmitting the end of the last bit of the last data octet indicating that the symbol containing the last data octet has been transferred and any signal extension has expired.

8.3.5.8.4 Effect of receipt

The receipt of this primitive by the MAC entity provides the time reference for the contention backoff protocol.

8.3.5.9 PHY-TXHEADEREND.indication

8.3.5.9.1 Function

This primitive indicates the transmission completion of the PHY header to the local MAC entity.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

8.3.5.9.2 Semantics of the service primitive

The semantics of the primitive are as follows:

PHY-TXHEADEREND.indication

This primitive has no parameters.

8.3.5.9.3 When generated

The PHY-TXHEADEREND.indication primitive is generated by a transmitter PHY entity at the end of transmission of the last symbol containing the PHY header.

8.3.5.9.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to record the time when this primitive is received only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding PHY-TXSTART.request primitive.

8.3.5.10 PHY-CCARESET.request

8.3.5.10.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to reset the PHY to the state appropriate for the end of a received frame and to turn IPI reporting on and off by means of the IPI-STATE parameter.

8.3.5.10.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-CCARESET.request(
                        IPI-STATE
                        )
```

The IPI-STATE parameter is present if dot11RadioMeasurementActivated is true. The IPI-STATE parameter can be one of two values: IPI-ON or IPI-OFF. The parameter value is IPI-ON when the MAC sublayer is requesting the PHY entity to report IPI values when the PHY is neither receiving nor transmitting a PPDU. IPI-ON turns on IPI reporting in the PHY entity. IPI-OFF turns off IPI reporting in the PHY entity.

8.3.5.10.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity at the end of a NAV and at a time indicated in 10.3.2.1 after each MAC slot boundary, which is described in 10.3.7 and 10.23.2.4. This request can be used by some PHY implementations that may synchronize antenna diversity with slot timings.

8.3.5.10.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to reset the PHY to the state appropriate for the end of a received frame and to initiate a new CCA evaluation cycle. If IPI-STATE parameter is IPI-ON, the PHY entity collects IPI values when it is not transmitting or receiving and provides those values to the MAC sublayer using the IPI-REPORT parameter.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

8.3.5.11 PHY-CCARESET.confirm

8.3.5.11.1 Function

This primitive is issued by the PHY to the local MAC entity to provide observed IPI values if IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive. This primitive is not issued by the PHY if IPI reporting was turned off prior to the receipt of the latest PHY-CCARESET.request primitive.

8.3.5.11.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-CCARESET.confirm(
                        IPI-REPORT
                        )
```

The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY-CCA.indication primitive, whichever occurred latest.

8.3.5.11.3 When generated

This primitive is issued by the PHY to the MAC entity when IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive.

8.3.5.11.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to collect IPI values when IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive.

8.3.5.12 PHY-CCA.indication

8.3.5.12.1 Function

This primitive is an indication by the PHY to the local MAC entity of the current state of the medium and to provide observed IPI values when IPI reporting is turned on.

8.3.5.12.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-CCA.indication(
                        STATE,
                        IPI-REPORT,
                        channel-list
                        )
```

The STATE parameter can be one of two values: BUSY or IDLE. The parameter value is BUSY if the assessment of the channel(s) by the PHY determines that the channel(s) are not available. Otherwise, the value of the parameter is IDLE.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The IPI-REPORT parameter is present if dot11RadioMeasurementActivated is true and if IPI reporting has been turned on by the IPI-STATE parameter. The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values may be used by the MAC sublayer for radio measurement purposes. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY-CCA.indication primitive, whichever occurred latest.

When STATE is IDLE or when, for the type of PHY in operation, CCA is determined by a single channel, the channel-list parameter is absent. Otherwise, it carries a set indicating which channels are busy. The channel-list parameter in a PHY-CCA.indication primitive generated by a VHT or S1G STA contains at most a single entry. Table 8-5 defines the members of this set.

Table 8-5—The channel-list parameter entries

Channel-list parameter entry	Meaning
primary	In an HT STA that is not a VHT STA, indicates that the primary channel is busy according to the rules specified in 19.3.19.5.2. In a VHT STA, indicates that the primary 20 MHz channel is busy according to the rules specified in 21.3.18.5.3. In a TVHT STA, indicates that the primary channel is busy according to the rules specified in 22.3.18.6.3.
secondary	In an HT STA that is not a VHT STA, indicates that the secondary channel is busy according to the rules specified in 19.3.19.5.5. In a VHT STA, indicates that the secondary 20 MHz channel is busy according to the rules specified in 21.3.18.5.4. In a TVHT STA, indicates that the secondary channel is busy according to the rules specified in 22.3.18.6.4.
secondary40	In a VHT STA, indicates that the secondary 40 MHz channel is busy according to the rules specified in 21.3.18.5.4. In a TVHT STA, indicates that the secondary TVHT_2W channel is busy according to the rules specified in 22.3.18.6.4.
secondary80	In a VHT STA, indicates that the secondary 80 MHz channel is busy according to the rules specified in 21.3.18.5.4.
primary1	In an S1G STA, indicates that the primary 1 MHz channel is busy according to the rules specified in 23.3.18.5.4
primary2	In an S1G STA, indicates that the primary 2 MHz channel is busy according to the rules specified in 23.3.18.5.4.
secondary2	In an S1G STA, indicates that the secondary 2 MHz channel is busy according to the rules specified in 23.3.18.5.5.
secondary4	In an S1G STA, indicates that the secondary 4 MHz channel is busy according to the rules specified in 23.3.18.5.5.
secondary8	In an S1G STA, indicates that the secondary 8 MHz channel is busy according to the rules specified in 23.3.18.5.5.

For a TVHT STA, the relationship of the channel-list parameter entries to the TVHT_4W and TVHT_2W+2W BSS operating channel is illustrated in Figure 8-4.

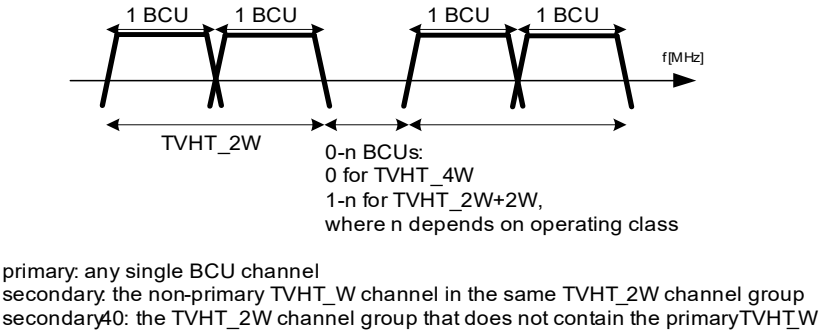

Figure 8-4—TVHT channel-list parameter entry and channel bandwidth for TVHT_4W and TVHT_2W+2W

For an S1G STA, the relationship of the channel-list parameter entries to the 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz BSS operating channel is illustrated by example Figure 8-5.

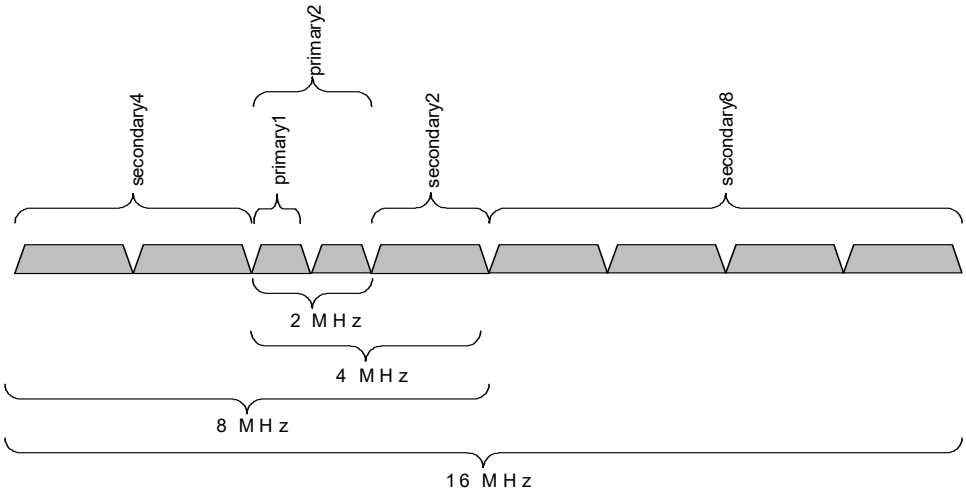

Figure 8-5—The channel-list parameter entries for the 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz channel width

8.3.5.12.3 When generated

For Clause 15 to Clause 20 PHYs, this primitive is generated within aCCATime of the occurrence of a change in the status of the primary channel from channel idle to channel busy or from channel busy to channel idle or when the entries of the channel-list parameter change. For Clause 21 and Clause 22 PHYs, this primitive is generated when the status of the channel(s) changes from channel idle to channel busy or from channel busy to channel idle or when the entries of the channel-list parameter change. This includes the period of time when the PHY is receiving data. The timing of PHY-CCA.indication primitives related to transitions on secondary channel(s) is PHY specific. Refer to specific PHY clauses for details about CCA behavior for a given PHY.

NOTE—For the VHT PHY, the timing information is omitted here and is defined in 21.3.18.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the STA is an HT STA but not a VHT STA and the operating channel width is 20 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

— In a valid SIG field if the format of the PPDU is NON_HT
— In a valid HT-SIG field if the format of the PPDU is HT_MF or HT_GF

If the STA is an HT STA but not a VHT STA and the operating channel width is 40 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

— In a valid SIG field if the format of the PPDU is NON_HT and the PPDU is received in the primary channel
— In a valid HT-SIG field if the format of the PPDU is HT_MF or HT_GF provided that the PPDU is either a 20 MHz PPDU received in the primary channel or a 40 MHz PPDU

When the PHY is supporting one or more MAC entities that are coordinated by an MM-SME, this primitive is generated upon PHY-TXSTART or PHY-TXEND actions from those MAC entities. A PHY-CCA.indication primitive with STATE set to BUSY is generated when the PHY issues a PHY-TXSTART.confirm primitive to one of the MAC entities coordinated by an MM-SME, and it is generated to all coordinated MAC entities except to the one to which it responds with the PHY-TXSTART.confirm primitive. A PHY-CCA.indication primitive with STATE set to IDLE is generated when the PHY issues a PHY-TXEND.confirm primitive to one of the MAC entities coordinated by an MM-SME, and it is generated to all coordinated MAC entities except to the one to which it responds with the PHY-TXEND.confirm primitive. The ICI-REPORT parameter of the PHY-CCA.indication primitive is set as described above. The channel-list parameter is set to indicate the channels in use per the TXVECTOR of a PHY-TXSTART.request primitive from a coordinated MAC entity, or is not present when the PHY-CCA.indication primitive is generated in response to a PHY-TXEND.confirm primitive from a coordinated MAC entity.

8.3.5.12.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to update the physical CS state, and to collect IPI values when IPI reporting was turned on.

8.3.5.13 PHY-RXSTART.indication

8.3.5.13.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PHY has received a valid start of a PPDU, including a valid PHY header.

NOTE—This primitive is not generated until the PHY has determined the PPDU format (e.g., a VHT PPDU, which starts with an HT PHY header).

8.3.5.13.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-RXSTART.indication(
                        RXVECTOR
                        )
```

The RXVECTOR represents a list of parameters that the PHY provides the local MAC entity upon receipt of a valid PHY header. The required parameters are listed in 8.3.4.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

See 1.4 for interpretation of references to frames, MPDUs, A-MPDUs and PPDUs being received with a certain RXVECTOR.

8.3.5.13.3 When generated

This primitive is generated by the local PHY entity to the MAC sublayer when the PHY has successfully validated the PHY header at the start of a new PPDU.

After generating a PHY-RXSTART.indication primitive, the PHY is expected to maintain physical medium busy status (not generating a PHY-CCA.indication(IDLE) primitive) during the period required by that PHY to transfer a frame of the indicated LENGTH at the indicated DATARATE. This physical medium busy condition should be maintained even if a PHY-RXEND.indication(CarrierLost) primitive or a PHY-RXEND.indication(FormatViolation) primitive is generated by the PHY prior to the end of this period.

8.3.5.13.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to prepare for a new receive flow (see Figure 5-1).

8.3.5.14 PHY-RXEND.indication

8.3.5.14.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PPDU currently being received is complete.

8.3.5.14.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-RXEND.indication(
                        RXERROR,
                        RCPI
                        )
```

The RXERROR parameter can convey NoError or one or more values indicating an error condition. A number of error conditions may occur after the PHY's receive state machine has detected what appears to be a valid preamble and SFD. The following describes the parameter returned for each of those error conditions:

- *NoError*. This value is used to indicate that no error occurred during the receive process in the PHY.
- *FormatViolation.* This value is used to indicate that the format of the received PPDU was in error.
- *CarrierLost.* This value is used to indicate that during the reception of the incoming PSDU, the carrier was lost and no further processing of the PSDU can be accomplished.
- *UnsupportedRate.* This value is used to indicate that during the reception of the incoming PPDU, a nonsupported date rate was detected.
- *Filtered*. This value is used to indicate that during the reception of the PPDU, the PPDU was filtered out due to a condition set in the PHYCONFIG_VECTOR.

  NOTE 1—The filtered condition might occur in a VHT STA due to GROUP_ID or PARTIAL_AID filtering in the PHY.

RCPI is a parameter included in the PHY-RXEND.indication primitive that the PHY provides the local MAC entity. If present, RCPI is a measure of the received RF power averaged over all of the receive chains in the data portion of a received frame. RCPI is an included parameter only when

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

dot11RadioMeasurementActivated is true and the PHY is not a DMG, CDMG, or CMMG PHY. The required parameters are listed in 8.3.4.4.

NOTE 2—When dot11RadioMeasurementActiviated is true, for DMG, CDMG, or CMMG PHYs, RCPI is included in the RXVECTOR parameter of the PHY-RXSTART.indication primitive instead.

8.3.5.14.3 When generated

This primitive is generated by the PHY for the local MAC entity to indicate that the receive state machine has completed a reception with or without errors. When a signal extension is present, the primitive is generated at the end of the signal extension.

In the case of an RXERROR value of NoError, the MAC uses the PHY-RXEND.indication primitive as reference for channel access timing, as shown in Figure 10-21 (in 10.3.7) and Figure 10-25.

8.3.5.14.4 Effect of receipt

The effect of receipt of this primitive is for the MAC to begin inter-frame space processing, as described in 10.3.7 and 10.23.2.4.

8.3.5.15 PHY-CONFIG.request

8.3.5.15.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to configure the PHY.

8.3.5.15.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-CONFIG.request(
                        PHYCONFIG_VECTOR
                        )
```

8.3.5.15.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity when it desires to change the configuration of the PHY.

8.3.5.15.4 Effect of receipt

The effect of receipt of this primitive by the PHY is to apply the parameters provided with the primitive and to configure the PHY for future operation.

8.4 PHY management

The MIB comprises the managed objects, attributes, actions, and notifications required to manage a STA. The definition of these managed objects, attributes, actions, and notifications, as well as their structure, is presented in Annex C.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9. Frame formats

9.1 General requirements

The format of the MAC frames is specified in this clause. A STA shall be able to properly construct a subset of the frames specified in this clause for transmission and to decode a (potentially different) subset of the frames specified in this clause upon validation following reception. The particular subset of these frames that a STA constructs and decodes is determined by the functions supported by that particular STA. A STA shall be able to validate every received frame using the frame check sequence (FCS) and to interpret certain fields from the MAC headers of all frames.

A STA shall transmit frames using only the frame formats described in Clause 9.

9.2 MAC frame formats

9.2.1 Basic components

Each frame consists of the following basic components:

a) A *MAC header*, which comprises frame control, duration, address, optional sequence control information, optional QoS Control information (QoS Data frames only), and optional HT Control fields (+HTC frames only);
b) A variable length *frame body*, which contains information specific to the frame *type* and *subtype*;
c) An *FCS*, which contains a 32-bit CRC based on ITU-T Recommendation V.42 [B55] (see 9.2.4.8).

9.2.2 Conventions

Structures defined in the MAC sublayer are described as a sequence of components (e.g., fields, subfields, elements and subelements) in specific order. Each figure and table in Clause 9 depicts the components as they appear in the MAC frame and in the order in which they are passed to the physical layer (PHY), from left to right and then from top to bottom.

Unless specified otherwise, a number in a field is encoded as an unsigned integer.

A field or subfield within the figure depiction of a frame format that includes a decimal value within parentheses indicates that this field or subfield is set to the indicated value upon transmission.

In figures, all bits within fields are numbered, from 0 to k, where the length of the field is $k + 1$ bits. Bits within numeric fields that are longer than a single bit are depicted in increasing order of significance, i.e., with the lowest numbered bit having the least significance. The octet boundaries within a field can be obtained by taking the bit numbers of the field modulo 8. Octets within numeric fields that are longer than a single octet are depicted in increasing order of significance, from lowest numbered bit to highest numbered bit. The octets in fields longer than a single octet are sent to the PHY in order from the octet containing the lowest numbered bits to the octet containing the highest numbered bits.

Any field containing a CRC is an exception to this convention and is transmitted commencing with the coefficient of the highest-order term. There are other exceptions; these are explicitly indicated in the description of the field in question.

MAC addresses are assigned as ordered sequences of bits. The Individual/Group bit is always transferred first and is bit 0 of the MAC address. Bit 47 of the MAC address is always transferred last. This is illustrated in Figure 9-1. Also see Clause 8 of IEEE Std 802-2014.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

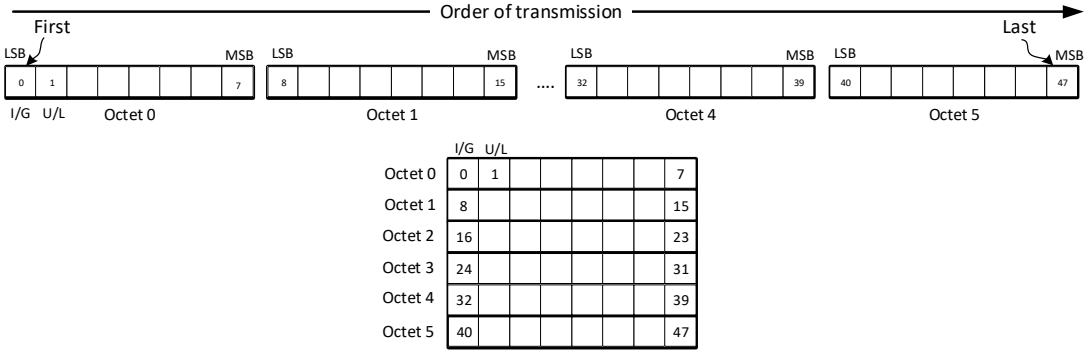

Figure 9-1—Representation of a 48-bit MAC address

A MAC address can be represented using hexadecimal values separated by hyphens, as described in IEEE Std 802.

Organizationally Unique Identifiers (OUIs), Company IDs (CIDs), and Organization Identifiers are specified in two forms: an ordered sequence of octets, and a numeric form. Treating the OUI, CID, or Organization Identifier as an ordered sequence of octets, the leftmost octet is always transferred first. This is equivalent to transmitting the most significant octet of the numeric form first.

Values specified in decimal are coded in natural binary unless otherwise stated. The values in Table 9-1 are in binary, with the bit assignments shown in the table. Values in other tables are shown in decimal notation.

ASCII and UTF-8 strings are defined in 1.4.

For evaluation purposes a nonce is interpreted as a sequence of octets with the most significant octet first and the most significant bit of an octet first.

Reception, in references to frames or fields within frames (e.g., received Beacon frames or a received Duration/ID field), applies to MPDUs indicated from the PHY without error and validated by FCS within the MAC sublayer. Without further qualification, *reception* by the MAC sublayer implies that the frame contents are valid, and that the protocol version is supported (see 9.2.4.1.2), with no implication regarding frame addressing or regarding whether the frame type or other fields in the MAC header are meaningful to the MAC entity that receives the frame.

A frame that contains the HT Control field is referred to as a *+HTC frame*. A Control Wrapper frame is a +HTC frame.

A QoS Data frame that is transmitted by a mesh STA is referred to as a *mesh Data frame*.

NOTE 1—Subclause 9.2.4.1.4 constrains the setting of the From DS and To DS subfields in mesh Data frames.

Parentheses enclosing portions of names or acronyms are used to designate a set of related names that vary based on the inclusion of the parenthesized portion. For example,

— *QoS +CF-Poll frame* refers to the three QoS data subtypes that include "+CF-Poll": the QoS Data +CF-Poll frame, subtype 1010; QoS Data +CF-Ack +CF-Poll frame, subtype 1011; and QoS CF-Ack +CF-Poll frame, subtype 1111.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— *QoS CF-Poll frame* refers specifically to the QoS CF-Poll frame, subtype 1110.
— *QoS (+)CF-Poll frame* refers to all four QoS data subtypes with CF-Poll: the QoS CF-Poll frame, subtype 1110; the QoS CF-Ack +CF-Poll frame, subtype 1111; the QoS Data +CF-Poll frame, subtype 1010; and the QoS Data +CF-Ack +CF-Poll frame, subtype 1011.
— *QoS (+)Null frame* refers to all three QoS data subtypes with an empty frame body: the QoS Null frame, subtype 1100; the QoS CF-Poll frame, subtype 1110; and the QoS CF-Ack +CF-Poll frame, subtype 1111.
— *QoS +CF-Ack frame* refers to the three QoS data subtypes that include "+CF-Ack": the QoS Data +CF-Ack frame, subtype 1001; QoS Data +CF-Ack +CF-Poll frame, subtype 1011; and QoS CF-Ack +CF-Poll frame, subtype 1111.
— (NDP) CTS refers to CTS and NDP CTS.
— (NDP) CF-End refers to CF-End and NDP CF-End.
— (NDP) PS-Poll refers to PS-Poll and NDP PS-Poll.
— (NDP) Ack refers to Ack and NDP Ack.
— NDP (PS-Poll-)Ack refers to NDP Ack and NDP PS-Poll-Ack.
— (NDP) Block Ack refers to Block Ack and NDP Block Ack.
— PS-Poll(+BDT) refers to PS-Poll and PS-Poll+BDT.

Reserved fields and subfields defined in this clause are set to 0 upon transmission and are ignored upon reception.

NOTE 2—This applies to reserved fields and subfields in MAC headers. Reserved fields and subfields in PHY headers might be set to a nonzero value upon transmission, and might not be ignored upon reception.

Reserved field and subfield values are not used upon transmission. Upon reception of a reserved field or subfield value, the behavior is undefined.

9.2.3 General frame format

The MAC frame format comprises a set of fields that occur in a fixed order in all frames. Figure 9-2 depicts the general MAC frame format for protocol version 0 (PV0) MPDUs, and Figure 9-978 (in 9.8.2) depicts the general MAC frame format for protocol version 1 (PV1) frames. The first 2 bits of the first subfield (Protocol Version) of the Frame Control field and the last field (FCS) in Figure 9-2 are present in all PV0 MPDUs and PV1 MPDUs, including reserved types and subtypes.

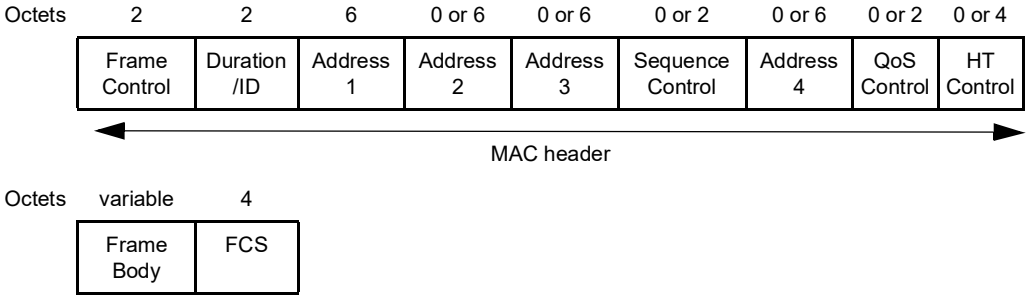

Figure 9-2—MAC frame format

For PV0 MPDUs, the first three fields (Frame Control, Duration/ID, and Address 1) and the last field (FCS) in Figure 9-2 constitute the minimal frame format and are present in all these frames, including reserved types and subtypes. The fields Address 2, Address 3, Sequence Control, Address 4, QoS Control, HT Control, and Frame Body are present only in certain frame types and subtypes. Each field is defined in 9.2.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For PV1 MPDUs, the fields constituting the minimal frame format are defined in 9.8.2. The format of each of the individual subtypes of each frame type is defined in 9.3, the format of each PV1 frame type is defined in 9.8, and the format of NDP CMAC PPDUs is defined in 23.3.12. The components of (PV0) Management frame bodies are defined in 9.4. The formats of Action frame bodies (PV0 and PV1) are defined in 9.6.

The Frame Body field is of variable size, constrained as defined in 9.2.4.7.1.

9.2.4 Frame fields

9.2.4.1 Frame Control field

9.2.4.1.1 General

The first three subfields of the Frame Control field of a PV0 frame are Protocol Version, Type, and Subtype. The remaining subfields of the Frame Control field depend on the setting of the Type and Subtype subfields.

For a frame carried in an non-S1G PPDU, when the Type subfield is not 1 or the Subtype subfield is not 6, the remaining subfields within the Frame Control field are To DS, From DS, More Fragments, Retry, Power Management, More Data, Protected Frame, and +HTC. In this case, the format of the Frame Control field is shown in Figure 9-3.

	B0 B1	B2 B3	B4 B7	B8	B9	B10	B11	B12	B13	B14	B15
	Protocol Version	Type	Subtype	To DS	From DS	More Frag-ments	Retry	Power Management	More Data	Protected Frame	+HTC
Bits:	2	2	4	1	1	1	1	1	1	1	1

Figure 9-3—Frame Control field format in non-S1G PPDUs when Type subfield is not equal to 1 or Subtype subfield is not equal to 6

For a frame carried in an non-S1G PPDU, when the Type subfield is 1 and the Subtype subfield is 6, the remaining subfields within the Frame Control field are the following: Control Frame Extension, Power Management, More Data, Protected Frame, and +HTC. In this case, the format of the Frame Control field is shown in Figure 9-4.

	B0 B1	B2 B3	B4 B7	B8 B11	B12	B13	B14	B15
	Protocol Version	Type	Subtype	Control Frame Extension	Power Management	More Data	Protected Frame	+HTC
Bits:	2	2	4	4	1	1	1	1

Figure 9-4—Frame Control field format in non-S1G PPDUs when Type subfield is equal to 1 and Subtype subfield is equal to 6

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For a frame carried in an S1G PPDU, when the Type subfield is 0 or 2, the remaining subfields within the Frame Control field are: To DS, From DS, More Fragments, Retry, Power Management, More Data, Protected Frame, and +HTC. In this case, the format of the Frame Control field is shown in Figure 9-5).

	B0 B1	B2 B3	B4 B7	B8	B9	B10	B11	B12	B13	B14	B15

Bits:	2	2	4	1	1	1	1	1	1	1	1

Figure 9-5—Frame Control field format in S1G PPDUs when Type subfield is equal to 0 or 2

When the Type subfield is equal to 3 and the Subtype subfield is equal to 1, the format of the Frame Control field is shown in Figure 9-6.

	B0 B1	B2 B3	B4 B7	B8	B9	B10	B11 B13	B14	B15
	Protocol Version	Type	Subtype	Next TBTT Present	Compressed SSID Present	ANO Present	BSS BW	Security	AP PM
Bits:	2	2	4	1	1	1	3	1	1

Figure 9-6—Frame Control field format when Type subfield is equal to 3 and Subtype subfield is equal to 1

9.2.4.1.2 Protocol Version subfield

The Protocol Version subfield is invariant in size and placement across all revisions of this standard. For this standard, the value of the protocol version is 0 for MAC frames as described in 9.2 and 1 for PV1 MAC frames as described in 9.8. All other values are reserved. The revision level is incremented only when a fundamental incompatibility exists between a new revision and the prior edition of the standard. See 10.28.2.

9.2.4.1.3 Type and Subtype subfields

The Type and Subtype subfields together identify the function of the frame. There are three frame types: control, data, and management. Each of the frame types has several defined subtypes. In Data frames, the most significant bit (MSB) of the Subtype subfield, B7, is defined as the QoS subfield. Table 9-1 defines the valid combinations of type and subtype. (The numeric values in Table 9-1 are shown in binary.)

Table 9-1—Valid type and subtype combinations

Type value B3 B2	Type description	Subtype value B7 B6 B5 B4	Subtype description
00	Management	0000	Association Request
00	Management	0001	Association Response
00	Management	0010	Reassociation Request
00	Management	0011	Reassociation Response
00	Management	0100	Probe Request
00	Management	0101	Probe Response
00	Management	0110	Timing Advertisement

Table 9-1—Valid type and subtype combinations *(continued)*

Type value B3 B2	Type description	Subtype value B7 B6 B5 B4	Subtype description
10	Data	1101	Reserved
10	Data	1110	QoS CF-Poll
10	Data	1111	QoS CF-Ack +CF-Poll
11	Extension	0000	DMG Beacon
11	Extension	0001	S1G Beacon
11	Extension	0010–1111	Reserved

Each Subtype subfield bit position is used to indicate a specific modification of the basic Data frame (subtype 0). Frame Control bit 4 is set to 1 in data subtypes that include +CF-Ack, bit 5 is set to 1 in data subtypes that include +CF-Poll, bit 6 is set to 1 in data subtypes that contain no Frame Body field, and bit 7 is set to 1 in the QoS data subtypes, which have QoS Control fields in their MAC headers.

The Control Frame Extension subtype is used to increase the subtype space by reusing bits B8–B11. These additional Control frames are defined in Table 9-2.

Table 9-2—Control Frame Extension

Type value B3 B2	Subtype value B7 B6 B5 B4	Control Frame Extension value B11 B10 B9 B8	Description
01	0110	0000	Reserved

9.2.4.1.4 To DS and From DS subfields

The meaning of the combinations of values for the To DS and From DS subfields in Data frames are shown in Table 9-3.

Table 9-3—To/From DS combinations in Data frames

To DS and From DS values	Meaning
To DS = 0 From DS = 0	A Data frame from one STA to another STA within the same IBSS or the same PBSS, a Data frame direct from one non-AP STA to another non-AP STA within the same infrastructure BSS, or a Data frame outside the context of a BSS. This is the only valid combination for Data frames transmitted by an IBSS or PBSS STA, or outside the context of a BSS.
To DS = 1 From DS = 0	A Data frame destined for the DS or being sent by a STA associated with an AP to the Port Access Entity in that AP.
To DS = 0 From DS = 1	A Data frame exiting the DS or being sent by the Port Access Entity in an AP, or a group addressed mesh Data frame with the Mesh Control field present using the three-address MAC header format. This is the only valid combination for Data frames transmitted by a non-GLK AP and group addressed Data frames transmitted by a mesh STA.
To DS = 1 From DS = 1	A Data frame using the four-address MAC header format. This standard defines procedures for using this combination of field values in mesh BSSs by S1G relays, as specified in 10.54, or by a GLK STA. This is the only valid combination for individually addressed Data frames transmitted by a mesh STA.

The meanings of the combinations of values of the Management frame To DS and From DS subfields are shown in Table 9-4.

Table 9-4—To/From DS combinations in Management frames

To DS and From DS values	Meaning
To DS = 0 From DS = 0	All non-QMF Management frames.
To DS = 1 From DS = 0	All QMF Management frames.
To DS = 0 From DS = 1	This combination is reserved.
To DS = 1 From DS = 1	This combination is reserved.

In Control frames, To DS and From DS, when present, are both zero.

NOTE—In Control frames of subtype Control Frame Extension, the To DS and From DS subfields are not defined, and their bit positions are part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.2.4.1.5 More Fragments subfield

The More Fragments subfield is set to 1 in all Data or Management frames that have another fragment of the current MSDU or current MMPDU to follow. It is set to 0 in all other frames in which the More Fragments subfield is present.

NOTE—In Control frames of subtype Control Frame Extension, the More Fragments subfield is not present, and its bit position is part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

9.2.4.1.6 Retry subfield

The Retry subfield is set to 1 in any Data or Management frame that is a retransmission of an earlier frame. It is set to 0 in all other frames in which the Retry subfield is present. A receiving STA uses this indication to aid in the process of eliminating duplicate frames. These rules do not apply for frames sent by a non-DMG STA under a block agreement.

NOTE—In Control frames of subtype Control Frame Extension, the Retry subfield is not present, and its bit position is part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

9.2.4.1.7 Power Management subfield

The Power Management subfield is used to indicate the power management mode of a STA. The subfield is either reserved (as defined below) or remains constant in each frame from a particular STA within a frame exchange sequence (see Annex G). The value indicates the mode of the STA after the successful completion of the frame exchange sequence.

In an infrastructure BSS or PBSS, the following applies:

- The Power Management subfield is valid only in frame exchanges as described in 11.2.3 and 11.2.7. In such exchanges, the Power Management subfield set to 1 indicates that the STA will be in PS mode. The Power Management subfield set to 0 indicates that the STA will be in active mode.
- The Power Management subfield is reserved in all Management frames transmitted by a STA to an AP or PCP with which it is not associated.
- The Power Management subfield is reserved in all frames transmitted by the AP.

In an IBSS, the Power Management subfield is valid only in certain frames as described in 11.2.4.4. In such frames, the Power Management subfield set to 1 indicates that the STA will be in PS mode. The Power Management subfield set to 0 indicates that the STA will be in active mode.

In an MBSS, the Power Management subfield is valid only in frame exchanges as described per the mesh power management mode transitions rules in 14.14. In such exchanges, the value indicates the STA's power management mode (see 14.14).

9.2.4.1.8 More Data subfield

The More Data subfield is used differently by a DMG, S1G, and other STAs.

A non-DMG and non-S1G STA uses the More Data subfield to indicate to a STA in PS mode that more BUs are buffered for that STA at the AP. The More Data subfield is valid in individually addressed Data or Management frames transmitted by an AP to a STA in PS mode. The More Data subfield is set to 1 to indicate that at least one additional buffered BU is present for the same STA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

An AP optionally sets the More Data subfield to 1 in Ack frames to a non-DMG and non-S1G STA from which it has received a frame that contains a QoS Capability element in which the More Data Ack subfield is equal to 1 and that has one or more ACs that are delivery enabled and that is in PS mode to indicate that the AP has a pending transmission for the STA.

A TDLS peer STA optionally sets the More Data subfield to 1 in Ack frames to a STA that has TDLS peer PSM enabled and that has the More Data Ack subfield equal to 1 in the QoS Capability element of its transmitted TDLS Setup Request frame or TDLS Setup Response frame to indicate that it has a pending transmission for the STA.

The More Data subfield is 1 in individually addressed frames transmitted by a mesh STA to a peer mesh STA that is either in light sleep mode or in deep sleep mode for the corresponding mesh peering, when additional BUs remain to be transmitted to this peer mesh STA.

The More Data subfield is set to 1 in individually addressed frames transmitted by a VHT AP to a VHT STA when both support the VHT TXOP power save feature (as determined from their VHT Capabilities elements) to indicate that at least one additional buffered BU is present for the STA. See 11.2.3.17.

A non-DMG and non-S1G STA sets the More Data subfield to 0 in all other individually addressed frames.

A non-DMG and non-S1G STA sets the More Data subfield to 1 in non-GCR-SP group addressed frames transmitted by the AP when additional group addressed bufferable units (BUs) that are not part of an active GCR-SP remain to be transmitted by the AP during this beacon interval. The More Data subfield is set to 0 in non-GCR-SP group addressed frames transmitted by the AP when no more group addressed BUs that are not part of an active GCR-SP remain to be transmitted by the AP during this beacon interval and in all group addressed frames transmitted by non-AP STAs.

An S1G STA sets the More Data subfield to 1 in individually addressed frames to indicate that the S1G STA has MSDUs, MMPDU or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP. An S1G STA does not set the More Data subfield to 1 in individually addressed frames if it does not have any MSDUs, MMPDU or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP.

An S1G AP sets the More Data subfield to 1 in group addressed frames when additional group addressed BUs remain to be transmitted by the AP during this beacon interval or short beacon interval (see 11.1.3.10.2). The S1G AP sets the More Data subfield to 0 in group addressed frames transmitted by the AP when no more group addressed BUs remain to be transmitted by the AP during this beacon interval or short beacon interval.

The More Data subfield is set to 1 in GCR-SP group addressed frames transmitted by the AP when additional group addressed BUs that are part of an active GCR-SP remain to be transmitted by the AP during this GCR-SP. The More Data subfield is set to 0 in GCR-SP group addressed frames transmitted by the AP when no more group addressed BUs that are part of an active GCR-SP remain to be transmitted by the AP during this GCR-SP.

The More Data subfield is 1 in group addressed frames transmitted by a mesh STA when additional group addressed BUs remain to be transmitted. The More Data subfield is 0 in group addressed frames transmitted by a mesh STA when no more group addressed BUs remain to be transmitted.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A DMG STA sets the More Data subfield as follows:

— In individually addressed frames, it is set to 1 to indicate that the STA has MSDUs or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP.

— It is set to 1 in group addressed frames transmitted by the AP when additional group addressed BUs remain to be transmitted by the AP during this beacon interval. The More Data subfield is set to 0 in group addressed frames transmitted by the AP when no more group addressed BUs remain to be transmitted by the AP during this beacon interval.

A DMG STA does not set the More Data bit to 1 if it does not have any MSDUs or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP.

The More Data subfield is set to 1 in individually addressed frames transmitted by a CMMG AP to a CMMG STA when both support the CMMG TXOP power save feature (as determined from their CMMG Capabilities elements) to indicate that at least one additional buffered BU is present for the STA, see 11.2.3.19.

9.2.4.1.9 Protected Frame subfield

The Protected Frame subfield is set to 1 if the Frame Body field contains information that has been processed by a cryptographic encapsulation algorithm. The Protected Frame subfield is reserved in Control frames of subtype Control Frame Extension. When the Protected Frame subfield is equal to 1, the Frame Body field is protected utilizing the cryptographic encapsulation algorithm and expanded as defined in Clause 12. The Protected Frame subfield is set to 0 in Data frames of subtype Null, QoS Null, QoS CF-Poll, and QoS CF-Ack +CF-Poll (see, for example, 12.5.2.2 and 12.5.3.1 that show that the frame body needs to be 1 octet or longer to apply the encapsulation).

9.2.4.1.10 +HTC subfield

The +HTC subfield is set as follows:

— It is set to 1 in a QoS Data or Management frame transmitted with the FORMAT parameter of the TXVECTOR set to HT_GF, HT_MF, VHT or S1G to indicate that the frame contains an HT Control field.

— It is set to 1 in an RTS frame transmitted with the FORMAT parameter of the TXVECTOR set to S1G to indicate that the intended recipient of the frame has permission to extend the TXOP as described in 10.54.5.4.

— It is set to 1 in a QoS Data or Management frame transmitted by a CMMG STA to indicate that the frame contains a CMMG variant HT Control field.

Otherwise, the +HTC subfield is set to 0.

NOTE—The +HTC subfield is always set to 0 for frames transmitted by a DMG STA.

9.2.4.1.11 Bandwidth Indication and Dynamic Indication subfields

The Bandwidth Indication subfield identifies the bandwidth of the PPDU. The Bandwidth Indication and Dynamic Indication subfields are used to negotiate the bandwidth of PPDUs within a TXOP. Table 9-5 defines the bandwidth used for exchanging PPDUs between a TXOP holder and a TXOP responder.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-5—Bandwidth Indication subfield encoding

Bandwidth Indication encoding	Meaning
0	1 MHz
1	2 MHz
2	4 MHz
3	8 MHz
4	16 MHz
5–7	Reserved

Table 9-6 indicates whether the bandwidth used for exchanging PPDUs in a TXOP is static or can change dynamically.

Table 9-6—Dynamic Indication subfield encoding

Dynamic Indication encoding	Meaning
0	Static
1	Dynamic

9.2.4.1.12 Next TWT Info Present subfield

The Next TWT Info Present subfield is set to 1 if the Next TWT Info/Suspend Duration field is present in the frame. Otherwise, it is set to 0.

9.2.4.1.13 Flow Control subfield

The Flow Control subfield is used for flow suspension signaling as described in 10.61.

9.2.4.1.14 Poll Type subfield

The Poll Type subfield is defined in Table 9-7 if the Power Management subfield is 1 in PS-Poll frame. Otherwise, the Poll Type subfield is reserved.

Table 9-7—Poll Type subfield encoding

Poll Type subfield	Description
0	Request for a buffered frame without a request to reschedule the awake/doze cycle
1	Request for the information of change sequence of the beacon and partial timestamp
2	Request for a duration to a TBTT or Next TWT to reschedule awake/doze cycle
3	Request for a duration to a service period to reschedule awake/doze cycle

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.2.4.1.15 Next TBTT Present subfield

The Next TBTT Present subfield is set to 1 if the Next TBTT field is present; otherwise, it is set to 0.

9.2.4.1.16 Compressed SSID Present subfield

The Compressed SSID Present subfield is set to 1 if the Compressed SSID field is present; otherwise, it is set to 0.

9.2.4.1.17 ANO Present subfield

The ANO Present subfield is set to 1 if the Access Network Options field is present; otherwise, it is set to 0.

9.2.4.1.18 BSS BW subfield

The BSS BW subfield indicates the minimum and the maximum operating bandwidths of the BSS as defined in Table 9-8.

Table 9-8—Frame Control field BSS BW setting

BSS BW	Minimum BSS BW (MHz)	Maximum BSS BW (MHz)
0	1	2
1	Equal to the BW of the PPDU carrying the BSS BW field	Equal to the BW of the PPDU carrying the BSS BW field
2	1	4
3	2	4
4	1	8
5	2	8
6	1	16
7	2	16

9.2.4.1.19 Security subfield

The Security subfield is set to 1 if the AP is an RSNA AP.

9.2.4.1.20 AP-PM subfield

The AP-PM subfield indicates whether the AP can go to Power Save mode until the next TBTT or TSBTT. If the AP-PM subfield is equal to 1, the AP can go to Power Save mode until the next TBTT or TSBTT unless otherwise is indicated by restricted access windows (RAWs) or TWTs. If the AP-PM subfield is equal to 0, the AP does not go to Power Save mode until the next TBTT or TSBTT.

9.2.4.2 Duration/ID field

The contents of the Duration/ID field vary with frame type and subtype, and with the QoS capabilities of the sending STA. The contents of the field are defined as follows:

a) In Control frames of subtype PS-Poll other than PS-Poll+BDT frames, and for broadcast transmissions in S1G PPDUs, the Duration/ID field carries the association identifier (AID) of the

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

STA that transmitted the frame in the 14 least significant bits (LSB), and the 2 most significant bits (MSB) both set to 1.

b) In all other frames sent by non-QoS STAs and other Control frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 9.3.

c) In Data and Management frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 9.2.5. In Extension frames the Duration/ID field contains a duration value as defined in 9.3.4.

See 10.28.3 on the processing of this field in received frames.

The encoding of the Duration/ID field is given in Table 9-9.

Table 9-9—Duration/ID field encoding

Bits 0–13	Bit 14	Bit 15	Usage
0–32 767		0	Duration value (in microseconds) within all frames except PS-Poll frames that are not PS-Poll+BDT
0–16 383	0	1	Reserved
0	1	1	AID 0 is used for broadcast transmission in S1G PPDU, reserved if not in S1G PPDU.
1–2007	1	1	AID in PS-Poll frames other than PS-Poll+BDT.
2008–8191	1	1	Additional AIDs in S1G PS-Poll frames other than PS-Poll+BDT. Reserved if not in S1G PS-Poll frames.
8192–16 383	1	1	Reserved

See also 9.7.3 on the setting of the Duration/ID field of MAC headers of MPDUs in an A-MPDU.

9.2.4.3 Address fields

9.2.4.3.1 General

There are four address fields in the MAC frame format. These fields are used to indicate the basic service set identifier (BSSID), source address (SA), destination address (DA), transmitting address (TA), and receiving address (RA). Certain frames might not contain some of the address fields.

Certain address field usage is specified by the relative position of the address field (1–4) within the MAC header, independent of the type of address present in that field. Specifically, the Address 1 field always identifies the intended receiver(s) of the frame, and the Address 2 field, where present, always identifies the transmitter of the frame.

NOTE—The Address 2 field is not equal to the MAC address of the transmitter, in the case of a bandwidth signaling TA.

9.2.4.3.2 Address representation

Each Address field contains a 48-bit address as defined in Clause 8 of IEEE Std 802-2014.

Copyright © 2021 IEEE. All rights reserved.

9.2.4.3.3 Address designation

A MAC sublayer address is one of the following two types:

a) *Individual address.* The address assigned to a particular STA on the network.

b) *Group address.* A multidestination address, which might be in use by one or more STAs on a given network. The two kinds of group addresses are as follows:

   1) *Multicast-group address.* An address associated by higher level convention with a group of logically related STAs.

   2) *Broadcast address.* A distinguished, predefined group address that always denotes the set of all STAs on a given LAN. All 1s are interpreted to be the broadcast address. This group is predefined for each communication medium to consist of all STAs actively connected to that medium; it is used to broadcast to all of the active STAs on that medium.

The address space is also partitioned into locally administered and universal (globally administered) addresses. The nature of a body and the procedures by which it administers these universal (globally administered) addresses is beyond the scope of this standard. See IEEE Std 802 for more information.

9.2.4.3.4 BSSID field

The BSSID field is of the same format as an IEEE 802 MAC address. When dot11OCBActivated is false, this field uniquely identifies each BSS. This field, in an infrastructure BSS, is the MAC address currently in use by the STA in the AP of the BSS.

This field in a PBSS is set to the MAC address of the PCP.

This field in an IBSS is set to a locally administered IEEE MAC address formed from a 46-bit random number generated according to the procedure defined in 11.1.4. The Individual/Group bit of the address is set to 0. The Universal/Local bit of the address is set to 1. This mechanism is used to provide a high probability of selecting a unique BSSID.

This field is set to all 1s to indicate the wildcard BSSID. The wildcard value is not used in the BSSID field except where explicitly permitted in this standard. When dot11OCBActivated is true, the wildcard value is used in the BSSID field. When dot11OCBActivated is false and the BSSID field contains the wildcard value, the Address 1 (DA) field is also set to all 1s to indicate the broadcast address.

9.2.4.3.5 DA field

The DA field contains an IEEE MAC individual or group address that identifies the MAC entity or entities intended as the final recipient(s) of the MSDU (or fragment thereof) or A-MSDU, as defined in 9.3.2.1, contained in the frame body field.

9.2.4.3.6 SA field

The SA field contains an IEEE MAC individual address that identifies the MAC entity from which the transfer of the MSDU (or fragment thereof) or A-MSDU, as defined in 9.3.2.1, contained in the frame body field was initiated. The Individual/Group bit is always transmitted as a 0 in the source address.

9.2.4.3.7 RA field

The RA field contains an IEEE MAC individual or group address that identifies the intended immediate recipient STA(s), on the WM, for the information contained in the frame body field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.2.4.3.8 TA field

The TA field contains an IEEE MAC address that identifies the STA that has transmitted, onto the WM, the MPDU contained in the frame body field. If the Individual/Group bit is 0, then the TA field is the individual address of the STA; otherwise, the TA field is a bandwidth signaling TA, indicating that the frame carries additional information in the scrambling sequence (see 9.3.1.2, 9.3.1.5.1, 9.3.1.7.1, 9.3.1.8.1, 9.3.1.19, 9.3.1.20, 10.6.6.6, and 10.6.12).

9.2.4.4 Sequence Control field

9.2.4.4.1 Sequence Control field structure

The Sequence Control field consists of two subfields, the Sequence Number and the Fragment Number. The format of the Sequence Control field is shown in Figure 9-7. The Sequence Control field is not present in Control frames.

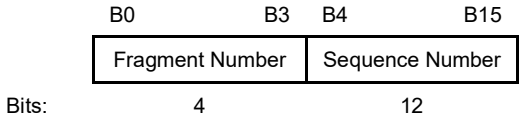

Figure 9-7—Sequence Control field format

9.2.4.4.2 Sequence Number field

Each MSDU, A-MSDU, or MMPDU is assigned a sequence number. See 10.3.2.14. Sequence numbers are not assigned to Control frames, as the Sequence Control field is not present in those frames.

The Sequence Number field in Data frames indicates the sequence number of the MSDU or A-MSDU.

The Sequence Number field in QMFs comprises the QMF Sequence Number subfield and the AC Index (ACI) subfield. The QMF Sequence Number subfield indicates the sequence number of the frame. The ACI subfield indicates the ACI of the frame. The format of the Sequence Number field in QMFs is shown in Figure 9-8.

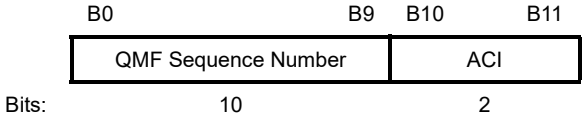

Figure 9-8—Sequence Number field format in QMFs

The ACI subfield represents the ACI of the frame as defined in 9.4.2.28.

The Sequence Number field in Management frames that are not QMFs indicates the sequence number of the frame.

Each fragment of an MSDU or MMPDU contains a copy of the sequence number assigned to that MSDU or MMPDU. The sequence number remains constant in all retransmissions of an MSDU, MMPDU, or fragment thereof, except when the MSDU is delivered via both DMS and group addressed delivery via NoAck, GCR unsolicited retry, or GCR block ack retransmission policies. In such cases, the sequence numbers assigned to the MSDUs (re)transmitted using group addressed delivery need not match the sequence number of the corresponding individually addressed A-MSDUs delivered via DMS.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.2.4.4.3 Fragment Number field

The Fragment Number field indicates the number of each fragment of an MSDU or MMPDU. The fragment number is set to 0 in the first or only fragment of an MSDU or MMPDU and is incremented by one for each successive fragment of that MSDU or MMPDU. The fragment number is set to 0 in an MPDU containing an A-MSDU, and in an MPDU containing an MSDU or MMPDU that is not fragmented. The fragment number remains constant in all retransmissions of the fragment.

9.2.4.5 QoS Control field

9.2.4.5.1 QoS Control field structure

The QoS Control field identifies the TC or TS to which the frame belongs as well as various other QoS-related, A-MSDU related, and mesh-related information about the frame that varies by frame type, subtype, and type of transmitting STA. The QoS Control field is present in all Data frames in which the QoS subfield of the Subtype subfield is equal to 1 (see 9.2.4.1.3).

When not transmitted within a DMG PPDU, each QoS Control field comprises five or eight subfields, as defined for the particular sender (HC or non-AP STA) and frame type and subtype. The usage of these subfields and the various possible layouts of the QoS Control field are described in 9.2.4.5.2 to 9.2.4.5.12 and shown in Table 9-10.

Table 9-10—QoS Control field

Applicable frame (sub)types	Bits 0–3	Bit 4	Bits 5–6	Bit 7	Bits 8	Bit 9	Bit 10	Bits 11–15
QoS CF-Poll and QoS CF-Ack +CF-Poll frames sent by HC	TID	EOSP	Ack Policy Indicator	Reserved	TXOP Limit			
QoS Data +CF-Poll and QoS Data +CF-Ack +CF-Poll frames sent by HC	TID	EOSP	Ack Policy Indicator	A-MSDU Present	TXOP Limit			
QoS Data and QoS Data +CF-Ack frames sent by HC	TID	EOSP	Ack Policy Indicator	A-MSDU Present	AP PS Buffer State			
QoS Null frames sent by HC	TID	EOSP	Ack Policy Indicator	Reserved	AP PS Buffer State			
QoS Data and QoS Data +CF-Ack frames sent in a nonmesh BSS by non-AP STAs that are not a TPU buffer STA or a TPU sleep STA	TID	0	Ack Policy Indicator	A-MSDU Present	TXOP Duration Requested			
	TID	1	Ack Policy Indicator	A-MSDU Present	Queue Size			
QoS Null frames sent in a nonmesh BSS by non-AP STAs that are not a TPU buffer STA or a TPU sleep STA	TID	0	Ack Policy Indicator	Reserved	TXOP Duration Requested			
	TID	1	Ack Policy Indicator	Reserved	Queue Size			
QoS Data and QoS Data +CF-Ack frames sent by TPU buffer STAs	TID	EOSP	Ack Policy Indicator	A-MSDU Present	Reserved			

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-10—QoS Control field *(continued)*

Applicable frame (sub)types	Bits 0–3	Bit 4	Bits 5–6	Bit 7	Bits 8	Bit 9	Bit 10	Bits 11–15
QoS Null frames sent by TPU buffer STAs	TID	EOSP	Ack Policy Indicator	Reserved	Reserved			
QoS Data and QoS Data +CF-Ack frames sent by TPU sleep STAs	TID	Reserved	Ack Policy Indicator	A-MSDU Present	Reserved			
QoS Null frames sent by TPU sleep STAs	TID	Reserved	Ack Policy Indicator	Reserved	Reserved			
All frames sent by mesh STAs in a mesh BSS	TID	EOSP	Ack Policy Indicator	A-MSDU Present	Mesh Control Present	Mesh Power Save Level	RSPI	Reserved

See 10.12.1 for constraints on the contents of the QoS Control field when present in an A-MPDU.

The format of the QoS Control field for MPDUs transmitted within a DMG PPDU is provided in Table 9-11. Data subtypes not shown in the table are not transmitted within a DMG PPDU.

Table 9-11—QoS Control field for frames transmitted within a DMG PPDU

Applicable frame (sub)types	Bits 0–3	Bit 4	Bits 5–6	Bit 7	Bit 8	Bit 9	Bits 10–13	Bit 14	Bit 15
QoS Data	TID	EOSP	Ack Policy Indicator	A-MSDU Present	A-MSDU Type	RDG/ More PPDU	Buffered AC	Reserved	AC Constraint
QoS Null	TID	EOSP	Ack Policy Indicator	Reserved	Reserved	RDG/ More PPDU	Buffered AC	Reserved	AC Constraint

9.2.4.5.2 TID subfield

The TID subfield identifies the TC or TS to which the corresponding MSDU (or fragment thereof) or A-MSDU in the Frame Body field belongs. The TID subfield also identifies the TC or TS of traffic for which a TXOP is being requested, through the setting of TXOP duration requested or queue size. The encoding of the TID subfield depends on the access policy (see 9.4.2.29) and is shown in Table 9-12. Additional information on the interpretation of the contents of this field appears in 5.1.1.3.

Table 9-12—TID subfield

Access policy	Usage	Allowed values
EDCA	UP for either TC or TS, regardless of whether admission control is required	0–7
HCCA, SPCA	TSID	8–15
HEMM, SEMM	TSID, regardless of the access mechanism used	8–15

Copyright © 2021 IEEE. All rights reserved.

In QoS Data +CF-Poll frames, the TID subfield in the QoS Control field indicates the TID of the data. In QoS (+)CF-Poll frames of subtype Null, the TID subfield in the QoS Control field indicates the TID for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA can respond with any frame (see 10.23.3.5.1). For STAs where dot11OCBActivated is true, traffic streams are not used and the TID always corresponds to a TC.

9.2.4.5.3 EOSP (end of service period) subfield

The EOSP subfield is used by the HC to indicate the end of the current service period (SP) and by a DMG STA to indicate the end of the current SP or the end of the current allocated CBAP with a destination AID that is not the broadcast AID. The HC sets the EOSP subfield to 1 in its transmission and retransmissions of the SP's final frame to end an SP and sets it to 0 otherwise. To end an SP allocation or a CBAP allocation with a destination AID that is not the broadcast AID, the DMG STA sets the EOSP subfield to 1 in its final frame transmission and retransmissions within the allocation; otherwise, the DMG STA sets the EOSP subfield to 0.

The mesh STA uses the EOSP subfield to indicate the end of the current mesh peer service period in which it operates as the owner. The mesh STA sets the EOSP subfield to 1 in its transmission and retransmissions of the mesh peer service period's final frame to end a mesh peer service period, and sets it to 0 otherwise. See 14.14.9.4 for details.

If dot11RobustAVStreamingImplemented is true, then the HC sets the EOSP subfield to 1 in a GCR-SP group addressed frame in order to indicate that no more GCR-SP frames of that group address are to be transmitted by the AP until the next scheduled SP for this GCR-SP stream.

NOTE—As GCR-A frames are sent outside of any SP, the EOSP subfield is set to 0 in a group addressed frame delivered using the GCR-A procedures described in 11.21.16.3.8.

9.2.4.5.4 Ack Policy Indicator subfield

The Ack Policy Indicator subfield, together with other information, as shown in Table 9-13, identifies the ack policy, i.e. the behavior followed upon the delivery of the MPDU.

Table 9-13—Ack policy

Ack policy	Ack Policy Indicator subfield		Other conditions	Meaning
	Bit 0	Bit 1		
Normal Ack	0	0	MPDU is a non-A-MPDU frame	Where the frame contains a fragment and both the originator and the addressed recipient support fragment BA : The addressed recipient returns an NDP BlockAck or BAT frame after a SIFS, according to the procedures defined in 10.3.2.12 and 10.47.2. Otherwise: The addressed recipient returns an Ack, STACK, or QoS +CF-Ack frame after a short interframe space (SIFS) period, according to the procedures defined in 10.3.2.11, 10.47.2, and 10.23.3.5. A non-DMG STA uses this ack policy for individually addressed QoS Null frames.

Copyright © 2021 IEEE. All rights reserved.

Table 9-13—Ack policy *(continued)*

Ack policy	Ack Policy Indicator subfield		Other conditions	Meaning
	Bit 0	Bit 1		
Implicit BAR	0	0	MPDU is not a non-A-MPDU frame NOTE—This MPDU is sent under a block ack agreement.	The addressed recipient returns a BlockAck, TACK or BAT frame, either individually or as part of an A-MPDU starting a SIFS after the PPDU carrying the frame, according to the procedures defined in 10.3.2.11, 10.25.6.5, 10.29.3, 10.29.4, 10.47.2, and 10.34.3.
No Ack	1	0	None	The addressed recipient takes no action upon receipt of the frame. More details are provided in 10.26. This ack policy is used in all individually addressed frames in which the sender does not require immediate acknowledgment. It is also used in all group addressed frames that use the QoS frame format except QoS Data frames with a TID for which a block ack agreement exists. It is not used for QoS Data frames with a TID for which a block ack agreement exists.
No Explicit Acknowledgment	0	1	Bit 6 of the Frame Control field (see 9.2.4.1.3) is equal to 1	There might be a response frame to the frame that is received, but it is neither the Ack frame nor any Data frame of subtype +CF-Ack. This ack policy is used for QoS CF-Poll and QoS CF-Ack +CF-Poll Data frames. NOTE—Bit 6 of the Frame Control field (see 9.2.4.1.3) indicates the absence of a Frame Body field in a QoS Data frame. When equal to 1, the QoS Data frame contains no Frame Body field, and any response is generated in response to a QoS CF-Poll or QoS CF-Ack +CF-Poll frame, but does not signify an acknowledgment of data.
PSMP Ack	0	1	Bit 6 of the Frame Control field (see 9.2.4.1.3) is equal to 0	The acknowledgment for a frame indicating PSMP Ack when it appears in a PSMP downlink transmission time (PSMP-DTT) is to be received in a later PSMP uplink transmission time (PSMP-UTT). The acknowledgment for a frame indicating PSMP Ack when it appears in a PSMP-UTT is to be received in a later PSMP-DTT. See 10.30.2.7.
Block Ack	1	1	None	The addressed recipient takes no action upon the receipt of the frame except for recording the state. The recipient can expect a BlockAckReq frame or implicit block ack request in the future to which it responds using the procedure described in 10.25.

9.2.4.5.5 TXOP Limit subfield

The TXOP Limit subfield is present in QoS Data frames of subtypes that include CF-Poll and specifies the time limit on a TXOP granted by a QoS (+)CF-Poll frame from an HC in an infrastructure BSS. In QoS Data frames with subtypes that include CF-Poll, the addressed STA is granted a TXOP that begins a SIFS after

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

this frame and lasts no longer than the number of 32 μs periods specified by the TXOP Limit subfield value. The range of time values is 32 μs to 8160 μs. A TXOP Limit subfield set to 0 indicates that only one MPDU or one QoS Null frame is to be transmitted immediately following the QoS (+)CF-Poll frame.

9.2.4.5.6 Queue Size subfield

The Queue Size subfield indicates the amount of buffered traffic for a given TC or TS at the STA sending this frame. The Queue Size subfield is present in QoS Data frames sent by non-AP STAs with bit 4 of the QoS Control field equal to 1. The AP might use information contained in the Queue Size subfield to determine the TXOP duration assigned to the STA.

The Queue Size subfield is set to the total size, rounded up to the nearest multiple of 256 octets and expressed in units of 256 octets, of all MSDUs and A-MSDUs buffered at the STA (excluding the MSDU or A-MSDU of the present QoS Data frame) in the delivery queue used for MSDUs and A-MSDUs with TID values equal to the value in the TID subfield of this QoS Control field. The Queue Size subfield is set to 0 to indicate the absence of any buffered traffic in the queue used for the specified TID. The Queue Size subfield is set to 254 for all sizes greater than 64 768 octets. The Queue Size subfield is set to 255 to indicate an unspecified or unknown size.

9.2.4.5.7 TXOP Duration Requested subfield

The TXOP Duration Requested subfield indicates the duration, in units of 32 μs, that the sending STA determines it needs for its next TXOP for the specified TID. The TXOP Duration Requested subfield is set to 0 to indicate that no TXOP is requested for the specified TID in the current SP. The TXOP Duration Requested subfield is set to a nonzero value to indicate a requested TXOP duration in the range 32 μs to 8160 μs in increments of 32 μs. See 10.23.3.5.2.

9.2.4.5.8 AP PS Buffer State subfield

The AP PS Buffer State subfield, defined in Figure 9-9, indicates the PS buffer state at the AP for a STA. The AP PS Buffer State subfield is further subdivided into three subfields: Buffer State Indicated, Highest Priority Buffered AC, and AP Buffered Load.

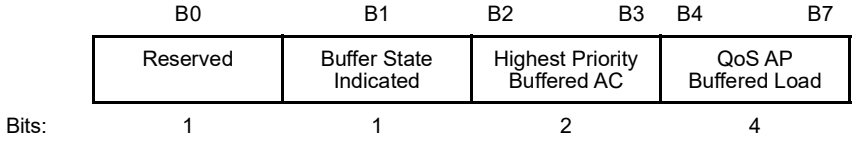

Figure 9-9—QoS AP PS Buffer State subfield format

The Buffered State Indicated subfield is used to indicate whether the AP PS buffer state is specified. This subfield is set to 1 to indicate that the AP PS buffer state is specified.

The Highest Priority Buffered AC subfield is used to indicate the AC of the highest priority traffic remaining that is buffered at the AP, excluding the MSDU or A-MSDU of the present frame.

The AP Buffered Load subfield is used to indicate the total buffer size, rounded up to the nearest multiple of 4096 octets and expressed in units of 4096 octets, of all MSDUs and A-MSDUs buffered at the QoS AP (excluding the MSDU or A-MSDU of the present QoS Data frame). An AP Buffered Load field set to 15 indicates that the buffer size is greater than 57 344 octets. An AP Buffered Load subfield set to 0 is used solely to indicate the absence of any buffered traffic for the indicated highest priority buffered AC when the Buffer State Indicated bit is 1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When the Buffered State Indicated subfield is equal to 0, the Highest Priority Buffered AC subfield and the AP Buffered Load subfield are reserved.

9.2.4.5.9 A-MSDU Present subfield

The A-MSDU Present subfield indicates the presence of an A-MSDU. The A-MSDU Present subfield is set to 1 to indicate that the Frame Body field contains an entire A-MSDU as defined in 9.3.2.2. The A-MSDU Present subfield is set to 0 to indicate that the Frame Body field contains an MSDU or fragment thereof as defined in 9.3.2.1.

NOTE—A DMG STA, when the A-MSDU Present subfield is set to 1, can use one of two A-MSDU formats in the Frame Body. The specific A-MSDU format present is indicated by the A-MSDU Type subfield.

9.2.4.5.10 Mesh Control Present subfield

The Mesh Control Present subfield indicates the presence of a Mesh Control field in the frame body. When the Mesh Control Present subfield is 1, the Frame Body field contains a Mesh Control field as defined in 9.2.4.7.3. The mesh STA sets the Mesh Control Present subfield to 1 in the mesh Data frame containing an unfragmented MSDU, an A-MSDU, or the first fragment of an MSDU.

9.2.4.5.11 Mesh Power Save Level subfield

The Mesh Power Save Level subfield indicates whether the mesh STA's peer-specific mesh power management mode will be deep sleep mode or light sleep mode after the successful completion of the frame exchange sequence.

When the Power Management subfield in the Frame Control field in the frame is 1, the following applies:

In individually addressed mesh Data frames, the Mesh Power Save Level subfield is set to of 0 to indicate that the mesh STA's peer-specific mesh power management mode for the recipient mesh STA will be light sleep mode (see 14.14.8.4). In individually addressed mesh Data frames, the Mesh Power Save Level subfield is set to 1 to indicate that the mesh STA's peer-specific mesh power management mode for the recipient mesh STA will be deep sleep mode (see 14.14.8.5).

In group addressed mesh Data frames, the Mesh Power Save Level subfield is set to 0 to indicate that none of the peer-specific mesh power management modes of the mesh STA will be deep sleep mode. In group addressed mesh Data frames, the Mesh Power Save Level subfield is set to 1 to indicate that at least one of the peer-specific mesh power management modes of the mesh STA is deep sleep mode.

The Mesh Power Save Level subfield is reserved if the Power Management subfield in the Frame Control field is 0.

9.2.4.5.12 Receiver Service Period Initiated (RSPI) subfield

The Receiver Service Period Initiated (RSPI) subfield is set to 0 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is not initiated. The subfield is set to 1 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is initiated. The use of the RSPI subfield is described in 14.14.9.2. The RSPI subfield is reserved in group addressed frames.

9.2.4.5.13 A-MSDU Type subfield

The A-MSDU Type subfield indicates the type of A-MSDU present in the Frame Body field. When the A-MSDU Type subfield is set to 0, the Frame Body field contains a Basic A-MSDU as defined in 9.3.2.2.2. When the A-MSDU Type subfield is set to 1, the Frame Body field contains a Short A-MSDU as defined in 9.3.2.2.3. The A-MSDU Type subfield is reserved if the A-MSDU Present subfield is set to 0.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.2.4.5.14 RDG/More PPDU subfield

The RDG/More PPDU subfield of the QoS Control field for DMG frames is interpreted differently depending on whether it is transmitted by a reverse direction (RD) initiator or an RD responder, as defined in Table 9-15.

9.2.4.5.15 AC Constraint subfield

The AC Constraint subfield of the QoS Control field for DMG frames indicates whether the mapped AC of an RD Data frame is constrained to a single AC, as defined in Table 9-14.

9.2.4.5.16 Buffered AC subfield

The Buffered AC subfield is a 4-bit bitmap that indicates buffered traffic for four ACs as defined in Figure 9-10. At least one BU for the indicated AC is buffered if the related subfield is 1. The Buffered AC subfield is reserved except in QoS Data frames and QoS Null frames. A non-AP and non-PCP STA can use information contained in the Buffered AC subfield to determine the ACs for which BU are buffered for it.

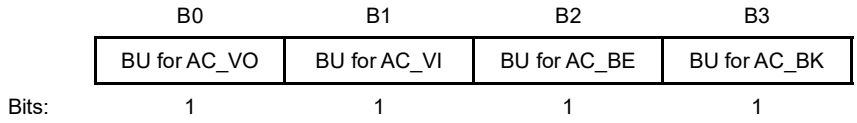

Figure 9-10—Buffered AC subfield format

9.2.4.6 HT Control field

9.2.4.6.1 General

The HT Control field is always present in a Control Wrapper frame and is present in QoS Data and Management frames as determined by the +HTC subfield of the Frame Control field as defined in 9.2.4.1.10.

NOTE 1—The only control frame subtype for which HT Control field is present is the Control Wrapper frame. A Control frame that is described as +HTC (e.g., an RTS+HTC, CTS+HTC, BlockAck+HTC or BlockAckReq+HTC frame) implies the use of the Control Wrapper frame to carry that Control frame.

The format of the HT Control field transmitted by a non-CMMG STA is shown in Figure 9-11.

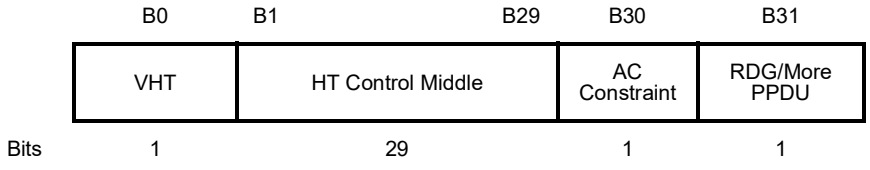

Figure 9-11—Non-CMMG variant HT Control field format

The HT Control field transmitted by a non-CMMG STA has two forms, the HT variant and the VHT variant. The two forms differ in the format of the HT Control Middle subfield, described in 9.2.4.6.2 for the HT variant and in 9.2.4.6.3 for the VHT variant and in the value of the VHT subfield.

The VHT subfield of the HT Control field indicates whether the HT Control Middle subfield is the VHT variant or the HT variant. The VHT subfield is set to 1 to indicate that the HT Control Middle subfield is the VHT variant and is set to 0 to indicate that the HT Control Middle subfield is the HT variant.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The HT Control field transmitted by a CMMG STA has one form, the CMMG variant HT Control. The format of the HT Control field transmitted by a CMMG STA is shown in Figure 9-20.

The AC Constraint subfield of the HT Control field indicates whether the mapped AC of an RD Data frame is constrained to a single AC, as defined in Table 9-14.

Table 9-14—AC Constraint subfield values

Value	Description
0	The response to a reverse direction grant (RDG) contains Data frames from any TID; see 10.29.4.
1	The response to an RDG contains Data frames only from the same AC as the last Data frame received from the RD initiator; see 10.29.4.

NOTE 2—The AC of the last Data frame received from the RD initiator is determined directly from the TID of the received frame if the TID is between 0 and 7 or from the UP field of the TSPEC identified by the TID of the received frame if the TID is between 8 and 15.

The RDG/More PPDU subfield of the HT Control field is interpreted differently depending on whether it is transmitted by an RD initiator or an RD responder, as defined in Table 9-15.

Table 9-15—RDG/More PPDU subfield values

Value	Role of transmitting STA	Interpretation of value
0	Not an RD responder	No reverse grant
	RD responder	The PPDU carrying the frame is the last transmission by the RD responder
1	RD initiator	An RDG is present
	RD responder	The PPDU carrying the frame is followed by another PPDU

9.2.4.6.2 HT variant

The format of the HT Control Middle subfield of the HT variant HT Control field is shown in Figure 9-12.

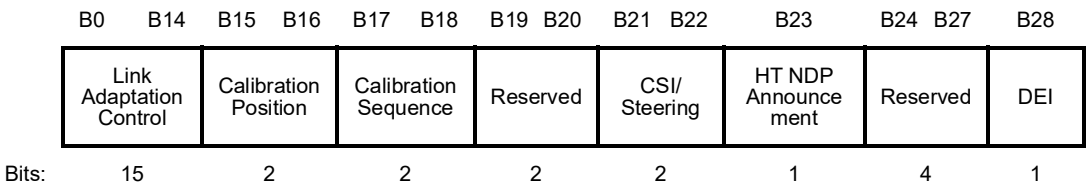

Figure 9-12—HT Control Middle subfield of the HT variant HT Control field format

The format of the Link Adaptation Control subfield of the HT variant HT Control field is defined in Figure 9-13.

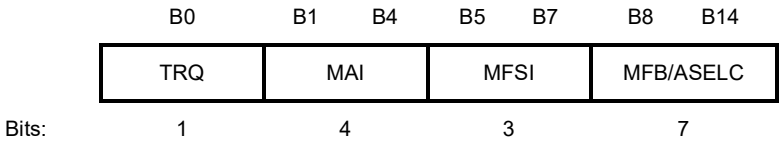

Figure 9-13—Link Adaptation Control subfield format

The subfields of the Link Adaptation Control subfield are defined in Table 9-16.

Table 9-16—Subfields of Link Adaptation Control subfield

Subfield	Meaning	Definition
TRQ	Training request	Set to 1 to request the responder to transmit a sounding PPDU. Set to 0 to indicate that the responder is not requested to transmit a sounding PPDU. See 10.34.2 and 10.36.2.
MAI	MCS request (MRQ) or ASEL indication	Set to 14 (indicating ASELI) to indicate that the MFB/ASELC subfield is interpreted as ASELC. Otherwise, the MAI subfield is interpreted as shown in Figure 9-14, and the MFB/ASELC subfield is interpreted as MCS feedback (MFB).
MFSI	MCS feedback sequence identifier	Set to the received value of MSI contained in the frame to which the MFB information refers. Set to 7 for unsolicited MFB.
MFB/ASELC	MCS feedback and antenna selection command/data	When the MAI subfield is equal to the value ASELI, this subfield is interpreted as defined in Figure 9-15 and Table 9-18. Otherwise, this subfield contains recommended MFB. Set to 127 to indicate that no feedback is present.

The structure of the MAI subfield of the Link Adaptation Control subfield is defined in Figure 9-14. The subfields of the MAI subfield are defined in Table 9-17.

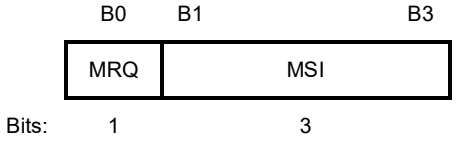

Figure 9-14—MAI subfield format

Table 9-17—Subfields of the MAI subfield

Subfield	Meaning	Definition
MRQ	MCS request	Set to 1 to indicate that MFB is requested. Set to 0 to indicate that no MFB is requested.
MSI	MRQ sequence identifier	When the MRQ subfield is equal to 1, the MSI subfield contains a sequence number in the range 0 to 6 that identifies the specific request. When the MRQ subfield is equal to 0, the MSI subfield is reserved.

The ASELC subfield of the Link Adaptation Control subfield contains the ASEL Command and ASEL Data subfields, as shown in Figure 9-15. The encoding of these subfields is shown in Table 9-18.

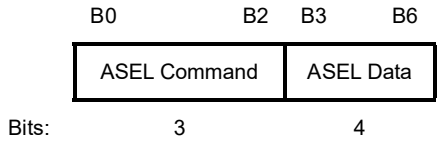

Figure 9-15—ASELC subfield format

Table 9-18—ASEL Command and ASEL Data subfields

ASEL Command	Interpretation of ASEL Command	ASEL Data
0	Transmit Antenna Selection Sounding Indication (TXASSI)	Number of remaining sounding PPDUs to be transmitted See NOTE
1	Transmit Antenna Selection Sounding Request (TXASSR) or Transmit ASEL Sounding Resumption	0 when the command is Transmit ASEL Sounding Request A number in the range 1 to 15, the number being the number of the first sounding PPDU to be transmitted when the command is Transmit ASEL Sounding Resumption, where 0 corresponds to the first sounding PPDU in the original ASEL training sequence
2	Receive Antenna Selection Sounding Indication (RXASSI)	Number of remaining sounding PPDUs to be received See NOTE
3	Receive Antenna Selection Sounding Request (RXASSR)	Number of sounding PPDUs required
4	Sounding Label	Sequence number of the sounding PPDU corresponding to a channel state information (CSI) frame in ASEL feedback
5	No Feedback Due to ASEL Training Failure or Stale Feedback	The number of the first sounding PPDU that was not received properly, where 0 corresponds to the first sounding PPDU in the ASEL training sequence, or 0 if no sounding PPDUs were received properly, or 0 if this is a request for a full retraining sequence
6	Transmit Antenna Selection Sounding Indication requesting feedback of explicit CSI (TXASSI-CSI)	Number of remaining sounding PPDUs to be transmitted See NOTE
7	Reserved	Reserved

NOTE—If the HT variant HT Control field is carried in a sounding PPDU, then the ASEL Data field contains the remaining number of sounding frames following the current one. If null data PPDU (NDP) sounding frame is used, then the ASEL Data field contains the number of NDPs following a non-NDP+HTC. The HT NDP Announcement subfield in the HT Control field is set to 1 to indicate NDP sounding.

The Calibration Position and Calibration Sequence subfields of the HT variant HT Control field are defined in Table 9-19.

Table 9-19—Calibration control subfields

Subfield	Meaning	Definition
Calibration Position	Position in calibration sounding exchange sequence	Set to 0 indicates this is not a calibration frame. Set to 1 indicates calibration start. Set to 2 indicates sounding response. Set to 3 indicates sounding complete.
Calibration Sequence	Calibration sequence identifier	The field is included in each frame within the calibration procedure and its value is unchanged for the frame exchanges during one calibration procedure. See 10.34.2.4.3.

The Calibration Sequence subfield identifies an instance of the calibration procedure. The subfield is included in each frame within a calibration procedure, and its value is unchanged for frames within the same calibration procedure.

The CSI/Steering subfield of the HT variant HT Control field indicates the type of feedback, as shown in Table 9-20.

Table 9-20—CSI/Steering subfield values

Value	Definition
0	No feedback required
1	CSI
2	Noncompressed beamforming
3	Compressed beamforming

The HT NDP Announcement subfield of the HT variant HT Control field indicates that an NDP will be transmitted after the frame (according to the rules described in 10.36). It is set to 1 to indicate that an NDP will follow; otherwise, it is set to 0.

The DEI subfield of the HT Control field is set by the transmitting STA to indicate the suitability of the corresponding MSDU or A-MSDU to be discarded if there are insufficient resources at the receiving STA, per the value of the drop eligible parameter in the MA-UNITDATA.request. See 10.8 and 11.25.2. In a Management frame, the DEI subfield is reserved.

9.2.4.6.3 VHT variant

In a non-S1G STA, the format of the HT Control Middle subfield of the VHT variant HT Control field is shown in Figure 9-16.

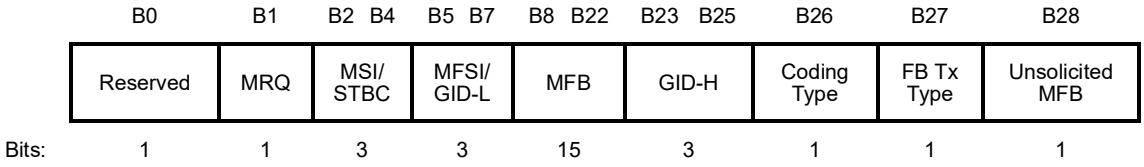

Figure 9-16—HT Control Middle subfield of the VHT variant HT Control field format

The subfields of VHT variant HT Control field are defined in Table 9-21.

Table 9-21—VHT variant HT Control field subfields

Subfield	Meaning	Definition
MRQ	VHT-MCS feedback request	Set to 1 to request VHT-MCS feedback (solicited MFB); otherwise, set to 0.
MSI/STBC	MRQ sequence identifier/STBC indication	If the Unsolicited MFB subfield is 0 and the MRQ subfield is 1, the MSI/STBC subfield contains a sequence number in the range 0 to 6 that identifies the specific MCS feedback request. If the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the MSI/STBC subfield is reserved. If the Unsolicited MFB subfield is 1 and the MFB does not contain the value representing "no feedback is present," the MSI/STBC field contains the Compressed MSI and STBC Indication subfields as shown in Figure 9-17. The STBC Indication subfield indicates whether the estimate in the MFB subfield is computed based on a PPDU using STBC encoding: Set to 0 if the PPDU was not STBC encoded Set to 1 if the PPDU was STBC encoded The Compressed MSI subfield contains a sequence number that identifies the specific MCS feedback request. It is in the range 0 to 3 if STBC Indication equals 0 or in the range 0 to 2 if STBC Indication equals 1. Otherwise, the MSI/STBC subfield is reserved.
MFSI/GID-L	MFB sequence identifier/LSBs of group ID	If the Unsolicited MFB subfield is 0, the MFSI/GID-L subfield contains the received value of MSI contained in the frame to which the MFB information refers. If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and the MFB is estimated from a VHT MU PPDU, then the MFSI/GID-L subfield contains the lowest 3 bits of group ID of that PPDU from which the MFB was estimated (bit 0 of the group ID appears in the lowest numbered bit of the field MFSI/GID-L). If the unsolicited MFB is estimated from an SU PPDU, the MFSI/GID-L subfield is set to all 1s. Otherwise, this subfield is reserved.
MFB	NUM_STS, VHT-MCS, BW and SNR feedback	MFB subfield is interpreted as defined in Table 9-22. This subfield contains the recommended MFB. The combination of VHT-MCS=15 and NUM_STS=7 indicates that no feedback is present.

Table 9-21—VHT variant HT Control field subfields *(continued)*

Subfield	Meaning	Definition
GID-H	MSBs of group ID	If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and the unsolicited MFB is estimated from a VHT MU PPDU, then the GID-H subfield contains the highest 3 bits of group ID of the PPDU from which the unsolicited MFB was estimated (bit 3 of the group ID appears in the lowest numbered bit of the field GID-H). If the unsolicited MFB is estimated from an SU PPDU, the GID-H subfield is set to all 1s. Otherwise, this subfield is reserved.
Coding Type	Coding type of the measured PPDU	If the Unsolicited MFB subfield is 1 and the MFB does not contain the value representing "no feedback is present," the Coding Type subfield contains the Coding information (0 for BCC and 1 for LDPC) of the PPDU from which the unsolicited MFB was estimated. Otherwise, this subfield is reserved.
FB Tx Type	Transmission type of the measured PPDU	If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and FB Tx Type subfield is 0, then the unsolicited MFB is estimated from a VHT PPDU with the RXVECTOR parameter BEAMFORMED equal to 0. If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and the FB Tx Type subfield is 1, then the unsolicited MFB is estimated from a VHT PPDU with the RXVECTOR parameter BEAMFORMED equal to 1. Otherwise, this subfield is reserved.
Unsolicited MFB	Unsolicited VHT-MCS feedback indicator	Set to 1 if the MFB is not a response to an MRQ. Set to 0 if the MFB is a response to an MRQ.

The format of the MSI/STBC subfield when the Unsolicited subfield is 1 is shown in Figure 9-17.

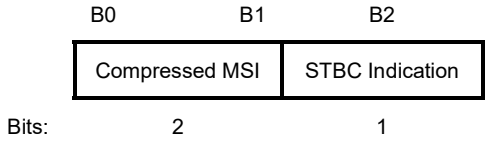

Figure 9-17—MSI/STBC subfield format when the Unsolicited MFB subfield is 1

The format of the MFB subfield in the VHT variant HT Control field is shown in Figure 9-18.

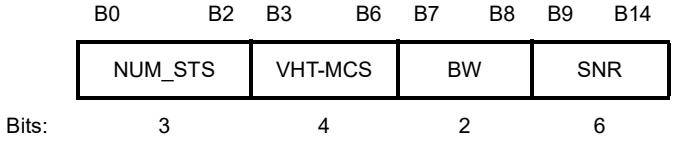

Figure 9-18—MFB subfield format in the VHT variant HT Control field

In an S1G STA, the format of the MFB subfield in the VHT variant HT Control field is shown in Figure 9-19.

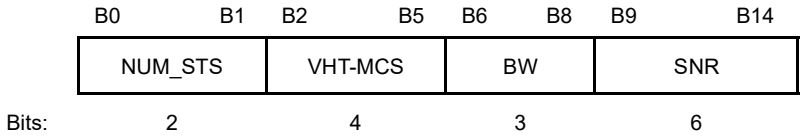

Figure 9-19—MFB subfield format in the VHT variant HT Control field when carried in S1G PPDU

The subfields of the MFB subfield in the VHT variant HT Control field are defined in Table 9-22.

Table 9-22—MFB subfield in the VHT variant HT Control field

Subfield	Meaning	Definition
NUM_STS	Recommended NUM_STS	Indicates the recommended NUM_STS as defined in 10.32.3. The NUM_STS subfield contains an unsigned integer representing the number of space-time streams minus 1.
VHT-MCS	Recommended VHT-MCS	Indicates the recommended VHT-MCS as defined in 10.32.3. The VHT-MCS subfield contains an unsigned integer in the range 0 to 9 representing a VHT-MCS Index value (defined in 21.5).
BW	Bandwidth of the recommended VHT-MCS or S1G-MCS	If the Unsolicited MFB subfield is 1, the BW subfield indicates the bandwidth for which the recommended VHT-MCS or S1G-MCS is intended, as defined in 10.32.3: For a VHT STA: Set to 0 for 20 MHz Set to 1 for 40 MHz Set to 2 for 80 MHz Set to 3 for 160 MHz and 80+80 MHz. For a TVHT STA: Set to 0 for TVHT_W Set to 1 for TVHT_2W and TVHT_W+W Set to 2 for TVHT_4W and TVHT_2W+2W The value 3 is reserved. In an S1G STA: Set to 0 for 1 MHz Set to 1 for 2 MHz Set to 2 for 4 MHz Set to 3 for 8 MHz. Set to 4 for 16 MHz. The values 5 to 7 are reserved. If the Unsolicited MFB subfield is 0, the BW subfield is reserved.
SNR	Average SNR	Indicates the average SNR, which is an SNR averaged over data subcarriers and space-time streams. The SNR is averaged over all of the space-time streams and data subcarriers and is encoded as a 6-bit 2s complement number of SNR_average – 22, where SNR_average is the sum of the values of SNR per frequency subcarrier (in decibels) per space-time stream divided by the product of the number of space-time streams, as indicated in the NUM_STS subfield, and the number of frequency subcarriers represented in the bandwidth in which the MFB was estimated. This encoding covers the SNR range from –10 dB to 53 dB in 1 dB steps.

9.2.4.6.4 CMMG variant HT Control field

The format of the CMMG variant HT Control field is shown in Figure 9-20.

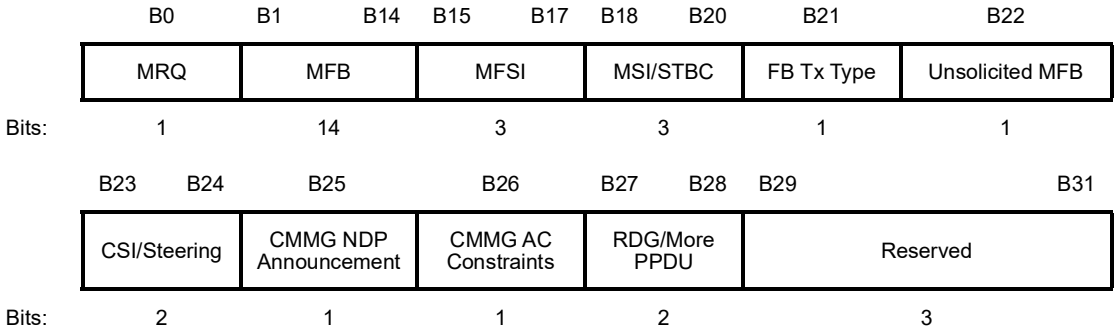

Figure 9-20—CMMG variant HT Control field format

The link adaptation related subfields including the first six subfields are defined in Table 9-23.

Table 9-23—Subfields corresponding to link adaptation

Subfield	Meaning	Definition
MRQ	CMMG-MCS Feedback request	Set to 1 to request CMMG-MCS feedback (solicited MFB); otherwise, set to 0.
MFB	NUM_STS, CMMG-MCS, BW and SNR feedback	MFB subfield is interpreted as defined in Table 9-24. This subfield contains the recommended MFB. The combination of CMMG-MCS=31 and NUM_STS=3 indicates that no feedback is present.
MFSI	MFB sequence identifier	Set to the received value of MSI contained in the frame to which the MFB information refers. Set to 7 for unsolicited MFB.
MSI/STBC	MSI/STBC	If the Unsolicited MFB subfield is 0 and the MRQ subfield is 1, the MSI/STBC subfield contains a sequence number in the range 0 to 6 that identifies the specific MCS feedback request. If the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the MSI/STBC subfield is reserved. If the Unsolicited MFB subfield is 1 and the MFB does not contain the value representing "no feedback is present," the MSI/STBC field contains the Compressed MSI and STBC Indication subfields as shown in Figure 9-22. The STBC Indication subfield indicates whether the estimate in the MFB subfield is computed based on a PPDU using STBC encoding: Set to 0 if the PPDU was not STBC encoded. Set to 1 if the PPDU was STBC encoded. The Compressed MSI subfield contains a sequence number that identifies the specific MCS feedback request. It is in the range 0 to 3 if STBC Indication equals 0 or in the range 0 to 2 if STBC Indication equals 1. Otherwise, the MSI/STBC subfield is reserved.

Table 9-23—Subfields corresponding to link adaptation *(continued)*

Subfield	Meaning	Definition
FB Tx Type	Transmission type of the measured PPDU	If the Unsolicited MFB subfield is 1 and FB Tx Type subfield is 0, then the unsolicited MFB is estimated from a CMMG PPDU with the RXVECTOR parameter BEAMFORMED equal to 0. If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing "no feedback is present," and the FB Tx Type subfield is 1, then the unsolicited MFB is estimated from a CMMG PPDU with the RXVECTOR parameter BEAMFORMED equal to 1. Otherwise, this subfield is reserved.
Unsolicited MFB	Unsolicited CMMG-MCS feedback indicator	Set to 1 if the MFB is not a response to an MRQ. Set to 0 if the MFB is a response to an MRQ.

The format of the MFB subfield in the CMMG variant HT Control field is shown in Figure 9-21.

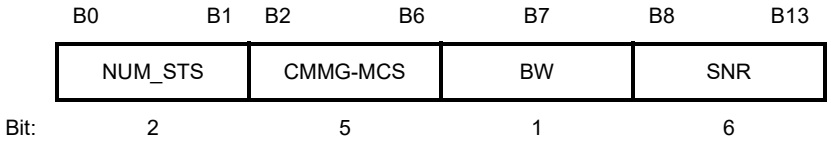

Figure 9-21—MFB subfield in the CMMG variant HT Control field format

The subfields of the MFB subfield in the CMMG variant HT Control field are defined in Table 9-24.

Table 9-24—MFB subfield in the CMMG variant HT Control field

Subfield	Meaning	Definition
NUM_STS	Recommended NUM_STS	Indicates the recommended NUM_STS as defined in 10.30.4. The NUM_STS subfield contains an unsigned integer representing the number of space-time streams minus 1.
CMMG-MCS	Recommended CMMG-MCS	Indicates the recommended CMMG-MCS as defined in 10.30.4. The CMMG-MCS subfield contains an unsigned integer representing a CMMG-MCS Index value (defined in 25.15).
BW	Bandwidth of the recommended CMMG-MCS	If the Unsolicited MFB subfield is 1, the BW subfield indicates the bandwidth for which the recommended CMMG-MCS is intended, as defined in 10.30.4: Set to 0 for 540 MHz. Set to 1 for 1080 MHz. If the Unsolicited MFB subfield is 0, the BW subfield is reserved.
SNR	Average SNR	The SNR subfield of the MFB subfield in the CMMG variant HT Control field is defined in Table 9-22.

The format of the MSI/STBC subfield when the Unsolicited MFB subfield is 1 is shown in Figure 9-22.

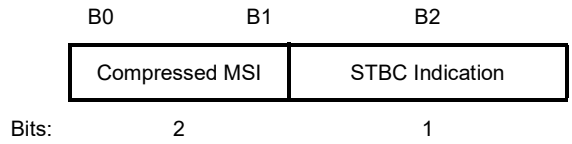

Figure 9-22—MSI/STBC subfield format when the Unsolicited MFB subfield is 1

The CSI/Steering subfield of the CMMG variant HT Control field is defined in Table 9-20.

The CMMG NDP Announcement subfield of the CMMG variant HT Control field indicates that an NDP will be transmitted after the frame (according to the rules described in 10.33. It is set to 1 to indicate that an NDP follows; otherwise, it is set to 0.

The CMMG AC Constraint subfield of the CMMG variant HT Control field is the same as defined in Table 9-14.

The RDG/More PPDU subfield of the CMMG variant HT Control field is defined in Table 9-15.

9.2.4.7 Frame Body field

9.2.4.7.1 General

The Frame Body field is a variable length field that contains information specific to individual frame types and subtypes. The minimum length of the frame body is 0 octets. The maximum length of the frame body is constrained or affected by the following:

— The maximum MMPDU, MSDU, A-MSDU, and MPDU sizes supported by the recipient(s) for the PPDU format in use, as specified in Table 9-25.
— The maximum PPDU duration [e.g., HT_MF L-SIG L_LENGTH, HT_GF, VHT, TVHT, S1G, or DMG aPPDUMaxTime (see Table 9-25); any nonzero TXOP limit; any regulatory constraints (e.g., CS4-msBehavior)].
— The fields present in the MAC header (e.g., QoS Control, Address 4, HT Control).
— The presence of security encapsulation (e.g., TKIP, CCMP or GCMP header and MIC).
— The presence of Mesh Control fields (see 9.2.4.7.3).

NOTE 1—In an A-MSDU, the Mesh Control field is located in the A-MSDU Subframe Header (see Figure 9-70). In an MMPDU, the Mesh Control field is located within the MMPDU (see 9.6.17). Such Mesh Control fields need to be taken into account if a maximum A-MSDU or MMPDU size constraint applies as well as if a maximum MPDU size constraint applies.

NOTE 2—TKIP is not allowed with A-MSDUs (see 12.2.5) or MMPDUs (see 12.5.4.1) and, therefore, need not be taken into account if a maximum A-MSDU or MMPDU size constraint applies.

Table 9-25—Maximum data unit sizes (in octets) and durations (in microseconds)

	Non-HT non-VHT non-S1G non-DMG PPDU and non-HT duplicate PPDU	HT PPDU	VHT PPDU	S1G PPDU	DMG PPDU
MMPDU size	2304	2304	See NOTE 1	See NOTE 1	2304
MSDU size	2304	2304	2304	2304	7920
A-MSDU size	3839 or 4065 (see NOTE 2) (HT STA, see also Table 9-184), or N/A (non-HT STA, see also 10.11)	3839 or 7935 (see also Table 9-184)	See NOTE 3	See NOTE 3	7935

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-25—Maximum data unit sizes (in octets) and durations (in microseconds) *(continued)*

	Non-HT non-VHT non-S1G non-DMG PPDU and non-HT duplicate PPDU	HT PPDU	VHT PPDU	S1G PPDU	DMG PPDU
MPDU size	See NOTE 4	See NOTE 5	3895 or 7991 or 11 454 (see also Table 9-271)	3895 or 7991 (see also Table 9-300)	See NOTE 5
PSDU size	2^{12}–1 (see Table 15-5, Table 16-4, Table 17-21, Table 18-5)	2^{16}–1 (see Table 19-25)	4 692 480 (~$2^{22.16}$) (see Table 21-28)	797 160 (~$2^{19.60}$) (see Table 23-40)	2^{18}–1 (see Table 20-30)
PPDU duration	See NOTE 6	5484 (HT_MF; see 10.27.4) or 10 000 (HT_GF; see Table 19-25)	5484 (see Table 21-28)	27 840 (see Table 23-40)	2000 (see Table 20-30)

NOTE 1—No direct constraint on the maximum MMPDU size; indirectly constrained by the maximum MPDU size (see 9.3.3.1).

NOTE 2—Indirect constraint from the maximum PSDU size: 2^{12}–1 octets minus the minimum QoS Data frame overhead (26 octets for the MAC header and 4 octets for the FCS).

NOTE 3—No direct constraint on the maximum A-MSDU size; indirectly constrained by the maximum MPDU size.

NOTE 4—No direct constraint on the maximum MPDU size; indirectly constrained by the maximum MSDU/MMPDU or (for HT STAs only) A-MSDU size.

NOTE 5—No direct constraint on the maximum MPDU size; indirectly constrained by the maximum A-MSDU size.

NOTE 6—No direct constraint on the maximum duration, but an L_LENGTH value above 2332 might not be supported by some receivers (see NOTE 2 in 10.27.4).

9.2.4.7.2 Overhead for encryption

The overhead for encryption is described in Clause 12. When the Mesh Control field is present in the frame body, the Mesh Control field is encrypted as a part of data.

9.2.4.7.3 Mesh Control field

The Mesh Control field is present in a mesh Data frame containing an unfragmented MSDU or the first fragment of a fragmented MSDU and is present in a Multihop Action frame transmitted by a mesh STA.

In mesh Data frames, when the Mesh Control Present subfield in the QoS Control field is 1, the Mesh Control field is prepended to the MSDU and located as follows:

— When the frame body contains an MSDU (or a fragment thereof) and the frame is not encrypted, the Mesh Control field is located in the first octets of the frame body.

— When the frame body contains an MSDU (or a fragment thereof) and the frame is encrypted, the Mesh Control field is located in the first octets of the encrypted data portion.

— When the frame body contains an A-MSDU, the Mesh Control field is located in the A-MSDU subframe header as shown in Figure 9-70.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In the Multihop Action frame, the Mesh Control field is present as specified in 9.6.17.

The Mesh Control field is of variable length (6, 12, or 18 octets). The structure of the Mesh Control field is defined in Figure 9-23.

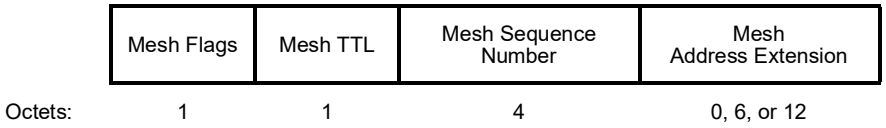

Figure 9-23—Mesh Control field format

The Mesh Flags subfield contains the Address Extension Mode subfield. The structure of the Mesh Flags subfield is shown in Figure 9-24.

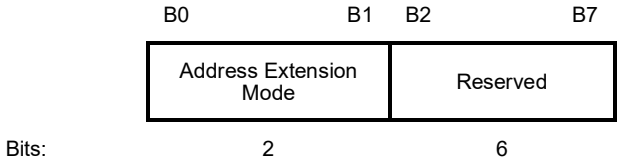

Figure 9-24—Mesh Flags subfield format

The Address Extension Mode subfield indicates the contents of the Mesh Address Extension subfield. Table 9-26 defines valid values for the Address Extension Mode and describes the corresponding contents of the Mesh Address Extension subfield.

Table 9-26—Valid values for the Address Extension Mode subfield

Address extension mode value	Address extension mode name	Address extension mode description	Mesh Address Extension subfield length (octets)	Applicable frame types
0	None	No Mesh Address Extension subfield	0	Data, Management (Multihop Action, group addressed)
1	Address4	Mesh Address Extension subfield contains Address 4	6	Management (Multihop Action, individually addressed), Data (proxied, group addressed)
2	Address5&6	Mesh Address Extension subfield contains Address 5 and Address 6	12	Data (proxied, individually addressed)
3		Reserved	—	—

The Mesh TTL subfield contains a nonzero unsigned integer corresponding to the remaining number of hops the MSDU/MMPDU is forwarded. How the Mesh TTL is used in both individually and group addressed frames is described in 10.38.3 and 10.38.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Mesh Sequence Number subfield contains an unsigned integer sequence number counter value. Source mesh STAs assign mesh sequence numbers from a single modulo 2^{32} counter, starting at 0 and incrementing by 1 for each MSDU or MMPDU that is transmitted with a Mesh Control field. Usage of the Mesh Sequence Number is described in 10.38.6.

NOTE 1—It is believed that a 32-bit sequence number is sufficient as the rollover would occur after a period of 5 days assuming a source continuously transmitting at a rate of 10^4 frames per second.

The Mesh Address Extension subfield, shown in Figure 9-25, is present only when the Address Extension Mode subfield of the Mesh Flags subfield is a nonzero nonreserved value. The Mesh Address Extension subfield provides additional address fields for mesh address extension as defined in Table 9-26. The interpretation of the extended Address fields is described in 9.3.5.

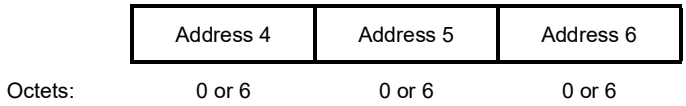

Figure 9-25—Mesh Address Extension subfield format

The Address 4 subfield is present when the Address Extension Mode subfield in the Mesh Flags subfield is 1. It carries a fourth address that is not included as a part of the MAC header for these frames.

The Address 5 subfield and Address 6 subfield are present when the Address Extension Mode subfield in the Mesh Flags subfield is 2. It carries the addresses of source and destination end station of the end-to-end IEEE 802 communication if either (or both) of the end stations are not mesh STAs at the beginning or end of a single mesh path. (See Figure 9-81.)

NOTE 2—This is useful, for example, when the end stations of IEEE 802 communication are nonmesh, external STAs that communicate over a mesh BSS via proxy mesh gates.

Details on the usage of these optional address fields are given in 14.10.8.4.

9.2.4.8 FCS field

The FCS field contains a 32-bit CRC. The FCS field value is calculated over all of the fields of the MAC header and the Frame Body field. These are referred to as the *calculation fields*.

The FCS field value is calculated using the following standard generator polynomial of degree 32:

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

The FCS field value is the 1s complement of the sum (modulo 2) of the following:

a) The remainder of $x^k \times (x^{31} + x^{30} + x^{29} + \ldots + x^2 + x + 1)$ divided (modulo 2) by $G(x)$, where k is the number of bits in the calculation fields, and

b) The remainder after multiplication of the contents (treated as a polynomial) of the calculation fields by x^{32} and then division by $G(x)$.

The FCS field is transmitted commencing with the coefficient of the highest-order term.

As a typical implementation, at the transmitter, the initial remainder of the division is preset to all 1s and is then modified by division of the calculation fields by the generator polynomial $G(x)$. The 1s complement of this remainder is transmitted, with the highest-order bit first, as the FCS field.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

At the receiver, the initial remainder is preset to all 1s and the serial incoming bits of the calculation fields and FCS, when divided by $G(x)$, results (in the absence of transmission errors) in a unique nonzero remainder value. The unique remainder value is the polynomial:

$$x^{31} + x^{30} + x^{26} + x^{25} + x^{24} + x^{18} + x^{15} + x^{14} + x^{12} + x^{11} + x^{10} + x^{8} + x^{6} + x^{5} + x^{4} + x^{3} + x + 1$$

9.2.5 Duration/ID field (QoS STA)

9.2.5.1 General

The value in the Duration/ID field within Poll, SPR, Grant, Grant Ack, DMG CTS, DMG DTS, SSW, SSW-Feedback, and SSW-Ack frames transmitted by a DMG STA are described in 9.3.1.10 to 9.3.1.18. The value in the Duration/ID field within DMG Beacon frames transmitted by a DMG STA is described in 9.3.4.2.

The value in the Duration/ID field in a frame transmitted by a QoS STA is defined in 9.2.5.2 to 9.2.5.8.

All times are calculated in microseconds. If a calculated duration includes a fractional microsecond, that value inserted in the Duration/ID field is rounded up to the next higher integer. If a calculated duration results in a negative value, the Duration/ID field is 0.

The value in the Duration field of NDP Ack, and NDP CTS frames transmitted by an S1G STA is defined in 9.2.5.7. Setting the Duration field is additionally constrained by the same rules that apply to the Duration/ID field of Ack, and CTS frames as described in 9.2.5.2 and 9.2.5.8.

The value in the Duration field for the NDP_1M Ack frame when the Idle Indication field is 0, the NDP_1M CTS frame and the NDP_1M CF-End frame is calculated in multiples of 40 μs. If a calculated duration is not a multiple of 40 μs, the value inserted in the Duration field is rounded up to the next higher integer so that the contained duration is a multiple of 40 μs. If a calculated duration results in a negative value, the Duration field is 0. See 23.3.12.2.4.2 (NDP_1M Ack) for the value in the Duration field for the NDP_1M Ack frame when the Idle Indication field is 1. See 23.3.12.2.5.2 for the value in the Duration field for the NDP_1M PS-Poll-Ack frame.

The value in the Duration field for the NDP_2M Ack frame when the Idle Indication field is 0, the NDP_2M PS-Poll-Ack frame when the Idle Indication field is 0, the NDP_2M CTS frame, and the NDP_2M CF-End frame is calculated in microseconds. If a calculated duration includes a fractional microsecond, the value inserted in the Duration field is rounded up to the next higher integer. If a calculated duration results in a negative value, the Duration field is 0. See 23.3.12.2.4.3 for the value in the Duration field for the NDP_2M Ack frame when the Idle Indication field is 1. See 23.3.12.2.5.3 for the value in the Duration field for the NDP_2M PS-Poll-Ack frame when the Idle Indication field is 1.

9.2.5.2 Setting for single and multiple protection under enhanced distributed channel access (EDCA)

In transmissions under EDCA by a STA that initiates a TXOP, there are two classes of duration settings: single protection and multiple protection. In single protection, the Duration/ID field of the frame can set a network allocation vector (NAV) value at receiving STAs that protects up to the end of any following Data, Management, or response frame plus any additional overhead frames as described below. In multiple protection, the Duration/ID field of the frame can set a NAV that protects up to the estimated end of a sequence of multiple frames.

The STA selects between single and multiple protection when it transmits the first frame of a TXOP. All subsequent frames transmitted by the STA in the same TXOP use the same class of duration settings. A STA always uses multiple protection in a TXOP that includes the following:

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— Frames that have the RDG/More PPDU subfield equal to 1
— PSMP frames
— VHT NDP Announcement frames or Beamforming Report Poll frames
— S1G Beacon frames
— Frames transmitted by an S1G STA with the TXVECTOR parameter RESPONSE INDICATION equal to Long Response

For S1G STAs, Duration/ID field determination rules are further specified in 10.3.2.15.

The Duration/ID field is set as follows:

a) Single protection settings.
   1) In an RTS frame that is not part of a dual clear-to-send (CTS) exchange and is not part of a BDT exchange, the Duration/ID field is set to the estimated time, in microseconds, required to transmit the pending frame, plus one CTS frame, plus one Ack or BlockAck frame if required, plus any NDPs required, plus explicit feedback if required, plus applicable IFSs.
   2) In all CTS frames sent by STAs as the first frame in the exchange under EDCA and with the receiver address (RA) matching the MAC address of the transmitting STA, the Duration/ID field is set to one of the following:
      i) If there is a response frame, the estimated time required to transmit the pending frame, plus one SIFS, plus the response frame (Ack or BlockAck), plus any NDPs required, plus explicit feedback if required, plus an additional SIFS
      ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS
   3) In a BlockAckReq frame, the Duration/ID field is set to the estimated time required to transmit one Ack or BlockAck frame, as applicable, plus one SIFS.
   4) In a BlockAck frame that is not sent in response to a BlockAckReq frame or an implicit block ack request, the Duration/ID field is set to the estimated time required to transmit an Ack frame plus a SIFS.
   5) In Management frames, non-QoS Data frames (i.e., with bit 7 of the Frame Control field equal to 0), and individually addressed Data frames with an ack policy other than No Ack or Block Ack, the Duration/ID field is set to one of the following:
      i) If the frame is the final frame of the TXOP, the estimated time required for the transmission of one Ack frame (including appropriate IFSs)
      ii) Otherwise, the estimated time required for the transmission of one Ack frame, plus the time required for the transmission of the following frame and its response if required, plus applicable IFSs.
   6) In individually addressed QoS Data frames with an ack policy of No Ack or Block Ack, for Action No Ack frames, and for group addressed frames, the Duration/ID field is set to one of the following:
      i) If the frame is the final frame of the TXOP, 0
      ii) Otherwise, the estimated time required for the transmission of the following frame and its response frame, if required (including appropriate IFSs)

b) Multiple protection settings. The Duration/ID field is set to a value D as follows:
   1) If $T_{TXOP} = 0$ and $T_{END\text{-}NAV} = 0$, then $D = T_{SINGLE\text{-}MSDU} - T_{\text{PPDU}}$
   2) Else if $T_{TXOP} = 0$ and $T_{END\text{-}NAV} > 0$, then $D = \max(0, T_{END\text{-}NAV} - T_{PPDU})$
   3) Else if $T_{END\text{-}NAV} = 0$, then $\min(T_{PENDING}, T_{TXOP} - T_{PPDU}) \le D \le T_{TXOP} - T_{PPDU}$
   4) Else $T_{END\text{-}NAV} - T_{PPDU} \le D \le T_{TXOP\text{-}REMAINING} - T_{PPDU}$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where

$T_{SINGLE\text{-}MSDU}$ is the estimated time required for the transmission of the allowed frame exchange sequence defined in 10.23.2.9 (for a TXOP limit of 0), including applicable IFSs

$T_{PENDING}$ is the estimated time required for the transmission of

- Pending MPDUs of the same AC
- Any associated immediate response frames
- Any HT NDP, VHT NDP, or Beamforming Report Poll frame transmissions and explicit feedback response frames
- Applicable IFSs
- Any RDG
- Any BDT
- Any pending QoS Null frame exchanges by paged STAs
- Any pending PS-Poll or NDP PS-Poll frame exchanges by paged STAs

T_{TXOP} is the duration given by dot11EDCATableTXOPLimit (dot11QAPEDCATableTXOPLimit for the AP) for that AC

$T_{TXOP\text{-}REMAINING}$ is T_{TXOP} less the time already used within the TXOP

$T_{END\text{-}NAV}$ is the remaining duration of any NAV set by the TXOP holder, or 0 if no NAV has been established

T_{PPDU} is the time required for transmission of the current PPDU

The estimated time required for transmission of a VHT Compressed Beamforming frame response is determined by assuming the following:

- All feedback segments (as defined in 10.36.5.3) are transmitted, even if a Beamforming Report Poll frame is used and not all of the bits in the included Feedback Segment Retransmission Bitmap field are equal to 1.
- The subfield values of the VHT MIMO Control field are as follows:
  - The Feedback Type, Nr Index, and Channel Width fields are as specified in 10.36.5.
  - The Nc Index field is as specified in 10.36.5 if the Feedback Type field is MU, or to the greatest value allowed by 10.36.5 if the Feedback Type field is SU.
  - The Grouping field indicates no grouping.
  - The Codebook Information field has the value 1.

NOTE 1—Estimated times might prove to be inexact, if the TXOP responder has a choice of PHY options (e.g., BCC v. LDPC, use of STBC, use of short GI, PHY header/preamble format options) or MAC options (e.g., use of HT Control). Heuristics such as the TXOP responder's previous choices and channel conditions might be used to minimize the inexactitude.

NOTE 2—If a TXOP includes the transmission of a VHT Compressed Beamforming frame by the TXOP responder, the TXOP holder can, if the duration estimates prove excessive, indicate truncation of the TXOP by using a CF-End frame, provided that the remaining duration of the TXOP after the transmission of the last frame can accommodate the CF-End frame (see 10.23.2.10).

In a PS-Poll+BDT frame or an RTS frame generated by an S1G STA as part of a BDT exchange the Duration/ID field is set as follows:

- In a PS-Poll+BDT frame, the Duration/ID field is set to the estimated time required for the transmission of one Ack frame, plus the estimated time required for the transmission of its following MPDUs and their responses if required, plus applicable IFS durations.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— In an RTS frame that is sent as a response to the PS-Poll+BDT frame, the Duration/ID field is set to a value D: min ($T_{END\text{-}NAV} + T_{PENDING} - T_{PPDU}$; $T_{TXOP\text{-}REMAINING} - T_{PPDU}$) ≤ D ≤ $T_{TXOP\text{-}REMAINING} - T_{PPDU}$.

In any frame that includes a Duration/ID field, transmitted by an S1G STA as a response to PV1 frames that are not part of a BDT exchange, the Duration/ID field of the frame is set to 0. For any frame transmitted by a BDT initiator that is the TXOP holder as a response to PV1 frames, the Duration/ID field of the frame is set to the value of the TXNAV timer minus the estimated time required to transmit the frame. In any frame transmitted by a BDT initiator that is not the TXOP holder as a response to PV1 frames, the Duration/ID field of the frame is set to the remaining duration of the TXOP.

9.2.5.3 Setting for QoS CF-Poll frames

Within a Data frame containing QoS CF-Poll, the Duration/ID field value is set to one of the following:

a) One SIFS plus the TXOP limit, if the TXOP limit is nonzero, or
b) The time required for the transmission of one MPDU of nominal MSDU size and the associated Ack frame plus two SIFSs, if the TXOP limit is 0.

9.2.5.4 Setting for frames sent by a TXOP holder under HCCA

Within a frame sent by a TXOP holder under hybrid coordination function (HCF) controlled channel access (HCCA), to provide NAV protection for the entire controlled access phase (CAP), the Duration/ID field is set to one of the following values:

a) In an RTS frame
    1) If the pending frame is the final frame, the time required to transmit the pending frame, plus one CTS frame, plus one Ack frame if required, plus three SIFSs
    2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP
b) In a CTS frame
    1) If the pending frame is the sole frame in the TXOP, one of the following:
        i) If there is a response frame, the time required to transmit the pending frame, plus one SIFS, plus the response frame (Ack or BlockAck), plus an additional SIFS
        ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS
    2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP
c) Otherwise
    1) If the frame is a nonfinal frame in a TXOP with multiple frame exchanges, the remaining duration of the TXOP
    2) If the frame is the sole or final frame in the TXOP, the actual remaining time needed for this frame exchange sequence

9.2.5.5 Settings within a PSMP sequence

Within a PSMP frame the Duration/ID field is set to a value that is no less than the time required to complete all PSMP-DTT and PSMP-UTT periods described in the frame.

Within the PSMP-DTT and PSMP-UTT of a PSMP sequence, the Duration/ID field is set to the Duration/ID value of the preceding PSMP frame minus the time between the end of the PSMP frame and the end of the PPDU carrying the frame.

NOTE—In other words, all frames transmitted within a PSMP sequence locate the same NAV endpoint.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.2.5.6 Settings within a dual CTS sequence

Within a frame ("Frame1") (excluding a second CTS (CTS2) transmission, as defined in 10.3.2.10) sent by a QoS STA that is not a TXOP holder in a PPDU that contains an immediate response or that is sent by an RD responder, the Duration/ID field is set to the Duration/ID value from the frame(s) ("Frames2") that elicited the response or that carried the RDG minus the time interval between the end of the PPDU that carried Frame1 and the end of the PPDU that carries Frames2.

Within a frame ("Frame1") (excluding a CTS2 transmission, as defined in 10.3.2.10) sent by a QoS STA that is a TXOP holder, the Duration/ID field is set according to the rules in the following subclauses:

— 9.2.5.2 rule b) for multiple protection if Frame1 is not a QoS +CF-Poll frame and the TXOP holder is not operating under HCCA or PSMP
— 9.2.5.3 if Frame1 is a QoS +CF-Poll frame and the TXOP holder is not operating under HCCA or PSMP
— 9.2.5.4 if the TXOP holder is operating under HCCA
— 9.2.5.5. if the TXOP holder is operating under PSMP

Within the CTS2 of a dual CTS exchange, defined in 10.3.2.10, the Duration/ID field is set to the value of the Duration/ID field of the RTS frame that initiated the exchange minus the time required to transmit the first clear-to-sent (CTS1), CTS2, and the applicable IFSs.

9.2.5.7 Setting for control response frames

This subclause describes how to set the Duration/ID field for CTS, Ack, and BlockAck frames transmitted by a QoS STA.

In a CTS frame that is not part of a dual CTS sequence transmitted in response to an RTS frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the RTS frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the RTS frame and the end of the PPDU carrying the CTS frame.

In an Ack frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the Ack frame.

In a BlockAck frame transmitted in response to a BlockAckReq frame or transmitted in response to a frame containing an implicit block ack request, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the BlockAck frame.

In an NDP CTS frame transmitted in response to an RTS frame, the Duration field is set to the value obtained from the Duration/ID field of the RTS frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the RTS frame and the end of the NDP CTS frame except as described in 10.54.5.4.

In an NDP Ack frame with the Idle Indication field equal to 0, the Duration field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the NDP Ack frame except when the eliciting frame is a PS-Poll frame in which case the Duration field can be set as described in 10.3.2.15.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In an NDP Ack frame with the Idle Indication field equal to 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period is expected from the STA that elicited the response, starting from the end of NDP Ack frame response.

In a TACK frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the TACK frame.

9.2.5.8 Setting for other response frames

In any frame transmitted by a STA that is not the TXOP holder and is not specified by 9.2.5.1 to 9.2.5.7, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the frame.

9.3 Format of individual frame types

9.3.1 Control frames

9.3.1.1 Format of Control frames

In the following descriptions, “immediately previous” frame means a frame whose reception concluded within the SIFS preceding the start of the current frame.

The Frame Control, Duration and Address 1 (RA) fields are present in all control frame subtypes. The Address 2 (TA) field is present in some control frame subtypes.

The subfields within the Frame Control field of Control frames carried in a non-S1G PPDU are set as shown in Figure 9-26.

	B0 B1	B2 B3	B4 B7	B8	B9	B10	B11	B12	B13	B14	B15
	Protocol Version	Type (Control)	Subtype	To DS (0)	From DS (0)	More Frag (0)	Retry (0)	Power Man-age-ment	More Data	Protected Frame (0)	+HTC (0)
Bits:	2	2	4	1	1	1	1	1	1	1	1

Figure 9-26—Frame Control field subfield values within Control frames carried in a non-S1G PPDU

In a Control frame carried in an S1G PPDU, when the Subtype subfield is not equal to 3 and not equal to 10, the format of the Frame Control field is shown in Figure 9-27.

	B0 B1	B2 B3	B4 B7	B8 B10	B11	B12	B13	B14	B15
	Protocol Version	Type	Subtype	Bandwidth Indication	Dynamic Indication	Power Manageme nt	More Data	Protected Frame	+HTC
Bits:	2	2	4	3	1	1	1	1	1

Figure 9-27—Frame Control field format in Control frames carried in an S1G PPDU when Subtype subfield is not equal to 3 and not equal to 10

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In a Control frame carried in an S1G PPDU, when the Subtype subfield is equal to 3, the format of the Frame Control field is shown in Figure 9-28.

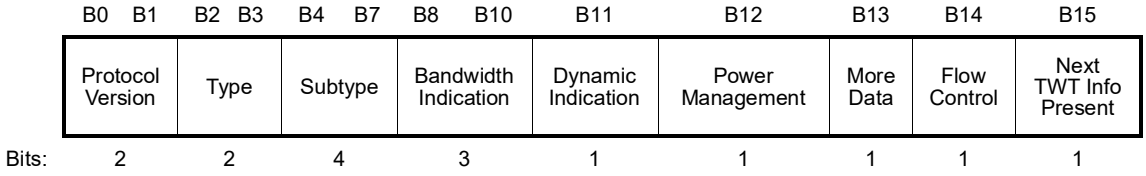

Figure 9-28—Frame Control field format in Control frames carried in an S1G PPDU when Subtype subfield is equal to 3

In a Control frame carried in an S1G PPDU, when the Subtype subfield is equal to 10, the format of the Frame Control field is shown in Figure 9-29.

Figure 9-29—Frame Control field format in Control frames carried in an S1G PPDU when Subtype subfield is equal to 10

9.3.1.2 RTS frame format

The frame format for the RTS frame is defined in Figure 9-30.

Figure 9-30—RTS frame format

The RA field of the RTS frame is the address of the STA that is the intended immediate recipient of a pending individually addressed frame.

The TA field is the address of the STA transmitting the RTS frame or the bandwidth signaling TA of the STA transmitting the RTS frame. In an RTS frame transmitted by a VHT STA in a non-HT or non-HT duplicate format to another VHT STA, the scrambling sequence carries the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT (see 10.3.2.7) and the TA field is a bandwidth signaling TA.

For all RTS frames sent by non-QoS STAs, the Duration field is the time, in microseconds, required to transmit the pending Data or Management frame, plus one CTS frame, plus one Ack frame, plus three SIFSs. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. For RTS frames sent by QoS STAs, see 9.2.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.3.1.3 CTS frame format

The frame format for the CTS frame is defined in Figure 9-31.

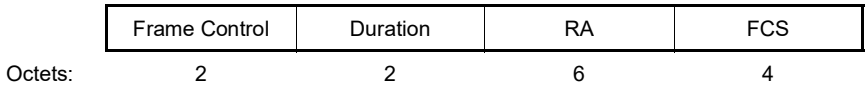

Figure 9-31—CTS frame format

When the CTS frame is a response to an RTS frame, the RA field of the CTS frame is set to the address from the TA field of the RTS frame with the Individual/Group bit set to 0. When the CTS frame is the first frame in a frame exchange, the RA field is set to the MAC address of the transmitter.

For all CTS frames transmitted by a non-QoS STA in response to RTS frames, the Duration field is the value obtained from the Duration field of the immediately previous RTS frame, minus the time, in microseconds, required to transmit the CTS frame and its SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

At a non-QoS STA, if the CTS frame is the first frame in the exchange and the pending Data or Management frame requires acknowledgment, the Duration field is the time, in microseconds, required to transmit the pending Data or Management frame, plus two SIFSs plus one Ack frame. At a non-QoS STA, if the CTS frame is the first frame in the exchange and the pending Data or Management frame does not require immediate acknowledgment, the Duration field is the time, in microseconds, required to transmit the pending Data or Management frame, plus one SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

For other CTS frame transmissions by a QoS STA, the Duration field is set as defined in 9.2.5.

A CTS-to-self frame is a CTS frame in which the RA field is equal to the transmitter's MAC address.

A CTS-to-AP frame is a CTS frame that is not transmitted in response to an RTS frame and in which the RA field is equal to the MAC address of the AP with which the STA is associated.

9.3.1.4 Ack frame format

The frame format for the Ack frame is defined in Figure 9-32.

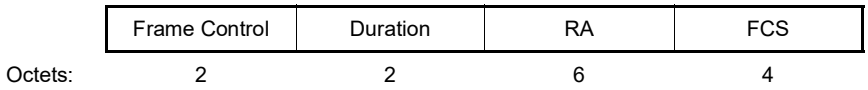

Figure 9-32—Ack frame format

The RA field of the Ack frame is the nonbandwidth signaling TA from the Address 2 field of the immediately previous individually addressed Data, Management, BlockAckReq, BlockAck, or PS-Poll frames.

For Ack frames sent by non-QoS STAs, if the More Fragments bit was equal to 0 in the Frame Control field of the immediately previous individually addressed Data or Management frame, the Duration field is set to 0. In other Ack frames sent by non-QoS STAs, the Duration field is the value obtained from the Duration/ID field of the immediately previous Data, Management, BlockAckReq, or BlockAck frame minus the time, in microseconds, required to transmit the Ack frame and its SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In all other Ack frames, the Duration field is specified by 9.2.5.

9.3.1.5 PS-Poll frame format

9.3.1.5.1 General

The frame format for the PS-Poll frame is defined in Figure 9-33.

	Frame Control	Duration/ID	BSSID(RA)	TA	FCS
Octets:	2	2	6	6	4

Figure 9-33—PS-Poll frame format

The BSSID (RA) field is set to the address of the STA contained in the AP. The TA field value is the address of the STA transmitting the frame or a bandwidth signaling TA. In a PS-Poll frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field value is a bandwidth signaling TA.

9.3.1.5.2 Non-BDT variant of the PS-Poll frame format

The Duration/ID field contains the AID value assigned to the STA transmitting the frame by the AP in the (Re)Association Response frame that established that STA's current association, with the two MSBs set to 1.

9.3.1.5.3 BDT variant of the PS-Poll frame format

A PS-Poll frame with the Duration/ID field that contains a duration value as described in 9.2.5 is a BDT variant of the PS-Poll frame and is referred to as PS-Poll+BDT frame.

The Poll Type field in the Frame Control field of the PS-Poll+BDT frame is set to 0.

Bit 15 of the Duration/ID field of a PS-Poll+BDT frame is set to 0.

A non-S1G STA does not transmit PS-Poll+BDT frames.

9.3.1.6 CF-End frame format

The frame format for the CF-End frame is defined in Figure 9-34.

	Frame Control	Duration	RA	BSSID(TA)	FCS
Octets:	2	2	6	6	4

Figure 9-34—CF-End frame format

When transmitted by a non-DMG and non-S1G STA, the Duration field is set to 0. When transmitted by a DMG STA, the Duration field is set to the time required to complete the CF-End truncation sequence of which it is part (see 10.39.8): Duration = $(i - 1) \times$ (TXTIME(CF-End) + SIFS), where i is in the range 1 to 3 and indicates the order of the CF-End frame in the truncation sequence in the reverse direction (i.e., i=1 corresponds to the last CF-End frame in the sequence). When transmitted by an S1G STA, the Duration field is set to either 0 or a truncated time as described in 10.23.2.9.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When transmitted by a non-DMG STA, the RA field is the broadcast address. When transmitted by a DMG STA, the RA field is the MAC address of the STA that is the intended immediate recipient of the individually addressed Data or Management frame, or the broadcast address.

When transmitted by a non-DMG STA, the BSSID (TA) field is the address of the STA contained in the AP except that the Individual/Group bit of the BSSID (TA) field is set to 1 in a CF-End frame transmitted by a VHT STA to a VHT AP in a non-HT or non-HT duplicate format to indicate that the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT. When transmitted by a DMG STA, the TA field is the MAC address of the STA transmitting the frame.

9.3.1.7 BlockAckReq frame format

9.3.1.7.1 Overview

The frame format of the BlockAckReq frame is defined in Figure 9-35.

	Frame Control	Duration	RA	TA	BAR Control	BAR Information	FCS
Octets:	2	2	6	6	2	variable	4

Figure 9-35—BlockAckReq frame format

The Duration field value is set as defined in 9.2.5.

The RA field of the BlockAckReq frame is the address of the recipient STA.

The TA field value is the address of the STA transmitting the BlockAckReq frame or a bandwidth signaling TA. In a BlockAckReq frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field value is a bandwidth signaling TA.

The BAR (for block acknowledgment request) Control field is shown in Figure 9-36.

	B0	B1	B2	B3 B4	B5 B11	B12 B15
	Reserved	Multi-TID	Compressed Bitmap	GCR Mode	Reserved	TID_INFO
Bits:	1	1	1	2	7	4

Figure 9-36—BAR Control field format

The values of the Multi-TID, Compressed Bitmap, and GCR Mode subfields indicate the BlockAckReq frame variants used, as indicated in Table 9-27.

DMG STAs use only the Compressed BlockAckReq variant and the Extended Compressed BlockAckReq variant.

The meaning of the TID_INFO subfield of the BAR Control field depends on the BlockAckReq frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAckReq frame variants.

The meaning of the BAR Information field of the BlockAckReq frame depends on the BlockAckReq frame variant type. The meaning of this field is explained within the subclause for each of the BlockAckReq frame variants.

Table 9-27—BlockAckReq frame variant encoding

Multi-TID subfield value	Compressed Bitmap subfield value	GCR Mode subfield value (B3 B4)	BlockAckReq frame variant
0	0	00	Reserved
		01	Reserved
		10	Reserved
		11	Reserved
0	1	00	Compressed BlockAck
		01	GLK-GCR BlockAck
		10	GCR BlockAck
		11	Reserved
1	0	00	Extended Compressed BlockAck
		01	Reserved
		10	Reserved
		11	Reserved
1	1	00	Multi-TID BlockAck
		01	Reserved
		10	Reserved
		11	Reserved

NOTE—Reference to "a BlockAckReq" frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

9.3.1.7.2 Compressed BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Compressed BlockAckReq frame contains the TID for which a BlockAck frame is requested.

The BAR Information field of the Compressed BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 9-37. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

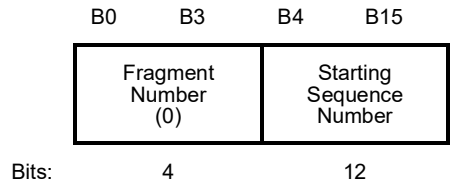

Figure 9-37—Block Ack Starting Sequence Control subfield format

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.3.1.7.3 Extended Compressed BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Extended Compressed BlockAckReq frame contains the TID for which a BlockAck frame is requested.

The BAR Information field of the Extended Compressed BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 9-37. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

9.3.1.7.4 Multi-TID BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Multi-TID BlockAckReq frame determines the number of TIDs present in the Multi-TID BlockAckReq frame as given by TID_INFO + 1, e.g., a 2 in the TID_INFO subfield means that three TID values are present in the Multi-TID BlockAckReq frame's BAR Information field.

The BAR Information field of the Multi-TID BlockAckReq frame comprises multiple sets of Per TID Info subfields and Block Ack Starting Sequence Control subfields, as shown in Figure 9-38. The Per TID Info subfield is shown in Figure 9-39. The Block Ack Starting Sequence Control subfield is shown in Figure 9-37. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

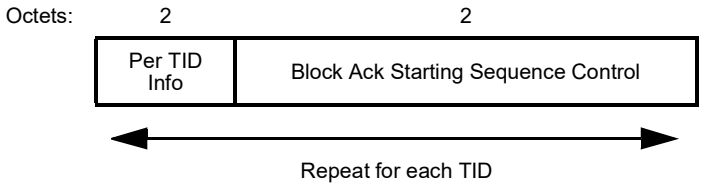

Figure 9-38—BAR Information field format (Multi-TID BlockAckReq)

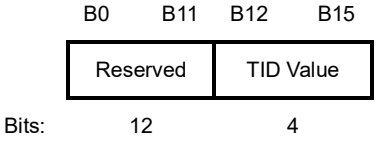

Figure 9-39—Per TID Info subfield format

9.3.1.7.5 GCR BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the GCR BlockAckReq frame is set to 0.

The BAR Information field of the GCR BlockAckReq frame contains the Block Ack Starting Sequence Control subfield and GCR Group Address subfield, as shown in Figure 9-40. The Block Ack Starting Sequence Control subfield is shown in Figure 9-37. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

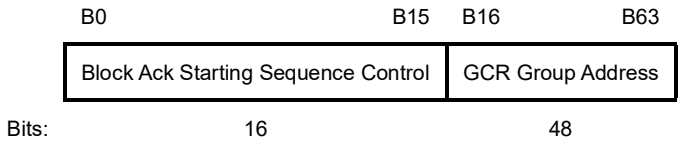

Figure 9-40—BAR Information field format (GCR BlockAckReq)

The GCR Group Address subfield contains the MAC address of the group for which reception status is being requested.

9.3.1.7.6 GLK-GCR BlockAckReq variant

For the BlockAcqReq variant, the TID_INFO subfield in the BAR Control field in the GLK-GCR BlockAckReq frame is 0.

The BAR Information field in the GLK-GCR BlockAckReq frame contains the Block Ack Starting Sequence Control subfield as shown in Figure 9-37. The Starting Sequence Number subfield in the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this GLK-GCR BlockAckReq frame is sent. The Fragment Number subfield in the Block Ack Starting Sequence Control subfield is 0.

9.3.1.8 BlockAck frame format

9.3.1.8.1 Overview

The frame format of the BlockAck frame is defined in Figure 9-41.

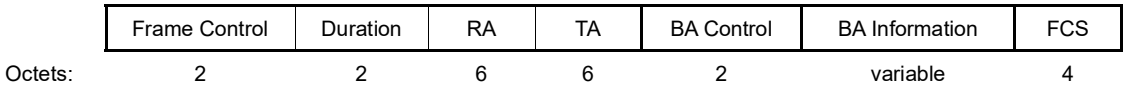

Figure 9-41—BlockAck frame format

The Duration field value is set as defined in 9.2.5.

The RA field of the BlockAck frame is the address of the recipient STA that requested the BlockAck frame.

The TA field value is the address of the STA transmitting the BlockAck frame.

The BA Control field is defined in Figure 9-42.

Figure 9-42—BA Control field format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The values of the Multi-TID, Compressed Bitmap, and GCR Mode subfields of the BA Control field determine the BlockAck frame variants represented, as indicated in the Table 9-28.

Table 9-28—BlockAck frame variant encoding

Multi-TID subfield value	Compressed Bitmap subfield value	GCR Mode subfield value(B3 B4)	BlockAck frame variant
0	0	00	Reserved
		01	Reserved
		10	Reserved
		11	Reserved
0	1	00	Compressed BlockAck
		01	GLK-GCR BlockAck
		10	GCR BlockAck
		11	Reserved
1	0	00	Extended Compressed BlockAck
		01	Reserved
		10	Reserved
		11	Reserved
1	1	00	Multi-TID BlockAck
		01	Reserved
		10	Reserved
		11	Reserved

NOTE—Reference to "a BlockAck" frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

The GCR Mode subfield indicates whether the BlockAck frame was sent in response to a GCR BlockAckReq or a GLK-GCR BlockAckReq frame.

The meaning of the TID_INFO subfield of the BA Control field depends on the BlockAck frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAck frame variants.

The meaning of the BA Information field depends on the BlockAck frame variant type. The meaning of this field is explained within the subclause for each of the BlockAck frame variants.

9.3.1.8.2 Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the Compressed BlockAck frame contains the TID for which this BlockAck frame is sent.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The BA Information field of the Compressed BlockAck frame comprises the Block Ack Starting Sequence Control subfield and the Block Ack Bitmap subfield, as shown in Figure 9-43. The Block Ack Starting Sequence Control subfield is shown in Figure 9-37. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.6.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

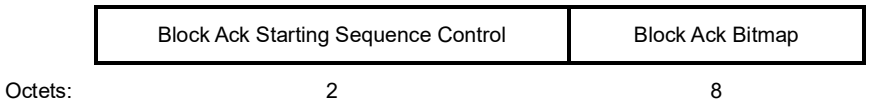

Figure 9-43—BA Information field format (Compressed BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Compressed BlockAck frame is used to indicate the received status of up to 64 entries, where each entry represents an MSDU or an A-MSDU. Each bit that is equal to 1 in the compressed Block Ack Bitmap field acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack Bitmap field corresponding to the MSDU or A-MSDU with the sequence number that matches the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

9.3.1.8.3 Multi-TID BlockAck variant

The TID_INFO subfield of the BA Control field of the Multi-TID BlockAck frame contains the number of TIDs, minus one, for which information is reported in the BA Information field.

The BA Information field of the Multi-TID BlockAck frame comprises one or more instances of the Per TID Info, Block Ack Starting Sequence Control, and the Block Ack Bitmap subfields, as shown in Figure 9-44. The Per TID Info subfield is shown in Figure 9-39, and the Block Ack Starting Sequence Control subfield is shown in Figure 9-37.

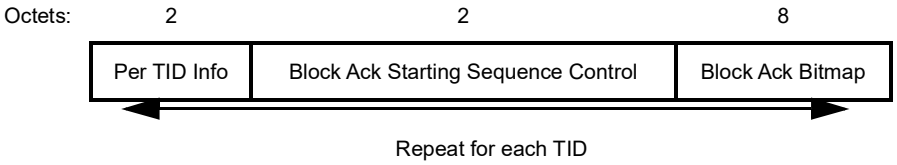

Figure 9-44—BA Information field format (Multi-TID BlockAck)

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield is the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.6.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0. The first instance of the Per TID Info, Block Ack Starting Sequence Control, and Block Ack Bitmap subfields that is transmitted corresponds to the lowest TID value, with subsequent instances ordered by increasing values of the Per TID Info subfield.

The Block Ack Bitmap subfield of the BA Information field of the Multi-TID BlockAck frame contains an 8-octet block ack bitmap. Each bit that is equal to 1 in the Block Ack Bitmap subfield acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU or A-MSDU with the sequence number that matches the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

9.3.1.8.4 Extended Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the Compressed BlockAck frame contains the TID for which a BlockAck frame is requested.

The BA Information field of the Extended Compressed BlockAck frame is shown in Figure 9-45. The Block Ack Starting Sequence Control subfield is shown in Figure 9-37. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.6.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

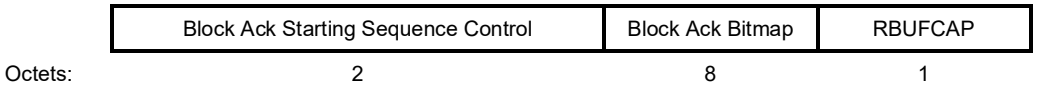

Figure 9-45—BA Information field format (Extended Compressed BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Extended Compressed BlockAck frame is used to indicate the received status of up to 64 entries, where each entry represents an MSDU or an A-MSDU. Each bit that is set to 1 in the Block Ack Bitmap subfield acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number. The first bit of the Block Ack Bitmap subfield corresponds to the MSDU or A-MSDU with the sequence number that matches the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

The RBUFCAP field contains an unsigned integer that is the number of MPDU buffers available to store received MPDUs at the time of transmission of the Extended Compressed BlockAck frame (10.42.9).

9.3.1.8.5 GCR Block Ack variant

The TID_INFO subfield of the BA Control field of the GCR BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the GCR BlockAck frame comprises the Block Ack Starting Sequence Control, GCR Group Address, and the Block Ack Bitmap subfields, as shown in Figure 9-46. The Block Ack Starting Sequence Control subfield is shown in Figure 9-37. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.8. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

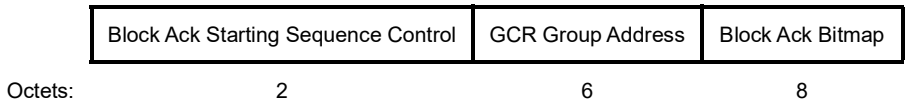

Figure 9-46—BA Information field format (GCR BlockAck)

The GCR Group Address subfield is set to the value from the Group Address subfield of the GCR BAR Information field in the BlockAckReq frame to which the BlockAck frame is sent in response.

The Block Ack Bitmap subfield is used to indicate the received status of up to 64 entries, where each entry represents an MSDU or an A-MSDU. Each bit that is equal to 1 in the Block Ack Bitmap subfield acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU or A-MSDU with the sequence number that matches the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

9.3.1.8.6 GLK-GCR BlockAck variant

The TID_INFO subfield in the BA Control field in the GLK-GCR BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field in the GLK-GCR BlockAck frame comprises the Block Ack Starting Sequence Control and the Block Ack Bitmap subfields, as shown in Figure 9-47. The Block Ack Starting Sequence Control subfield is shown in Figure 9-47 The Starting Sequence Number subfield in the Block Ack Starting Sequence Control subfield contains the sequence number of the first A-MSDU for which this BlockAck frame is sent. This subfield is defined in 10.25.8. The Fragment Number subfield in the Block Ack Starting Sequence Control subfield is 0.

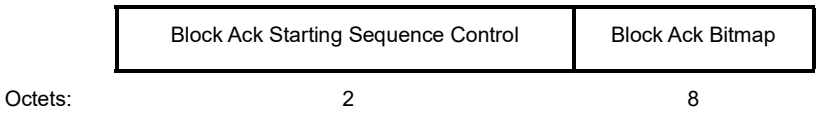

Figure 9-47—BA Information field format (GLK-GCR BlockAck)

The Block Ack Bitmap subfield is used to indicate the received status of up to 64 MSDUs and A-MSDUs. Each bit that is equal to 1 in the Block Ack Bitmap subfield acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU or A-MSDU with the sequence number that matches the Starting Sequence Number subfield in the Block Ack Starting Sequence Control subfield.

9.3.1.9 Control Wrapper frame format

The format of the Control Wrapper frame is shown in Figure 9-48.

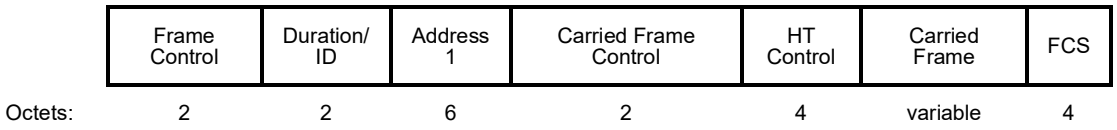

Figure 9-48—Control Wrapper frame format

The Control Wrapper frame is used to wrap any other Control frame (i.e., excluding the Control Wrapper frame) together with an HT Control field.

The Duration/ID field of the Control Wrapper frame is generated by following the rules for the Duration/ID field of the Control frame that is being wrapped.

The Address 1 field of the Control Wrapper frame is generated by following the rules for the Address 1 field of the Control frame that is being wrapped.

The Carried Frame Control field contains the value of the Frame Control field of the wrapped Control frame.

The HT Control field is defined in 9.2.4.6.

The Carried Frame field contains the fields that follow the Address 1 field of the Control frame that is being wrapped, excluding the FCS field.

The FCS field is defined in 9.2.4.8.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.3.1.10 Poll frame format

The format of the Poll frame is shown in Figure 9-49.

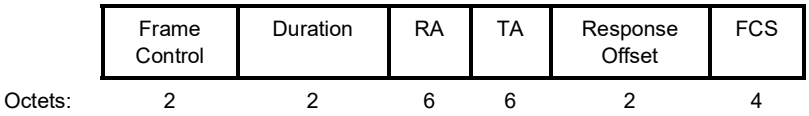

Figure 9-49—Poll frame format

The Duration field is set to include the duration, in microseconds, of the remaining Poll frame transmissions (see 10.39.7.2), plus all appropriate IFSs (10.3.2.3), plus the duration of the SPR frame transmissions.

The RA field contains the MAC address of the STA being polled.

The TA field contains the MAC address of the AP or PCP.

The Response Offset field indicates the offset, in units of 1 μs, beginning SIFS after the end of the Poll frame when the SPR frame in response to this Poll frame is transmitted.

9.3.1.11 Service period request (SPR) frame format

The format of the SPR frame is shown in Figure 9-50.

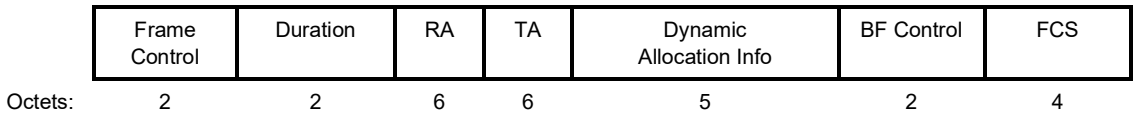

Figure 9-50—SPR frame format

When an SPR frame is sent in response to a Poll frame (see 10.39.7), the Duration field in the SPR frame is set to the value of the Duration field contained in the Poll frame, minus the value of the Response Offset field contained in the Poll frame multiplied by its unit as specified in 9.3.1.10, minus SIFS, minus the time taken to transmit the SPR frame. When the SPR frame is not sent in response to a Poll frame (see 10.39.9 and 11.4.13) and transmitted within an SP or a TXOP allocation, the Duration field is set to the time left in the allocation excluding the SPR transmission time. In all other cases, the Duration field is set to 0.

The RA field contains the MAC address of the AP or PCP.

The TA field contains the MAC address of the STA transmitting the SP request.

The Dynamic Allocation Info field is defined in 9.5.2.

The BF Control field is defined in 9.5.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.3.1.12 Grant frame format

The format of the Grant frame is shown in Figure 9-51.

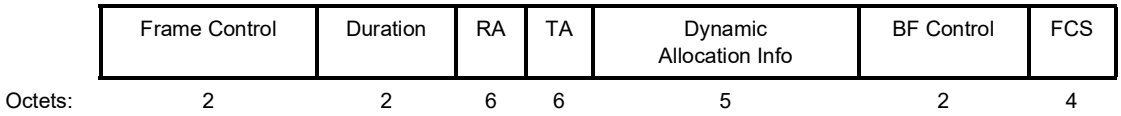

Figure 9-51—Grant frame format

For individually addressed Grant frames:

— If the Grant frame is used to obtain a TXOP, the Duration field is set to a value subject to the TXOP limit as described in 10.23.2.9. In all other cases within a CBAP, the Duration field is set to the Duration field of the immediately preceding frame minus TXTIME(Grant frame) minus aSIFSTime.

— If the Grant frame is sent within an SP, the Duration field is set according to the rules in 10.39.7, 10.39.8, and 10.39.9 as appropriate depending on the Grant frame usage.

— If the Grant frame is sent within an ATI, the Duration field is set according to the rules in 10.39.3.

For group addressed Grant frames, the Duration field is set to the time between PHY-TXEND.indication primitive of the Grant frame and the start of the allocation as indicated by the Allocation Duration subfield within the Dynamic Allocation Info field.

The RA field contains the MAC address of the STA receiving the SP grant.

The TA field contains the MAC address of the STA that has transmitted the Grant frame.

The Dynamic Allocation Info field is defined in 9.5.2.

The BF Control field is defined in 9.5.5.

9.3.1.13 DMG CTS frame format

The frame format for the DMG CTS frame is defined in Figure 9-52.

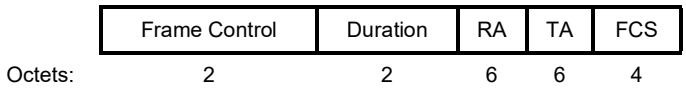

Figure 9-52—DMG CTS frame format

When the DMG CTS frame is a response to an RTS frame, the RA field of the DMG CTS frame is set to the address from the TA field of the RTS frame. When the DMG CTS frame is the first frame in a frame exchange, the RA field is set to the MAC address of the transmitter.

A DMG CTS-to-self frame is a DMG CTS frame in which the RA field is equal to the transmitter's MAC address.

For DMG CTS frames other than DMG CTS-to-self frames, the Duration field is set to the value of the Duration field of the immediately previous RTS frame, minus the time, in microseconds, required to transmit the DMG CTS frame and its SIFS. For DMG CTS-to-self frames, the Duration field is set to the remaining duration of the TXOP or SP. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For DMG CTS frames other than DMG CTS-to-self frames, the TA field is the MAC address of the STA transmitting the DMG CTS frame. For DMG CTS-to-self frames, the TA field is set to the individual address of the recipient or the group address of the recipients of the frame that the DMG STA intends to transmit after the DMG CTS-to-self frame.

9.3.1.14 DMG DTS frame format

The frame format for the DMG Denial to Send (DTS) frame is defined in Figure 9-53.

	Frame Control	Duration	RA	NAV-SA	NAV-DA	FCS
Octets:	2	2	6	6	6	4

Figure 9-53—DMG DTS frame format

The Duration field is set to the value of the transmitting STA's NAV – (TXTIME(DMG DTS) + SIFS) or the remaining time in the SP at the end of the DMG DTS frame transmission, whichever is smaller. The transmitting STA's NAV is the value of its NAV at the start of the DMG DTS frame transmission.

The RA field of the frame is copied from the TA field of the immediately previous RTS frame to which the DMG DTS frame is a response.

The NAV-SA and the NAV-DA fields contain the MAC addresses of the source DMG STA and the destination DMG STA, respectively, whose exchange of an RTS and DMG CTS frame caused the last update to the NAV at the transmitting STA.

9.3.1.15 Sector sweep (SSW) frame format

The frame format for the SSW frame is defined in Figure 9-54.

	Frame Control	Duration	RA	TA	SSW	SSW Feedback	FCS
Octets:	2	2	6	6	3	3	4

Figure 9-54—SSW frame format

The Duration field is set to the time until the end of the current SSW slot when the SSW frame is transmitted within an association beamforming training (A-BFT). Otherwise, it is set to the time until the end of the SSW frame transmission that has the CDOWN subfield within the SSW field equal to 0, plus MBIFS, or until the end of the current allocation (see 10.42), whichever comes first.

The RA field contains the MAC address of the STA that is the intended receiver of the sector sweep.

The TA field contains the MAC address of the transmitter STA of the sector sweep frame.

The SSW field is defined in 9.5.1.

The SSW Feedback field is defined in 9.5.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

9.3.1.16 Sector sweep feedback (SSW-Feedback) frame format

The format of the SSW-Feedback frame is shown in Figure 9-55.

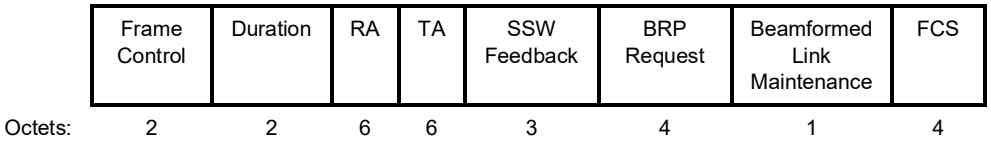

Figure 9-55—SSW-Feedback frame format

The Duration field is set to 0 when the SSW-Feedback frame is transmitted within an association beamforming training (A-BFT). When transmitted within a DTI, the Duration field is set to one of the following:

a) If a BRP phase is requested through the BRP Request field, the Duration field is set to the time, in microseconds, required to transmit an SSW-Ack frame plus 2×MBIFS (10.42.3.1).

b) If a BRP phase is not requested, the Duration field is set to the time, in microseconds, required to transmit an SSW-Ack frame, plus MBIFS (10.42.3.1) or the time until the end of the current allocation, whichever comes earlier.

The RA field contains the MAC address of the STA that is the intended destination of the SSW-Feedback frame.

The TA field contains the MAC address of the STA transmitting the SSW-Feedback frame.

The SSW Feedback field is defined in 9.5.3.

The BRP Request field is defined in 9.5.4.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.3.1.17 Sector sweep Ack (SSW-Ack) frame format

The format of the SSW-Ack frame is shown in Figure 9-56.

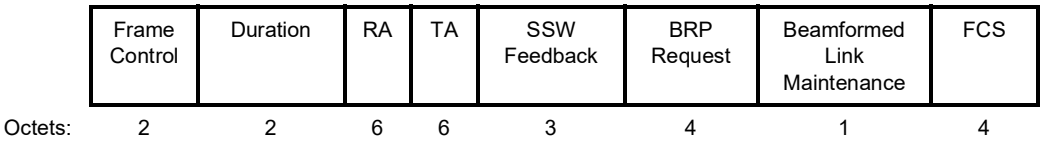

Figure 9-56—SSW-Ack frame format

The Duration field is set to the value of the Duration field of the immediately preceding SSW-Feedback frame, minus MBIFS, minus the time required to transmit the SSW-Ack frame.

The RA field contains the MAC address of the STA that is the intended destination of the SSW-Ack frame.

The TA field contains the MAC address of the STA transmitting the SSW-Ack frame.

The SSW Feedback field is defined in 9.5.3.

The BRP Request field is defined in 9.5.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.3.1.18 Grant Ack frame format

The format of the Grant Ack frame is shown in Figure 9-57. The Grant Ack frame is sent as a response to the reception of a Grant frame.

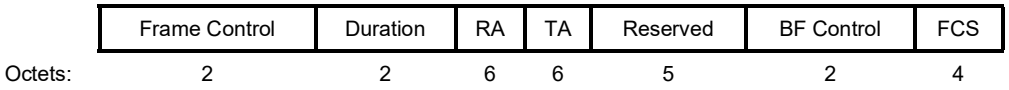

Figure 9-57—Grant Ack frame format

The Duration field is set to the value obtained from the Duration field of the immediately previous Grant frame minus the time, in microseconds, required to transmit the Grant Ack frame and its SIFS.

The RA field of the Grant Ack frame is copied from the Address 2 field of the immediately previous Grant frame.

The TA field contains the MAC address of the STA that has transmitted the Grant Ack frame.

The BF Control field is defined in 9.5.5.

9.3.1.19 VHT NDP Announcement frame format

The frame format of the VHT NDP Announcement frame is shown in Figure 9-58.

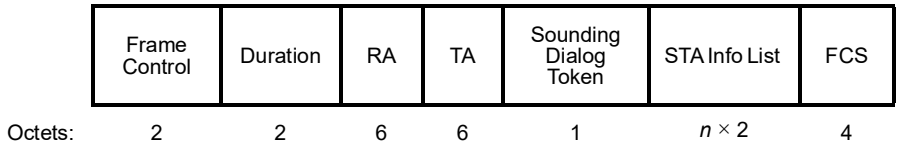

Figure 9-58—VHT NDP Announcement frame format

The Duration field is set as defined in 9.2.5.

The VHT NDP Announcement frame contains at least one STA Info field. If the VHT NDP Announcement frame contains only one STA Info field, then the RA field is set to the address of the STA that can provide feedback (see 10.36.5.2). If the VHT NDP Announcement frame contains more than one STA Info field, then the RA field is set to the broadcast address.

The TA field is set to the address of the STA transmitting the VHT NDP Announcement frame or the bandwidth signaling TA of the STA transmitting the VHT NDP Announcement frame. In a VHT NDP Announcement frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field is set to a bandwidth signaling TA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The format of the Sounding Dialog Token field is shown in Figure 9-59.

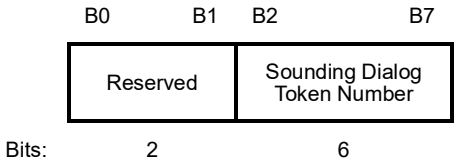

Figure 9-59—Sounding Dialog Token field format

The Sounding Dialog Token Number subfield in the Sounding Dialog Token field contains a value selected by the beamformer to identify the VHT NDP Announcement frame.

The STA Info List field contains one or more (*n*) STA Info fields.

If the VHT NDP Announcement frame is transmitted by a non-S1G STA, then the format of the STA Info field is shown in Figure 9-60.

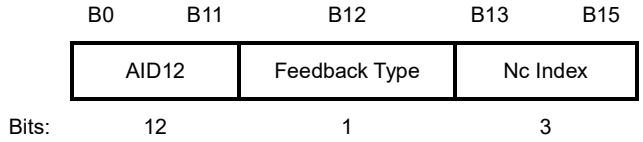

Figure 9-60—STA Info field format in a non-S1G STA

The subfields in the STA Info field are described in Table 9-29.

Table 9-29—STA Info subfields

Subfield	Description
AID12	Contains the 12 least significant bits of the AID of a STA expected to process the following VHT NDP and prepare the sounding feedback. Equal to 0 if the STA is an AP, mesh STA, or IBSS STA.
Feedback Type	Indicates the type of feedback requested. Set to 0 for SU. Set to 1 for MU.
Nc Index	If the Feedback Type field indicates MU, then Nc Index indicates the number of columns minus 1, ($Nc - 1$), in the compressed beamforming feedback matrix. Reserved if the Feedback Type field indicates SU.

If the VHT NDP Announcement frame is transmitted in an S1G PPDU, the frame is referred to as an S1G NDP Announcement frame, and the format of the STA Info field is shown in Figure 9-61. The Feedback Type and Nc Index subfields are defined in Table 9-29, wherein the Nc Index field does not indicate a value that is more than 4. The AID13 subfield contains the least significant bits of the AID of the STA that could process the following S1G NDP and prepare sounding feedback. The AID13 subfield is equal to 0 if the STA is an AP or is in an IBSS.

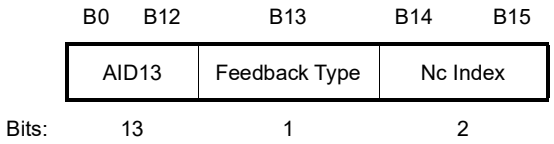

Figure 9-61—STA Info field format in an S1G STA

9.3.1.20 Beamforming Report Poll frame format

The Beamforming Report Poll frame is shown in Figure 9-62.

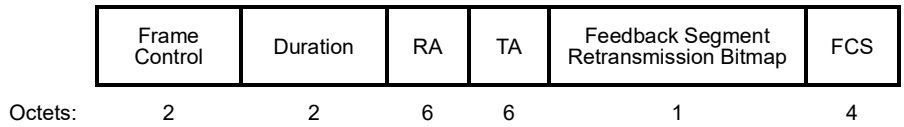

Figure 9-62—Beamforming Report Poll frame format

The Duration field is set as defined in 9.2.5.

The RA field is set to the address of the intended recipient.

The TA field is set to the address of the STA transmitting the Beamforming Report Poll or a bandwidth signaling TA. In a Beamforming Report Poll frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field is set to a bandwidth signaling TA.

The Feedback Segment Retransmission Bitmap field indicates the requested feedback segments of a VHT Compressed Beamforming report (see 10.36.5.3). If the bit in position *n* (*n=0* for LSB and *n=7* for MSB) is 1, then the feedback segment with the Remaining Feedback Segments subfield in the VHT MIMO Control field equal to *n* is requested. If the bit in position *n* is 0, then the feedback segment with the Remaining Feedback Segments subfield in the VHT MIMO Control field equal to *n* is not requested.

9.3.1.21 TACK frame format

The frame format of the TACK frame is defined in Figure 9-63.

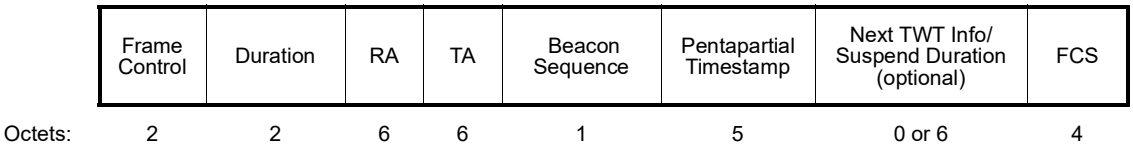

Figure 9-63—TACK frame format

The Duration field is described in 9.2.5.7.

The RA field contains the address of the intended recipient of the frame.

The TA field contains the address of the transmitter sending the frame.

The Beacon Sequence field contains the value of the Change Sequence field from the most recently transmitted S1G Beacon frame.

The Pentapartial Timestamp field contains the value of the 5 least significant octets of the STA's TSF timer at the time that the start of the data symbol containing the first bit of the Pentapartial Timestamp field appears at the transmit antenna connector.

The format for the optional Next TWT Info/Suspend Duration field is defined in Figure 9-64.

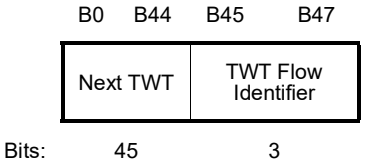

Figure 9-64—Next TWT Info/Suspend Duration field format

If the Next TWT Info Present field of the Frame Control field is equal to 1 and the Flow Control field of the Frame Control field is equal to 0, then the Next TWT Info/Suspend Duration field is present and is set to 0 or contains the 45 MSBs of the value of the 6 least significant octets of the TSF timer corresponding to the next scheduled TWT SP for the TWT agreement identified by the TWT Flow Identifier subfield for the STA that is the intended recipient of the frame. If the Next TWT Info/Suspend Duration field is 0, the transmitter does not currently have a Next TWT value available for transmission for the TWT agreement identified by the TWT Flow Identifier subfield for the STA that is the intended recipient of the frame.

If the Next TWT Info Present field of the Frame Control field is equal to 1 and the Flow Control field of the Frame Control field is equal to 1, then the Next TWT Info/Suspend Duration field is present and contains a flow suspension duration in microseconds during which the intended recipient TWT STA is not allowed to transmit Data frames to the STA identified by the TA field of the TACK frame.

If the Next TWT Info Present field is equal to 0 in the Frame Control field, the Next TWT Info/Suspend Duration field is not present in the TACK frame.

9.3.2 Data frames

9.3.2.1 Format of Data frames

9.3.2.1.1 General

The format of a Data frame is defined in Figure 9-65. The Frame Control, Duration, Address 1, Address 2, Address 3, and Sequence Control fields are present in all data frame subtypes. The presence of the Address 4 field is determined by the setting of the To DS and From DS subfields of the Frame Control field (see below). The presence of the QoS Control field is determined by the setting of the QoS subfield of the Subtype subfield (see 9.2.4.1.3 of the Frame Control field. The presence of the HT Control field is determined by the setting of the +HTC subfield of the Frame Control field (see 9.2.4.1.10).

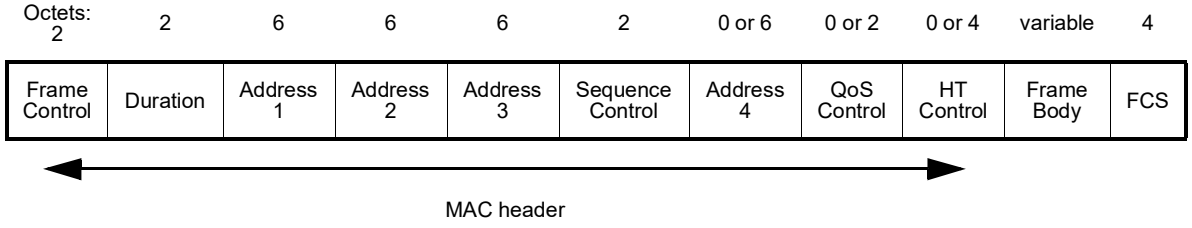

Figure 9-65—Data frame format

NOTE—The maximum frame body size shown in Figure 9-65 is for GCMP encryption of a maximum-size A-MSDU (note that TKIP encryption is not allowed in this case and any Mesh Control fields are part of the A-MSDU subframes). The corresponding maximum for CCMP encryption is 7951 octets. The maximum frame body size if A-MSDUs are not used is 2346 octets for GCMP encryption of a maximum-size MSDU, 2338 octets for CCMP encryption of a maximum-size MSDU and 2342 octets for TKIP encryption of a maximum-size MSDU, including in both cases an 18-octet Mesh Control field. The frame body size might in all cases be greater if a vendor-specific cipher suite is used.

Data frames with the QoS subfield of the Subtype subfield (see 9.2.4.1.3) set to 1 contain *QoS* in their names and contain a QoS Control field in the MAC header. Depending on the context, *QoS Data frame* either refers to any such frame, or refers specifically to the Data frame with subtype 1000. References nearby to other specific Data frames with *QoS* in their name (e.g., QoS Null or QoS Data +CF-Poll) typically suggest the latter interpretation.

A QoS STA always uses QoS Data frames for data transmissions to other QoS STAs. A QoS STA uses frames with the QoS subfield of the Subtype subfield set to 0 for data transmissions to non-QoS STAs. A non-QoS STA always uses frames with the QoS subfield of the Subtype subfield set to 0 for data transmissions to other STAs. All STAs use frames with the QoS subfield of the Subtype subfield set to 0 for nonconcealed GCR broadcast Data frames unless a transmitting STA knows that all STAs in a BSS have QoS capability, in which case the transmitting STAs use QoS Data frames. All STAs use frames with the QoS subfield of the Subtype subfield set to 0 for nonconcealed GCR group addressed Data frames unless it is known to the transmitter that all STAs in the BSS that are members of the multicast group have QoS capability, in which case STAs use QoS Data frames. APs where dot11RobustAVStreamingImplemented is true or mesh STAs where dot11MeshGCRImplemented is true use frames with the QoS subfield of the Subtype subfield set to 1 for concealed GCR frames, as described in 11.21.16.3.5.

9.3.2.1.2 Address and BSSID fields

The content of the address fields of Data frames is dependent upon the values of the To DS and From DS subfields in the Frame Control field and whether the Frame Body field contains either an MSDU (or fragment thereof) or an entire A-MSDU, as determined by the A-MSDU Present subfield of the QoS Control field (see 9.2.4.5.9). The content of the address fields transmitted by nonmesh STAs is defined in Table 9-30. The content of the address fields transmitted by mesh STAs is defined in 9.3.5, and the content of the fields transmitted by GLK STAs is defined in 10.65. Where the content of a field is shown as not applicable (N/A), the field is omitted. Note that Address 1 always holds the receiver address of the intended receiver (or, in the case of group addressed frames, receivers) and that Address 2 always holds the address of the STA that is transmitting the frame.

A STA uses the contents of the Address 2 field to direct the acknowledgment if an acknowledgment is necessary.

The DA field contains the destination of the MSDU (or fragment thereof) or A-MSDU in the Frame Body field.

NOTE 1—A SYNRA is never the DA. When a GLK AP uses a SYNRA as the RA, the actual DA is carried in another field. See 10.65.

The SA field contains the address of the MAC entity that initiated the MSDU (or fragment thereof) or A-MSDU in the Frame Body field.

When a Data frame carries an MSDU (or fragment thereof), the DA and SA values related to that MSDU are carried in the Address 1, Address 2, Address 3, and Address 4 fields (according to the setting of the To DS and From DS subfields) as defined in Table 9-30.

When a Data frame carries a basic A-MSDU, the DA and SA values related to each MSDU carried by the A-MSDU are carried within the A-MSDU subframe header. Zero, one, or both of these fields are present in the Address 1 and Address 2 fields as indicated in Table 9-30.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-30—Address field contents

To DS	From DS	Address 1	Address 2	Address 3		Address 4	
				MSDU and Short A-MSDU case	Basic A-MSDU and Dynamic A-MSDU case	MSDU and Short A-MSDU case	Basic A-MSDU and Dynamic A-MSDU case
0	0	RA = DA	TA = SA	BSSID	BSSID	N/A	N/A
0	1	RA (see NOTE 1)	TA = BSSID	SA	BSSID	N/A	N/A
1	0	RA = BSSID	TA (see NOTE 2)	DA	BSSID	N/A	N/A
1	1	RA	TA	DA	BSSID	SA	BSSID

NOTE 1—Address 1 field of a frame with To DS equal to 0 and From DS equal to 1 is equal to the DA, except when an individually addressed A-MSDU frame is used in DMS and S1G relay, in which case, the destination address of the frame is included in the DA field of the A-MSDU subframe (see 11.21.16 and 10.54).

NOTE 2—Address 2 field of a frame with To DS equal to 1 and From DS equal to 0 is equal to the SA, except when an individually addressed A-MSDU frame is used in S1G relay, in which case, the source address of the frame is included in the SA field of the A-MSDU subframe (see 10.54).

The RA field is the individual address of the STA that is the immediate intended receiver of the frame or the group address of the STAs that are the immediate intended receivers of the frame.

When a GLK AP Data frame is sent with a four-address MAC header with a groupcast RA, the RA is a SYNRA (see 10.65). A SYNRA is also used when the DA is not known by the corresponding IEEE 802.1Q bridge. The format of the RA field when it carries a SYNRA is shown in Figure 9-66.

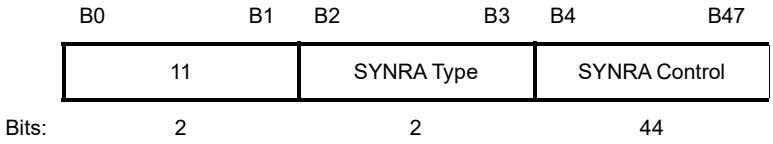

Figure 9-66—Format of an RA field carrying a SYNRA

NOTE 2—IEEE Std 802 and IEEE Std 802.1CQ define groupcast MAC addresses with a similar format to a SYNRA, but groupcast MAC addresses are DAs in the context of IEEE Std 802.11. Since SYNRAs only occur in the RA field, the similar formats are disambiguated by virtue of being used within an RA or DA.

The SYNRA Type subfield is used to select between multiple possible SYNRA formats. The SYNRA types and the format of the SYNRA Control subfield for each type are listed in Table 9-31.

The SYNRA Control subfield format is specified separately for each SYNRA type, as defined in Table 9-31.

Table 9-31—SYNRA Type field encoding

Value	Description	SYNRA Control subfield format
0	Basic SYNRA	See Figure 9-67.
1–3	Reserved	—

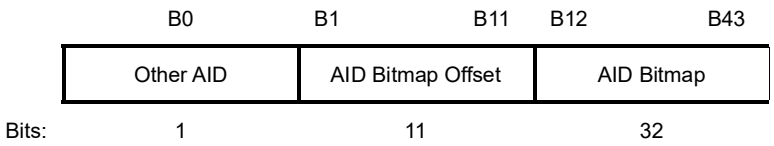

Figure 9-67—Basic SYNRA Control subfield format

The AID Bitmap Offset subfield in a Basic SYNRA Control subfield is used to indicate the starting AID value, which is associated with bit 0 of the AID Bitmap subfield. Its value is multiplied by 4 to find the starting AID value, and it has a value from 0 to 494 for a non-S1G STA, or 0 to 2040 for an S1G STA. Other values are reserved.

NOTE 3—These match the maximum AID values of 2007 (for non-S1G STAs) and 8191 (for S1G STAs).

The AID Bitmap subfield in a Basic SYNRA Control subfield provides the accept/discard indication for a range of 32 consecutive AIDs. Bits B12 to B43 represent AID values in the range AID Bitmap Offset × 4 + 1 to AID Bitmap Offset × 4 + 32, respectively. For each bit in the AID Bitmap subfield, a 1 indicates acceptance, and a 0 indicates discarding.

The Other AID subfield in a Basic SYNRA Control subfield provides the accept/discard indication for AIDs outside the range of values covered by the AID Bitmap subfield. A 1 indicates acceptance, and a 0 indicates discarding.

The TA field is the address of the STA that is transmitting the frame.

The BSSID field of the Data frame is set as follows:

a) If the STA is contained within an AP or is associated with an AP, the BSSID is the address currently in use by the STA contained in the AP.
b) If the STA is an IBSS STA, the BSSID is that selected by the STA that started the IBSS.
c) If the STA is transmitting a Data frame when dot11OCBActivated is true, the BSSID is the wildcard BSSID.
d) If the STA is a member of an MBSS, the BSSID is the address of the transmitter and is equal to the Data frame's TA.
e) If the STA participates in a PBSS, the BSSID is the address of the STA contained in the PCP.

9.3.2.1.3 Other MAC Header fields

The Sequence Control field is defined in 9.2.4.4.

The QoS Control field is defined in 9.2.4.5. The presence of the QoS Control field is determined by the Subtype subfield of the Frame Control field, as specified in 9.2.4.1.3.

The HT Control field is defined in 9.2.4.6. The presence of the HT Control field is determined by the +HTC subfield of the Frame Control field, as specified in 9.2.4.1.10.

9.3.2.1.4 The frame body

The frame body consists of either of the following:

— The MSDU (or a fragment thereof), the Mesh Control field (present if the frame is transmitted by a mesh STA and the Mesh Control Present subfield of the QoS Control field is 1, otherwise absent), and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— The A-MSDU and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)

The presence of an A-MSDU in the frame body is indicated by setting the A-MSDU Present subfield of the QoS Control field to 1, as shown in Table 9-10.

For Data frames of subtype Null, QoS Null, QoS CF-Ack, QoS CF-Poll, and QoS CF-Ack +CF-Poll, the Frame Body field is null (i.e., has a length of 0 octets); these subtypes are used for MAC control purposes. For Data frames of subtype Data, the Frame Body field contains all of, or a fragment of, an MSDU after any encapsulation for security. For Data frames of subtypes QoS Data, QoS Data +CF-Ack, QoS Data +CF-Poll, and QoS Data +CF-Ack +CF-Poll, the Frame Body field contains an MSDU (or fragment thereof) or A-MSDU after any encapsulation for security. For Data frames of subtype QoS Data that are transmitted by a mesh STA, the Frame Body field also contains a Mesh Control field, as described in 9.2.4.7.3.

The maximum length of the Frame Body field can be determined from the maximum MSDU length plus the length of the Mesh Control field (if present) plus any overhead from encapsulation for encryption (i.e., it is always possible to send a maximum length MSDU, with any encapsulations provided by the MAC layer within a single Data frame). When the frame body carries an A-MSDU, the size of the Frame Body field is limited by:

— The PHY's maximum PHY service data unit (PSDU) length
— If A-MPDU aggregation is used by a non-VHT and non-DMG STA, a maximum MPDU length of 4095 octets (see 9.7)

9.3.2.1.5 Duration field

Within all Data frames sent by the QoS STA, the Duration field contains a duration value as defined in 9.2.5. Within all Data frames sent by non-QoS STAs, the Duration field is set according to the following rules:

— If the Address 1 field contains a group address, the Duration field is set to 0.
— If the More Fragments bit is 0 in the Frame Control field of a frame and the Address 1 field contains an individual address, the Duration field is set to the time, in microseconds, required to transmit one Ack frame, plus one SIFS.
— If the More Fragments bit is 1 in the Frame Control field of a frame and the Address 1 field contains an individual address, the Duration field is set to the time, in microseconds, required to transmit the next fragment of this Data frame, plus two Ack frames, plus three SIFSs.

The Duration field calculation for the Data frame is based on the rules in 10.6 that determine the data rate at which the Control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration field values less than or equal to 32 767 from valid Data frames (without regard for the RA, DA, and/or BSSID address values that might be present in these frames) to update their NAV settings as appropriate under the coordination function rules.

NOTE 1—The QoS Data and QoS Null subtypes are the only Data subtypes transmitted by a DMG STA.

NOTE 2—The HT Control field is not present in frames transmitted by a DMG STA.

9.3.2.2 Aggregate MSDU (A-MSDU) format

9.3.2.2.1 General

An A-MSDU is a sequence of A-MSDU subframes as shown in Figure 9-68. Each A-MSDU subframe consists of an A-MSDU subframe header followed by an MSDU and 0 to 3 octets of padding as shown in Figure 9-69 (in 9.3.2.2.2), Figure 9-71 (in 9.3.2.2.3), and Figure 9-72 (in 9.3.2.2.4).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

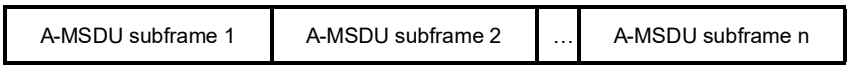

Figure 9-68—A-MSDU structure

Three A-MSDU subframe formats are defined: the Basic A-MSDU subframe described in 9.3.2.2.2, the Short A-MSDU subframe described in 9.3.2.2.3, and the Dynamic A-MSDU subframe described in 9.3.2.2.4. Unless otherwise noted, in this standard, the term A-MSDU applies to any of the Basic A-MSDU, the Short A-MSDU, and the Dynamic A-MSDU. The Basic A-MSDU uses only the Basic A-MSDU subframe format, the Short A-MSDU uses only the Short A-MSDU subframe format, and the Dynamic A-MSDU uses only the Dynamic A-MSDU subframe format.

9.3.2.2.2 Basic A-MSDU subframe format

The structure of a Basic A-MSDU subframe is shown in Figure 9-69.

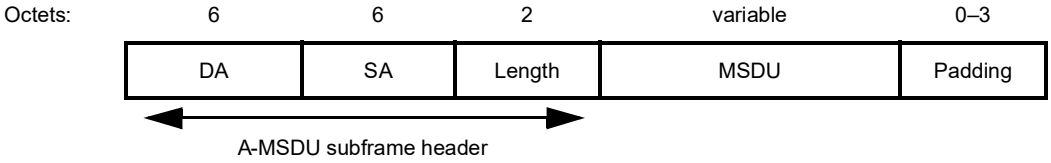

Figure 9-69—Basic A-MSDU subframe structure

In the Basic A-MSDU subframe, each A-MSDU subframe (except the last) is padded so that its length is a multiple of 4 octets. The last A-MSDU subframe has no padding.

The A-MSDU subframe header contains three fields: DA, SA, and Length. The order of these fields and the bits within these fields are the same as the IEEE 802.3™ frame format. The DA and SA fields of the A-MSDU subframe header contain the values passed in the MA-UNITDATA.request and MA-UNITDATA.indication primitives. The Length field contains the length in octets of the MSDU.

An A-MSDU contains only MSDUs whose DA and SA parameter values map to the same receiver address (RA) and transmitter address (TA) values. The rules for determining RA and TA are independent of whether the frame body carries an A-MSDU.

NOTE 1—It is possible to have different DA and SA parameter values in A-MSDU subframe headers of the same A-MSDU as long as they all map to the same Address 1 and Address 2 parameter values.

The MPDU containing the A-MSDU is carried in any of the following data frame subtypes: QoS Data, QoS Data +CF-Ack, QoS Data +CF-Poll, QoS Data +CF-Ack +CF-Poll. The A-MSDU structure is contained in the frame body of a single MPDU. If encrypted, the MPDU is encrypted as a single unit.

NOTE 2—The TID present in the QoS Control field of the MPDU carrying the A-MSDU indicates the TID for all MSDUs in the A-MSDU. Because this TID is common to all MSDUs in the A-MSDU, only MSDUs delivered to the MAC by an MA-UNITDATA.request primitive with an integer priority parameter that maps to the same TID can be aggregated together using A-MSDU.

When mesh Data frames are aggregated, the A-MSDU subframe header includes Mesh DA, Mesh SA, Length, and Mesh Control. The A-MSDU subframe structure for Mesh Data is defined in Figure 9-70.

The Mesh DA and Mesh SA fields contain the addresses of the destination mesh STA and the source mesh STA, respectively, determined in 9.3.5.

The Length field contains the length in octets of the MSDU.

Copyright © 2021 IEEE. All rights reserved.

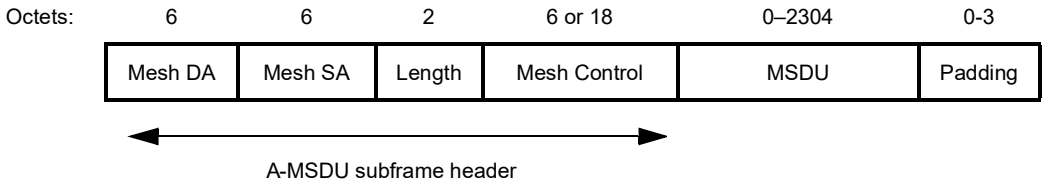

Figure 9-70—A-MSDU subframe structure for Mesh Data

The format of the Mesh Control field is described in 9.2.4.7.3.

NOTE 3—It is possible to have different Mesh DA, Mesh SA, and Mesh Control in subframe headers of the same A-MSDU as long as they all map to the same Address 1 and Address 2 values.

9.3.2.2.3 Short A-MSDU subframe format

The Short A-MSDU subframe is shown in Figure 9-71. In the Short A-MSDU subframe, each A-MSDU subframe (except the last) is padded so that its length excluding the A-MSDU subframe header is a multiple of 4 octets. The last A-MSDU subframe has no padding.

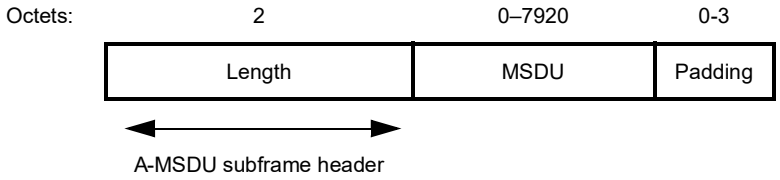

Figure 9-71—Short A-MSDU subframe structure

The Short A-MSDU subframe header consists of a Length field that contains the length in octets of the MSDU.

NOTE—The Short A-MSDU subframe format is not transmitted by non-DMG STAs.

9.3.2.2.4 Dynamic A-MSDU format

The structure of a Dynamic A-MSDU subframe is shown in Figure 9-72. In the Dynamic A-MSDU subframe, each A-MSDU subframe (except the last) is padded, so that its length is a multiple of 4 octets. The last A-MSDU subframe has no padding.

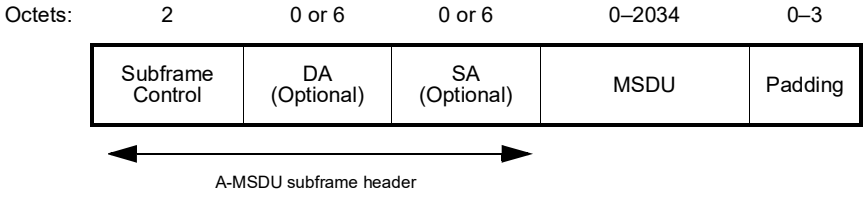

Figure 9-72—Dynamic A-MSDU subframe structure

The A-MSDU subframe header contains the Subframe Control field and optionally the DA and SA fields. A Dynamic A-MSDU subframe has 0, 1, or 2 addresses associated with it, as governed by the Subframe Control field.

The Subframe Control field is defined in Figure 9-73 and contains the Length, DA Present, and SA Present subfields.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

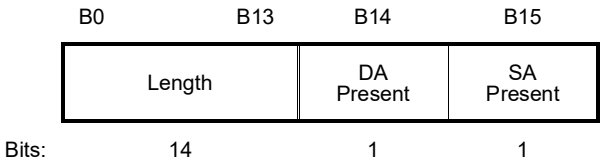

Figure 9-73—Subframe Control field format

The Length subfield contains the length in octets of the MSDU.

The DA Present field is set to 1 when the DA field is present in the Dynamic A-MSDU subframe header and is set to 0 when the DA field is not present.

The SA Present field is set to 1 when the SA field is present in the Dynamic A-MSDU subframe header and is set to 0 when the SA field is not present.

If present, the DA field of the Dynamic A-MSDU subframe header contains the destination address of the MSDU. When the DA field is not present, the DA of the MSDU is defined by the rules in 10.11.

If present, the SA field of the Dynamic A-MSDU subframe header contains the source address of the MSDU. When the SA field is not present in a Dynamic A-MSDU subframe, the SA is defined by the rules in 10.11.

The MSDU field contains the MSDU that is carried in the Dynamic A-MSDU subframe.

The Padding field contains 0 to 3 octets of padding, so that the length of the Dynamic A-MSDU subframe is a multiple of 4 octets, except for the last Dynamic A-MSDU subframe in a Dynamic A-MSDU, which has no padding.

9.3.3 (PV0) Management frames

9.3.3.1 Format of (PV0) Management frames

The format of a Management frame is defined in Figure 9-74. The Frame Control, Duration, Address 1, Address 2, Address 3, and Sequence Control fields are present in all management frame subtypes. In an MMPDU carried in one or more non-VHT PPDUs, the maximum MMPDU size is specified in Table 9-25. The presence of the HT Control field is determined by the setting of the +HTC subfield of the Frame Control field (see 9.2.4.1.10. In an MMPDU carried in one or more PPDU(s), all of which are VHT or S1G PPDU(s), the maximum MMPDU size specified in Table 9-25 is the maximum MPDU size supported by the recipient(s) less the shortest management frame MAC header and FCS.

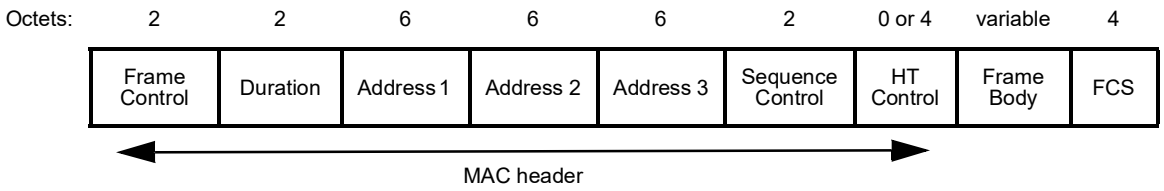

Figure 9-74—Management frame format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—In an MMPDU carried in one or more PPDUs, all of which are VHT or S1G PPDUs, the presence of encryption overhead (i.e., the MMPDU is transmitted in protected robust Management frames) or an HT Control field might cause an MMPDU to be fragmented that would not otherwise need to be fragmented.

A STA uses the contents of the Address 1 field to perform the address matching for receive decisions. In the case where the Address 1 field contains a group address and the frame subtype is other than Beacon or the frame subtype Action, Category Multihop Action (Multihop Action frame), the Address 3 field also is validated to verify that the group addressed frame originated from a STA in the BSS of which the receiving STA is a member or from a mesh STA to which mesh peering is maintained. Details of addressing and forwarding of the group addressed frame in an MBSS are defined in 10.38.4. When the Address 1 field contains a group address and the frame subtype is either Probe Request or Action with Category Public, a wildcard BSSID value matches all receiving STA's BSSIDs. If the frame subtype is Beacon, other address matching rules apply, as specified in 11.1.3.7. Frames of subtype Probe Request are additionally processed as described in 11.1.4.3.2 for non-DMG STAs and 11.1.4.3.3 for DMG STAs. If the frame subtype is Action, the Category is Public, and the Action is 20/40 BSS Coexistence Management, then additional address matching rules for receive decisions apply as specified in 11.15 and 11.16.

The address fields for all Management frames except Multihop Action frames are as follows:

a) The Address 1 field of the Management frame is the RA (=DA) and is the destination of the frame.
b) The Address 2 field of the Management frame is the TA (=SA) and is the address of the STA transmitting the frame.
    1) If the STA is an AP with dot11MultiBSSDImplemented set to false, then this address is the BSSID.
    2) If the STA is an AP with dot11MultiBSSIDImplemented set to true and the Address 1 field is not set to the broadcast address, then this address is the BSSID of the AP's BSS (which is either the transmitted BSSID or a nontransmitted BSSID).
    3) If the STA is an AP with dot11MultiBSSIDImplemented set to true and the Address 1 field is set to the broadcast address, then this address is the transmitted BSSID.
c) The Address 3 field of the Management frame is set and determined as follows:
    1) In Probe Request frames, the Address 3 field can be the wildcard BSSID as defined in the procedures specified in 11.1.4. If Address 3 is not the wildcard BSSID, then it is (for a nonmesh STA) the BSSID of the BSS of the intended recipient(s), or (for a mesh STA) the MAC address of the intended recipient.

    NOTE 2—Per 11.1.4.3.4, a mesh STA does not examine the Address 3 field in Probe Request frames it receives. Using an individual address, however, might prevent unwanted responses from other STAs.

    2) In Public Action frames, the Address 3 field is the BSSID. The BSSID value is set according to 11.17.
    3) If dot11OCBActivated is true, the Address 3 field is the wildcard BSSID.
    4) Otherwise:
        i) If the STA is an AP or PCP, the Address 3 field is the same as the Address 2 field.
        ii) If the STA is transmitting the Management frame to an AP that is not in a multiple BSSID set or to a PCP, the Address 3 field is the BSSID, irrespective of whether the STA is associated with that AP or PCP.
        iii) If the STA is transmitting the Management frame to an AP that is in a multiple BSSID set, the Address 3 field is the BSSID of the AP's BSS (which is either the transmitted BSSID or a nontransmitted BSSID), irrespective of whether the STA is associated with that AP.
        iv) If the STA is transmitting the Management frame to one or more IBSS STAs, the Address 3 field is the BSSID.
        v) If the STA is a mesh STA, the Address 3 field is the TA.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

vi) If the STA is a TDLS STA transmitting the Management frame to a TDLS peer STA, and the AP to which they are associated is not in a multiple BSSID set, the Address 3 field is the BSSID.

vii) If the STA is a TDLS STA transmitting the Management frame to a TDLS peer STA, and the AP to which they are associated is in a multiple BSSID set, the Address 3 field is the BSSID of the AP's BSS (which is either the transmitted BSSID or a nontransmitted BSSID).

The address fields for)Multihop Action frames are described in 9.3.5.

Within all Management frames sent by the QoS STA, the Duration field contains a duration value as defined in 9.2.5. Within all Management frames sent by non-QoS STAs, the Duration field is set according to the following rules:

— If the DA field contains a group address, the Duration field is set to 0.

— If the More Fragments bit is 0 in the Frame Control field of a frame and the DA field contains an individual address, the Duration field is set to the time, in microseconds, required to transmit one Ack frame, plus one SIFS.

— If the More Fragments bit is 1 in the Frame Control field of a frame, and the DA field contains an individual address, the Duration field is set to the time, in microseconds, required to transmit the next fragment of this Management frame, plus two Ack frames, plus three SIFSs.

The Duration field calculation for the Management frame is based on the rules in 10.6 that determine the data rate at which the Control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration field values less than or equal to 32 767 from valid Management frames to update their NAV settings as appropriate under the coordination function rules.

The HT Control field is defined in 9.2.4.6. The presence of the HT Control field is determined by the +HTC subfield of the Frame Control field, as specified in 9.2.4.1.10.

A Management frame is an IQMF when both

— The RA of the Management frame corresponds to an individual MAC address; and

— The To DS subfield is set to 1 and the From DS subfield of the Frame Control field is set to 0.

A Management frame is a GQMF when both

— The RA of the Management frame corresponds to a group MAC address; and

— The To DS subfield is set to 1 and the From DS subfield of the Frame Control field is set to 0.

The frame body consists of fields and elements as defined for each management frame subtype. All fields and elements are mandatory unless stated otherwise. Fields and elements appear in the specified, relative order, skipping fields or elements that are not present. STAs that encounter an element ID they do not recognize in the frame body of a received Management frame ignore that element and continue to parse the remainder of the management frame body (if any) for additional elements with recognizable element IDs. See 10.28.7.

9.3.3.2 Beacon frame format

The frame body of a Beacon frame contains the information shown in Table 9-32.

Table 9-32—Beacon frame body

Order	Information	Notes
1	Timestamp	See 9.4.1.10 for Timestamp field format.
2	Beacon Interval	See 9.4.1.3 for Beacon Interval field format.
3	Capability Information	See 9.4.1.4 for Capability Information field format.
4	Service Set Identifier (SSID)	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2.
5	Supported Rates and BSS Membership Selectors	
6	DSSS Parameter Set	The element is optionally present. The DSSS Parameter Set element is present within Beacon frames generated by STAs using Clause 15, Clause 16, and Clause 18 PHYs. The element is present within Beacon frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band.
7	IBSS Parameter Set	The IBSS Parameter Set element is present only within Beacon frames generated by IBSS STAs.
8	Traffic indication map (TIM)	The TIM element is present only within Beacon frames generated by APs or mesh STAs.
9	Country	The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
10	Power Constraint	The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true.
11	Channel Switch Announcement	Channel Switch Announcement element is optionally present if dot11SpectrumManagementRequired is true.
12	Quiet	The Quiet element is optionally present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
13	IBSS DFS	IBSS DFS element is present if dot11SpectrumManagementRequired is true in an IBSS.
14	TPC Report	The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
15	ERP	The ERP element is present within Beacon frames generated by STAs using extended rate PHYs (ERPs) defined in Clause 18 and is optionally present in other cases.
16	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optional otherwise.
17	RSN	The RSNE is present within Beacon frames generated by STAs that have dot11RSNAActivated equal to true.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-32—Beacon frame body *(continued)*

Order	Information	Notes
18	BSS Load	The BSS Load element is present if dot11QosOptionImplemented and dot11QBSSLoadImplemented are both true.
19	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true, and dot11MeshActivated is false, and the QoS Capability element is not present.
20	QoS Capability	The QoS Capability element is present if dot11QosOptionImplemented is true, and dot11MeshActivated is false, and EDCA Parameter Set element is not present.
21	AP Channel Report	If dot11RMAPChannelReportActivated is true, one AP Channel Report element is present for each operating class that has at least 1 channel to report.
22	BSS Average Access Delay	The BSS Average Access Delay element is present if dot11RMBSSAverageAccessDelayActivated is true and the AP Average Access Delay field is not equal to 255 (measurement not available); otherwise, the BSS Average Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true.
23	Antenna	The Antenna element is present if dot11RMAntennaInformationActivated is true and the Antenna ID field is not equal to 0 (unknown antenna); otherwise, the Antenna element is optionally present if dot11RMAntennaInformationActivated is true.
24	BSS Available Admission Capacity	The BSS Available Admission Capacity element is present if dot11RMBSSAvailableAdmissionCapacityActivated is true with the following exceptions: 1) when Available Admission Capacity Bitmask equals 0 (Available Admission Capacity List contains no entries), or 2) when the BSS Load element is present and the Available Admission Capacity Bitmask states that only AC_VO is present in the Available Admission Capacity List field.
25	BSS AC Access Delay	The BSS AC Access Delay element is present if dot11RMBSSAverageAccessDelayActivated is true and at least one field of the element is not equal to 255 (measurement not available); otherwise, the BSS AC Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true.
26	Measurement Pilot Transmission	The Measurement Pilot Transmission element is present if dot11RMMeasurementPilotActivated is a value between 2 and 7.
27	Multiple BSSID	One or more Multiple BSSID elements are present if dot11RMMeasurementPilotActivated is a value between 2 and 7 and the AP is a member of a multiple BSSID set (see 11.10.14) with two or more members, or if dot11MultiBSSIDImplemented is true, or if dot11InterworkingServiceActivated is true and the AP is a member of a multiple BSSID set with two or more members and at least one dot11GASAdvertisementID exists.
28	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
29	Mobility Domain	The Mobility Domain element (MDE) is present if dot11FastBSSTransitionActivated is true.
30	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
31	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-32—Beacon frame body *(continued)*

Order	Information	Notes
32	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true. The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true.
33	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
34	HT Operation	The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented is true.
35	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
36	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true.
37	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
38	FMS Descriptor	The FMS Descriptor element is present if dot11FMSActivated is true.
39	QoS Traffic Capability	The QoS Traffic Capability element is optionally present if dot11ACStationCountActivated is true.
40	Time Advertisement	The Time Advertisement element is present every dot11TimeAdvertisementDTIMInterval if dot11UTCTSFOffsetActivated is true.
41	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
42	Advertisement Protocol	Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID MIB attribute exists.
43	Roaming Consortium	The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
44	Emergency Alert Identifier	One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network.
45	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
46	Mesh Configuration	The Mesh Configuration element is present if dot11MeshActivated is true.
47	Mesh Awake Window	The Mesh Awake Window element is optionally present if dot11MeshActivated is true.
48	Beacon Timing	The Beacon Timing element is optionally present if both dot11MeshActivated and dot11MBCAActivated are true.
49	MCCAOP Advertisement Overview	The MCCAOP Advertisement Overview element is optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
50	MCCAOP Advertisement	One or more MCCAOP Advertisement elements are optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
51	Mesh Channel Switch Parameters	The Mesh Channel Switch Parameters element is present when dot11MeshActivated is true and either Channel Switch Announcement element or Extended Channel Switch Announcement element is present.

Table 9-32—Beacon frame body *(continued)*

Order	Information	Notes
52	QMF Policy	Indicates the QMF policy parameters of the transmitting STA. The QMF Policy element is present when dot11QMFActivated is true and the transmitting STA is an AP or a mesh STA. This element is not present otherwise.
53	QLoad Report	The QLoad Report element is present every dot11QLoadReportIntervalDTIM DTIMs if dot11QLoadReportActivated is true.
54	HCCA TXOP Update Count	The HCCA TXOP Update Count element is present if both dot11PublicHCCATXOPNegotiationActivated is true and an HC is collocated with the AP.
55	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
56	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
57	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true; otherwise, it is not present.
58	Transmit Power Envelope element	One Transmit Power Envelope element is present for each distinct value of the Local Maximum Transmit Power Unit Interpretation subfield that is supported for the BSS if both of the following conditions are met: — dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true; — Either dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. Otherwise, this element is not present.
59	Channel Switch Wrapper element	The Channel Switch Wrapper element is optionally present if dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true and at least one of a Channel Switch Announcement element or an Extended Channel Switch Announcement element is also present in the Beacon frame and the Channel Switch Wrapper element contains at least one subelement.
60	Extended BSS Load element	The Extended BSS Load element is optionally present if dot11QosOptionImplemented, dot11QBSSLoadImplemented, and dot11VHTOptionImplemented are true.
61	Quiet Channel	Either one Quiet Channel element containing an AP Quiet Mode field equal to 0 or, in an infrastructure BSS, one or more Quiet Channel elements each containing an AP Quiet Mode field equal to 1 are optionally present if dot11VHTOptionImplemented is true, and either dot11SpectrumManagementRequired or dot11RadioMeasurementActivated is true.
62	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
63	Reduced Neighbor Report	The Reduced Neighbor Report element is optionally present if dot11TVHTOptionImplemented or dot11FILSActivated is true; otherwise not present.
64	TVHT Operation	The TVHT Operation element is present for a TVHT STA when dot11TVHTOptionImplemented is true; otherwise it is not present.
65	Estimated Service Parameters Inbound	The Estimated Service Parameters Inbound element is present if dot11EstimatedServiceParametersInboundOptionImplemented is true.
66	Future Channel Guidance	The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true.

Table 9-32—Beacon frame body *(continued)*

Order	Information	Notes
67	Common Advertisement Group (CAG) Number	The CAG Number element is optionally present if dot11FILSActivated is true; otherwise not present.
68	FILS Indication	The FILS Indication element is present if dot11FILSActivated is true; otherwise not present.
69	AP-CSN	The AP Configuration Sequence Number (AP-CSN) element is optionally present if dot11FILSActivated is true; otherwise not present.
70	DILS	The DILS element is optionally present if dot11FILSActivated is true; otherwise not present.
71	Max Channel Switch Time	The Max Channel Switch Time element is optionally present when a Channel Switch Announcement or an Extended Channel Switch Announcement element is also present.
72	Estimated Services Parameters Outbound	The Estimated Service Parameters Outbound element is optionally present if dot11EstimatedServiceParametersOutboundOptionImplemented is true.
73	Service Hint	The Service Hint element is optionally present if dot11UnsolicitedPADActivated is true.
74	Service Hash	The Service Hash element is optionally present if dot11UnsolicitedPADActivated is true.
75	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
Last -1	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.
Last	MME	The MME is present if dot11BeaconProtectionEnabled is true at the AP.
NOTE—The MME appears after all fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 12.5.4.		

9.3.3.3 ATIM frame format

The frame body of an ATIM frame is null.

9.3.3.4 Disassociation frame format

The frame body of a Disassociation frame contains the information shown in Table 9-33.

Table 9-33—Disassociation frame body

Order	Information
1	Reason code
Last – 1	One or more Vendor Specific elements are optionally present.
Last	The MME is present when management frame protection is enabled at the AP and the frame is a group addressed frame.
NOTE—The MME appears after all fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 12.5.4.

9.3.3.5 Association Request frame format

The frame body of an Association Request frame contains the information shown in Table 9-34.

Table 9-34—Association Request frame body

Order	Information	Notes
1	Capability Information	See 9.4.1.4 for Capability Information field format.
2	Listen Interval	
3	SSID	
4	Supported Rates and BSS Membership Selectors	This element is not present if dot11DMGOptionImplemented is true.
5	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optional otherwise. This element is not present if dot11DMGOptionImplemented is true.
6	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
7	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false.
8	RSN	The RSNE is present if dot11RSNAActivated is true.
9	QoS Capability	The QoS Capability element is present if dot11QosOptionImplemented is true.
10	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
11	Mobility Domain	The Mobility Domain element (MDE) is present in an Association Request frame if dot11FastBSSTransitionActivated is true and if the frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated equal to true).
12	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true.
13	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
14	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
15	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
16	QoS Traffic Capability	The QoS Traffic Capability element is present if dot11QoSTrafficCapabilityActivated is true.
17	TIM Broadcast Request	The TIM Broadcast Request element is present if dot11TIMBroadcastActivated is true.
18	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 11.3.5).

Table 9-34—Association Request frame body *(continued)*

Order	Information	Notes
19	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
20	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
21	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
22	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
23	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
24	FILS Session	The FILS Session element is optionally present if dot11FILSActivated is true; otherwise not present.
25	FILS Public Key	The FILS Public Key element is present if dot11FILSActivated is true and FILS Public Key authentication is used; otherwise not present.
26	FILS Key Confirmation	The FILS Key Confirmation element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
27	FILS HLP Container	One or more FILS HLP Container elements are optionally present if dot11FILSActivated is true; otherwise not present.
28	FILS IP Address Assignment	The FILS IP Address Assignment element is optionally present if dot11FILSActivated is true; otherwise not present.
29	TWT	The TWT element is optionally present if dot11TWTOptionActivated is true; otherwise not present.
30	AID Request	The AID Request element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
31	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
32	EL Operation	The EL Operation element is optionally present if dot11S1GELOperationActivated is true; otherwise not present.
33	S1G Relay	The S1G Relay element is present if dot11RelaySTAImplemented is true; otherwise not present.
34	BSS Max Idle Period	The BSS Max Idle Period element is optionally present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or if dot11S1GOptionImplemented is true; otherwise not present.
35	Header Compression	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true.
36	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
37	Reachable Address	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
38	S1G Relay Activation	The S1G Relay Activation element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
39	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.

Copyright © 2021 IEEE. All rights reserved.

Table 9-34—Association Request frame body *(continued)*

Order	Information	Notes
40	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
41	GLK-GCR Parameter Set	The GLK-GCR Parameter Set element is present if dot11GLKImplemented is true to indicate the number of reorder buffers the STA has to support GLK-GCR with GCR block ack and respond to corresponding GLK-GCR BlockAckReq frames. Otherwise this element is not present.
42	Fast BSS Transition	An FTE is present in an Association Request frame if dot11FastBSSTransitionActivated is true, dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:16 or 00-0F-AC:17, and FT initial mobility domain association over FILS in an RSN is being performed.
43	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
44	Supplemental Class 2 Capabilities	The Supplemental Class 2 Capabilities element is present when dot11Class2CapabilitiesOptionImplemented is true; otherwise not present.
45	MSCS Descriptor	The MSCS Descriptor element is optionally present if dot11MSCSActivated is true; otherwise not present.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.

9.3.3.6 Association Response frame format

The frame body of an Association Response frame contains the information shown in Table 9-35.

Table 9-35—Association Response frame body

Order	Information	Notes
1	Capability Information	See 9.4.1.4 for Capability Information field format.
2	Status code	
3	AID	This field is not present when dot11S1GOptionImplemented is true.
4	Supported Rates and BSS Membership Selectors	This field is not present if dot11DMGOptionImplemented is true.
5	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates and is optionally present otherwise. This element is not present if dot11DMGOptionImplemented is true.
6	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true; otherwise not present.
7	RCPI	The RCPI element is present if dot11RMRCPIMeasurementActivated is true.
8	RSNI	The RSNI element is present if dot11RMRSNIMeasurementActivated is true.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 9-35—Association Response frame body *(continued)*

Order	Information	Notes
9	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
10	RSN	The RSNE is present if dot11FILSActivated is true; otherwise not present.
11	Mobility Domain	An MDE is present in an Association Response frame when dot11FastBSSTransitionActivated is true and this frame is a response to an Association Request frame that contained an MDE (i.e., an FT initial mobility domain association exchange).
12	Fast BSS Transition	A Fast BSS Transition element (FTE) is present in an Association Response frame when dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to an Association Request frame that contained an MDE (i.e., an FT initial mobility domain association exchange in an RSN).
13	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
14	Timeout Interval (Association Comeback time)	A Timeout Interval element (TIE) containing the Association Comeback time is present when dot11RSNAActivated is true, dot11RSNAProtectedManagementFramesActivated is true, and either the association request is rejected with a status code REFUSED_TEMPORARILY or the association request is accepted with a status code 0 and when dot11S1GOptionImplemented is true.
15	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
16	HT Operation	The HT Operation element is included by an AP when dot11HighThroughputOptionImplemented is true.
17	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
18	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true.
19	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.
20	BSS Max Idle Period	The BSS Max Idle Period element is present if dot11WirelessManagementImplemented is true or optionally present if dot11S1GOptionImplemented is true.
21	TIM Broadcast Response	The TIM Broadcast Response element is present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the Association Request frame that elicited this Association Response frame.
22	QoS Map	The QoS Map element is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Association Request frame is 1.
23	QMF Policy	The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Association Request frame that elicited this Association Response frame.
24	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.

Table 9-35—Association Response frame body *(continued)*

Order	Information	Notes
25	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
26	DMG Operation	The DMG Operation element is present if dot11DMGOptionImplemented is true.
27	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
28	Neighbor Report	One or more Neighbor Report elements is present if the Status Code field is REJECTED_WITH_SUGGESTED_BSS_TRANSITION.
29	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
30	VHT Operation	The VHT Operation element is present when dot11VHTOptionImplemented is true; otherwise, it is not present.
31	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
32	Future Channel Guidance	The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true.
33	FILS Session	The FILS Session element is present if dot11FILSActivated is true; otherwise not present.
34	FILS Public Key	The FILS Public Key element is present if dot11FILSActivated is true and FILS Public Key authentication is used; otherwise not present.
35	FILS Key Confirmation	The FILS Key Confirmation element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
36	FILS HLP Container	One or more FILS HLP Container elements are optionally present if dot11FILSActivated is true; otherwise not present.
37	FILS IP Address Assignment	The FILS IP Address Assignment element is optionally present if dot11FILSActivated is true; otherwise not present.
38	Key Delivery	The Key Delivery element is present if dot11FILSActivated is true; otherwise not present.
39	S1G Sector Operation	The S1G Sector Operation element is optionally present if dot11S1GSectorizationActivated is true; otherwise not present.
40	TWT	The TWT element is present if dot11TWTOptionActivated is true and the TWT element is present in the Association Request frame that elicited this Association Response frame.
41	TSF Timer Accuracy	The TSF Timer Accuracy element is optionally present when dot11TSFTimerAccuracyImplemented is true; otherwise not present.
42	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
43	S1G Operation	The S1G Operation element is present if dot11S1GOptionImplemented is true; otherwise not present.
44	AID Response	The AID Response element is present when dot11S1GOptionImplemented is true.

Table 9-35—Association Response frame body *(continued)*

Order	Information	Notes
45	Sectorized Group ID List	The Sectorized Group ID List element is optionally present when dot11S1GSectorizationActivated is true; otherwise not present.
46	S1G Relay	The S1G Relay element is optionally present if dot11RelayAPImplemented is true; otherwise not present.
47	Header Compression	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true.
48	SST Operation	The SST Operation element is present if dot11SelectiveSubchannelTransmissionPermitted is true.
49	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
50	S1G Relay Activation	The S1G Relay Activation element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
51	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
52	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
53	CMMG Operation	The CMMG Operation element is present when dot11CMMGOptionImplemented is true; otherwise not present.
54	GLK-GCR Parameter Set	The GLK-GCR Parameter Set element is present if dot11GLKimplemented is true and the AP has set up a GLK-GCR for groupcast transmissions over the underlying general link. Otherwise this element is not present.
55	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield.
56	MSCS Descriptor	The MSCS Descriptor element is optionally present if dot11MSCSActivated is true; otherwise not present.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.

9.3.3.7 Reassociation Request frame format

The frame body of a Reassociation Request frame contains the information shown in Table 9-36.

Table 9-36—Reassociation Request frame body

Order	Information	Notes
1	Capability Information	See 9.4.1.4 for Capability Information field format.
2	Listen Interval	
3	Current AP address	
4	SSID	
5	Supported Rates and BSS Membership Selectors	This field is not present if dot11DMGOptionImplemented is true.

Table 9-36—Reassociation Request frame body *(continued)*

Order	Information	Notes
6	Extended Supported Rates and BSS Membership Selectors	The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optional otherwise. This element is not present if dot11DMGOptionImplemented is true.
7	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
8	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false.
9	RSN	The RSNE is present if dot11RSNAActivated is true; otherwise not present.
10	QoS Capability	The QoS Capability element is present if dot11QosOptionImplemented is true.
11	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
12	Mobility Domain	The MDE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and the frame is being sent to an AP that advertised its FT Capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true).
13	Fast BSS Transition	An FTE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and dot11RSNAAuthenticationSuiteSelected is equal to an AKM suite selector value for which the Authentication type column indicates FT authentication. See Table 9-151 (i.e., part of a fast BSS transition in an RSN).
14	Resource information container (RIC)	The set of elements that formulate a RIC-Request is optionally present in a Reassociation Request frame if — dot11FastBSSTransitionActivated is true, — The FT resource request protocol is not used, — The frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true), and — Either dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:3, 00-0F-AC:4, 00-0F-AC:9, 00-0F-AC:13, 00-0F-AC:16, or 00-0F-AC:17 (i.e., part of a fast BSS transition in an RSN) or dot11RSNAActivated is false (i.e., not in an RSN).
15	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated or dot11OperatingClassesRequired is true.
16	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
17	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true.
18	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero.

Table 9-36—Reassociation Request frame body *(continued)*

Order	Information	Notes
19	QoS Traffic Capability	The QoS Traffic Capability element is present if dot11QoSTrafficCapabilityActivated is true.
20	TIM Broadcast Request	The TIM Broadcast Request element is present if dot11TIMBroadcastActivated is true.
21	FMS Request	The FMS Request element is optionally present if dot11FMSActivated is true.
22	DMS Request	The DMS Request element is optionally present if dot11DMSActivated is true.
23	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 11.3.5).
24	Multi-band	The Multi-band element is optionally present if dot11MultibandImplemented is true.
25	DMG Capabilities	The DMG Capabilities element is present if dot11DMGOptionImplemented is true.
26	Multiple MAC Sublayers	The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true.
27	VHT Capabilities	The VHT Capabilities element is present when dot11VHTOptionImplemented is true.
28	Operating Mode Notification	The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true.
29	FILS Session	The FILS Session element is optionally present if dot11FILSActivated is true; otherwise not present.
30	FILS Public Key	The FILS Public Key element is present if dot11FILSActivated is true and FILS Public Key authentication is used; otherwise not present.
31	FILS Key Confirmation	The FILS Key Confirmation element is present if dot11FILSActivated is true and FILS authentication is used; otherwise not present.
32	FILS HLP Container	One or more FILS HLP Container elements are optionally present if dot11FILSActivated is true; otherwise not present.
33	FILS IP Address Assignment	The FILS IP Address Assignment element is optionally present if dot11FILSActivated is true; otherwise not present.
34	TWT	The TWT element is optionally present if dot11TWTOptionActivated is true; otherwise not present.
35	AID Request	The AID Request element is present when dot11S1GOptionImplemented is true.
36	S1G Capabilities	The S1G Capabilities element is present if dot11S1GOptionImplemented is true; otherwise not present.
37	EL Operation	The EL Operation element is present if dot11S1GELOperationActivated is true.
38	BSS Max Idle Period	The BSS Max Idle Period element is optionally present if dot11WirelessManagementImplemented and dot11BSSMaxIdlePeriodIndicationByNonAPSTA are true, or if dot11S1GOptionImplemented is true; otherwise not present.

Table 9-36—Reassociation Request frame body *(continued)*

Order	Information	Notes
39	S1G Relay	The S1G Relay element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
40	Header Compression	The Header Compression element is present if dot11PV1MACHeaderOptionImplemented is true.
41	MAD	The MAD element is optionally present if dot11S1GOptionImplemented is true; otherwise not present.
42	Reachable Address	The Reachable Address element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
43	S1G Relay Activation element	The S1G Relay Activation element is optionally present if dot11RelaySTAImplemented is true; otherwise not present.
44	CDMG Capabilities	The CDMG Capabilities element is present if dot11CDMGOptionImplemented is true; otherwise not present.
45	CMMG Capabilities	The CMMG Capabilities element is present when dot11CMMGOptionImplemented is true; otherwise not present.
46	OCI	OCI element is present if dot11FILSActivated and dot11RSNAOperatingChannelValidationActivated are both true; otherwise not present.
47	GLK-GCR Parameter Set	The GLK-GCR Parameter Set element is present if dot11GLKImplemented is true to indicate the number of reorder buffers the STA has to support GLK-GCR with GCR block ack and respond to corresponding GLK-GCR BlockAckReq frames. Otherwise this element is not present.
48	RSN Extension	The RSNXE is present if any subfield of the Extended RSN Capabilities field in this element is nonzero, except the Field Length subfield and, in the case of FT reassociation, the rules for FT reassociation in Table 13-1 do not omit the RSNXE from the third message.
49	Supplemental Class 2 Capabilities	The Supplemental Class 2 Capabilities element is present when dot11Class2CapabilitiesOptionImplemented is true; otherwise not present.
50	MSCS Descriptor	The MSCS Descriptor element is optionally present if dot11MSCSActivated is true; otherwise not present.
Last	Vendor Specific	One or more Vendor Specific elements are optionally present. These elements follow all other elements.
