q) If the CH_BANDWIDTH and CH_OFFSET parameters of the TXVECTOR indicate that upper or lower 20 MHz are to be used in 40 MHz, move the complex numbers associated with subcarriers –28 to 28 in each transmit chain to carriers 4 to 60 in the upper channel or –60 to –4 in the lower channel. Note that this shifts the signal in frequency from the center of the 40 MHz channel to +10 MHz or –10 MHz offset from the center of the 40 MHz channel. The complex numbers in the other subcarriers are set to 0.

r) For each group of N_{ST} subcarriers and each of the N_{TX} transmit chains, convert the subcarriers to time domain using IDFT. Prepend to the Fourier-transformed waveform a circular extension of itself, thus forming a GI, and truncate the resulting periodic waveform to a single OFDM symbol length by applying time domain windowing. Determine the length of the GI according to the GI_TYPE parameter of the TXVECTOR. Refer to 19.3.11.11 and 19.3.11.12 for details. When beamforming is not used, it is sometimes possible to implement the cyclic shifts in the time domain.

s) Append the OFDM symbols associated with each transmit chain one after another, starting after the final field of the PHY preamble. Refer to 19.3.2 and 19.3.7 for details.

t) Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 19.3.7 for details. The transmit chains are connected to antenna elements according to ANTENNA_SET of the TXVECTOR if ASEL is applied.

19.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation, coding, and number of spatial channels. It is a compact representation that is carried in the HT-SIG. Rate-dependent parameters for the full set of MCSs are shown in Table 19-27 to Table 19-41 (in 19.5). These tables give rate-dependent parameters for MCSs with indices 0 to 76. MCSs with indices 0 to 7 and 32 have a single spatial stream; MCSs with indices 8 to 31 have multiple spatial streams using equal modulation (EQM) on all of the streams; MCSs with indices 33 to 76 have multiple spatial streams using unequal modulation (UEQM) on the spatial streams. MCS indices 77 to 127 are reserved.

Table 19-27 to Table 19-30 show rate-dependent parameters for EQM MCSs for one, two, three, and four streams for 20 MHz operation. Table 19-31 to Table 19-34 show rate-dependent parameters for EQM MCSs in one, two, three, and four streams for 40 MHz operation. The same EQM MCSs are used for 20 MHz and 40 MHz operation. Table 19-35 shows rate-dependent parameters for the 40 MHz, 6 Mb/s MCS 32 format.

The remaining tables, Table 19-36 to Table 19-41, show rate-dependent parameters for the MCSs with UEQM of the spatial streams for use with $N_{SS} > 1$.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

UEQM MCSs are detailed in the following tables:

— Table 19-36 to Table 19-38 are for 20 MHz operation.
— Table 19-39 to Table 19-41 are for 40 MHz operation.

An HT STA shall support all equal modulation (EQM) rates for one spatial stream (MCSs 0 to 7) using a 20 MHz channel width. An HT AP that is not a VHT AP shall support all EQM rates for two spatial streams (MCSs 8 to 15) using a 20 MHz channel width. All other MCSs and modes are optional, specifically including transmit and receive support of 400 ns GI, operation in 40 MHz, and support of MCSs with indices 16 to 76.

19.3.6 Timing-related parameters

Table 19-6 defines the timing-related parameters.

Table 19-6—Timing-related constants

Parameter	TXVECTOR CH_BANDWIDTH			
	NON_HT_CBW20	HT_CBW20	HT_CBW40 or NON_HT_CBW40	
			HT format	MCS 32 and non-HT duplicate
N_{SD}: Number of complex data numbers	48	52	108	48
N_{SP}: Number of pilot values	4	4	6	4
N_{ST}: Total number of subcarriers See NOTE 1	52	56	114	104
N_{SR}: Highest data subcarrier index	26	28	58	58
Δ_F : Subcarrier frequency spacing	312.5 kHz (20 MHz/64)	312.5 kHz	312.5 kHz (40 MHz/128)	
T_{DFT}: IDFT/DFT period	3.2 µs	3.2 µs	3.2 µs	
T_{GI}: Guard interval duration	0.8 µs= T_{DFT}/4	0.8 µs	0.8 µs	
T_{GI2}: Double guard interval	1.6 µs	1.6 µs	1.6 µs	
T_{GIS}: Short guard interval duration	N/A	0.4 µs = T_{DFT}/8	0.4 µs See NOTE 2	
$T_{L\text{-}STF}$: Non-HT short training sequence duration	8 µs=10× T_{DFT}/4	8 µs	8 µs	
$T_{HT\text{-}GF\text{-}STF}$: HT-greenfield short training field duration	N/A	8 µs=10× T_{DFT}/4	8 µs See NOTE 2	
$T_{L\text{-}LTF}$: Non-HT long training field duration	8 µs=2× T_{DFT}+T_{GI2}	8 µs	8 µs	
T_{SYM}: Symbol interval	4 µs= T_{DFT}+T_{GI}	4 µs	4 µs

Table 19-6—Timing-related constants *(continued)*

Parameter	TXVECTOR CH_BANDWIDTH			
	NON_HT_CBW20	HT_CBW20	HT_CBW40 or NON_HT_CBW40	
			HT format	MCS 32 and non-HT duplicate
T_{SYMS}: Short GI symbol interval	N/A	3.6 μs = T_{DFT}+T_{GIS}	3.6 μs See NOTE 2	
$T_{L\text{-}SIG}$: Non-HT SIGNAL field duration	4 μs= T_{SYM}	4 μs	4 μs	
$T_{HT\text{-}SIG}$: HT SIGNAL field duration	N/A	8 μs= 2T_{SYM}	8 μs See NOTE 2	
$T_{HT\text{-}STF}$: HT short training field duration	N/A	4 μs	4 μs See NOTE 2	
$T_{HT\text{-}LTF1}$: First HT long training field duration	N/A	4 μs in HT-mixed format, 8 μs in HT-greenfield format	4 μs in HT-mixed format, 8 μs in HT-greenfield format See NOTE 2	
$T_{HT\text{-}LTFs}$: Second, and subsequent, HT long training fields duration	N/A	4 μs	4 μs See NOTE 2	

NOTE 1—$N_{ST} = N_{SD} + N_{SP}$ except in the cases of MCS 32 and non-HT duplicate, where the number of data subcarriers differs from the number of complex data numbers, and the number of pilot subcarriers differs from the number of pilot values. In those cases, data numbers and pilot values are replicated in upper and lower 20 MHz portions of 40 MHz signal to make a total of 104 subcarriers.

NOTE 2—Not applicable in non-HT formats.

NOTE 3—N/A = Not applicable.

Table 19-7 defines parameters used frequently in Clause 19.

Table 19-7—Frequently used parameters

Symbol	Explanation
N_{CBPS}	Number of coded bits per symbol
$N_{CBPSS}(i)$	Number of coded bits per symbol per the *i*-th spatial stream
N_{DBPS}	Number of data bits per symbol
N_{BPSC}	Number of coded bits per single carrier
$N_{BPSCS}(i)$	Number of coded bits per single carrier for spatial stream *i*
N_{RX}	Number of receive chains
N_{STS}	Number of space-time streams
N_{SS}	Number of spatial streams
N_{ESS}	Number of extension spatial streams
N_{TX}	Number of transmit chains

Table 19-7—Frequently used parameters *(continued)*

Symbol	Explanation
N_{ES}	Number of BCC encoders for the Data field
$N_{HT\text{-}LTF}$	Number of HT Long Training fields (see 19.3.9.4.6)
$N_{HT\text{-}DLTF}$	Number of Data HT Long Training fields
$N_{HT\text{-}ELTF}$	Number of Extension HT Long Training fields
R	Coding rate

19.3.7 Mathematical description of signals

For the description of the convention on mathematical description of signals, see 17.3.2.5.

In the case of either a 20 MHz non-HT format (TXVECTOR parameter FORMAT equal to NON_HT, MODULATION parameter equal to one of {ERP-OFDM, OFDM}) transmission or a 20 MHz HT format (TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, CH_BANDWIDTH equal to HT_CBW20) transmission, the channel is divided into 64 subcarriers. In the 20 MHz non-HT format, the signal is transmitted on subcarriers –26 to –1 and 1 to 26, with 0 being the center (dc) carrier. In the 20 MHz HT format, the signal is transmitted on subcarriers –28 to –1 and 1 to 28.

In the case of the 40 MHz HT format, a 40 MHz channel is used. The channel is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

In the case of 40 MHz HT upper format or 40 MHz HT lower format, the upper or lower 20 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –60 to –4 in the case of a 40 MHz HT lower format transmission and on subcarriers 4 to 60 in the case of a 40 MHz HT upper format transmission.

In the case of the MCS 32 and non-HT duplicate formats, the same data are transmitted over two adjacent 20 MHz channels. In this case, the 40 MHz channel is divided into 128 subcarriers, and the data are transmitted on subcarriers –58 to –6 and 6 to 58.

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (19-1).

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\} \tag{19-1}$$

where

f_c is the center frequency of the carrier

The transmitted RF signal is derived by modulating the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 19-4.

The time offset, t_{Field}, determines the starting time of the corresponding field.

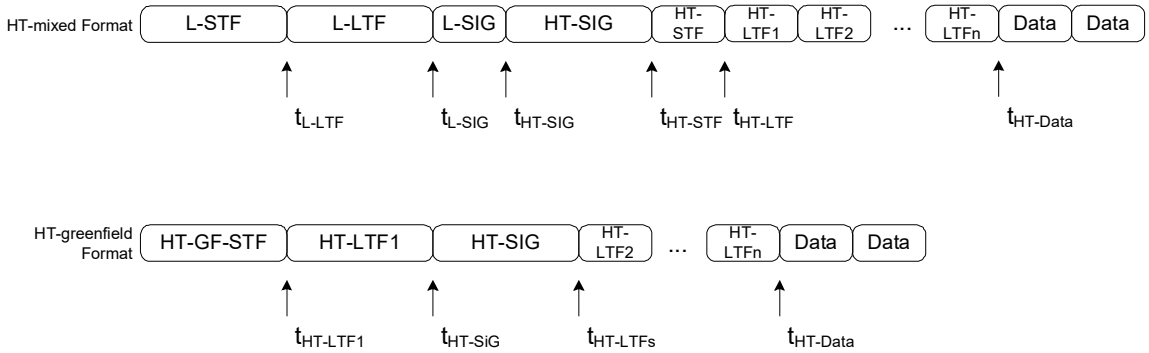

Figure 19-4—Timing boundaries for PPDU fields

In HT-mixed format, the signal transmitted on transmit chain i_{TX} shall be as shown in Equation (19-2).

$$\begin{aligned} r_{PPDU}^{(i_{TX})}(t) &= r_{L\text{-}STF}^{(i_{TX})}(t) + r_{L\text{-}LTF}^{(i_{TX})}(t - t_{L\text{-}LTF}) \\ &+ r_{L\text{-}SIG}^{(i_{TX})}(t - t_{L\text{-}SIG}) + r_{HT\text{-}SIG}^{(i_{TX})}(t - t_{HT\text{-}SIG}) + r_{HT\text{-}STF}^{(i_{TX})}(t - t_{HT\text{-}STF}) \\ &+ \sum_{i_{LTF}=1}^{N_{HTLTF}} r_{HT\text{-}LTF}^{(i_{TX}, i_{LTF})}(t - t_{HT\text{-}LTF} - (i_{LTF} - 1)T_{HT\text{-}LTFs}) + r_{HT\text{-}DATA}^{(i_{TX})}(t - t_{HT\text{-}DATA}) \end{aligned} \tag{19-2}$$

where

$$t_{L\text{-}LTF} = T_{L\text{-}STF}$$
$$t_{L\text{-}SIG} = t_{L\text{-}LTF} + T_{L\text{-}LTF}$$
$$t_{HT\text{-}SIG} = t_{L\text{-}SIG} + T_{L\text{-}SIG}$$
$$t_{HT\text{-}STF} = t_{HT\text{-}SIG} + T_{HT\text{-}SIG}$$
$$t_{HT\text{-}LTF} = t_{HT\text{-}STF} + T_{HT\text{-}STF}$$
$$t_{HT\text{-}Data} = t_{HT\text{-}LTF} + N_{HT\text{-}LTF} \cdot T_{HT\text{-}LTFs}$$

In the case of HT-greenfield format, the transmitted signal on transmit chain i_{TX} shall be as shown in Equation (19-3).

$$\begin{aligned} r_{PPDU}^{(i_{TX})}(t) &= r_{HT-GF-STF}^{(i_{TX})}(t) + r_{HT-LTF1}^{(i_{TX})}(t - t_{HT-LTF1}) \\ &+ r_{HT-SIG}^{(i_{TX})}(t - t_{HT-SIG}) \\ &+ \sum_{i_{LTF}=2}^{N_{HTLTF}} r_{HT-LTF}^{(i_{TX}, i_{LTF})}(t - t_{HT-LTFs} - (i_{LTF} - 2)T_{HT-LTFs}) \\ &+ r_{HT-DATA}^{(i_{TX})}(t - t_{HT-DATA}) \end{aligned} \tag{19-3}$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where

$t_{HT-LTF1} = T_{HT-GF-STF}$

$t_{HT\text{-}SIG} = t_{HT\text{-}LTF1} + T_{HT\text{-}LTF1}$

$t_{HT\text{-}LTFs} = t_{HT\text{-}SIG} + T_{HT\text{-}SIG}$

$t_{HT\text{-}Data} = t_{HT\text{-}LTFs} + (N_{HT\text{-}LTF} - 1) \cdot T_{HT\text{-}LTFs}$

Each baseband waveform, $r_{\text{Field}}^{(i_{TX})}(t)$, is defined via the discrete Fourier transform (DFT) per OFDM symbol as shown in Equation (19-4).

$$r_{\text{Field}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} \cdot N_{TX}}} w_{\text{T}_{\text{Field}}}(t) \sum_{k} \Upsilon_k X_k^{(i_{TX})} \exp(j2\pi k \Delta_F t) \quad (19\text{-}4)$$

This general representation holds for all fields. A suggested definition of the windowing function, $w_{\text{T}_{\text{Field}}}(t)$, is given in 17.3.2.5. The frequency domain symbols $X_k^{(i_{TX})}$ represent the output of any spatial processing in subcarrier k for transmit chain i_{TX} required for the field.

The function Υ_k is used to represent a rotation of the upper tones in a 40 MHz channel as shown in Equation (19-5) and Equation (19-6).

$$\Upsilon_k = \begin{cases} 1, k \le 0, \text{ in a 40 MHz channel} \\ j, k > 0, \text{ in a 40 MHz channel} \end{cases} \quad (19\text{-}5)$$

$$\Upsilon_k = 1, \text{ in a 20 MHz channel} \quad (19\text{-}6)$$

The $1/\sqrt{N_{\text{Field}}^{\text{Tone}} \cdot N_{TX}}$ scale factor in Equation (19-4) causes the total power of the time domain signal as summed over all transmit chains to be either 1 or lower than 1 when required. Table 19-8 summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$.

Table 19-8—Value of tone scaling factor N_{Field}^{Tone}

Field	N_{Field}^{Tone}, see NOTE 1	
	20 MHz	40 MHz
L-STF	12	24
HT-GF-STF	12	24
L-LTF	52	104
L-SIG	52	104
HT-SIG	52/56, see NOTE 2	104/114, see NOTE 2
HT-STF	12	24

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 19-8—Value of tone scaling factor N_{Field}^{Tone} *(continued)*

Field	N_{Field}^{Tone}, see NOTE 1	
	20 MHz	40 MHz
HT-LTF	56	114
HT-DATA	56	114
MCS 32	—	104
Non-HT Duplicate	—	104

NOTE 1—The numbers in the table refer only to the value of N_{Field}^{Tone} as it appears in Equation (19-4) and in subsequent specification of various fields. This value might be different from the actual number of tones being transmitted.
NOTE 2—The values 56 and 114 are for HT-greenfield format; the values 52 and 104 are for HT-mixed format.

19.3.8 Transmission in the upper/lower 20 MHz of a 40 MHz channel

When transmitting in the upper/lower 20 MHz portion of a 40 MHz channel, the mathematical definition of transmission shall follow that of a 20 MHz channel with f_c in Equation (19-1) replaced by $f_c \pm 10$ MHz.

This rule applies to 20 MHz HT transmission in the upper/lower 20 MHz of a 40 MHz channel (TXVECTOR primitive CH_BANDWIDTH equal to HT_CBW20 and CH_OFFSET primitive equal to CH_OFF_20U or CH_OFF_20L) and to 20 MHz non-HT transmission in the upper/lower 20 MHz of a 40 MHz channel (TXVECTOR primitive CH_BANDWIDTH equal to NON_HT_CBW20 and CH_OFFSET primitive equal to CH_OFF_20U or CH_OFF_20L).

19.3.9 HT preamble

19.3.9.1 Introduction

The HT preambles are defined in HT-mixed format and in HT-greenfield format to carry the required information to operate in a system with multiple transmit and multiple receive antennas.

In the HT-mixed format, to provide compatibility with non-HT STAs, specific non-HT fields are defined so that they can be received by non-HT STAs compliant with Clause 17 or Clause 18 followed by the fields specific to HT STAs.

In the HT-greenfield format, all of the non-HT fields are omitted. The specific HT fields used are as follows:

— One HT-GF-STF for automatic gain control convergence, timing acquisition, and coarse frequency acquisition,
— One or several HT-LTFs, provided as a way for the receiver to estimate the channel between each spatial mapper input and receive chain. The first HT-LTFs (HT-DLTFs) are necessary for demodulation of the HT-Data portion of the PPDU and are followed, for sounding PPDUs only, by optional HT-LTFs (HT-ELTFs) to sound extra spatial dimensions of the MIMO channel,
— HT-SIG, which provides all the information required to interpret the HT packet format.

In the case of multiple transmit chains, the HT preambles use cyclic shift techniques to prevent unintentional beamforming.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

19.3.9.2 HT-mixed format preamble

In HT-mixed format frames, the preamble has fields that support compatibility with Clause 17 and Clause 18 STAs and fields that support HT operation. The non-HT portion of the HT-mixed format preamble enables detection of the PPDU and acquisition of carrier frequency and timing by both HT STAs and STAs that are compliant with Clause 17 or Clause 18. The non-HT portion of the HT-mixed format preamble contains the SIGNAL field (L-SIG) defined in Clause 17 and is thus decodable by STAs compliant with Clause 17 and Clause 18 as well as HT STAs.

The HT portion of the HT-mixed format preamble enables estimation of the MIMO channel to support demodulation of the data portion of the frame by HT STAs. The HT portion of the HT-mixed format preamble also contains the HT-SIG field that supports HT operation.

19.3.9.3 Non-HT portion of the HT-mixed format preamble

19.3.9.3.1 Introduction

The transmission of the L-STF, L-LTF and the L-SIG as part of an HT-mixed format packet is described in 19.3.9.3.2 to 19.3.9.3.5.

19.3.9.3.2 Cyclic shift definition

The cyclic shift values defined in this subclause apply to the non-HT fields in the HT-mixed format preamble and the HT-SIG in the HT-mixed format preamble.

Cyclic shifts are used to prevent unintentional beamforming when the same signal or scalar multiples of one signal are transmitted through different spatial streams or transmit chains. A cyclic shift of duration T_{CS} on a signal $s(t)$ on interval $0 \le t \le T$ is defined as follows, where T is defined as T_{DFT} as referenced in Table 19-6.

With $T_{CS} \le 0$, replace $s(t)$ with $s(t - T_{CS})$ when $0 \le t < T + T_{CS}$ and with $s(t - T_{CS} - T)$ when $T + T_{CS} \le t \le T$. The cyclic-shifted signal is defined as shown in Equation (19-7).

$$s_{CS}(t;T_{CS})\big|_{T_{CS}<0} = \begin{cases} s(t - T_{CS}) & 0 \le t < T + T_{CS} \\ s(t - T_{CS} - T) & T + T_{CS} \le t \le T \end{cases} \quad (19\text{-}7)$$

The cyclic shift is applied to each OFDM symbol in the packet separately. Table 19-9 specifies the values for the cyclic shifts that are applied in the L-STF (in an HT-mixed format packet), the L-LTF, and L-SIG. It also applies to the HT-SIG in an HT-mixed format packet.

With more than four transmit chains, each cyclic shift on the additional transmit chains shall be between –200 ns and 0 ns.

Table 19-9—Cyclic shift for non-HT portion of PPDU

$T_{CS}^{i_{TX}}$ values for non-HT portion of PPDU				
Number of transmit chains	**Cyclic shift for transmit chain 1 (ns)**	**Cyclic shift for transmit chain 2 (ns)**	**Cyclic shift for transmit chain 3 (ns)**	**Cyclic shift for transmit chain 4 (ns)**
1	0	—	—	—
2	0	–200	—	—
3	0	–100	–200	—
4	0	–50	–100	–150

19.3.9.3.3 L-STF definition

The non-HT short training OFDM symbol in the 20 MHz channel width is shown in Equation (19-8).

$$\begin{aligned} S_{-26,26} = & \sqrt{1/2} \\ & \{0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ & 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \end{aligned} \quad (19\text{-}8)$$

The normalization factor $\sqrt{1/2}$ is the QPSK normalization.

NOTE—Other than the scaling difference, Equation (19-8) represents the same BPSK constellations per subcarrier as those represented in Equation (17-8).

The non-HT short training OFDM symbol in a 40 MHz channel width is given by Equation (19-9), after rotating the tones in the upper subchannel (subcarriers 6–58) by +90° [see Equation (19-10)].

$$\begin{aligned} S_{-58,58} = & \sqrt{1/2} \\ & \{0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ & 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, \\ & 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, \\ & 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \end{aligned} \quad (19\text{-}9)$$

In HT-mixed format, the L-STF on transmit chain i_{TX} shall be as shown in Equation (19-10).

$$r_{L-STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-STF}^{Tone}}} w_{T_{L-STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_k S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{TX}})) \quad (19\text{-}10)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and takes values from Table 19-9

Υ_k is defined in Equation (19-5) and Equation (19-6)

The L-STF has a period of 0.8 μs. The entire STF includes ten such periods, with a total duration of $T_{L\text{-}STF} = 8$ μs.

19.3.9.3.4 L-LTF definition

The non-HT long training OFDM symbol is identical to the Clause 17 long training OFDM symbol. In the 20 MHz channel width, the long training OFDM symbol is given by Equation (19-11).

$$L_{-26,26} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (19\text{-}11)$$

The non-HT long training OFDM symbol in a 40 MHz channel width is given by Equation (19-12), after rotating the tones in the upper subchannel (subcarriers 6–58) by +90° [see Equation (19-13)].

$$L_{-58,58} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 0, 0, 0, 0, 0, 0,$$
$$0, 0, 0, 0, 0, 0, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0,$$
$$1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (19\text{-}12)$$

The subcarriers at ± 32 in 40 MHz, which are the dc subcarriers for the non-HT 20 MHz transmission, are both nulled in the L-LTF. Such an arrangement allows proper synchronization of a 20 MHz non-HT STA.

The L-LTF waveform shall be as shown in Equation (19-13).

$$r_{L-LTF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-LTF}^{Tone}}} w_{T_{L-LTF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_k L_k \exp(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}^{i_{TX}})) \quad (19\text{-}13)$$

where

T_{GI2} is 1.6 μs

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and takes values specified in Table 19-9

Υ_k is defined in Equation (19-5) and Equation (19-6)

The entire LTF includes two 3.2 μs IDFT/DFT periods and an additional 1.6 μs double GI. The entire LTF is modulated with the L-LTF waveform.

19.3.9.3.5 L-SIG definition

The L-SIG is used to communicate rate and length information.The structure of the L-SIG is shown in Figure 19-5.

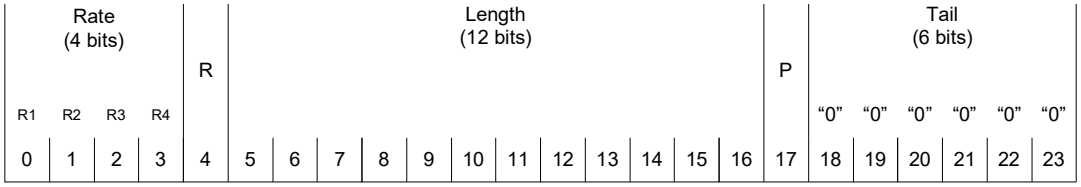

Figure 19-5—L-SIG structure

The value in the Rate field is obtained from the L_DATARATE field of the TXVECTOR. The value in the Length field is obtained from the L_LENGTH field of the TXVECTOR. The Length field is transmitted LSB first.

The reserved bit shall be set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The parity field has the even parity of bits 0–16.

The L-SIG shall be encoded, interleaved and mapped, and it shall have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, and 17.3.5.9. The stream of 48 complex numbers generated by the steps described in 17.3.5.7 is denoted by $d_k, k = 0 \ldots 47$. The time domain waveform of the L-SIG in 20 MHz transmission shall be as given by Equation (19-14).

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-SIG}^{Tone}}} w_{T_{SYM}}(t) \sum_{k=-26}^{26} (D_k + p_0 P_k) \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{TX}})) \quad (19\text{-}14)$$

In a 40 MHz transmission the time domain waveform of the L-SIG shall be as given by Equation (19-15).

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-SIG}^{Tone}}} w_{T_{SYM}}(t) \sum_{k=-26}^{26} (D_k + p_0 P_k) \cdot (\exp(j2\pi(k-32)\Delta_F (t - T_{GI} - T_{CS}^{i_{TX}})) + j \exp(j2\pi(k+32)\Delta_F (t - T_{GI} - T_{CS}^{i_{TX}}))) \quad (19\text{-}15)$$

where

$$D_k = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M^r(k)}, \text{otherwise} \end{cases}$$

$$M^r(k) = \begin{cases} k + 26, -26 \le k \le -22 \\ k + 25, -20 \le k \le -8 \\ k + 24, -6 \le k \le -1 \\ k + 23, 1 \le k \le 6 \\ k + 22, 8 \le k \le 20 \\ k + 21, 22 \le k \le 26 \end{cases}$$

P_k is defined in 17.3.5.10

p_0 is the first pilot value in the sequence defined in 17.3.5.10

N_{L-SIG}^{Tone} has the value given in Table 19-8

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and is defined by Table 19-9 for HT-mixed format PPDUs

NOTE—D_k exists for $-N_{SR} \le k \le N_{SR}$ and takes the values from d_k that exists for $0 \le k \le N_{SD} - 1$. $M^r(k)$ is a "reverse" function of the function $M(k)$ defined in 17.3.5.10.

19.3.9.4 HT portion of HT-mixed format preamble

19.3.9.4.1 Introduction

When an HT-mixed format preamble is transmitted, the HT preamble consists of the HT-STF, the HT-LTFs, and the HT-SIG.

All numeric fields are transmitted in unsigned format, LSB first.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

19.3.9.4.2 Cyclic shift definition

The cyclic shift values defined in this subclause apply to the HT-STF and HT-LTFs of the HT-mixed format preamble. The cyclic shift values defined in 19.3.9.3.2 apply to the HT-SIG in an HT-mixed format preamble.

Throughout the HT portion of an HT-mixed format preamble, cyclic shift is applied to prevent beamforming when similar signals are transmitted in different space-time streams. The same cyclic shift is applied to these streams during the transmission of the data portion of the frame. The values of the cyclic shifts to be used during the HT portion of the HT-mixed format preamble (with the exception of the HT_SIG) and the data portion of the frame are specified in Table 19-10.

Table 19-10—Cyclic shift values of HT portion of PPDU

$T_{CS}^{i_{STS}}$ values for HT portion of PPDU				
Number of space-time streams	**Cyclic shift for space-time stream 1 (ns)**	**Cyclic shift for space-time stream 2 (ns)**	**Cyclic shift for space-time stream 3 (ns)**	**Cyclic shift for space-time stream 4 (ns)**
1	0	—	—	—
2	0	–400	—	—
3	0	–400	–200	—
4	0	–400	–200	–600

19.3.9.4.3 HT-SIG definition

The HT-SIG is used to carry information required to interpret the HT packet formats. The fields of the HT-SIG are described in Table 19-11.

Table 19-11—HT-SIG fields

Field	Number of bits	Explanation and coding
Modulation and Coding Scheme	7	Index into the MCS table.
CBW 20/40	1	Set to 0 for 20 MHz or 40 MHz upper/lower. Set to 1 for 40 MHz.
HT Length	16	The number of octets of data in the PSDU. See NOTE.
Smoothing	1	Set to 1 indicates that channel estimate smoothing is recommended. Set to 0 indicates that only per-carrier independent (unsmoothed) channel estimate is recommended. See 19.3.11.11.2.
Not Sounding	1	Set to 0 indicates that PPDU is a sounding PPDU. Set to 1 indicates that the PPDU is not a sounding PPDU.
Reserved	1	Set to 1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 19-11—HT-SIG fields *(continued)*

Field	Number of bits	Explanation and coding
Aggregation	1	Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0.
STBC	2	Set to a nonzero number, to indicate the difference between the number of space-time streams (N_{STS}) and the number of spatial streams (N_{SS}) indicated by the MCS. Set to 00 to indicate no STBC ($N_{STS} = N_{SS}$).
FEC Coding	1	Set to 1 for LDPC. Set to 0 for BCC.
Short GI	1	Set to 1 to indicate that the short GI is used after the HT-LTFs. Set to 0 otherwise.
Number of Extension Spatial Streams	2	Indicates the number of extension spatial streams (N_{ESS}). Set to 0 for no extension spatial stream. Set to 1 for 1 extension spatial stream. Set to 2 for 2 extension spatial streams. Set to 3 for 3 extension spatial streams.
CRC	8	CRC of bits 0–23 in HT-SIG$_1$ and bits 0–9 in HT-SIG$_2$. See 19.3.9.4.4. The first bit to be transmitted is bit C7 as explained in 19.3.9.4.4.
Tail Bits	6	Used to terminate the trellis of the convolution coder. Set to 0.
NOTE—A value of 0 in the HT Length field indicates a PPDU that does not include a data field, i.e., NDP. NDP transmissions are used for sounding purposes only (see 10.36.2). The packet ends after the last HT-LTF or the HT-SIG.		

The structure of the HT-SIG$_1$ and HT-SIG$_2$ fields is defined in Figure 19-6.

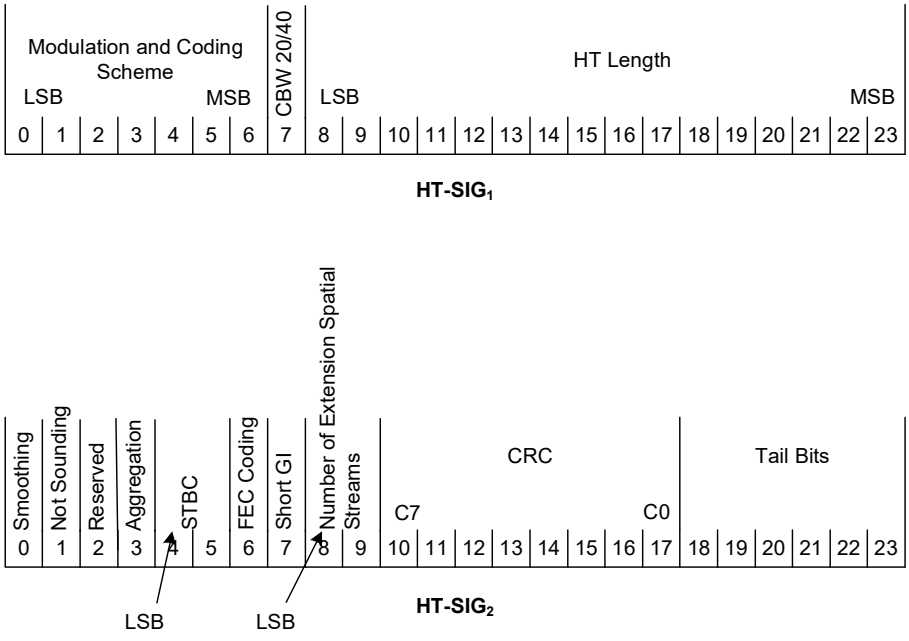

Figure 19-6—Format of HT-SIG$_1$ and HT-SIG$_2$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The HT-SIG is composed of two parts, HT-SIG$_1$ and HT-SIG$_2$, each containing 24 bits, as shown in Figure 19-6. All of the fields in the HT-SIG are transmitted LSB first, and HT-SIG$_1$ is transmitted before HT-SIG$_2$.

The HT-SIG parts shall be encoded at R = 1/2, interleaved, and mapped to a BPSK constellation, and they have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9, respectively. The BPSK constellation is rotated by 90° relative to the L-SIG in order to accommodate detection of the start of the HT-SIG. The stream of 96 complex numbers generated by these steps is divided into two groups of 48 complex numbers: $d_{k,n}$, $0 \le k \le 47$, $n = 0, 1$. The time domain waveform for the HT-SIG in an HT-mixed format packet in a 20 MHz transmission shall be as shown in Equation (19-16).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (jD_{k,n} + p_{n+1}P_k) \exp(j2\pi k\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})) \quad (19\text{-}16)$$

In a 40 MHz transmission the time domain waveform shall be as shown in Equation (19-17).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (jD_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})) + j\exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}}))) \quad (19\text{-}17)$$

where

$$D_{k,n} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M^r(k),n}, \text{otherwise} \end{cases}$$

$M^r(k)$ is defined in 19.3.9.3

P_k and p_n are defined in 17.3.5.10

N_{HT-SIG}^{Tone} has the value given in Table 19-8

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and is defined by Table 19-9 for HT-mixed format PPDUs

NOTE—This definition results in a quadrature binary phase shift keying (QBPSK) modulation in which the constellation of the data tones is rotated by 90° relative to the L-SIG in HT-mixed format PPDUs and relative to the first HT-LTF in HT-greenfield format PPDUs (see Figure 19-7). In HT-mixed format PPDUs, the HT-SIG is transmitted with the same number of subcarriers and the same cyclic shifts as the preceding non-HT portion of the preamble. This is done to accommodate the estimation of channel parameters needed to robustly demodulate and decode the information contained in the HT-SIG.

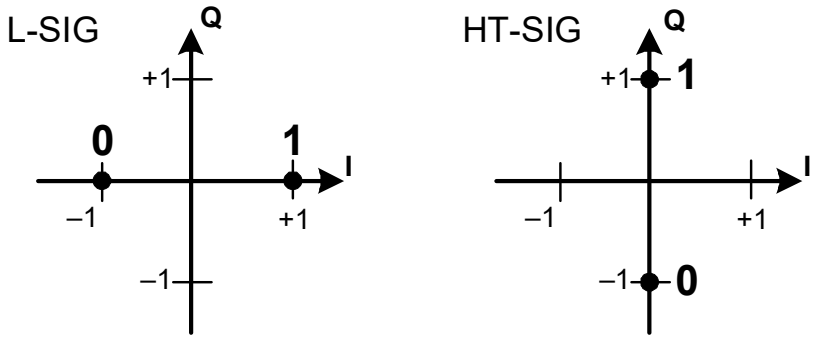

Figure 19-7—Data tone constellations in an HT-mixed format PPDU

19.3.9.4.4 CRC calculation for HT-SIG

The CRC protects bits 0–33 of the HT-SIG (bits 0–23 of HT-SIG$_1$ and bits 0–9 of HT-SIG$_2$). The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \tag{19-18}$$

where

$M(D) = m_0 D^{33} + m_1 D^{32} + \ldots + m_{32} D + m_{33}$ is the HT-SIG represented as a polynomial

where

m_0 is bit 0 of HT-SIG$_1$

m_{33} is bit 9 of HT-SIG$_2$

$I(D) = \sum_{i=26}^{33} D^i$ are initialization values that are added modulo 2 to the first 8 bits of HT-SIG$_1$

$G(D) = D^8 + D^2 + D + 1$ is the CRC generating polynomial

$crc(D) = c_0 D^7 + c_1 D^6 + \ldots + c_6 D + c_7$

The CRC field is transmitted with c_7 first.

Figure 19-8 shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, C7 first, through an inverter.

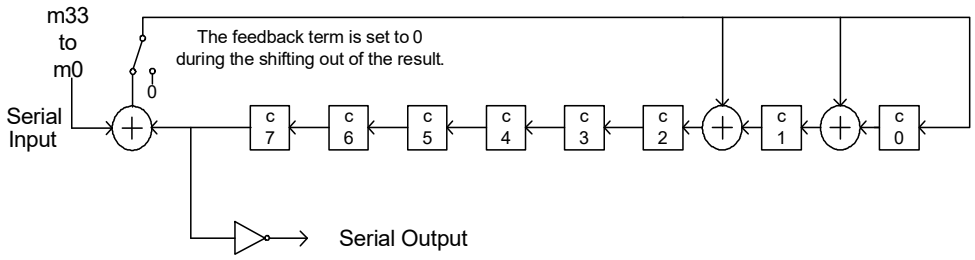

Figure 19-8—HT-SIG CRC calculation

As an example, if bits $\{m_0 \ldots m_{33}\}$ are given by $\{1\,1\,1\,1\,0\,0\,0\,1\,0\,0\,1\,0\,0\,1\,1\,0\,0\,0\,0\,0\,0\,0\,0\,0\,1\,1\,1\,0\,0\,0\,0\,0\,0\}$, the output bits $\{B_7 \ldots B_0\}$, where B_7 is output first, are $\{1\,0\,1\,0\,1\,0\,0\,0\}$.

19.3.9.4.5 HT-STF definition

The purpose of the HT-STF is to improve automatic gain control estimation in a MIMO system. The duration of the HT-STF is 4 μs. In a 20 MHz transmission, the frequency sequence used to construct the HT-STF is identical to L-STF. In a 40 MHz transmission, the HT-STF is constructed from the 20 MHz version by duplicating and frequency shifting and by rotating the upper subcarriers by 90°. The frequency sequences are shown in Equation (19-19) and Equation (19-20).

For 20 MHz:

$$\begin{aligned} HTS_{-28,28} = \sqrt{1/2} \\ \{&0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ &0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0\} \end{aligned} \tag{19-19}$$

For 40 MHz:

$$\begin{aligned} HTS_{-58,58} = \sqrt{1/2} \\ \{&0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ &0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, \\ &0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, \\ &0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \end{aligned} \tag{19-20}$$

The time domain representation of the transmission in transmit chain i_{TX} shall be as shown in Equation (19-21).

$$\begin{aligned} r_{HT-STF}^{i_{TX}}(t) = &\frac{1}{\sqrt{N_{STS} \cdot N_{HT-STF}^{Tone}}} w_{\mathrm{T}_{HT-STF}}(t) \\ &\sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} \Upsilon_k HTS_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \end{aligned} \tag{19-21}$$

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for the space-time stream i_{STS} and takes the values given in Table 19-10

Q_k is defined in 19.3.11.11.2

Υ_k is defined in Equation (19-5) and Equation (19-6)

19.3.9.4.6 HT-LTF definition

The HT-LTF provides a means for the receiver to estimate the MIMO channel between the set of QAM mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. If the transmitter is providing training for exactly the space-time streams (spatial mapper inputs) used for the transmission of the PSDU, the number of training symbols, N_{LTF}, is equal to the number of space-time streams, N_{STS}, except that for three space-time streams, four training symbols are required. If the transmitter is providing

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

training for more space-time streams (spatial mapper inputs) than the number used for the transmission of the PSDU, the number of training symbols is greater than the number of space-time streams. This latter case happens in a sounding PPDU.

The HT-LTF portion has one or two parts. The first part consists of one, two, or four HT-LTFs that are necessary for demodulation of the HT-Data portion of the PPDU. These HT-LTFs are referred to as *HT-DLTFs*. The optional second part consists of zero, one, two, or four HT-LTFs that may be used to sound extra spatial dimensions of the MIMO channel that are not utilized by the HT-Data portion of the PPDU. These HT-LTFs are referred to as *HT-ELTFs*. If a receiver has not advertised its ability to receive HT-ELTFs, it shall either issue a PHY-RXEND.indication(UnsupportedRate) primitive upon reception of a frame that includes HT-ELTFs or decode that frame. (When an HT packet includes one or more HT-ELTFs, it is optional for a receiver that has not advertised its capability to receive HT-ELTFs to decode the data portion of the PPDU.)

The number of HT-DLTFs is denoted $N_{HT\text{-}DLTF}$. The number of HT-ELTFs is denoted $N_{HT\text{-}ELTF}$. The total number of HT-LTFs is shown in Equation (19-22).

$$N_{HT\text{-}LTF} = N_{HT\text{-}DLTF} + N_{HT\text{-}ELTF} \tag{19-22}$$

$N_{HT\text{-}LTF}$ shall not exceed 5. Table 19-12 shows the determination of the number of space-time streams from the MCS and STBC fields in the HT-SIG. Table 19-13 shows the number of HT-DLTFs as a function of the number of space-time streams (N_{STS}). Table 19-14 shows the number of HT-ELTFs as a function of the number of extension spatial streams (N_{ESS}). N_{STS} plus N_{ESS} is less than or equal to 4. In the case where N_{STS} equals 3, N_{ESS} cannot exceed one; if N_{ESS} equals one in this case then N_{LTF} equals 5.

Table 19-12—Determining the number of space-time streams

Number of spatial streams (from MCS) N_{SS}	STBC field	Number of space-time streams N_{STS}
1	0	1
1	1	2
2	0	2

Table 19-14—Number of HT-ELTFs required for extension spatial streams

N_{ESS}	$N_{HT\text{-}ELTF}$
0	0
1	1
2	2
3	4

The HT-LTF sequence shown in Equation (19-23) is transmitted in the case of 20 MHz operation.

$$\begin{aligned} HT\text{-}LTF_{-28,28} = \{&1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 0,\\ &1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, -1, -1\} \end{aligned} \quad (19\text{-}23)$$

NOTE 1—This sequence is an extension of the L-LTF where the four extra subcarriers are filled with +1 for negative frequencies and –1 for positive frequencies.

In 40 MHz transmissions, including MCS 32 format frames, the sequence to be transmitted is shown in Equation (19-24).

$$\begin{aligned} HT\text{-}LTF_{-58,58} = \{&1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1,\\ &1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, -1, -1, -1, 1, 0,\\ &0, 0, -1, 1, 1, -1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1,\\ &1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1\} \end{aligned} \quad (19\text{-}24)$$

NOTE 2—This sequence is also constructed by extending the L-LTF in the following way: first, the L-LTF is duplicated and shifted as explained in 19.3.9.3.4 for the non-HT duplicate format; then the missing subcarriers [–32, –5, –4, –3, –2, 2, 3, 4, 5, 32] are filled with the values [1, –1, –1, –1, 1, –1, 1, 1, –1, 1], respectively.

This sequence, occupying 114 tones, is used even if the data portion is transmitted with MCS 32 format, which uses 104 tones.

NOTE 3—This sequence uses 114 tones when MCS 32 format is used to retain consistency with other 40 MHz formats and to facilitate channel estimation for beamforming and link adaptation.

In an HT-mixed format preamble, each HT-LTF consists of a single occurrence of the sequence plus a GI insertion and has a duration of 4 μs. In case of multiple space-time streams, cyclic shift is invoked as specified in Table 19-10.

The generation of HT-DLTFs is shown in Figure 19-9. The generation of HT-ELTFs is shown in Figure 19-10. In these figures, and in the following text, the following notational conventions are used:

— $[X]_{m,n}$ indicates the element in row m and column n of matrix X

— $[X]_N$ indicates a matrix consisting of the first N columns of matrix X

— $[X]_{M:N}$ indicates a matrix consisting of columns M to N of matrix X

where

$M \leq N$

X is either Q_k or $P_{HT\text{-}LTF}$

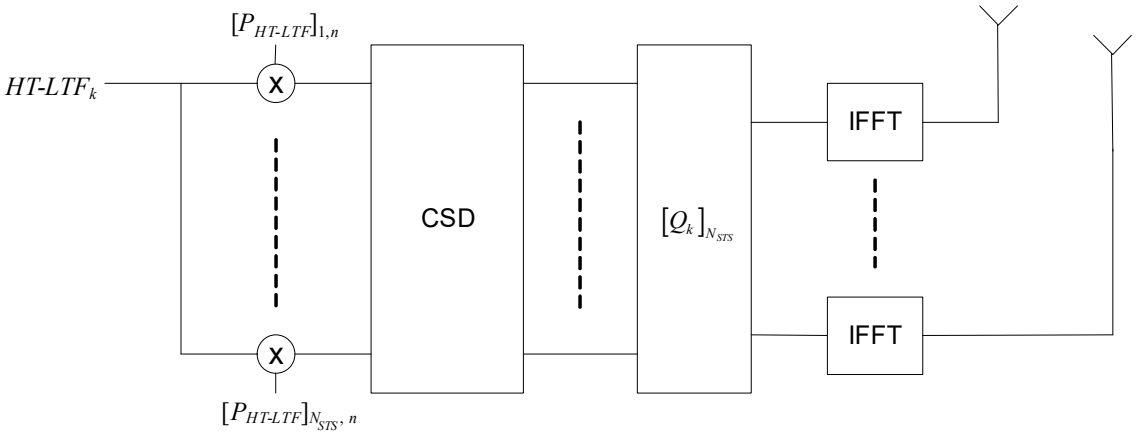

Figure 19-9—Generation of HT-DLTFs

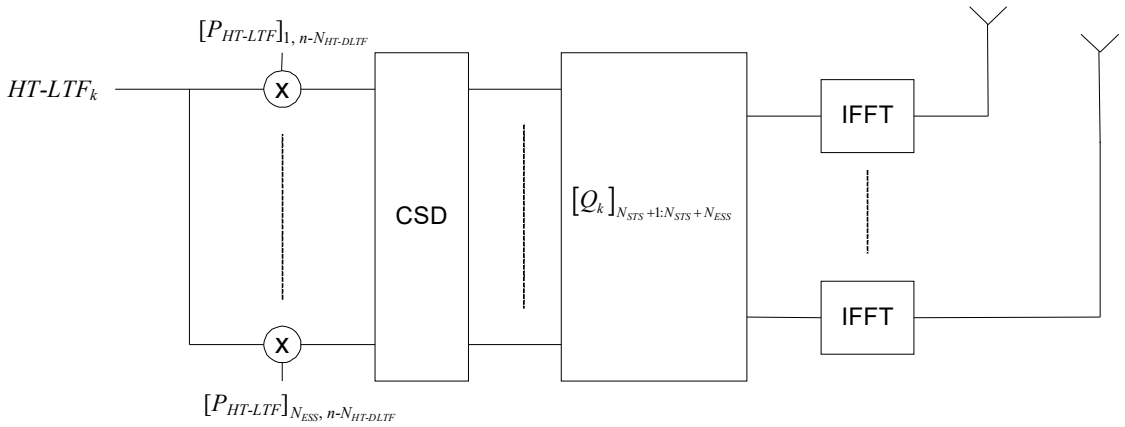

Figure 19-10—Generation of HT-ELTFs

The mapping between space-time streams and transmit chains is defined by the columns of an antenna map matrix Q_k for subcarrier k. The first N_{STS} columns define the space-time streams used for data transmission, and the next N_{ESS} columns (up to $N_{TX} - N_{STS}$ columns) define the extension spatial streams. Thus, for the purpose of defining HT-LTFs, Q_k is an $N_{TX} \times (N_{STS} + N_{ESS})$ dimension matrix. Columns

$1 \ldots N_{STS}$ of Q_k are excited by the HT-DLTFs, and columns $N_{STS}+1 \ldots N_{STS}+N_{ESS}$ are excited by the HT-ELTFs, where $N_{STS}+N_{ESS} \le N_{TX}$ is the total number of spatial streams being probed by the HT-LTFs.

Possible forms of Q_k and other limitations on Q_k are specified in 19.3.11.11.2. $P_{HT\text{-}LTF}$ is defined in Equation (19-27).

The time domain representation of the waveform transmitted on transmit chain i_{TX} during HT-DLTF n, where $1 \le n \le N_{HT\text{-}DLTF}$, shall be as shown in Equation (19-25).

$$r_{HT-LTF}^{n,i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-LTF}^{Tone}}} w_{T_{HT-LTFs}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, n} \Upsilon_k HT\text{-}LTF_k \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{STS}})) \quad (19\text{-}25)$$

For the HT-ELTFs ($N_{HT\text{-}DLTF} < n \le N_{HT\text{-}LTF}$), it shall be as shown in Equation (19-26).

$$r_{HT-LTF}^{n,i_{TX}}(t) = \frac{1}{\sqrt{N_{HT-LTF}^{Tone} \cdot N_{ESS}}} w_{T_{HT-LTFs}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{ESS}=1}^{N_{ESS}} \Big([Q_k]_{i_{TX}, N_{STS}+i_{ESS}} [P_{HT\text{-}LTF}]_{i_{ESS}, n-N_{HTDLTF}} \Upsilon_k HT\text{-}LTF_k \cdot \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{ESS}})) \Big) \quad (19\text{-}26)$$

where

$T_{CS}^{i_{STS}}$ cyclic shift values are given in Table 19-10

$T_{CS}^{i_{ESS}}$ cyclic shift values are given in Table 19-10 with $i_{ESS} = i_{STS}$

Q_k is defined in 19.3.11.11.2

Υ_k is defined in Equation (19-5) and Equation (19-6)

$P_{HT\text{-}LTF}$ the HT-LTF mapping matrix, is given by Equation (19-27)

$$P_{HT\text{-}LTF} = \begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix} \quad (19\text{-}27)$$

19.3.9.5 HT-greenfield format preamble

19.3.9.5.1 General

For HT-greenfield operation, compatibility with Clause 17 and Clause 18 STAs is not required. Therefore, the portions of the preamble that are compatible with Clause 17 and Clause 18 STAs are not included. The result is a shorter and more efficient PHY frame format that includes a STF, LTF(s), and an HT-SIG.

19.3.9.5.2 Cyclic shift definition for HT-greenfield format preamble

Throughout the HT-greenfield format preamble, cyclic shift is applied to prevent beamforming when similar signals are transmitted on different spatial streams. The same cyclic shift is applied to these streams during the transmission of the data portion of the frame. The values of the cyclic shift to be used during the HT-greenfield format preamble, as well as the data portion of the HT-greenfield format frame, are specified in Table 19-10.

19.3.9.5.3 HT-GF-STF definition

The HT-GF-STF is placed at the beginning of an HT-greenfield format frame. The time domain waveform for the HT-GF-STF on transmit chain i_{TX} shall be as shown in Equation (19-28).

$$r_{HT-GF-STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-GF-STF}^{Tone}}} w_{\mathrm{T}_{HT-GF-STF}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} \Upsilon_k S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \quad (19\text{-}28)$$

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for the space-time stream i_{STS} and takes values from Table 19-10

Q_k is defined in 19.3.11.11.2

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

S_k is defined in non-HT-STF (L-STF), Equation (19-8) for 20 MHz operation and Equation (19-9) for 40 MHz operation

Υ_k is defined in Equation (19-5) and Equation (19-6)

The waveform defined by Equation (19-28) has a period of 0.8 μs, and the HT-GF-STF includes ten such periods, with a total duration of $\mathrm{T}_{HT-GF-STF} = 8$ μs.

19.3.9.5.4 HT-greenfield format HT-SIG

The content and format of the HT-SIG of an HT-greenfield format frame is identical to the HT-SIG in an HT-mixed format frame, as described in 19.3.9.4.3. The placement of the HT-SIG in an HT-greenfield format frame is shown in Figure 19-1. In HT-greenfield format frames, the HT-SIG is transmitted with the same cyclic shifts and the same spatial mapping as the preceding portions of the preamble. This use of the same cyclic shifts and spatial mapping is done to accommodate the estimation of channel parameters needed to robustly demodulate and decode the information contained in the HT-SIG.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The time domain waveform for the HT-SIG on transmit chain i_{TX} with 20 MHz operation shall be as shown in Equation (19-29).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} (jD_{k,n} + p_n P_k) \cdot \exp(j2\pi k\Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})) \quad (19\text{-}29)$$

where

P_k and p_n are defined in 17.3.5.10

$D_{k,n}$ is defined in 19.3.9.4.3

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10

Q_k is defined in 19.3.11.11.2

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

The time domain waveform for the HT-SIG on transmit chain i_{TX} with 40 MHz operation shall be as shown in Equation (19-30).

$$r_{HT-SIG}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^{1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} \sum_{i_{STS}=1}^{N_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} (jD_{k,n} + p_n P_k) \cdot ([Q_{k-32}]_{i_{TX}, i_{STS}} \exp(j2\pi(k-32)\Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})) + j[Q_{k+32}]_{i_{TX}, i_{STS}} \exp(j2\pi(k+32)\Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}}))) \quad (19\text{-}30)$$

where

p_n and P_k are defined in 17.3.5.10

$D_{k,n}$ is defined in 19.3.9.4.3

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10

Q_k is defined in 19.3.11.11.2

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

19.3.9.5.5 HT-greenfield format LTF

The format of the LTF portion of the preamble in an HT-greenfield format frame is similar to that of the HT-LTF in an HT-mixed format frame, as described in 19.3.9.4.6, with the difference that the first HT-LTF (HT-LTF1) is twice as long (8 μs) as the other HT-LTFs. The time domain waveform for the long training symbol on transmit chain i_{TX} for the first HT-LTF in an HT-greenfield format frame shall be as shown in Equation (19-31).

$$r_{HT-LTF}^{1,i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-LTF}^{Tone}}} w_{T_{HT-LTF1}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT\text{-}LTF}]_{i_{STS}, 1} \Upsilon_k HT\text{-}LTF(k) \exp(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}^{i_{STS}})) \quad (19\text{-}31)$$

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10

Q_k is defined in 19.3.11.11.2

$P_{HT\text{-}LTF}$ is defined in Equation (19-27)

The first HT-LTF (HT-LTF1) consists of two periods of the long training symbol, preceded by a double-length (1.6 μs) cyclic prefix. The placement of the first and subsequent HT-LTFs in an HT-greenfield format frame is shown in Figure 19-1.

19.3.10 Transmission of NON_HT format PPDUs with more than one transmit chain

When an HT device transmits a NON_HT format PPDU with the MODULATION parameter equal to OFDM or ERP-OFDM using more than one transmit chain, it shall apply the cyclic shifts defined in Table 19-9 to the transmission in each chain.

19.3.11 Data field

19.3.11.1 General

When BCC encoding is used, the Data field consists of the 16-bit SERVICE field, the PSDU, either six or twelve tail bits, depending on whether one or two encoding streams are represented, and pad bits. When LDPC encoding is used, the Data field consists of the 16-bit SERVICE field and the PSDU, processed by the procedure in 19.3.11.7.5.

The number of OFDM symbols in the data field when BCC encoding is used is computed as shown in Equation (19-32).

$$N_{SYM} = m_{STBC} \left\lceil \frac{8 \cdot length + 16 + 6 \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (19\text{-}32)$$

where

m_{STBC} is 2 if STBC is used and 1 otherwise (making sure that the number of symbols is even when STBC is used)

length is the value of the HT Length field in the HT-SIG field defined in Table 19-11

N_{DBPS} takes the values defined in Table 19-27 to Table 19-41

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The number of "zero" pad bits is thus $N_{SYM} \times N_{DBPS} - 8 \times length - 16 - 6 \times N_{ES}$. The number of symbols in the data field when LDPC encoding is used is described in 19.3.11.7.

For LDPC encoding, the number of encoded data bits, N_{avbits}, is given by Equation (19-39); the number of OFDM symbols, N_{SYM}, is given by Equation (19-41); and the number of repeated encoded bits for padding, N_{rep}, is given by Equation (19-42), in 19.3.11.7.5.

19.3.11.2 SERVICE field

The SERVICE field is used for scrambler initialization. The SERVICE field is composed of 16 bits, all set to 0 before scrambling. In non-HT PPDUs, the SERVICE field is the same as in 17.3.5.2. In HT PPDUs, the SERVICE field is composed of 16 zero bits, scrambled by the scrambler, as defined in 19.3.11.3.

19.3.11.3 Scrambler

The data field shall be scrambled by the scrambler defined in 17.3.5.5. The Clause 17 TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT shall not be present; therefore, the initial state of the scrambler shall be set to a pseudorandom nonzero seed.

19.3.11.4 Coding

The Data field shall be encoded using either the BCC defined in 17.3.5.6 or the LDPC code defined in 19.3.11.7. The encoder is selected by the FEC coding field in the HT-SIG, as described in 19.3.9.4.3. A single FEC encoder is always used when LDPC coding is used. When the BCC FEC encoder is used, a single encoder is used, except that two encoders are used when the selected MCS has a PHY rate greater than 300 Mb/s (see 19.5). To determine whether to use one or two BCC FEC encoders, the rate is calculated based on the use of an 800 ns GI. The operation of the BCC FEC is described in 19.3.11.6. The operation of the LDPC coder is described in 19.3.11.7.

Support for the reception of BCC-encoded Data field frames is mandatory.

19.3.11.5 Encoder parsing operation for two BCC FEC encoders

If two BCC encoders are used, the scrambled data bits are divided between the encoders by sending alternating bits to different encoders. Bit with index i sent to the encoder j, denoted $x_i^{(j)}$, is shown in Equation (19-33).

$$x_i^{(j)} = b_{N_{ES} \cdot i + j} \quad ; \quad 0 \le j \le N_{ES} - 1 \tag{19-33}$$

Following the parsing operation, 6 scrambled "zero" bits following the end of the message bits in each BCC input sequence are replaced by unscrambled "zero" bits, as described in 17.3.5.3.

The replaced bits are shown in Equation (19-34).

$$x_i^{(j)} \quad : \quad 0 \le j \le N_{ES} - 1 \quad ; \quad \frac{length \cdot 8 + 16}{N_{ES}} \le i \le \frac{length \cdot 8 + 16}{N_{ES}} + 5 \tag{19-34}$$

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

19.3.11.6 BCC coding and puncturing

When BCC encoding is used, the encoder parser output sequences $\{x_i^0\}$, and $\{x_i^1\}$ where applicable, are each encoded by the rate 1/2 convolutional encoder defined in 17.3.5.6. After encoding, the encoded data shall be punctured by the method defined in 17.3.5.7 to achieve the rate selected by the MCS.

If rate 5/6 coding is selected, the puncturing scheme is defined in Figure 19-11.

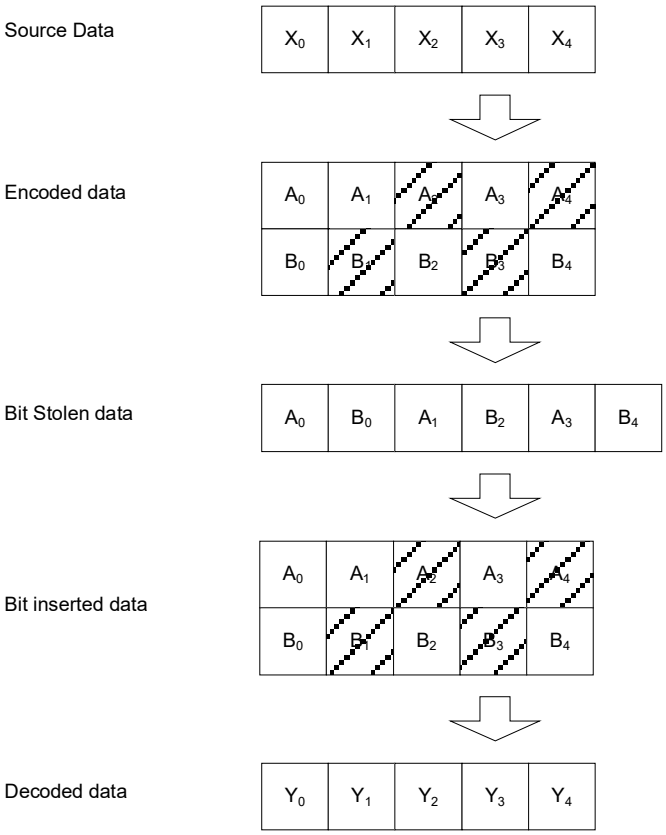

Figure 19-11—Puncturing at rate 5/6

19.3.11.7 LDPC codes

19.3.11.7.1 Introduction

HT LDPC codes are described in 19.3.11.7.2 to 19.3.11.7.6. These codes are optionally used in the HT system as a high-performance error correcting code instead of the convolutional code (19.3.11.6). The LDPC encoder shall use the rate-dependent parameters in Table 19-27 to Table 19-41, with the exception of the N_{ES} parameter.

Support for LDPC codes is optional.

19.3.11.7.2 LDPC coding rates and codeword block lengths

The supported coding rates, information block lengths, and codeword block lengths are described in Table 19-15.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 19-15—LDPC parameters

Coding rate (R)	LDPC information block length (bits)	LDPC codeword block length (bits)
1/2	972	1944
1/2	648	1296
1/2	324	648
2/3	1296	1944
2/3	864	1296
2/3	432	648
3/4	1458	1944
3/4	972	1296
3/4	486	648
5/6	1620	1944
5/6	1080	1296
5/6	540	648

19.3.11.7.3 LDPC encoder

For each of the three available codeword block lengths, the LDPC encoder supports rate 1/2, rate 2/3, rate 3/4, and rate 5/6 encoding. The LDPC encoder is systematic, i.e., it encodes an information block, c=(i_0,i_1,..., $i_{(k-1)}$), of size k, into a codeword, **c**, of size n, **c**=(i_0,i_1,... $i_{(k-1)}$, p_0, p_1,..., $p_{(n-k-1)}$), by adding $n-k$ parity bits obtained so that $\mathbf{H}\times\mathbf{c}^T = \mathbf{0}$, where **H** is an $(n-k)\times n$ parity-check matrix. The selection of the codeword block length (n) is achieved via the LDPC PPDU encoding process described in 19.3.11.7.5.

19.3.11.7.4 Parity-check matrices

Each of the parity-check matrices is partitioned into square subblocks (submatrices) of size $Z \times Z$. These submatrices are either cyclic-permutations of the identity matrix or null submatrices.

The cyclic-permutation matrix P_i is obtained from the $Z \times Z$ identity matrix by cyclically shifting the columns to the right by i elements. The matrix P_0 is the $Z \times Z$ identity matrix. Figure 19-12 illustrates examples (for a subblock size of 8 × 8) of cyclic-permutation matrices P_i.

Table F-1 displays the "matrix prototypes" of parity-check matrices for all four coding rates at block length n=648 bits. The integer i denotes the cyclic-permutation matrix P_i, as illustrated in Figure 19-12. Vacant entries of the table denote null (zero) submatrices.

Table F-2 displays the matrix prototypes of parity-check matrices for block length n=1296 bits, in the same fashion.

Table F-3 displays the matrix prototypes of parity-check matrices for block length n=1944 bits, in the same fashion.

$$P_0 = \begin{bmatrix} 1&0&0&0&0&0&0&0\\ 0&1&0&0&0&0&0&0\\ 0&0&1&0&0&0&0&0\\ 0&0&0&1&0&0&0&0\\ 0&0&0&0&1&0&0&0\\ 0&0&0&0&0&1&0&0\\ 0&0&0&0&0&0&1&0\\ 0&0&0&0&0&0&0&1 \end{bmatrix}, P_1 = \begin{bmatrix} 0&1&0&0&0&0&0&0\\ 0&0&1&0&0&0&0&0\\ 0&0&0&1&0&0&0&0\\ 0&0&0&0&1&0&0&0\\ 0&0&0&0&0&1&0&0\\ 0&0&0&0&0&0&1&0\\ 0&0&0&0&0&0&0&1\\ 1&0&0&0&0&0&0&0 \end{bmatrix}, P_5 = \begin{bmatrix} 0&0&0&0&0&1&0&0\\ 0&0&0&0&0&0&1&0\\ 0&0&0&0&0&0&0&1\\ 1&0&0&0&0&0&0&0\\ 0&1&0&0&0&0&0&0\\ 0&0&1&0&0&0&0&0\\ 0&0&0&1&0&0&0&0\\ 0&0&0&0&1&0&0&0 \end{bmatrix}$$

Figure 19-12—Examples of cyclic-permutation matrices with *Z*=8

19.3.11.7.5 LDPC PPDU encoding process

To encode an LDPC PPDU, step a) to step g) shall be performed in sequence:

a) Compute the number of available bits, N_{avbits}, in the minimum number of OFDM symbols in which the Data field of the packet may fit.

$$N_{pld} = length \times 8 + 16 \tag{19-35}$$

$$N_{avbits} = N_{CBPS} \times m_{STBC} \times \left\lceil \frac{N_{pld}}{N_{CBPS} \times R \times m_{STBC}} \right\rceil \tag{19-36}$$

where

m_{STBC} is 2 if STBC is used and 1 otherwise
length is the value of the HT Length field in the HT-SIG field defined in Table 19-11
N_{pld} is the number of bits in the PSDU and SERVICE field

b) Compute the integer number of LDPC codewords to be transmitted, N_{CW}, and the length of the codewords to be used, L_{LDPC} from Table 19-16.

Table 19-16—PPDU encoding parameters

Range of N_{avbits} (bits)	Number of LDPC codewords (N_{CW})	LDPC codeword length L_{LDPC} (bits)
$N_{avbits} \le 648$	1	1296, if $N_{avbits} \ge N_{pld} + 912 \times (1\text{-}R)$ 648, otherwise
$648 < N_{avbits} \le 1296$	1	1944, if $N_{avbits} \ge N_{pld} + 1464 \times (1\text{-}R)$ 1296, otherwise
$1296 < N_{avbits} \le 1944$	1	1944
$1944 < N_{avbits} \le 2592$	2	1944, if $N_{avbits} \ge N_{pld} + 2916 \times (1\text{-}R)$ 1296, otherwise
$2592 < N_{avbits}$	$\left\lceil \frac{N_{pld}}{1944 \cdot R} \right\rceil$	1944

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

c) Compute the number of shortening bits, N_{shrt}, to be padded to the N_{pld} data bits before encoding, as shown in Equation (19-37).

$$N_{shrt} = \max(0, (N_{CW} \times L_{LDPC} \times R) - N_{pld}) \quad (19\text{-}37)$$

When $N_{shrt} = 0$, shortening is not performed. (Note that N_{shrt} is inherently restricted to be non-negative due to the codeword length and count selection of Table 19-16). When $N_{shrt} > 0$, shortening bits shall be equally distributed over all N_{CW} codewords with the first N_{shrt} mod N_{CW} codewords shortened 1 bit more than the remaining codewords. Define $N_{spcw} = \lfloor N_{shrt} / N_{CW} \rfloor$. Then, when $N_{shrt} > 0$, the shortening is performed by setting information bits $i_{k-N_{spcw}-1}, \ldots, i_{k-1}$ to 0 in the first N_{shrt} mod N_{CW} codewords and setting information bits $i_{k-N_{spcw}}, \ldots, i_{k-1}$ to 0 in the remaining codewords. For all values of N_{shrt}, encode each of the N_{CW} codewords using the LDPC encoding technique described in 19.3.11.7.2 to 19.3.11.7.4. When $N_{shrt} > 0$, the shortened bits shall be discarded after encoding.

d) Compute the number of bits to be punctured, N_{punc}, from the codewords after encoding, as shown in Equation (19-38).

$$N_{punc} = \max(0, (N_{CW} \times L_{LDPC}) - N_{avbits} - N_{shrt}) \quad (19\text{-}38)$$

If $\left((N_{punc} > 0.1 \times N_{CW} \times L_{LDPC} \times (1-R)) \text{ AND} \left(N_{shrt} < 1.2 \times N_{punc} \times \frac{R}{1-R}\right)\right)$ is true OR if $(N_{punc} > 0.3 \times N_{CW} \times L_{LDPC} \times (1-R))$ is true, increment N_{avbits} and recompute N_{punc} by the following two equations once:

$$N_{avbits} = N_{avbits} + N_{CBPS} \times m_{STBC} \quad (19\text{-}39)$$

$$N_{punc} = \max(0, (N_{CW} \times L_{LDPC}) - N_{avbits} - N_{shrt}) \quad (19\text{-}40)$$

The punctured bits shall be equally distributed over all N_{CW} codewords with the first N_{punc} mod N_{CW} codewords punctured 1 bit more than the remaining codewords. Define $N_{\text{ppcw}} = \lfloor N_{\text{punc}} / N_{\text{CW}} \rfloor$. When $N_{\text{ppcw}} > 0$, the puncturing is performed by discarding parity bits $p_{n-k-N_{ppcw}-1}, \ldots, p_{n-k-1}$ of the first N_{punc} mod N_{CW} codewords and discarding parity bits $(p_{n-k-N_{ppcw}}, \ldots, p_{n-k-1})$ of the remaining codewords after encoding. The number of OFDM symbols to be transmitted in the PPDU is computed as shown in Equation (19-41).

$$N_{SYM} = N_{avbits} / N_{CBPS} \quad (19\text{-}41)$$

e) Compute the number of coded bits to be repeated, N_{rep}, as shown in Equation (19-42).

$$N_{rep} = \max(0, N_{avbits} - N_{CW} \times L_{LDPC} \times (1-R) - N_{pld}) \quad (19\text{-}42)$$

The number of coded bits to be repeated shall be equally distributed over all N_{CW} codewords with one more bit repeated for the first N_{rep} mod N_{CW} codewords than for the remaining codewords.

NOTE—When puncturing occurs, the coded bits are not repeated, and vice versa.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The coded bits to be repeated for any codeword shall be copied only from that codeword itself, starting from information bit i_0 and continuing sequentially through the information bits and, when necessary, into the parity bits, until the required number of repeated bits is obtained for that codeword. Note that these repeated bits are copied from the codeword after the shortening bits have been removed. If for a codeword the required number of repeated bits are not obtained in this manner (i.e., repeating the codeword once), the procedure is repeated until the required number is achieved. These repeated bits are then concatenated to the codeword after the parity bits in their same order. This process is illustrated in Figure 19-13. In this figure, the outlined arrows indicate the encoding procedure steps, while the solid arrows indicate the direction of puncturing and padding with repeated bits.

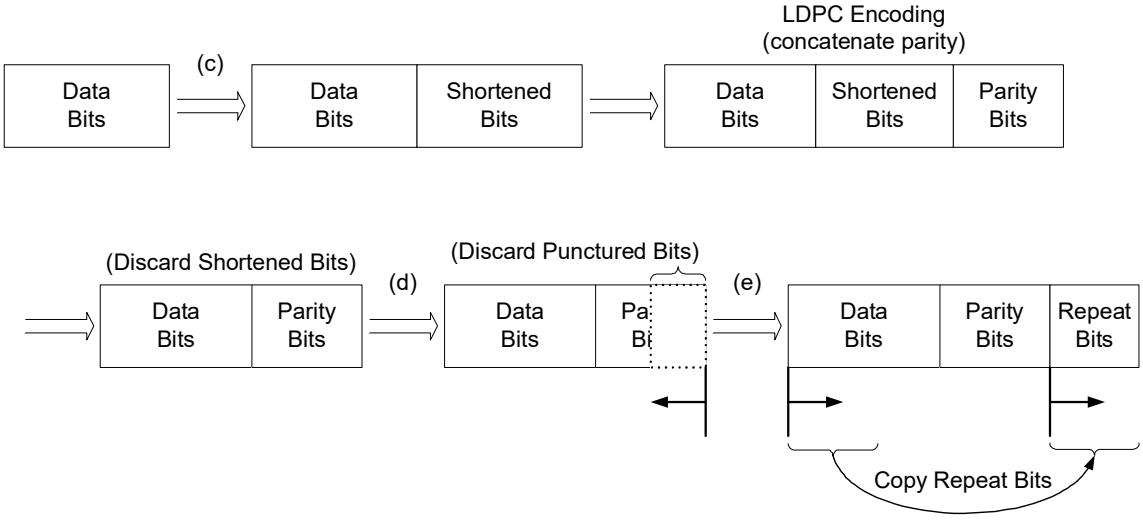

Figure 19-13—LDPC PPDU encoding padding and puncturing of a single codeword

f) For each of the N_{CW} codewords, process the data using the number of shortening bits per codeword as computed in step c) for encoding, and puncture or repeat bits per codeword as computed per step d) and step e), as illustrated in Figure 19-13.

g) Aggregate all codewords and parse as defined in 19.3.11.7.6.

19.3.11.7.6 LDPC parser

The succession of LDPC codewords that result from the encoding process of 19.3.11.7.5 shall be converted into a bitstream in sequential fashion. Within each codeword, bit i_0 is ordered first. The parsing of this encoded data stream into spatial streams shall follow exactly the parsing rules defined for the BCC encoder, as defined in 19.3.11.8.1. However, the frequency interleaver of 19.3.11.8.3 is bypassed.

19.3.11.8 Data interleaver

19.3.11.8.1 Overview

After coding and puncturing, the data bit streams at the output of the FEC encoders are rearranged into blocks of $N_{CBPSS}(i_{SS})$ bits, where $i_{SS} = 1, 2, \ldots N_{SS}$ is the spatial stream index. This operation is referred to as *stream parsing* and is described in 19.3.11.8.2. If BCC encoding was used, each of these blocks is then interleaved by an interleaver that is a modification of the Clause 17 interleaver.

19.3.11.8.2 Stream parser

The number of bits assigned to a single axis (real or imaginary) in a constellation point in spatial stream i_{SS} is denoted by Equation (19-43).

$$s(i_{SS}) = \max\left\{1, \frac{N_{BPSCS}(i_{SS})}{2}\right\} \tag{19-43}$$

The sum of these over all streams is $S = \sum_{i_{SS}=1}^{N_{SS}} s(i_{SS})$.

NOTE—If equal MCS is used for all spatial streams, this sum becomes $N_{SS} \cdot s$, where s is the number of bits for an axis common to all streams.

Consecutive blocks of $s(i_{SS})$ bits are assigned to different spatial streams in a round robin fashion.

If two encoders are present, the output of each encoder is used alternately for each round robin cycle, i.e., at the beginning S bits from the output of first encoder are fed into all spatial streams, and then S bits from the output of second encoder are used, and so on.

Input k to spatial stream i_{SS} shall be $y_i^{(j)}$, which is output bit i of the encoder j,

where

$$j = \left\lfloor \frac{k}{s(i_{SS})} \right\rfloor \bmod N_{ES} \tag{19-44}$$

$$i = \sum_{i'=1}^{i_{SS}-1} s(i') + S \cdot \left\lfloor \frac{k}{N_{ES} \cdot s(i_{SS})} \right\rfloor + k \bmod s(i_{SS}) \tag{19-45}$$

$$1 \le i_{SS} \le N_{SS}$$

For $i_{SS} = 1$, the first term in Equation (19-45) has a value of 0.

19.3.11.8.3 Frequency interleaver

MCS 32 interleaving shall be as defined in 17.3.5.7. Interleaving for all other MCSs is defined in this subclause.

The bits at the output of the stream parser are divided into blocks of $N_{CBPSS}(i_{SS})$, $i_{SS} = 1, 2, \ldots N_{SS}$ bits; and if BCC encoding was used, each block shall be interleaved by an interleaver based on the Clause 17 interleaver. This interleaver, which is based on entering the data in rows and reading them out in columns, has a different number of columns and rows depending on whether a 20 MHz channel or a 40 MHz channel is used. Table 19-17 defines the interleaver parameters. If LDPC encoding was used, no frequency interleaving is performed; hence the parsed streams are immediately mapped to symbols as defined in 19.3.11.9.

If more than one spatial stream exists after the operations based on the Clause 17 interleaver have been applied, a third operation called *frequency rotation* shall be applied to the additional spatial streams. The parameter for the frequency rotation is N_{ROT}.

Table 19-17—Number of rows and columns in the interleaver

Parameter	20 MHz	40 MHz
N_{COL}	13	18
N_{ROW}	$4 \times N_{BPSCS}(i_{SS})$	$6 \times N_{BPSCS}(i_{SS})$
N_{ROT}	11	29

The interleaving is defined using three permutations. The first permutation is defined by the rule shown in Equation (19-46).

$$i = N_{ROW} \times (k \bmod N_{COL}) + \lfloor k/N_{COL} \rfloor, \qquad k = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-46}$$

The second permutation is defined by the rule shown in Equation (19-47).

$$j = s(i_{SS}) \times \lfloor i/s(i_{SS}) \rfloor + (i + N_{CBPSS}(i_{SS}) - \lfloor N_{COL} \times i/N_{CBPSS}(i_{SS}) \rfloor) \bmod s(i_{SS}); \quad i = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-47}$$

The value of $s(i_{SS})$ is determined by the number of coded bits per subcarrier as shown in Equation (19-48).

$$s(i_{SS}) = \max(N_{BPSCS}(i_{SS})/2, 1) \tag{19-48}$$

If more than one spatial stream exists, a frequency rotation is applied to the output of the second permutation as shown in Equation (19-49).

$$r = \left(j - \left(((i_{SS} - 1) \times 2) \bmod 3 + 3 \times \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor\right) \times N_{ROT} \times N_{BPSCS}(i_{SS})\right) \bmod N_{CBPSS}(i_{SS}); \quad j = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-49}$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the index of the spatial stream on which this interleaver is operating

The deinterleaver uses the following operations to perform the inverse rotation. The index of the bit in the received block (per spatial stream) is denoted by *r*. The first permutation reverses the third (frequency rotation) permutation of the interleaver as shown in Equation (19-50).

$$j = \left(r + \left(((i_{SS} - 1) \times 2) \bmod 3 + 3 \times \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor\right) \times N_{ROT} \times N_{BPSCS}(i_{SS})\right) \bmod N_{CBPSS}(i_{SS}); \quad r = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-50}$$

The second permutation reverses the second permutation in the interleaver as shown in Equation (19-51).

$$i = s(i_{SS}) \times \lfloor j/s(i_{SS}) \rfloor + (j + \lfloor N_{COL} \times j/N_{CBPSS}(i_{SS}) \rfloor) \bmod s(i_{SS}); \quad j = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-51}$$

where $s(i_{SS})$ is defined in Equation (19-48).

The third permutation reverses the first permutation of the interleaver as shown in Equation (19-52).

$$k = N_{COL} \times i - (N_{CBPSS}(i_{SS}) - 1) \times \lfloor i/N_{ROW} \rfloor \qquad i = 0, 1, \ldots, N_{CBPSS}(i_{SS}) - 1 \tag{19-52}$$

19.3.11.9 Constellation mapping

19.3.11.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8.

The streams of complex numbers are denoted as shown in Equation (19-53).

$$d_{k,\,l,\,n},\ 0 \le k \le N_{SD}-1;1 \le l \le N_{SS};0 \le n \le N_{SYM}-1 \tag{19-53}$$

19.3.11.9.2 Space-time block coding (STBC)

This subclause defines a set of optional robust transmission formats that are applicable only when N_{STS} is greater than N_{SS}. In this case, N_{SS} spatial streams are mapped to N_{STS} space-time streams, which are mapped to N_{TX} transmit chains. These formats are based on STBC. When the use of STBC is indicated in the STBC field of the HT-SIG, a symbol operation shall occur between the constellation mapper and the spatial mapper (see Figure 19-3) as defined in this subclause.

If STBC is applied, the stream of complex numbers, $d_{k,\,i,\,n};k = 0\ldots N_{SD}-1;i = 1\ldots N_{SS};n = 0\ldots N_{SYM}-1$, generated by the constellation mapper, is the input of the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}_{k,\,i,\,n};k = 0\ldots N_{SD}-1;i = 1\ldots N_{STS};n = 0\ldots N_{SYM}-1$. For given values of k and i, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the value of $\tilde{d}_{k,\,i,\,2m}$ depends on $d_{k,\,i,\,2m}$ and $d_{k,\,i,\,2m+1}$, and $\tilde{d}_{k,\,i,\,2m+1}$ also depends on $d_{k,\,i,\,2m}$ and $d_{k,\,i,\,2m+1}$, as defined in Table 19-18.

Table 19-18—Constellation mapper output to spatial mapper input for STBC

N_{STS}	HT-SIG MCS field (bits 0–6 in HT-SIG$_1$)	N_{SS}	HT-SIG STBC field (bits 4–5 in HT-SIG$_2$)	i_{STS}	$\tilde{d}_{k,\,i,\,2m}$	$\tilde{d}_{k,\,i,\,2m+1}$
2	0–7	1	1	1	$d_{k,\,1,\,2m}$	$d_{k,\,1,\,2m+1}$
				2	$-d^{*}_{k,\,1,\,2m+1}$	$d^{*}_{k,\,1,\,2m}$
3	8–15, 33–38	2	1	1	$d_{k,\,1,\,2m}$	$d_{k,\,1,\,2m+1}$
				2	$-d^{*}_{k,\,1,\,2m+1}$	$d^{*}_{k,\,1,\,2m}$
				3	$d_{k,\,2,\,2m}$	$d_{k,\,2,\,2m+1}$

Table 19-18—Constellation mapper output to spatial mapper input for STBC *(continued)*

N_{STS}	HT-SIG MCS field (bits 0–6 in HT-SIG$_1$)	N_{SS}	HT-SIG STBC field (bits 4–5 in HT-SIG$_2$)	i_{STS}	$\tilde{d}_{k,i,2m}$	$\tilde{d}_{k,i,2m+1}$
4	8–15	2	2	1	$d_{k,1,2m}$	$d_{k,1,2m+1}$
				2	$-d^{*}_{k,1,2m+1}$	$d^{*}_{k,1,2m}$
				3	$d_{k,2,2m}$	$d_{k,2,2m+1}$
				4	$-d^{*}_{k,2,2m+1}$	$d^{*}_{k,2,2m}$
4	16–23, 39, 41, 43, 46, 48, 50	3	1	1	$d_{k,1,2m}$	$d_{k,1,2m+1}$
				2	$-d^{*}_{k,1,2m+1}$	$d^{*}_{k,1,2m}$
				3	$d_{k,2,2m}$	$d_{k,2,2m+1}$
				4	$d_{k,3,2m}$	$d_{k,3,2m+1}$

NOTE—The '*' operator represents the complex conjugate.

If STBC is not applied, $\tilde{d}_{k,i,n} = d_{k,i,n}$ and $N_{SS} = N_{STS}$.

NOTE 1—The specific STBC schemes for single spatial streams ($N_{SS} = 1$) with $N_{TX} \geq 3$ are not detailed in this subclause since they are covered through the use of spatial expansion as detailed in 19.3.11.11.2.

NOTE 2—STBC is applied only for the HT-SIG MCS field values specified in Table 19-18 and is not used with MCS 32.

19.3.11.10 Pilot subcarriers

In a 20 MHz transmission four pilot tones shall be inserted in the same subcarriers used in Clause 17, i.e., in subcarriers –21, –7, 7, and 21. The pilot sequence for the n^{th} symbols and $i_{STS}{}^{\text{th}}$ space-time stream shall be as shown in Equation (19-54).

$$P^{-28,28}_{(i_{STS},n)} = \left\{ 0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},n \bmod 4},0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},(n+1) \bmod 4},0,0,0,0,0,0,0, \right.$$
$$\left. 0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},(n+2) \bmod 4},0,0,0,0,0,0,0,0,0,0,0,0,0,\Psi^{(N_{STS})}_{i_{STS},(n+3) \bmod 4},0,0,0,0,0,0,0 \right\} \quad (19\text{-}54)$$

In a 40 MHz transmission (excluding MCS 32; see 19.3.11.11.5), pilot signals shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilot sequence for symbol n and space-time stream i_{STS} shall be as shown in Equation (19-55).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$P^{-58,58}_{(i_{STS},n)} = \Big\{ 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS},\, n \bmod 6}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0,$$
$$0, 0, \Psi^{(N_{STS})}_{i_{STS},\,(n+1) \bmod 6}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS},\,(n+2) \bmod 6}, 0, 0, 0, 0, 0, 0, 0, 0, 0,$$
$$0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS},\,(n+3) \bmod 6}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS},\,(n+4) \bmod 6},$$
$$0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, \Psi^{(N_{STS})}_{i_{STS},\,(n+5) \bmod 6}, 0, 0, 0, 0, 0 \Big\} \quad (19\text{-}55)$$

where the patterns $\Psi^{(N_{STS})}_{i_{STS},\,n}$ are defined in Table 19-19 and Table 19-20.

NOTE—For each space-time stream, there is a different pilot pattern, and the pilot patterns are cyclically rotated over symbols.

The basic patterns are also different according to the total number of space-time streams for the packet.

Table 19-19—Pilot values for 20 MHz transmission

19.3.11.11 OFDM modulation

19.3.11.11.1 General

The time domain signal is composed from the stream of complex numbers as shown in Equation (19-56).

$$\tilde{d}_{k,l,n},\ 0 \le k \le N_{SD}-1; 1 \le l \le N_{STS}; 0 \le n \le N_{SYM}-1 \tag{19-56}$$

and from the pilot signals. In a 40 MHz transmission, the upper subcarriers are rotated 90° relative to the lower subcarriers.

19.3.11.11.2 Spatial mapping

The transmitter may choose to rotate and/or scale the constellation mapper output vector (or the space-time block coder output, if applicable). This rotation and/or scaling is useful in the following cases:

— When there are more transmit chains than space-time streams, $N_{STS} < N_{TX}$
— As part of (an optional) sounding PPDU
— As part of (an optional) calibration procedure
— When the packet is transmitted using one of the (optional) beamforming techniques

If the data to be transmitted on subcarrier k on space-time stream i_{STS} are $X_k^{(i_{STS})}$, the transmitted data on the transmit chain i_{TX} shall be as shown in Equation (19-57).

$$r_{Field}^{(i_{TX})} = \frac{1}{\sqrt{N_{STS} \cdot N_{Field}^{Tone}}} w_{T_{Field}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} X_k^{(i_{STS})} \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \tag{19-57}$$

where

$[Q_k]_{i_{TX}, i_{STS}}$ is the element in row i_{TX} and column i_{STS} in a matrix Q_k with N_{TX} rows and N_{STS} columns; Q_k may be frequency dependent

Field is any field, as defined in 19.3.7, excluding L-STF, L-LTF, L-SIG, and HT-SIG in HT_MF PPDU

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Below are examples of spatial mapping matrices that might be used. There exist many other alternatives; implementation is not restricted to the spatial mapping matrices shown. The examples are as follows:

a) *Direct mapping*: Q_k is a diagonal matrix of unit magnitude complex values that takes one of two forms:

   1) $Q_k = \mathbf{I}$, the identity matrix

   2) A CSD matrix in which the diagonal elements represent cyclic shifts in the time domain: $[Q_k]_{i,i} = \exp(-j2\pi k\Delta_F\tau_{CS}^i)$, where τ_{CS}^i, $i = 1, \ldots, N_{TX}$ represents the CSD applied.

b) *Indirect mapping:* Q_k may be the product of a CSD matrix and a unitary matrix such as the Hadamard matrix or the Fourier matrix.

c) *Spatial expansion:* Q_k is the product of a CSD matrix and a square matrix formed of orthogonal columns. As an illustration:

   1) The spatial expansion may be performed by duplicating some of the N_{STS} streams to form the N_{TX} streams, with each stream being scaled by the normalization factor $\sqrt{N_{STS}/N_{TX}}$. The spatial expansion may be performed by using, for instance, one of the following matrices, denoted D, left-multiplied by a CSD matrix, denoted $M_{CSD}(k)$, and/or possibly multiplied by any unitary matrix. The resulting spatial mapping matrix is then $Q_k = M_{CSD}(k) \cdot D$, where D may take on one of the following values:

      i) N_{TX}=2, N_{STS}=1, $D = \frac{1}{\sqrt{2}}\begin{bmatrix}1 & 1\end{bmatrix}^T$

      ii) N_{TX}=3, N_{STS}=1, $D = \frac{1}{\sqrt{3}}\begin{bmatrix}1 & 1 & 1\end{bmatrix}^T$

      iii) N_{TX}=4, N_{STS}=1, $D = \frac{1}{2}\begin{bmatrix}1 & 1 & 1 & 1\end{bmatrix}^T$

      iv) N_{TX}=3, N_{STS}=2, $D = \sqrt{\frac{2}{3}}\begin{bmatrix}1 & 0\\ 0 & 1\\ 1 & 0\end{bmatrix}$

      v) N_{TX}=4, N_{STS}=2, $D = \frac{1}{\sqrt{2}}\begin{bmatrix}1 & 0\\ 0 & 1\\ 1 & 0\\ 0 & 1\end{bmatrix}$

      vi) N_{TX}=4, N_{STS}=3, $D = \frac{\sqrt{3}}{2}\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\\ 1 & 0 & 0\end{bmatrix}$

   2) Different spatial expansion over subcarriers should be used in HT-mixed format only and with the Smoothing bit equal to 0:

      i) N_{TX}=2, N_{STS}=1, $[Q_k]_{N_{STS}} = \begin{bmatrix}1 & 0\end{bmatrix}^T$ or $[Q_k]_{N_{STS}} = \begin{bmatrix}0 & 1\end{bmatrix}^T$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

ii) N_{TX}=3, N_{STS}=2, $[Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix}, \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$ or $\begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{bmatrix}$

iii) N_{TX}=4, N_{STS}=2, $[Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix}, \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix}$ or $\begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$

iv) N_{TX}=4, N_{STS}=3, $[Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ or $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

d) *Beamforming steering matrix:* Q_k is any matrix that improves the reception in the receiver based on some knowledge of the channel between the transmitter and the receiver. With transmit beamforming with explicit feedback, the steering matrix Q_k is determined using either H_{eff} for CSI feedback or V_k for noncompressed and compressed matrices feedback from the STA to which the beamformed packet is addressed.

When there are fewer space-time streams than transmit chains, the first N_{STS} columns of the matrices above that are square might be used.

The same matrix Q_k shall be applied to subcarrier *k* during all parts of the packet in HT-greenfield format and all parts of the packet following and including the HT-STF field in an HT-mixed format packet. This operation is transparent to the receiver.

When a beamforming steering matrix is applied, the Smoothing bit should be set to 0.

The CSD of Table 19-10 shall be applied at the input of the spatial mapper.

For the identity matrix direct mapping, the Smoothing bit should be set to 1.

If no spatial mapping is applied, the matrix Q_k is equal to the identity matrix and $N_{STS} = N_{TX}$.

Sounding PPDUs using spatial expansion shall use an orthonormal column matrix Q_k. When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix.

19.3.11.11.3 Transmission in 20 MHz HT format

For 20 MHz HT transmissions, the signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$ shall be as shown in Equation (19-58).

$$\tilde{D}_{k,\, i_{STS},\, n} = \begin{cases} 0,\ k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ \tilde{d}_{M^r(k),\, i_{STS},\, n},\ \text{otherwise} \end{cases}$$

$$M^r(k) = \begin{cases} k + 58,\ -58 \le k \le -54 \\ k + 57,\ -52 \le k \le -26 \\ k + 56,\ -24 \le k \le -12 \\ k + 55,\ -10 \le k \le -2 \\ k + 52,\ 2 \le k \le 10 \\ k + 51,\ 12 \le k \le 24 \\ k + 50,\ 26 \le k \le 52 \\ k + 49,\ 54 \le k \le 58 \end{cases}$$

$P^k_{(i_{STS},\, n)}$ is defined in Equation (19-55)

NOTE—The 90° rotation that is applied to the upper part of the 40 MHz channel is applied in the same way to the HT-STF, HT-LTF, and HT-SIG. The rotation applies to both pilots and the data in the upper part of the 40 MHz channel.

19.3.11.11.5 Transmission in MCS 32 format

The use of MCS 32 format is deprecated.

MCS 32 format provides the lowest transmission rate in 40 MHz. It is used only for one spatial stream and only with BPSK modulation and rate 1/2 coding.

In the MCS 32 format, the signal shall be as shown in Equation (19-60).

$$\begin{aligned} r^{i_{TX}}_{HT-DATA}(t) = {} & \frac{1}{\sqrt{N^{Tone}_{HT-Duplicate}}} \sum_{n=0}^{N_{SYM}-1} w_{\mathrm{T}_{SYM}}(t - nT_{SYM}) \\ & \cdot \sum_{k=-N_{SR}}^{N_{SR}} (D_{k,n} + p_{n+z}P_k)([Q_{k-32}]_{i_{TX},1} \exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI})) \\ & + j[Q_{k+32}]_{i_{TX},1} \exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI}))) \end{aligned} \tag{19-60}$$

where

z is defined in 19.3.11.11.3

P_k and p_n are defined in 17.3.5.10

$D_{k,n}$ is defined in 19.3.9.4.3

N_{SR} has the value defined for non-HT 20 MHz transmission

$[Q_k]_{i_{TX},1}$ is an element from a vector of length N_{TX}, which may be frequency dependent

$N^{Tone}_{HT-Duplicate}$ is defined in Table 19-8

The rules of spatial expansion CSD limitation, as specified in 19.3.11.11.2, shall apply to $[Q_k]_{i_{TX},1}$.

19.3.11.11.6 Transmission with a short GI

Short GI is used in the data field of the packet when the Short GI field in the HT-SIG is equal to 1. When it is used, the same formula for the formation of the signal shall be used as in 19.3.11.11.3, 19.3.11.11.4, and 19.3.11.11.5, with T_{GI} replaced by T_{GIS} and T_{SYM} replaced by T_{SYMS}.

NOTE—Short GI is not used in HT-greenfield format with one spatial stream, in which case the HT-SIG is immediately followed by data. It is very difficult to parse the HT-SIG in time to demodulate these data with the correct GI length if the GI length is not known in advance.

19.3.11.12 Non-HT duplicate transmission

Non-HT duplicate transmission is used to transmit to Clause 17 STAs, Clause 18 STAs, and Clause 19 STAs that may be present in either the upper or lower halves of the 40 MHz channel. The L-STF, L-LTF, and L-SIG shall be transmitted in the same way as in the HT 40 MHz transmission. The HT-SIG, HT-STF, and HT-LTF are not transmitted. Data transmission shall be as defined in Equation (19-61).

$$r^{i_{TX}}_{LEG-DUP}(t) = \frac{1}{\sqrt{N^{Tone}_{Non\text{-}HT\ Duplicate}}} \sum_{n=0}^{N_{SYM}-1} w_{\mathrm{T}_{SYM}}(t - nT_{SYM}) \cdot \sum_{k=-26}^{26} (D_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T^{i_{TX}}_{CS})) + j\exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T^{i_{TX}}_{CS}))) \quad (19\text{-}61)$$

where

P_k and p_n are defined in 17.3.5.10

$D_{k,n}$ is defined in 19.3.9.4.3

$T^{i_{TX}}_{CS}$ represents the cyclic shift of the transmit chain i_{TX} and is defined in Table 19-9

$N^{Tone}_{Non\text{-}HT\ Duplicate}$ is defined in Table 19-8

19.3.12 Beamforming

19.3.12.1 General

Beamforming is a technique in which the beamformer utilizes the knowledge of the MIMO channel to generate a steering matrix Q_k that improves reception in the beamformee.

The equivalent complex baseband MIMO channel model (3×2 example) is one in which, when a vector $\mathbf{x}_k = [x_1, x_2, \ldots x_{N_{TX}}]^T$ is transmitted in subcarrier *k*, the received vector $\mathbf{y}_k = [y_1, y_2, \ldots y_{N_{RX}}]^T$ is modeled as shown in Equation (19-62).

$$\mathbf{y}_k = H_k\mathbf{x}_k + \mathbf{n} \quad (19\text{-}62)$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where

H_k is channel matrix of dimensions $N_{RX} \times N_{TX}$

n is white (spatially and temporally) Gaussian noise as illustrated in Figure 19-14

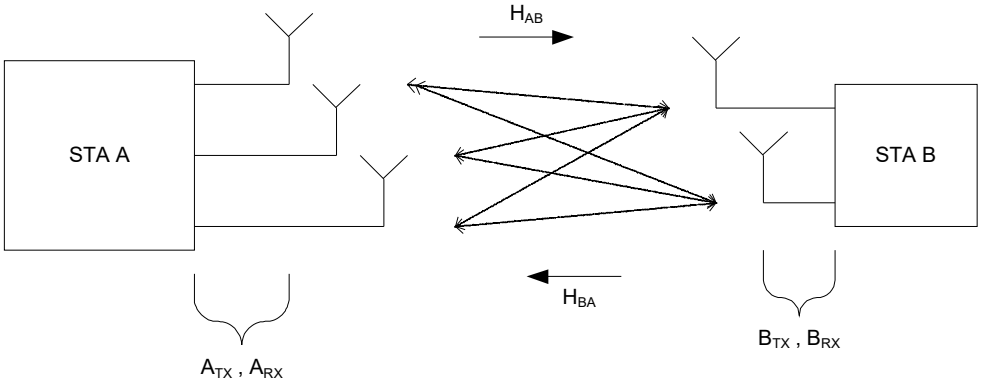

Figure 19-14—Beamforming MIMO channel model (3×2 example)

When beamforming is used, the beamformer replaces $\mathbf{x}_k$, which in this case has $N_{STS} \leq N_{TX}$ elements, with $Q_k\mathbf{x}_k$, where Q_k has N_{TX} rows and N_{STS} columns, so that the received vector is as shown in Equation (19-63).

$$\mathbf{y}_k = H_k Q_k \mathbf{x}_k + \mathbf{n} \tag{19-63}$$

The beamforming steering matrix that is computed (or updated) from a new channel measurement replaces the existing Q_k for the next beamformed data transmission. There are several methods of beamforming, differing in the way the beamformer acquires the knowledge of the channel matrices H_k and on whether the beamformer generates Q_k or the beamformee provides feedback information for the beamformer to generate Q_k.

19.3.12.2 Implicit feedback beamforming

Implicit feedback beamforming is a technique that relies on reciprocity in the time division duplex channel to estimate the channel over which a device is transmitting based on the MIMO reference that is received from the device to which it plans to transmit. This technique allows the transmitting device to calculate a set of transmit steering matrices, Q_k, one for each subcarrier, which are intended to optimize the performance of the link.

Referring to Figure 19-14, beamforming transmissions from STA A to STA B using implicit techniques are enabled when STA B sends STA A a sounding PPDU, the reception of which allows STA A to form an estimate of the MIMO channel from STA B to STA A, for all subcarriers. In a TDD channel in which the forward and reverse channels are reciprocal, the channel from STA A to STA B in subcarrier k is the matrix transpose of the channel from STA B to STA A in subcarrier k to within a complex scaling factor, i.e., $H_{\mathrm{AB},k} = \rho[H_{\mathrm{BA},k}]^T$. Here $H_{\mathrm{AB},k}$ is the MIMO channel matrix from STA A to STA B at subcarrier k, and $H_{\mathrm{BA},k}$ is the channel matrix from STA B to STA A at subcarrier k. STA A uses this relationship to compute transmit steering matrices that are suitable for transmitting to STA B over $H_{\mathrm{AB},k}$.

NOTE 1—In order for the recipient of the sounding to compute steering matrices when steered or unsteered sounding is used, the steering matrices need to have the property $(H_k Q_k)(H_k Q_k)^H = H_k H_k^H$, where X^H indicates the conjugate transpose of the matrix X.

While the over-the-air channel between the antenna(s) at one STA and the antenna(s) at a second STA is reciprocal, the observed baseband-to-baseband channel used for communication might not be, as it includes the transmit and receive chains of the STAs. Differences in the amplitude and phase characteristics of the transmit and receive chains associated with individual antennas degrade the reciprocity of the over-the-air channel and cause degradation of performance of implicit beamforming techniques. The over-the-air calibration procedure described in 10.34.2.4 may be used to restore reciprocity. The procedure provides the means for calculating a set of correction matrices that can be applied at the transmit side of a STA to correct the amplitude and phase differences between the transmit and receive chains in the STA. If this correction is done at least at the STA that serves as the beamformer, there is sufficient reciprocity for implicit feedback in the baseband-to-baseband response of the forward link and reverse channel.

Figure 19-15 illustrates the observed baseband-to-baseband channel, including reciprocity correction. Spatial mapping matrices $Q_{\mathrm{A},k}$ and $Q_{\mathrm{B},k}$ are assumed to be identity matrices here for simplicity of illustration.

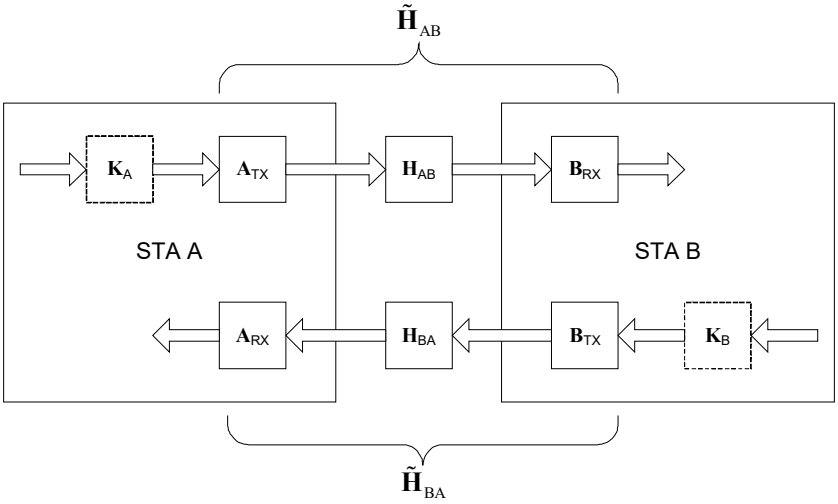

Figure 19-15—Baseband-to-baseband channel

NOTE 2—Spatial mapping matrix for sounding PPDUs are specified in 19.3.13.3.

The amplitude and phase responses of the transmit and receive chains can be expressed as diagonal matrices with complex valued diagonal entries, of the form $A_{TX,k}$ and $A_{RX,k}$ at STA A. The relationship between the baseband-to-baseband channel, $\tilde{H}_{\mathrm{AB},k}$, and the over-the-air channel, $H_{\mathrm{AB},k}$, is shown in Equation (19-64).

$$\tilde{H}_{\mathrm{AB},k} = B_{\mathrm{RX},k} H_{\mathrm{AB},k} A_{\mathrm{TX},k} \tag{19-64}$$

Similarly, the relationship between $\tilde{H}_{\mathrm{BA},k}$ and $H_{\mathrm{BA},k}$ is shown in Equation (19-65).

$$\tilde{H}_{\mathrm{BA},k} = A_{\mathrm{RX},k} H_{\mathrm{BA},k} B_{\mathrm{TX},k} \tag{19-65}$$

Copyright © 2021 IEEE. All rights reserved.
Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

As an example, consider the case where calibration is performed at both STA A and STA B. The objective is to compute correction matrices, $K_{\mathrm{A},k}$ and $K_{\mathrm{B},k}$, that restore reciprocity so that Equation (19-66) is true.

$$\tilde{H}_{\mathrm{AB},k}K_{\mathrm{A},k} = \rho[\tilde{H}_{\mathrm{BA},k}K_{\mathrm{B},k}]^{\mathrm{T}} \tag{19-66}$$

The correction matrices are diagonal matrices with complex valued diagonal entries. The reciprocity condition in Equation (19-66) is enforced when Equation (19-67) and Equation (19-68) are true.

$$K_{\mathrm{A},k} = \alpha_{\mathrm{A},k}[A_{\mathrm{TX},k}]^{-1}A_{\mathrm{RX},k} \tag{19-67}$$

and

$$K_{\mathrm{B},k} = \alpha_{\mathrm{B},k}[B_{\mathrm{TX},k}]^{-1}B_{\mathrm{RX},k} \tag{19-68}$$

where $\alpha_{\mathrm{A},k}$ and $\alpha_{\mathrm{B},k}$ are complex valued scaling factors.

Using these expressions for the correction matrices, the calibrated baseband-to-baseband channel between STA A and STA B is expressed as shown in Equation (19-69).

$$\hat{H}_{\mathrm{AB},k} = \tilde{H}_{\mathrm{AB},k}K_{\mathrm{A},k} = \alpha_{\mathrm{A},k}B_{\mathrm{RX},k}H_{\mathrm{AB},k}A_{\mathrm{RX},k} \tag{19-69}$$

If both sides apply the correction matrices, the calibrated baseband-to-baseband channel between STA A and STA B is expressed as shown in Equation (19-70).

$$\hat{H}_{\mathrm{BA},k} = \alpha_{\mathrm{B},k}A_{\mathrm{RX},k}H_{\mathrm{BA},k}B_{\mathrm{RX},k} = \frac{\alpha_{\mathrm{B},k}}{\alpha_{\mathrm{A},k}}[\hat{H}_{\mathrm{AB},k}]^{\mathrm{T}} \tag{19-70}$$

Focusing on STA A, the procedure for estimating $K_{\mathrm{A},k}$ is as follows:

a) STA A sends STA B a sounding PPDU, the reception of which allows STA B to estimate the channel matrices $\tilde{H}_{\mathrm{AB},k}$.
b) STA B sends STA A a sounding PPDU, the reception of which allows STA A to estimate the channel matrices $\tilde{H}_{\mathrm{BA},k}$.
c) STA B sends the quantized estimates of $\tilde{H}_{\mathrm{AB},k}$ to STA A.
d) STA A uses its local estimates of $\tilde{H}_{\mathrm{BA},k}$ and the quantized estimates of $\tilde{H}_{\mathrm{AB},k}$ received from STA B to compute the correction matrices $K_{\mathrm{A},k}$.

NOTE 3—When a nonidentity matrix is used for $Q_{A,k}$, STA A is responsible for accounting for the spatial mapping in its local channel estimate as well as in the quantized CSI fed back since the channel feedback received in step c) is actually $\tilde{H}_{\mathrm{AB},k}Q_{\mathrm{A},k}$ and not $\tilde{H}_{\mathrm{AB},k}$. Furthermore, since $Q_{\mathrm{B},k}$ is defined in 19.3.13.3, additional steps might be taken in STA A to remove the effect of $Q_{\mathrm{B},k}$ when computing the correction matrix $K_{A,k}$.

Steps a) and b) occur over a short time interval to so the channel changes as little as possible between measurements. A similar procedure is used to estimate $K_{\mathrm{B},k}$ at STA B. The details of the computation of the correction matrices is implementation specific and beyond the scope of this standard.

19.3.12.3 Explicit feedback beamforming

19.3.12.3.1 General

In explicit beamforming, in order for STA A to transmit a beamformed packet to STA B, STA B measures the channel matrices and sends STA A either the effective channel, $H_{eff,k}$, or the beamforming feedback matrix, V_k, for STA A to determine a steering matrix, $Q_{\text{steer},k} = Q_k V_k$, with V_k found from $H_k Q_k$, where Q_k is the orthonormal spatial mapping matrix that was used to transmit the sounding PPDU that elicited the V_k feedback. The effective channel, $H_{eff,k} = H_k Q_k$, is the product of the spatial mapping matrix used on transmit with the channel matrix. When new steering matrix $Q_{\text{steer},k}$ is found, $Q_{\text{steer},k}$ may replace Q_k for the next beamformed data transmission.

NOTE—$Q_{\text{steer},k}$ is a mathematical term to update a new steering matrix for Q_k in the next beamformed data transmission.

19.3.12.3.2 CSI matrices feedback

In CSI matrices feedback, the beamformer receives the quantized MIMO channel matrix, H_{eff}, from the beamformee. The beamformer then may use this matrix to compute a set of transmit steering matrices, Q_k. The CSI matrix, H_{eff}, shall be determined from the transmitter spatial mapper input to the receiver FFT outputs. The beamformee shall remove the CSD in Table 19-10 from the measured channel matrix.

The matrices $H_{eff}(k)$, where k is the subcarrier index, are encoded so that applying the procedure in 19.3.12.3.3 optimally reconstructs the matrix.

19.3.12.3.3 CSI matrices feedback decoding procedure

The received, quantized matrix $H^q_{eff}(k)$ (of a specific subcarrier, k) shall be decoded as follows:

a) The real and imaginary parts of each element of the matrix, $H^{q(R)}_{eff(m,l)}(k)$ and $H^{q(I)}_{eff(m,l)}(k)$, are decoded as a pair of 2s complement numbers to create the complex element, where $1 \le m \le N_r$ and $1 \le l \le N_c$.

b) Each element in the matrix of subcarrier k is then scaled using the value in the carrier matrix amplitude field (3 bits), $M_H(k)$, interpreted as a positive integer, in decibels, as follows:

   1) Calculate the linear value as defined in Equation (19-71).
   2) Calculate decoded values of the real and imaginary parts of the matrix element as defined in Equation (19-72) and Equation (19-73).

$$r(k) = 10^{M_H(k)/20} \tag{19-71}$$

$$\text{Re}\{\tilde{H}_{eff(m,l)}(k)\} = \frac{H^{q(R)}_{eff(m,l)}(k)}{r(k)} \tag{19-72}$$

$$\text{Im}\{\tilde{H}_{eff(m,l)}(k)\} = \frac{H^{q(I)}_{eff(m,l)}(k)}{r(k)} \tag{19-73}$$

19.3.12.3.4 Example of CSI matrices feedback encoding

The following is an example of an encoding process:

a) The maximums of the real and imaginary parts of each element of the matrix in each subcarrier are found, as defined by Equation (19-74).

$$m_H(k) = \max\left\{\max\left\{\left|\mathrm{Re}(H_{eff(m,l)}(k))\right|_{m=1,l=1}^{m=N_r,l=N_c}\right\}, \max\left\{\left|\mathrm{Im}(H_{eff(m,l)}(k))\right|_{m=1,l=1}^{m=N_r,l=N_c}\right\}\right\} \quad (19\text{-}74)$$

b) The scaling ratio is calculated and quantized to 3 bits as defined by Equation (19-75). A linear scaler is given by Equation (19-76).

$$M_H(k) = \min\left\{7, \left\lfloor 20\log_{10}\left(\frac{\max\{m_H(z)\}_{z=-N_{SR}}^{z=N_{SR}}}{m_H(k)}\right)\right\rfloor\right\} \quad (19\text{-}75)$$

where

$$M_H^{\mathrm{lin}}(k) = \frac{\max\{m_H(z)\}_{z=-N_{SR}}^{z=N_{SR}}}{10^{M_H(k)/20}} \quad (19\text{-}76)$$

c) The real and imaginary parts of each element in the matrix $H_{eff(m,l)}(k)$ are quantized to N_b bits in 2s complement encoding as defined by Equation (19-77) and Equation (19-78).

$$H_{eff(m,l)}^{q(R)}(k) = \left\lfloor \frac{\mathrm{Re}\{H_{eff(m,l)}(k)\}}{M_H^{\mathrm{lin}}(k)}(2^{N_b-1}-1)+0.5 \right\rfloor \quad (19\text{-}77)$$

$$H_{eff(m,l)}^{q(I)}(k) = \left\lfloor \frac{\mathrm{Im}\{H_{eff(m,l)}(k)\}}{M_H^{\mathrm{lin}}(k)}(2^{N_b-1}-1)+0.5 \right\rfloor \quad (19\text{-}78)$$

Each matrix is encoded using $3 + 2 \times N_b \times N_r \times N_c$ bits, where N_r and N_c are the number of rows and columns, respectively, in the channel matrix estimate computed by the receiving station and where N_b may have the value of 4, 5, 6, or 8 bits.

19.3.12.3.5 Noncompressed beamforming feedback matrix

In noncompressed beamforming feedback matrix, the beamformee shall remove the space-time stream CSD in Table 19-10 from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrices, $V(k)$, found by the beamformee are sent to the beamformer in the order of real and imaginary components per tone as specified in 9.4.1.28. The beamformer might use these matrices to determine the steering matrices, Q_k.

The beamformee shall encode the matrices $V(k)$ so a beamformer applying the procedure below optimally reconstructs the matrix.

The received matrix $V^q(k)$ (of a specific subcarrier k) shall be decoded as follows:

a) The real and imaginary parts of each element of the matrix, $V_{m,l}^{q,R}$ and $V_{m,l}^{q,I}$, shall be decoded as a pair of 2s complement numbers to create the complex element, where $1 \le m \le N_r$ and $1 \le l \le N_c$.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

b) The dimensions of the beamforming feedback matrices are $N_r \times N_c$, where N_r and N_c are the number of rows and columns, respectively, in the beamforming feedback matrix computed by the receiving station. Each matrix is encoded using $2 \times N_b \times N_r \times N_c$ bits. N_b may have the value of 2, 4, 6, or 8 bits.

c) Columns $1 \ldots N_c$ of the beamforming feedback matrix correspond to spatial streams $1 \ldots N_c$, respectively. The mapping of spatial stream to modulation is defined in the MCS tables in 19.5. A transmitter shall not reorder the columns of the beamforming feedback matrices.

19.3.12.3.6 Compressed beamforming feedback matrix

In compressed beamforming feedback matrix, the beamformee shall remove the space-time stream CSD in Table 19-10 from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrices, $V(k)$, found by the beamformee are compressed in the form of angles, which are sent to the beamformer. The beamformer might use these angles to decompress the matrices and determine the steering matrices Q_k.

The matrix V per tone shall be compressed as follows: The $N_r \times N_c$ beamforming feedback orthonormal column matrix V found by the beamformee shall be represented as shown in Equation (19-79). When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix.

$$V = \left[\prod_{i=1}^{\min(N_c, N_r - 1)} \left[D_i\left(1_{i-1} \; e^{j\phi_{i,i}} \; \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right) \prod_{l=i+1}^{N_r} G_{li}^{T}(\psi_{li}) \right] \right] \tilde{I}_{N_r \times N_c} \tag{19-79}$$

The matrix $D_i\left(1_{i-1} \; e^{j\phi_{i,i}} \; \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right)$ is an $N_r \times N_r$ diagonal matrix, where 1_{i-1} represents a sequence of 1s with length of *i*–1, as shown in Equation (19-80).

$$D\left(1_{i-1} \; e^{j\phi_{i,i}} \ldots \; e^{j\phi_{N_r-1,i}} \; 1 \right) = \begin{bmatrix} I_{i-1} & 0 & \ldots & \ldots & 0 \\ 0 & e^{j\phi_{i,i}} & 0 & \ldots & 0 \\ \ldots & 0 & \ddots & 0 & 0 \\ \ldots & \ldots & 0 & e^{j\phi_{N_r-1,i}} & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \tag{19-80}$$

The matrix $G_{li}(\psi)$ is an $N_r \times N_r$ Givens rotation matrix as shown in Equation (19-81).

$$G_{li}(\psi) = \begin{bmatrix} I_{i-1} & 0 & 0 & 0 & 0 \\ 0 & \cos(\psi) & 0 & \sin(\psi) & 0 \\ 0 & 0 & I_{l-i-1} & 0 & 0 \\ 0 & -\sin(\psi) & 0 & \cos(\psi) & 0 \\ 0 & 0 & 0 & 0 & I_{N_r-l} \end{bmatrix} \tag{19-81}$$

where each I_m is an $m \times m$ identity matrix, and $\cos(\psi)$ and $\sin(\psi)$ are located at row *l* and column *i*. $\tilde{I}_{N_r \times N_c}$ is an identity matrix padded with 0s to fill the additional rows or columns when $N_r \neq N_c$.

For example, a 4×2 V matrix has the representation shown in Equation (19-82).

$$V = \begin{bmatrix} e^{j\phi_{11}} & 0 & 0 & 0 \\ 0 & e^{j\phi_{21}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{31}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} \cos\psi_{21} & \sin\psi_{21} & 0 & 0 \\ -\sin\psi_{21} & \cos\psi_{21} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} \cos\psi_{31} & 0 & \sin\psi_{31} & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\psi_{31} & 0 & \cos\psi_{31} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} \cos\psi_{41} & 0 & 0 & \sin\psi_{41} \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\sin\psi_{41} & 0 & 0 & \cos\psi_{41} \end{bmatrix}^T$$
$$\times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & e^{j\phi_{22}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{32}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{32} & \sin\psi_{32} & 0 \\ 0 & -\sin\psi_{32} & \cos\psi_{32} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{42} & 0 & \sin\psi_{42} \\ 0 & 0 & 1 & 0 \\ 0 & -\sin\psi_{42} & 0 & \cos\psi_{42} \end{bmatrix}^T \times \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \quad (19\text{-}82)$$

The procedure for finding a compressed V matrix is described as follows:

A $N_r \times N_c$ beamforming feedback orthonormal column matrix V is column-wise phase invariant because the steering matrix needs a reference in phase per each column. When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix. In other words, V is equivalent to $\tilde{V}\tilde{D}$, where $\tilde{D}$ is a column-wise phase shift matrix such as $\tilde{D} = \text{diag}\left(e^{j\theta_1}, e^{j\theta_2}, \ldots, e^{j\theta_{N_c}}\right)$. When the beamformee estimates the channel, it may find $\tilde{V}$ for the beamforming feedback matrix for the beamformer, but it should send $\tilde{V}\tilde{D}$ back to the beamformer, where $V = \tilde{V}\tilde{D}$. The angle, θ_i, in $\tilde{D}$ is found to make the last row of $\tilde{V}\tilde{D}$ to be non-negative real numbers.

The angles $\phi_{1,1} \ldots \phi_{N_r-1,1}$ in the diagonal matrix $D_1\left(e^{j\phi_{11}} \ldots e^{j\phi_{N_r-1,1}} \; 1\right)^*$ shall satisfy the constraint that all elements in the first column of $D_1^* V$ are non-negative real numbers. Now, the first column of $(G_{N_r 1} \ldots G_{31} G_{21} D_1^*) \times V$ can be $\begin{bmatrix} 1 & 0 & \ldots & 0 \end{bmatrix}^T$ by the Givens rotations G_{l1} such as shown in Equation (19-83).

$$\begin{bmatrix} \cos\psi_{N_r 1} & 0 & 0 & \sin\psi_{N_r 1} \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\sin\psi_{N_r 1} & 0 & 0 & \cos\psi_{N_r 1} \end{bmatrix} \ldots \begin{bmatrix} \cos\psi_{31} & 0 & \sin\psi_{31} & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\psi_{31} & 0 & \cos\psi_{31} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos\psi_{21} & \sin\psi_{21} & 0 & 0 \\ -\sin\psi_{21} & \cos\psi_{21} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} e^{j\phi_{11}} & 0 & 0 & 0 \\ 0 & \mathrm{O} & 0 & 0 \\ 0 & 0 & e^{j\phi_{N_r-1,1}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^* \times V = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & & & \\ 0 & & V_2 & \\ 0 & & & \end{bmatrix} \quad (19\text{-}83)$$

For a new $(N_r - 1) \times (N_c - 1)$ submatrix V_2, this process is applied in the same way. Then, the angles $\phi_{2,2} \ldots \phi_{N_r-1,2}$ in the diagonal matrix $D_2\left(1 \; e^{j\phi_{22}} \ldots e^{j\phi_{N_r-1,2}} \; 1\right)^*$ shall satisfy the constraint that all elements in the second column of $D_2^* \times \text{diag}(1, V_2)$ are non-negative real numbers. Now, the first two columns of $(G_{N_r 2} \ldots G_{32} D_2^*)(G_{N_r 1} \ldots G_{31} G_{21} D_1^*) \times V$ can be $\tilde{I}_{N_r \times 2}$ by the Givens rotations G_{l2} such as shown in Equation (19-84).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{N_r,2} & 0 & \sin\psi_{N_r,2} \\ 0 & 0 & 1 & 0 \\ 0 & -\sin\psi_{N_r,2} & 0 & \cos\psi_{N_r,2} \end{bmatrix} \cdots \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{32} & \sin\psi_{32} & 0 \\ 0 & -\sin\psi_{32} & \cos\psi_{32} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & e^{j\phi_{22}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{N_r-1,2}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^* \times G_{N,1} \ldots G_{31} G_{21} D_1^* \times V = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & & \\ 0 & 0 & V_3 & \end{bmatrix} \quad (19\text{-}84)$$

This process continues until the first N_c columns of the right side matrix become $\tilde{I}_{N_r \times N_c}$. When $N_c < N_r$, this process does not need to continue because V_{N_c+1} is nulled out by $\tilde{I}_{N_r \times N_c}$. Then, by multiplying the complex conjugate transpose of the products of the D_i and G_{li} matrices on the left, V can be expressed as shown in Equation (19-85).

$$V = D_1 G_{21}^T G_{31}^T \ldots G_{N_r,1}^T \times D_2 G_{32}^T G_{42}^T \ldots G_{N_r,2}^T \times \ldots \times D_p G_{p+1,p}^T G_{p+2,p}^T \ldots G_{N_r,p}^T \times \tilde{I}_{N_r \times N_C} \quad (19\text{-}85)$$

where $p = \min(N_c, N_r - 1)$, which can be written in short form as in Equation (19-79).

The angles found from the decomposition process above, e.g., the values of $\psi_{i,j}$ and $\phi_{k,l}$, are quantized as described in 9.6.11.7.

Columns $1 \ldots N_c$ of the beamforming feedback matrix correspond to spatial streams $1 \ldots N_c$, respectively. The mapping of spatial stream to modulation is defined in the MCS tables in 19.5. A transmitter shall not reorder the columns of the beamforming feedback matrices in determining steering matrices.

19.3.13 HT Preamble format for sounding PPDUs

19.3.13.1 General

The MIMO channel measurement takes place in every PPDU as a result of transmitting the HT-LTFs as part of the PHY preamble. The number of HT-LTFs transmitted shall be determined by the number of space-time streams transmitted unless additional dimensions are optionally sounded using HT-ELTFs and these are transmitted using the same spatial transformation that is used for the Data field of the HT PPDU. The use of the same spatial transformation enables the computation of the spatial equalization at the receiver.

When the number of space-time streams, N_{STS}, is less than the number of transmit antennas, or less than $\min(N_{TX}, N_{RX})$, sending only N_{STS} HT-LTFs does not allow the receiver to recover a full characterization of the MIMO channel, even though the resulting MIMO channel measurement is sufficient for receiving the Data field of the HT PPDU.

However, it is often desirable to obtain as full a characterization of the channel as possible. This involves the transmission of a sufficient number of HT-LTFs to sound the full dimensionality of the channel, which is in some cases N_{TX} and in other cases $\min(N_{TX}, N_{RX})$. These cases of MIMO channel measurement are referred to as *MIMO channel sounding*. A sounding PPDU may be used to sound available channel dimensions. A sounding PPDU is identified by setting the Not Sounding field in the HT-SIG to 0. A sounding PPDU may have any allowed number of HT-LTFs satisfying $N_{HT\text{-}LTF} \geq N_{STS}$. In general, if the Not Sounding field in the HT-SIG is equal to 0 and $N_{HT\text{-}LTF} > N_{STS}$, HT-ELTFs are used, except where $N_{SS} = 3$ and $N_{HT\text{-}LTF} = 4$ or in an NDP.

19.3.13.2 Sounding with a NDP

A STA may sound the channel using a NDP (indicated by the HT Length field in the HT-SIG equal to 0) with the Not Sounding field equal to 0. The number of LTFs is the number implied by the MCS, which shall indicate two or more spatial streams. The last HT-LTF of an NDP shall not be followed by a Data field (see Figure 19-16).

It is optional for a STA to process an NDP.

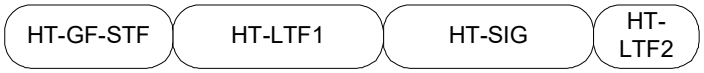

Figure 19-16—Example of an NDP used for sounding

19.3.13.3 Sounding PPDU for calibration

In the case of a bidirectional calibration exchange, two STAs exchange sounding PPDUs, the exchange of which enables the receiving STA to compute an estimate of the MIMO channel matrix H_k for each subcarrier k. In general, in an exchange of calibration messages, the number of spatial streams is less than the number of transmit antennas. In such cases, HT-ELTFs are used. In the case of sounding PPDUs for calibration, the antenna mapping matrix shall be as shown in Equation (19-86).

$$Q_k = C_{CSD}(k)P_{CAL} \tag{19-86}$$

where

$C_{CSD}(k)$ is a diagonal cyclic shift matrix in which the diagonal elements carry frequency domain representation of the cyclic shifts given in Table 19-9

P_{CAL} is one of the following unitary matrices:

For $N_{TX} = 1, P_{CAL} = 1$

For $N_{TX} = 2, P_{CAL} = \frac{\sqrt{2}}{2}\begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}$

For $N_{TX} = 3, P_{CAL} = \frac{\sqrt{3}}{3}\begin{bmatrix} 1 & 1 & 1 \\ 1 & e^{-j2\pi/3} & e^{-j4\pi/3} \\ 1 & e^{-j4\pi/3} & e^{-j2\pi/3} \end{bmatrix}$

For $N_{TX} = 4, P_{CAL} = \frac{1}{2}\begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix}$

19.3.13.4 Sounding PPDU for channel quality assessment

In response to an MRQ, sent by STA A to STA B, the responding STA B returns to the requesting STA A an MCS selection that STA B determines to be a suitable MCS for STA A to use in subsequent transmissions to STA B. In determining the MCS, STA B performs a channel quality assessment, which entails using whatever information STA B has about the channel, such as an estimate of the MIMO channel derived from

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

the sounding PPDU that carries the MRQ. To enable this calculation, the MRQ is sent in conjunction with a sounding PPDU.

The STA sending the MRQ (STA A) determines how many HT-LTFs to send, and whether to use HT-ELTFs or an NDP, based on the Transmit Beamforming Capabilities field, number of space-time streams used in the PPDU carrying the MRQ, the number of transmit chains it is using (N_{TX}), whether the transmit and receive STAs support STBC, and in some cases, the number of receive chains at the responding STA (N_{RX}).

The maximum number of available space-time streams is set by the number of transmit and receive chains and the STBC capabilities of the transmitter and receiver, as is shown in Table 19-21. While the number of receive chains is not communicated in a capabilities indicator, the maximum number of space-time streams supported may be inferred from the MCS capabilities and the STBC capabilities of the receiving STA. When the number of receive chains is known at the transmitter, the number of HT-LTFs sent to obtain a full channel quality assessment is determined according to the maximum number of space-time streams indicated in Table 19-21. The number of HT-LTFs to use in conjunction with the indicated number of space-time streams is determined according to 19.3.9.4.6.

Table 19-21—Maximum available space-time streams

N_{TX}	N_{RX}	$N_{STS,\max}$ without STBC	$N_{STS,\max}$ with STBC
1	1	1	N/A
2	1	1	2
3	1	1	2
3	2	2	3
4	1	1	2
4	2	2	4

If the requesting STA A sends an MRQ in a PPDU that uses fewer space-time streams in the data portion than the maximum number of space-time streams possible given the number of antennas at STA A and the responding STA B, the channel quality assessment made by STA B may be based on the HT-DLTFs alone. In this case, the MFB is limited to MCSs using the number of streams used in the Data field of the HT PPDU, or fewer. To determine whether an MCS should be chosen that uses more spatial streams than the PPDU containing the MRQ, it is necessary for the requesting STA A to either use HT-ELTFs (i.e., send the MRQ in a staggered sounding PPDU) or use an NDP (i.e., send the MRQ in conjunction with an NDP).

The sounding PPDU may have nonidentity spatial mapping matrix Q_k. For different receiving STAs, Q_k may vary.

19.3.14 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

19.3.15 Channel numbering and channelization

19.3.15.1 General

The STA may operate in the 5 GHz band and/or 2.4 GHz band. When using 20 MHz channels, it uses channels defined in 17.3.8.4 (5 GHz band) or 16.3.6 (2.4 GHz band). When using 40 MHz channels, it can operate in the channels defined in 19.3.15.2 and 19.3.15.3.

The set of valid operating channel numbers by regulatory domain is defined in Annex E.

19.3.15.2 Channel allocation in the 2.4 GHz band

Channel center frequencies are defined at every integer multiple of 5 MHz in the 2.4 GHz band. The relationship between center frequency and channel number is given by Equation (19-87).

$$\text{Channel center frequency} = 2407 + 5 \times n_{ch}(\text{MHz}) \quad (19\text{-}87)$$

where

n_{ch} = 1, 2, …, 13

19.3.15.3 Channel allocation in the 5 GHz band

Channel center frequencies are defined at every integer multiple of 5 MHz above the channel starting frequency. The relationship between center frequency and channel number is given in Equation (19-88).

$$\text{Channel center frequency} = \text{Channel starting frequency} + 5 \times n_{ch}(\text{MHz}) \quad (19\text{-}88)$$

where

n_{ch} = 1, …, 200

Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz or is defined as 5 GHz where dot11OperatingClassesRequired is false or not defined.

A channel center frequency of 5 GHz shall be indicated by dot11ChannelStartingFactor = 8000 and n_{ch} = 200.

19.3.15.4 40 MHz channelization

The set of valid operating channel numbers by regulatory domain is defined in Annex E.

The 40 MHz channels are specified by two fields: (*Nprimary_ch*, *Secondary*). The first field represents the channel number of the primary channel, and the second field indicates whether the secondary channel is above or below the primary channel (1 indicates above, –1 indicates below). The secondary channel number shall be $Nprimary_ch + Secondary \times 4$.

For example, a 40 MHz channel consisting of 40 MHz channel number 36 and Secondary 1 specifies the primary channel is 36 and the secondary channel is 40.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

19.3.16 Slot time

The slot time shall follow 17.3.8.6 for 5 GHz bands and 18.5.4 for 2.4 GHz bands.

The slot time for 40 MHz channel spacing shall be the same as that for 20 MHz channel spacing.

19.3.17 Transmit and receive impedance at the antenna connector

The impedance at the transmit antenna connector and receive antenna connector for each transmit and receive antenna shall follow 17.3.8.7.

19.3.18 PHY transmit specification

19.3.18.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause, i.e., its emissions can be no higher at any frequency offset than the minimum of the values specified in the regulatory and default masks.

NOTE 2—The transmit spectral mask figures in this subclause are not drawn to scale.

For rules regarding TX center frequency leakage levels by VHT STAs, see 21.3.17.4.2.

For the 2.4 GHz band, when transmitting in a 20 MHz channel, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –45 dBr and –53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-17. The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

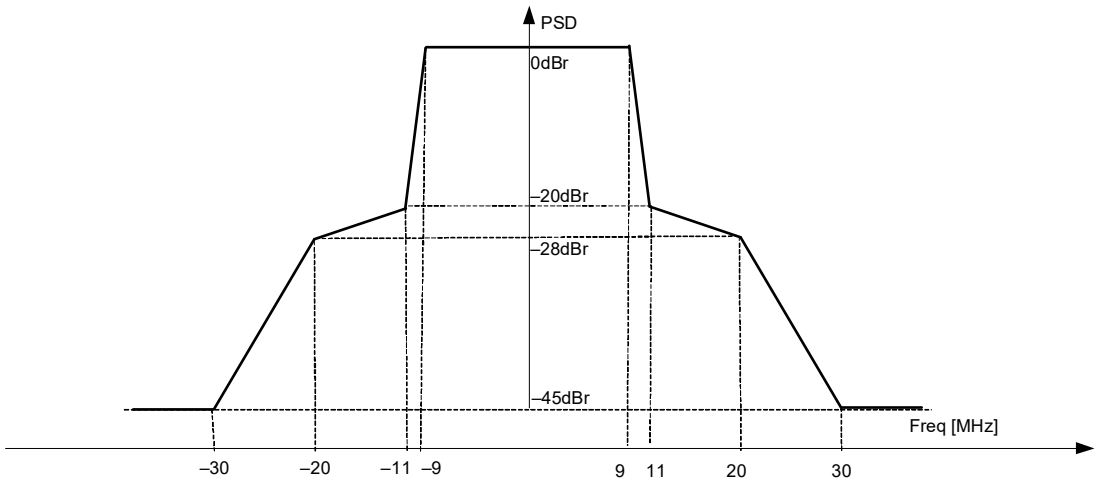

Figure 19-17—Transmit spectral mask for 20 MHz transmission in the 2.4 GHz band

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For the 2.4 GHz band, when transmitting in a 40 MHz channel, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz offset, and the maximum of –45 dBr and –56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-18.

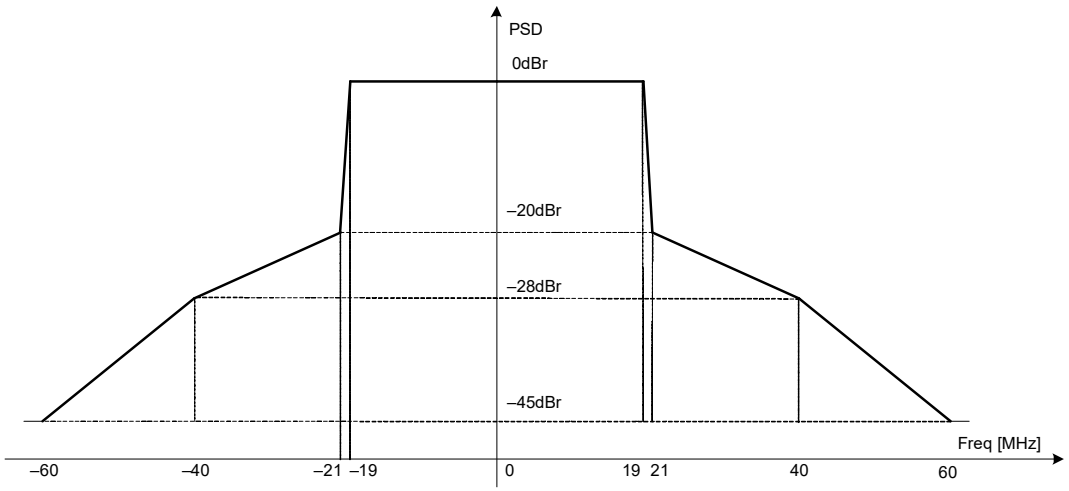

Figure 19-18—Transmit spectral mask for a 40 MHz channel in the 2.4 GHz band

For the 5 GHz band, when transmitting in a 20 MHz channel, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and the maximum of –40 dBr and –53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-19. The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

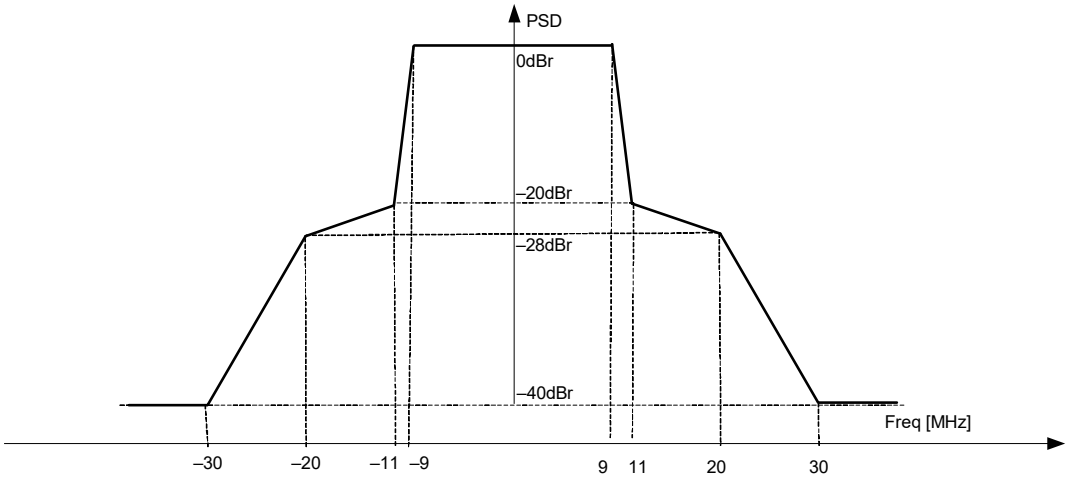

Figure 19-19—Transmit spectral mask for 20 MHz transmission in the 5 GHz band

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For the 5 GHz band, when transmitting in a 40 MHz channel, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz offset, and the maximum of –40 dBr and –56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-20.

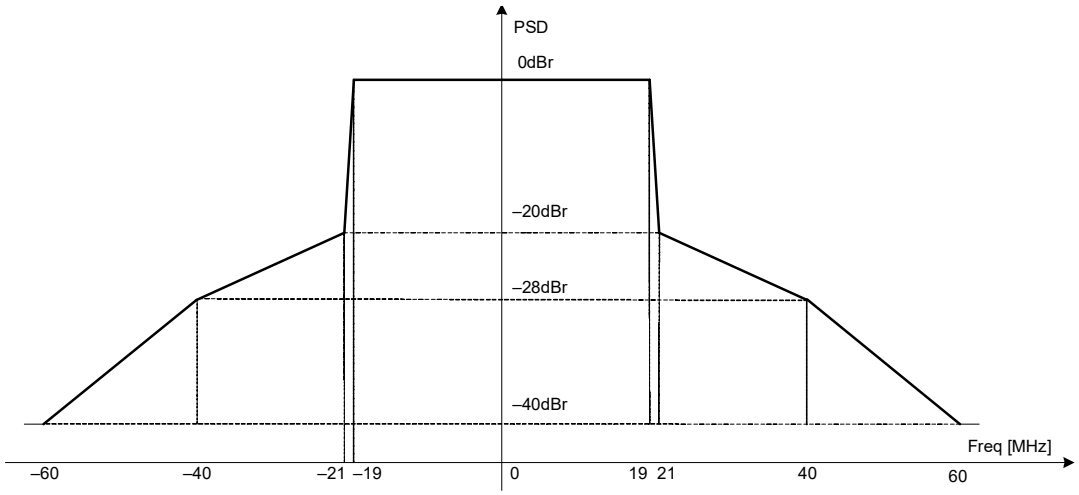

Figure 19-20—Transmit spectral mask for a 40 MHz channel in the 5 GHz band

Transmission with CH_OFF_20U, CH_OFF_20L, or CH_OFF_40 shall comply with the same mask that is used for the 40 MHz channel.

19.3.18.2 Spectral flatness

In a 20 MHz channel and in corresponding 20 MHz transmission in a 40 MHz channel, the average energy of the constellations in each of the subcarriers with indices –16 to –1 and +1 to +16 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –28 to –17 and +17 to +28 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –16 to –1 and +1 to +16.

In a 40 MHz transmission (excluding PPDUs in MCS 32 format and non-HT duplicate format), the average energy of the constellations in each of the subcarriers with indices –42 to –2 and +2 to +42 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –43 to –58 and +43 to +58 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –42 to –2 and +2 to +42.

In MCS 32 format and non-HT duplicate format, the average energy of the constellations in each of the subcarriers with indices –42 to –33, –31 to –6, +6 to +31, and +33 to +42 shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –43 to –58 and +43 to +58 shall deviate no more than +4/–6 dB from the average energy of subcarriers with indices –42 to –33, –31 to –6, +6 to +31, and +33 to +42.

The tests for the spectral flatness requirements may be performed with spatial mapping Q_k = **I** (see 19.3.11.11.2).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

19.3.18.3 Transmit power

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

19.3.18.4 Transmit center frequency tolerance

The transmitter center frequency tolerance shall be ± 20 ppm for the 5 GHz band and ± 25 ppm for the 2.4 GHz band. The different transmit chain center frequencies (LO) and each transmit chain symbol clock frequency shall all be derived from the same reference oscillator.

19.3.18.5 Packet alignment

If no signal extension is required (see 19.3.2), the receiver shall emit a PHY-CCA.indication(IDLE) primitive (see 8.3.5.12) at the 4 μs boundary following the reception of the last symbol of the packet. If a signal extension is required, the receiver shall emit a PHY-CCA.indication(IDLE) primitive a duration of aSignalExtension after the 4 μs boundary following the reception of the last symbol of the packet. This situation is illustrated for an HT-greenfield format packet using short GI in Figure 19-21.

If no signal extension is required, the transmitter shall emit a PHY-TXEND.confirm primitive (see 8.3.5.8) at the 4 μs boundary following the trailing boundary of the last symbol of the PPDU on the WM. If a signal extension is required, the transmitter shall emit a PHY-TXEND.confirm primitive (see 8.3.5.8) a duration of aSignalExtension after the 4 μs boundary following the trailing boundary of the last symbol of the PPDU on the WM. This situation is illustrated in Figure 19-21.

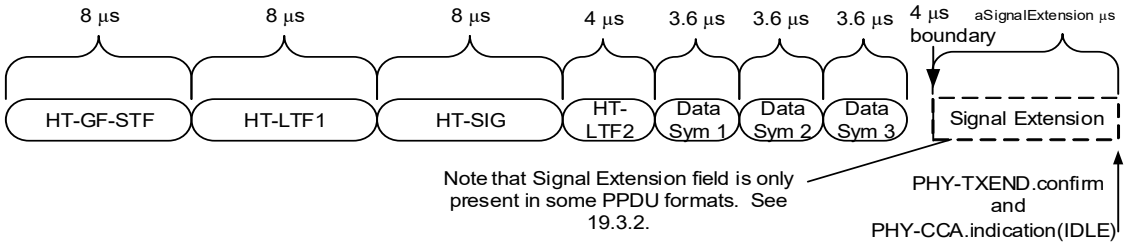

Figure 19-21—PHY-TXEND.confirm alignment (HT-greenfield format with short GI)

19.3.18.6 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ± 20 ppm for 5 GHz bands and ± 25 ppm for 2.4 GHz bands. The transmit center frequency and the symbol clock frequency for all transmit antennas shall be derived from the same reference oscillator.

19.3.18.7 Modulation accuracy

19.3.18.7.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 19.3.18.7.2 and 19.3.18.7.3. The test method is described in 19.3.18.7.4.

19.3.18.7.2 Transmit center frequency leakage

For VHT STAs the requirements on transmitter center frequency leakage are defined in 21.3.17.4.2; otherwise, the requirements are defined in this subclause.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The transmitter center frequency leakage shall follow 17.3.9.7.2 for all transmissions in a 20 MHz channel width. For transmissions in a 40 MHz channel width, the center frequency leakage shall not exceed $max(P - 20, -20)$ dBm, or, equivalently, 0 dB relative to the average energy of the rest of the subcarriers. For upper or lower 20 MHz transmissions in a 40 MHz channel, the center frequency leakage (center of a 40 MHz channel) shall not exceed $max(P - 17, -20)$ dBm. The transmit center frequency leakage is specified per antenna.

19.3.18.7.3 Transmitter constellation error

The relative constellation frame-averaged RMS error, calculated first by averaging over subcarriers, OFDM frames, and spatial streams, shall not exceed a data-rate-dependent value according to Table 19-22. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ with EQM MCSs shall be used and no beamforming steering matrix shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The same requirement applies both to 20 MHz channels and 40 MHz channels.

Table 19-22—Allowed relative constellation error versus constellation size and coding rate

Modulation	Coding rate	Relative constellation error (dB)
BPSK	1/2	–5
QPSK	1/2	–10
QPSK	3/4	–13
16-QAM	1/2	–16
16-QAM	3/4	–19
64-QAM	2/3	–22
64-QAM	3/4	–25
64-QAM	5/6	–27

19.3.18.7.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a streams of complex samples at 40 Msample/s or more, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, and analog-to-digital quantization noise. Each transmit chain is connected directly through a cable to the setup input port. A possible embodiment of such a setup is converting the signals to a low intermediate frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope, and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) Detect the start of frame.
b) Detect the transition from short sequences to channel estimation sequences, and establish fine timing (with one sample resolution).
c) Estimate the coarse and fine frequency offsets.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

d) Derotate the frame according to estimated frequency offset.

e) Estimate the complex channel response coefficients for each of the subcarriers and each of the transmit chains.

f) For each of the data OFDM symbols, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers in all spatial streams, derotate the subcarrier values according to estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, multiply the vector by a zero-forcing equalization matrix generated from the channel estimated during the channel estimation phase.

g) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.

h) Compute the average of the RMS of all errors in a frame. It is given by Equation (19-89).

$$Error_{RMS} = \frac{\sum_{i_f=1}^{N_f} \sqrt{\frac{\sum_{i_s=1}^{N_{SYM}} \left[\sum_{i_{ss}=1}^{N_{SS}} \left(\sum_{i_{sc}=1}^{N_{ST}} \left((I(i_f, i_s, i_{ss}, i_{sc}) - I_0(i_f, i_s, i_{ss}, i_{sc}))^2 + (Q(i_f, i_s, i_{ss}, i_{sc}) - Q_0(i_f, i_s, i_{ss}, i_{sc}))^2 \right) \right) \right]}{N_{SYM} \times N_{SS} \times N_{ST} \times P_0}}}{N_f} \quad (19\text{-}89)$$

where

N_f is the number of frames for the measurement

$I_0(i_f, i_s, i_{ss}, i_{sc})$, $Q_0(i_f, i_s, i_{ss}, i_{sc})$ denotes the ideal symbol point in the complex plane in subcarrier i_{sc}, spatial stream i_{ss}, and OFDM symbol i_s of frame i_f

$I(i_f, i_s, i_{ss}, i_{sc})$, $Q(i_f, i_s, i_{ss}, i_{sc})$ denotes the observed symbol point in the complex plane in subcarrier i_{sc}, spatial stream i_{ss}, and OFDM symbol i_s of frame i_f

P_0 is the average power of the constellation

The vector error on a phase plane is shown in Figure 17-16.

The test shall be performed over at least 20 frames (N_f), and the average of the RMS shall be taken. The frames under test shall be at least 16 OFDM symbols long. Random data shall be used for the symbols.

19.3.18.8 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is

$20 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to HT_CBW20

$40 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{40\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to HT_CBW40

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \geq 50$ MHz

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— FIRST_TRANSITION_FIELD is L-STF (for HT-mixed format) or HT-GF-STF (for HT-greenfield format)
— SECOND_TRANSITION_FIELD is L-LTF (for HT-mixed format) or HT-GF-LTF1 (for HT-greenfield format)
— TRAINING_FIELD is L-LTF (for HT-mixed format) or HT-LTF1 (for HT-greenfield format) windowed in a manner which should approximate the windowing described in 17.3.2.5 with T_{TR} = 100 ns.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns (for a CH_BANDWIDTH parameter equal to HT_CBW20) or 80 ns (for a CH_BANDWIDTH parameter equal to HT_CBW40).

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

19.3.19 HT PHY receiver specification

19.3.19.1 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 19-23 or less. The minimum input levels are measured at the antenna connector and are referenced as the average power per receive antenna. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized device under test input ports. Each output port of the transmitting STA shall be connected through a cable to one input port of the device under test. The test in this subclause and the minimum sensitivity levels specified in Table 19-23 apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

Table 19-23—Receiver minimum input level sensitivity

Modulation	Rate (R)	Adjacent channel rejection (dB)	Nonadjacent channel rejection (dB)	Minimum sensitivity (20 MHz channel spacing) (dBm)	Minimum sensitivity (40 MHz channel spacing) (dBm)
BPSK	1/2	16	32	–82	–79
QPSK	1/2	13	29	–79	–76
QPSK	3/4	11	27	–77	–74
16-QAM	1/2	8	24	–74	–71
16-QAM	3/4	4	20	–70	–67
64-QAM	2/3	0	16	–66	–63
64-QAM	3/4	–1	15	–65	–62
64-QAM	5/6	–2	14	–64	–61

19.3.19.2 Adjacent channel rejection

For all transmissions in a 20 MHz channel width, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 and raising the power of an interfering signal of 20 MHz bandwidth until 10% PER is caused for a PSDU length

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The adjacent channel center frequencies shall be separated by 20 MHz when operating in the 5 GHz band, and the adjacent channel center frequencies shall be separated by 25 MHz when operating in the 2.4 GHz band.

For all transmissions in a 40 MHz channel width, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 and raising the power of an interfering signal of 40 MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The adjacent channel center frequencies shall be separated by 40 MHz.

The interfering signal in the adjacent channel shall be a signal compliant with the HT PHY, unsynchronized with the signal in the channel under test. The corresponding rejection shall be no less than specified in Table 19-23. The interference signal shall have a minimum duty cycle of 50%.

The test in this subclause and the adjacent channel rejection levels specified in Table 19-23 apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

19.3.19.3 Nonadjacent channel rejection

For all transmissions in a 20 MHz channel width in the 5 GHz band, the nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 and raising the power of an interfering signal of 20 MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel center frequencies shall be separated by 40 MHz or more.

For all transmissions in a 40 MHz channel width in the 5 GHz band, the nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 and raising the power of an interfering signal of 40 MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel center frequencies shall be separated by 80 MHz or more.

The interfering signal in the nonadjacent channel shall be a signal compliant with the HT PHY, unsynchronized with the signal in the channel under test. The corresponding rejection shall be no less than specified in Table 19-23. The interference signal shall have a minimum duty cycle of 50%. The nonadjacent channel rejection for transmissions in a 20 MHz or 40 MHz channel width is applicable only to 5 GHz band.

The test in this subclause and the nonadjacent channel rejection level specified in Table 19-23 apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

19.3.19.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm in the 5 GHz band and –20 dBm in the 2.4 GHz band, measured at each antenna for any baseband modulation.

19.3.19.5 CCA sensitivity

19.3.19.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

19.3.19.5.2 CCA-Energy Detect (CCA-ED)

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2. The operating classes requiring the corresponding CCA-ED behavior class are given in E.1. The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary channel and dot11OFDMEDThreshold for the secondary channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5.

NOTE—The requirement to detect a channel busy condition as stated in 19.3.19.5.3, 19.3.19.5.4, and 19.3.19.5.5 is a mandatory energy detection requirement on all Clause 19 receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

19.3.19.5.3 CCA sensitivity for non-HT PPDUs

CCA sensitivity requirements for non-HT PPDUs in the primary channel are described in 17.3.10.6 and 18.4.6.

19.3.19.5.4 CCA sensitivity in 20 MHz

For an HT STA with the operating channel width equal to 20 MHz, the start of a 20 MHz HT signal at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –82 dBm shall cause the PHY to set PHY-CCA.indication(BUSY) with a probability > 90% within 4 μs. The receiver shall indicate a channel busy condition for any signal 20 dB or more above the minimum modulation and coding rate sensitivity (–82 + 20 = –62 dBm) in the 20 MHz channel.

An HT STA that does not support the reception of HT_GF PPDUs shall indicate a channel busy condition [PHY-CCA.indication(BUSY)] for any valid HT_GF signal in the 20 MHz channel at a receive level greater than or equal to –72 dBm.

19.3.19.5.5 CCA sensitivity in 40 MHz

This subclause describes the CCA sensitivity requirements for an HT STA with the operating channel width equal to 40 MHz.

The receiver of a 20/40 MHz STA with the operating channel width equal to 40 MHz shall provide CCA on both the primary and secondary channels.

When the secondary channel is idle, the start of a 20 MHz HT signal in the primary channel at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –82 dBm shall cause the PHY to generate a PHY-CCA.indication(BUSY, {primary}) primitive with a probability > 90% within 4 μs. The start of a 40 MHz HT signal that occupies both the primary and secondary channels at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of –79 dBm shall cause the PHY to generate a PHY-CCA.indication(BUSY, {primary, secondary}) primitive for both the primary and secondary channels with a probability per channel > 90% within 4 μs.

An HT STA that does not support the reception of HT_GF PPDUs shall indicate a {primary} channel busy condition (PHY-CCA.indication(BUSY, {primary}) primitive) for any valid HT_GF signal in the primary

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

channel at a receive level greater than or equal to –72 dBm when the secondary channel is idle. An HT STA that does not support the reception of HT_GF PPDUs shall indicate a {primary, secondary} channel busy condition (PHY-CCA.indication(BUSY, {primary, secondary}) primitive) for any valid 40 MHz HT_GF signal in both the primary and secondary channels at a receive level greater than or equal to –69 dBm.

The receiver shall indicate a {primary} channel busy condition for any signal at or above –62 dBm in the 20 MHz primary channel. This level is 20 dB above the minimum modulation and coding rate sensitivity for a 20 MHz PPDU. When the primary channel is idle, the receiver indicate a {secondary} channel busy condition for any signal at or above –62 dBm in the 20 MHz secondary channel. The receiver shall indicate a {primary, secondary} channel busy condition for any signal present in both the primary and secondary channels that is at or above –62 dBm in the primary channel and at or above –62 dBm in the secondary channel.

19.3.19.6 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the data portion of the received frame. The received power shall be the average of the power in all active receive chains.

The RCPI encoding is defined in 9.4.2.37.

RCPI shall equal the received RF power within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel width multiplied by 1.1.

19.3.19.7 Reduced interframe space (RIFS)

The receiver shall be able to decode a PPDU that was transmitted with a RIFS separation from the previous PPDU.

19.3.20 PHY transmit procedure

There are three options for the transmit PHY procedure. The first two options, for which typical transmit procedures are shown in Figure 19-22 and Figure 19-23, are selected if the FORMAT field of the PHY-TXSTART.request(TXVECTOR) primitive is equal to HT_MF or HT_GF, respectively. These transmit procedures do not describe the operation of optional features, such as LDPC or STBC. The third option is to follow the transmit procedure in Clause 17 or Clause 18 if the FORMAT field is equal to NON_HT. Additionally, if the FORMAT field is equal to NON_HT, CH_BANDWIDTH indicates NON_HT_CBW20, and NON_HT_MODULATION indicates OFDM, follow the transmit procedure in Clause 17. If the FORMAT field is equal to NON_HT, CH_BANDWIDTH indicates NON_HT_CBW20, and NON_HT_MODULATION indicates other than OFDM, follow the transmit procedure in Clause 18. And furthermore, if the FORMAT field is equal to NON_HT and CH_BANDWIDTH indicates NON_HT_CBW40, follow the transmit procedure in Clause 17, except that the signal in Clause 17 is generated simultaneously on each of the upper and lower 20 MHz channels that constitute the 40 MHz channel as defined in 19.3.8 and 19.3.11.12. In all these options, in order to transmit data, the PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 19.4. Other transmit parameters, such as MCS coding types and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 19.2.2.

A clear channel shall be indicated by issuing a PHY-CCA.indication(IDLE) primitive. Note that under some circumstances, the MAC uses the latest value of the PHY-CCA.indication primitive before issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 19-1.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

The data shall then be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC and PHY-DATA.confirm primitives issued by the PHY. Once PHY preamble transmission is started, the PHY entity shall immediately initiate data scrambling and data encoding. The encoding method shall be based on the FEC_CODING, CH_BANDWIDTH, and MCS parameter of the TXVECTOR. A modulation rate change, if any, shall be initiated starting with the SERVICE field data, as described in 19.3.2.

The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The SERVICE field and PSDU are encoded by the encoder selected by the FEC_CODING, CH_BANDWIDTH, and MCS parameters of the TXVECTOR as described in 19.3.3. Transmission can be prematurely terminated by the MAC through the primitive PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number supplied in the LENGTH field.

The packet transmission shall be completed, and the PHY entity shall enter the receive state. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. If the length of the coded PSDU is not an integer multiple of the OFDM symbol length, bits shall be stuffed to make the coded PSDU length an integer multiple of the OFDM symbol length.

The GI shall be inserted in every OFDM symbol as a countermeasure against delay spread.

In some PPDU formats (as defined in 19.3.2), a signal extension is present. When no signal extension is present, the PHY-TXEND.confirm primitive is generated at the end of last symbol of the PPDU. When a signal extension is present, the PHY-TXEND.confirm primitive is generated at the end of the signal extension.

A typical state machine implementation of the transmit PHY is provided in Figure 19-24. Requests (.request) and confirmations (.confirm) are issued once per state as shown. This state machine does not describe the operation of optional features, such as LDPC or STBC. If the TXVECTOR parameter FORMAT is equal to NON_HT and NON_HT_MODULATION is equal to ERP-OFDM or OFDM, refer to the transmit procedure and state machine in 17.3.11. If the TXVECTOR parameter FORMAT is equal to NON_HT and NON_HT_MODULATION is equal to ERP-DSSS or ERP-CCK, refer to the transmit procedure in 15.3.6 or 16.2.5, respectively.

NOTE—The transmit procedure and state machine for Clause 18 when TXVECTOR parameter NON_HT_MODULATION is ERP-OFDM is described in 17.3.11, except for the signal extension (refer to 18.3.2.4).

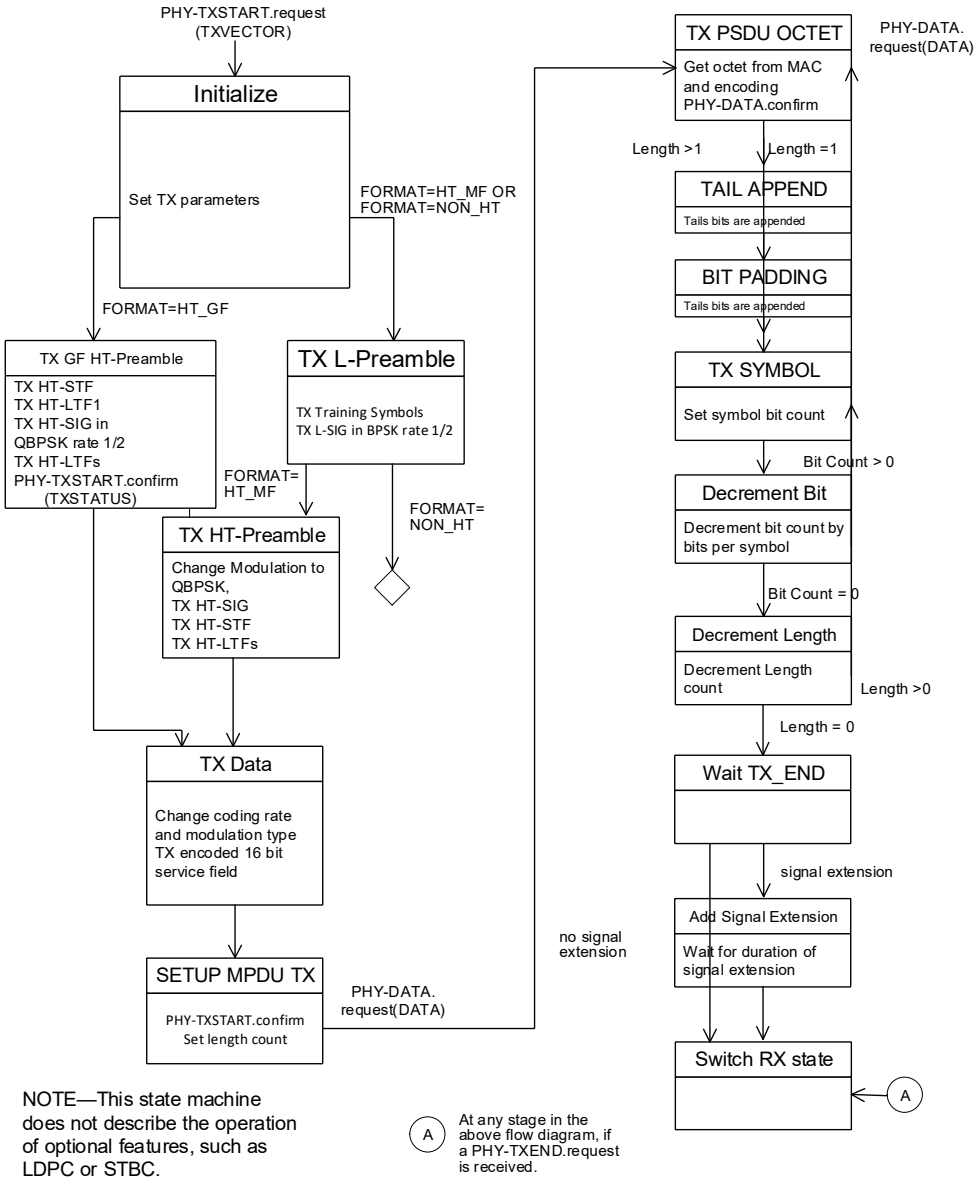

Figure 19-24—PHY transmit state machine

19.3.21 PHY receive procedure

Typical PHY receive procedures are shown in Figure 19-25 and Figure 19-26. The receive procedures correspond to HT-mixed format and HT-greenfield format, respectively. A typical state machine implementation of the receive PHY is given in Figure 19-27. These receive procedures and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates a non-HT PPDU format (denoted “Not HT-SIG” in Figure 19-27), refer to the receive procedure and state machine in 17.3.12 or 18.3.5. Further, through station management (via the PLME), the PHY is set to the appropriate frequency, as specified in 19.4. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.

Upon receiving the transmitted PHY preamble, the PHY measures a receive signal strength. This indicates activity to the MAC via the PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive shall also be issued as an initial indication of reception of a signal. The channel-list parameter of the PHY-CCA.indication primitive is set as follows:

— It is absent when the operating channel width is 20 MHz.
— It is set to {primary} when the operating channel width is 40 MHz and the signal is present only in the primary channel.
— It is set to {secondary} when the operating channel width is 40 MHz and the signal is present only in the secondary channel.
— It is set to {primary, secondary} when the operating channel width is 40 MHz and the signal is present in both the primary and secondary channels.

The RSSI parameter is reported to the MAC in the RXVECTOR.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for SIGNAL and HT-SIG in order to set the length of the data stream, the demodulation type, code type, and the decoding rate. If signal loss occurs before validating L-SIG and/or HT-SIG, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (for a missed preamble) specified in 19.3.19.5. If the check of the HT-SIG CRC is not valid, a PHY-RXSTART.indication primitive is not issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. The HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (for a missed preamble) specified in 19.3.19.5.

If the PHY preamble reception is successful and a valid HT-SIG CRC is indicated:

— Upon reception of an HT-mixed format preamble, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive for the predicted duration of the transmitted frame, as defined by TXTIME in 19.4.3, for all supported and unsupported modes except Reserved HT-SIG Indication. Reserved HT-SIG Indication is defined in the fourth item below.
— Upon reception of a GF preamble by an HT STA that does not support GF, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until either the predicted duration of the packet from the contents of the HT-SIG field, as defined by TXTIME in 19.4.3, except Reserved HT-SIG Indication, elapses or until the received level drops below the receiver minimum sensitivity level of BPSK, R=1/2 in Table 19-23 + 10 dB (–72 dBm for 20 MHz, –69 dBm for 40 MHz). Reserved HT-SIG Indication is defined in the fourth item below.
— Upon reception of a GF preamble by an HT STA that supports GF, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive for the predicted duration of the transmitted frame, as defined by TXTIME in 19.4.3, for all supported and unsupported modes except Reserved HT-SIG Indication. Reserved HT-SIG Indication is defined in the fourth item below.
— If the HT-SIG indicates a Reserved HT-SIG Indication, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (minimum modulation and coding rate sensitivity + 20 dB) specified in 19.3.19.5. Reserved HT-SIG Indication is defined as an HT-SIG with MCS field in the range 77–127 or Reserved field = 0 or STBC field = 3 and any other HT-SIG field bit combinations that do not correspond to modes of PHY operation defined in Clause 19.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Subsequent to an indication of a valid HT-SIG CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. If dot11TimingMsmtActivated is true, the PHY shall do the following:

— Complete receiving the PHY header and verify the validity of the PHY Header.
— If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 19.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.55 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 19-1. Upon reception of a GF preamble by an HT STA that does not support GF, the FORMAT field of RXVECTOR is equal to HT_GF, the remaining fields may be empty, and the PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. If the HT-SIG indicates an unsupported mode or Reserved HT-SIG Indication, the PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive.

Following training and SIGNAL fields, the coded PSDU (which comprises the coded PHY SERVICE field and scrambled and coded PSDU) shall be received. If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU, if no signal extension is present (as defined in 19.3.2), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state. Otherwise, the receiver waits for the duration of the signal extension before returning to the RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The number of PSDU octets is indicated in the HT Length field of the HT-SIG. The PHY shall proceed with PSDU reception. After the reception of the final bit of the last PSDU octet and possible tail and padding bits, the receiver shall be returned to the RX IDLE state if no signal extension is present (as defined in 19.3.2), as shown in Figure 19-27. Otherwise, the receiver waits for the duration of the signal extension before returning to the RX IDLE state. A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

While in the Signal Extension state, if the receiver detects a CS/CCA event, it issues an RXEND.indication primitive (with the RXERROR parameter set to NoError or CarrierLost, depending on whether a carrier lost event occurred during the reception of the PPDU), leaves the Signal Extension state, and enters the Detect SIG state. This sequence occurs when signal-extended PPDUs are transmitted while separated by a RIFS.

If the BCC is used, any data received after the indicated data length are considered pad bits (to fill out an OFDM symbol) and should be discarded.

19.4 HT PLME

19.4.1 PLME SAP sublayer management primitives

Table 19-24 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.2 and 6.5.4.

19.4.2 PHY MIB

HT PHY MIB attributes are defined in Annex C with specific values defined in Table 19-24. The "Operational semantics" column in Table 19-24 contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute. When MAX-ACCESS is equal to read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is equal to read-write, the MIB attribute may be read and written by management entities.

19.4.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive or calculated for the PHY receive procedure shall be calculated for HT-mixed format according to the Equation (19-90) and Equation (19-91) for short and long GI, respectively, and for HT-greenfield format according to Equation (19-92) and Equation (19-93) for short and long, respectively:

$$\begin{aligned}\text{TXTIME} = {} & T_{LEG_PREAMBLE} + T_{L_SIG} + T_{HT_TRAINING} + T_{HT_SIG} \\ & + T_{SYM} \times \left\lceil \frac{T_{SYMS} \times N_{SYM}}{T_{SYM}} \right\rceil + SignalExtension \end{aligned} \quad (19\text{-}90)$$

$$\begin{aligned}\text{TXTIME} = {} & T_{LEG_PREAMBLE} + T_{L_SIG} + T_{HT_TRAINING} + T_{HT_SIG} \\ & + T_{\text{SYM}} \times N_{SYM} + SignalExtension \end{aligned} \quad (19\text{-}91)$$

$$\text{TXTIME} = T_{GF_HT_TRAINING} + T_{HT_SIG} + T_{SYMS} \times N_{SYM} + SignalExtension \quad (19\text{-}92)$$

$$\text{TXTIME} = T_{GF_HT_TRAINING} + T_{HT_SIG} + T_{SYM} \times N_{SYM} + SignalExtension \quad (19\text{-}93)$$

where

$T_{LEG_PREAMBLE} = T_{L\text{-}STF} + T_{L\text{-}LTF}$ is the duration of the non-HT preamble

$T_{HT_TRAINING}$ is the duration of the HT-STF and HT-LTFs in HT-mixed format, given by $T_{HT-STF} + T_{HT-LTF1} + (N_{HT\text{-}LTF} - 1)T_{HT-LTFs}$

$T_{GF_HT_TRAINING}$ is the duration of the HT-GF-STF, HT-LTF1 and HT-LTFs in HT-greenfield format, given by $T_{HT-GF-STF} + T_{HT-LTF1} + (N_{HT\text{-}LTF} - 1)T_{HT-LTFs}$

T_{SYM}, T_{SYMS}, $T_{HT\text{-}SIG}$, $T_{L\text{-}STF}$, $T_{HT\text{-}STF}$, $T_{HT\text{-}GF\text{-}STF}$, $T_{L\text{-}LTF}$, $T_{HT\text{-}LTF1}$ and $T_{HT\text{-}LTFs}$ are defined in Table 19-6

SignalExtension is 0 μs when TXVECTOR parameter NO_SIG_EXTN is true and is aSignalExtension as defined in Table 19-25 when TXVECTOR parameter NO_SIG_EXTN is false

$N_{HT\text{-}LTF}$ is defined in Equation (19-22)

N_{SYM} is defined in Equation (19-32) for BCC and Equation (19-41) for LDPC

For non-HT modes of operation, refer to Clause 17 and Clause 18 for TXTIME calculations, except that frames transmitted with a value of NON_HT_DUP_OFDM for the TXVECTOR parameter NON_HT_MODULATION shall use Equation (18-1) for TXTIME calculation.

19.4.4 HT PHY

The static HT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25. The definitions for these characteristics are given in 6.5.4

Table 19-25—HT PHY characteristics

Characteristics	Value
aRIFSTime	2 μs
aSlotTime	When operating in the 2.4 GHz band: If dot11OperatingClassesRequired is false, long slot time = 20 μs If dot11OperatingClassesRequired is true, long slot time = 20 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-95) If dot11OperatingClassesRequired is false, short slot time = 9 μs If dot11OperatingClassesRequired is true, short slot time= 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-95) When operating in the 5 GHz band: If dot11OperatingClassesRequired is false, 9 μs If dot11OperatingClassesRequired is true, 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-95)
aSIFSTime	10 μs when operating in the 2.4 GHz band 16 μs when operating in the 5 GHz bands
aSignalExtension	0 μs when operating in the 5 GHz band 6 μs when operating in the 2.4 GHz band
aCCATime	Implementation dependent, see 10.3.7.
aRxPHYStartDelay	28 μs for HT-mixed format, 24 μs for HT-greenfield format
aRxTxTurnaroundTime	Implementation dependent, see 10.3.7.
aTxPHYDelay	Implementation dependent, see 10.3.7.
aRxPHYDelay	Implementation dependent, see 10.3.7.
aRxTxSwitchTime	Implementation dependent, see 10.3.7.
aTxRampOnTime	Implementation dependent, see 10.3.7.
aAirPropagationTime	As indicated by the coverage class (see 10.22.5).
aMACProcessingDelay	Implementation dependent, see 10.3.7.
aPSDUMaxLength	65 535 octets
aPPDUMaxTime	10 ms
aIUStime	8 μs
aDTT2UTTTime	32 μs
aCWmin	15
aCWmax	1023
aMaxCSIMatricesReportDelay	250 ms

For non-HT modes of operation, refer to Clause 17 and Clause 18 for PHY characteristics.

19.5 Parameters for HT-MCSs

Table 19-26 defines the symbols used in the rate-dependent parameter tables.

Table 19-26—Symbols used in MCS parameter tables

Symbol	Explanation
N_{SS}	Number of spatial streams
R	Coding rate
N_{BPSC}	Number of coded bits per single carrier (total across spatial streams)
$N_{BPSCS}(i_{SS})$	Number of coded bits per single carrier for each spatial stream, i_{SS} = 1,...,N_{SS}
N_{SD}	Number of complex data numbers per spatial stream per OFDM symbol
N_{SP}	Number of pilot values per OFDM symbol
N_{CBPS}	Number of coded bits per OFDM symbol
N_{DBPS}	Number of data bits per OFDM symbol
N_{ES}	Number of BCC encoders for the DATA field

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

The rate-dependent parameters for mandatory 20 MHz, N_{SS} = 1 MCSs with N_{ES} = 1 shall be as shown in Table 19-27.

Table 19-27—MCS parameters for mandatory 20 MHz, N_{SS} = 1, N_{ES} = 1

MCS Index	Modulation	R	$N_{BPSCS}(i_{SS})$	N_{SD}	N_{SP}	N_{CBPS}	N_{DBPS}	Data rate (Mb/s)	
								800 ns GI	400 ns GI (see NOTE)
0	BPSK	1/2	1	52	4	52	26	6.5	7.2
1	QPSK	1/2	2	52	4	104	52	13.0	14.4
2	QPSK	3/4	2	52	4	104	78	19.5	21.7
3	16-QAM	1/2	4	52	4	208	104	26.0	28.9
4	16-QAM	3/4	4	52	4	208	156	39.0	43.3
5	64-QAM	2/3	6	52	4	312	208	52.0	57.8
6	64-QAM	3/4	6	52	4	312	234	58.5	65.0
7	64-QAM	5/6	6	52	4	312	260	65.0	72.2

NOTE—Support of 400 ns GI is optional on transmit and receive.

20. Directional multi-gigabit (DMG) PHY specification

20.1 DMG PHY introduction

20.1.1 Scope of DMG PHY services

The DMG PHY supports two modulation methods:

— A control modulation using MCS 0 (the DMG control mode; see 20.4)

— A single carrier (SC) modulation using MCS 1 to MCS 12, MCS 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, and 12.6 (the DMG SC mode; see 20.5) and MCS 25 to MCS 31 (the DMG low-power SC mode; see 20.6)

All DMG modulation methods share a similar preamble (see 20.3.6).

The services provided to the MAC by the DMG PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PHY service data units (PSDU) into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the DMG MCSs, these STAs support a mixture of DMG SC mode, DMG low-power SC mode, and DMG control mode.

20.1.2 DMG PHY functions

The DMG PHY contains two functional entities: the PHY and the layer management function (PLME). Each of these functions is described in detail in 20.3 to 20.11. The DMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 8.

20.1.2.1 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

20.1.2.2 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

20.2 DMG PHY service interface

20.2.1 Introduction

The PHY interfaces to the MAC through the TXVECTOR, RXVECTOR, and the PHYCONFIG_VECTOR. Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received packet parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

This interface is an extension of the generic PHY service interface defined in 8.3.4.

20.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 20-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 20-1—TXVECTOR and RXVECTOR parameters

Parameter	Value	TXVECTOR	RXVECTOR
MCS	The MCS parameter is an enumerated type that indicates the modulation and coding scheme used in the transmission of the packet. Values are integers in the range 0 to 31 and the values 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6. — An MCS value of 0 indicates the use of DMG control mode. — MCS values of 1 to 12 and 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6 indicate use of single carrier modulations. The value is an index to Table 20-15. — MCS values of 25 to 31 indicate use of DMG low-power SC mode. The value is an index to Table 20-21.	Y	Y
LENGTH	Indicates the number of octets in the PSDU in the range 1 to 262 143.	Y	Y
ADD_PPDU	Enumerated Type: — ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — NO-ADD-PPDU indicates no additional PPDU follows this PPDU.	Y	Y
PPDU_TYPE	Enumerated Type: — TRN-R indicates either a PPDU whose Data field is followed by one or more TRN subfields, or a PPDU that is requesting TRN subfields to be appended to a future response PPDU. — TRN-T indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV configuration at the beginning of each TRN subfield. This parameter is reserved if TRN_LEN is 0.	Y	Y
TRN_LEN	TRN_LEN indicates the length of the training field. Values are in the range 0–16 (see 20.9.2.2.3).	Y	Y
AGGREGATION	Indicates whether the PSDU contains an A-MPDU. Enumerated Type: — AGGREGATED indicates this is a PSDU with A-MPDU aggregation. — NOT_AGGREGATED indicates this is a PSDU without A-MPDU aggregation.	Y	Y

Table 20-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
RSSI	The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the input of the antennas plus the antenna gain, or equivalent antenna gain for a phased-array antenna, used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.	N	Y
SNR	This parameter indicates the SNR measured during the reception of a DMG control mode packet. Values are –13 dB to 50.75 dB in 0.25 dB steps.	N	Y
RCPI	Is a measure of the received RF power measured over the preamble of a received frame. Refer to 20.3.10 for the definition of RCPI.	N	Y
ANT_CONFIG	Indicates which antenna configuration(s) is to be used throughout the transmission of the packet, and when to switch between configurations. Values are implementation dependent.	Y	N
CHAN_MEASUREMENT	Channel as measured during the reception of TRN subfields. Each measurement includes 63 complex numbers.	N	Y
TIME_OF_DEPARTURE_REQUESTED	Enumerated type: — true indicates that the MAC entity requests that the PHY PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. — false indicates that the MAC entity requests that the PHY PHY entity neither measures nor reports time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 10 nanosecond units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	See NOTE
BEAM_TRACKING_REQUEST	This parameter indicates whether beam tracking is requested. Enumerated type: BEAM-TRACKING-REQUESTED or BEAM-TRACKING-NOT-REQUESTED	Y	Y
LAST_RSSI	In the TXVECTOR, LAST_RSSI indicates the received power level of the last packet with a valid PHY header that was received a SIFS before transmission of the current packet; otherwise, it is 0 (10.3.2.3.3). In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the PCLP header of the received packet. Valid values are integers in the range 0 to 15: — Values of 2 to 14 represent power levels (–71+value×2) dBm. — A value of 15 represents power greater than or equal to –42 dBm. — A value of 1 represents power less than or equal to –68 dBm. — A value of 0 indicates that the previous packet was not received a SIFS before the current transmission.	Y	Y
TURNAROUND	Set to 1 or 0 as specified in 10.3.2.3.3.	Y	Y

Table 20-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
PSK_APPLIED	Indicates if π/2-8-PSK is applied for MCS 10 or MCS 11. π/2-8-PSK cannot be applied for MCS other than 10 or 11. Enumerated Type: PSK_APPLIED: indicates that π/2-8-PSK is applied. PSK_NOT_APPLIED: indicates that π/2-8-PSK is not applied.	Y	Y
NOTE— "Y" if dot11TimingMsmtActivated is true, otherwise "N".			

20.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a DMG PHY contains an OPERATING_CHANNEL parameter, which identifies the operating 2.16 GHz channel. The PHY shall set the channel number to 1, 2, 3, 4, 5, 6, 7, or 8 using the value of OPERATING_CHANNEL parameter, which shall be set to 1, 3, 5, 7, 9, 11, 13, or 15 as defined in 20.3.1.

20.2.4 TXSTATUS parameters

The parameters listed in Table 20-2 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

Table 20-2—TXSTATUS parameters

Parameter	Value
TIME_OF_DEPARTURE	When the first frame energy is sent by the transmitting port, in units equal to 1/TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	0 to 2^{16}–1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 10 nanosecond units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

20.3 Common parameters

20.3.1 Channelization

The DMG PHY operates in the channels defined in Annex E and shall support channel number 2 and may support the other channels.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The channel center frequency is defined as:

Channel center frequency = Channel starting frequency + Channel spacing × Channel number

where the channel starting frequency is equal to 56.16 GHz, and the channel spacing is defined in Annex E.

The OPERATING_CHANNEL parameter of PHYCONFIG_VECTOR is used to set up the operating channel number. The OPERATING_CHANNEL shall be set to 1, 3, 5, 7, 9, 11, 13, or 15. The relation between the channel number and OPERATING_CHANNEL is defined as follows:

Channel number = ½ × (OPERATING_CHANNEL + 1)

20.3.2 Transmit mask

The transmitted spectrum shall adhere to the transmit spectrum mask shown in the Figure 20-1. The transmit spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 1.88 GHz, –17 dBr at a 1.2 GHz offset, –22 dBr at a 2.7 GHz offset and –30 dBr at a 3.06 GHz offset and above, inside the channels allowed for the regulatory domain in which the device is transmitting. The measurement shall be made using a 1 MHz resolution bandwidth and a 300 kHz video bandwidth.

The transmit mask shall be measured on PPDUs longer than 10 μs without training fields.

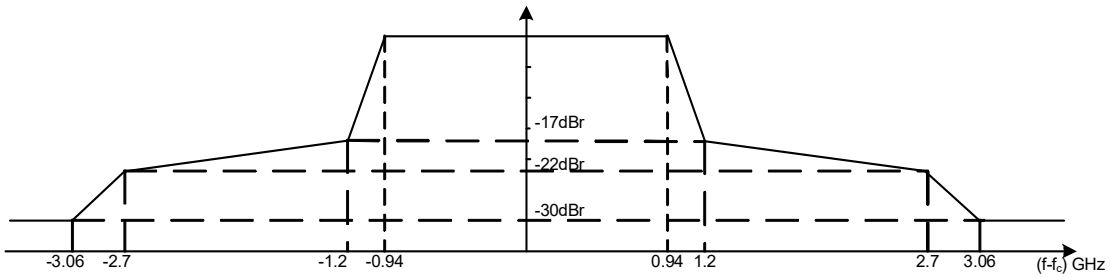

Figure 20-1—Transmit mask

20.3.3 Common requirements

20.3.3.1 Introduction

This subclause describes the common requirement from all three DMG modes: control, SC, and low-power SC.

In all of the modes, all defined fields are transmitted bit 0 first in time.

20.3.3.2 Center frequency tolerance

20.3.3.2.1 General

The transmitter center frequency tolerance shall be ± 20 ppm.

20.3.3.2.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 0.9 μs from the start of the packet.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

20.3.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

20.3.3.4 Transmit center frequency leakage

The transmitter center frequency leakage shall not exceed –23 dB relative to the overall transmitted power.

20.3.3.5 Transmit rampup and rampdown

The transmit power-on ramp is defined as the time it takes for a transmitter to rise from less than 10% to greater than 90% of the average power to be transmitted in the frame.

The transmit power-on ramp shall be less than 10 ns.

The transmit power-down ramp is defined as the time it takes the transmitter to fall from greater than 90% to less than 10% of the maximum power to be transmitted in the frame.

The transmit power-down ramp shall be less than 10 ns.

20.3.3.6 Antenna setting

Antenna setting shall remain constant for the transmission of the entire packet except for the case of transmission of BRP-TX PPDUs (see 20.9.2.2). During the transmission of BRP-TX PPDUs, it shall remain constant for the transmission of the STF, CE field, and Data field.

20.3.3.7 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver antenna for which the error rate criterion (defined in 20.3.3.8) is met. A receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 $\mu W/cm^2$ for each of the modulation formats that the receiver supports.

20.3.3.8 Receive minimum input sensitivity

For MCS 0, the PER shall be less than 5% for a PSDU length of 256 octets with the MCS dependent input levels listed in Table 20-3 defined at the antenna connector. For the other MCSs, the PER shall be less than 1% for a PSDU length of 4096 octets with the MCS dependent input levels listed in Table 20-3 defined at the antenna connector.

NOTE—For RF power measurements performed over the air, the input level shall be corrected to compensate for the antenna gain in the implementation. The gain of the antenna is the maximum estimated gain by the manufacturer. In the case of the phased-array antenna, the gain of the phased-array antenna is the maximum sum of estimated element gain minus 3 dB implementation loss.

Table 20-3 assumes 5 dB implementation loss and 10 dB noise factor (noise figure).

20.3.4 Timing-related parameters

Table 20-4 defines timing-related parameters.

Table 20-4—Timing-related parameters

Parameter	Value
N_{GI}	aSCGILength NOTE—aSCGILength is defined in Table 20-30
N_{SPB}	448
F_c: chip rate	1760 MHz
T_c: chip time	$1 / F_c$ (~0.57 ns)
T_{seq}	$128 \times T_c$ (~72.7 ns)
T_{STF}: Detection sequence duration	$17 \times T_{seq}$ (~1236 ns)
T_{CE}: Channel Estimation sequence duration	$9 \times T_{seq}$ (~655 ns)
T_{HEADER}: header duration	$2 \times$ aSCBlockSize $\times T_c$ (~0.582 μs) NOTE—aSCGIBlockSize is defined in Table 20-30
$T_{STF\text{-}CM}$: control mode short training field duration	$50 \times T_{seq}$ (~3.636 μs)
$T_{CE\text{-}CM}$: control mode channel estimation field duration	T_{CE} (~655 ns)
T_{Data}	$(N_{BLKS} \times$ aSCBlockSize + aSCGILength$) \times T_c$ NOTE—N_{BLKS} is defined in 20.5.3.2.3.3 and aSCBlockSize and aSCGILength are defined in Table 20-30.

Table 20-5 defines parameters used frequently in Clause 20.

Table 20-5—Frequently used parameters

Symbol	Explanation
N_{CBPS}	Number of coded bits per symbol
N_{DBPS}	Number of data bits per symbol
R	Code rate

20.3.5 Mathematical conventions in the signal description

20.3.5.1 General

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal $r(t)$ by the following relation:

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\}$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where

f_C is the center frequency of the carrier

The transmitted RF signal is generated by modulating the complex baseband signal, which consists of several fields. The fields and the timing boundaries for the various fields are shown in Figure 20-2.

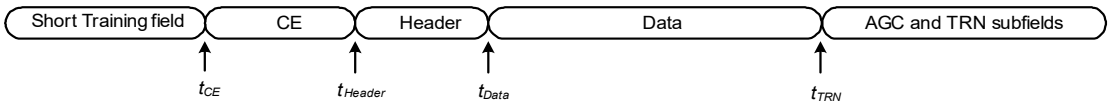

Figure 20-2—PPDU structure

The time offset, t_{Field}, determines the starting time of the corresponding field.

$$r_{PPDU}(t) = r_{STF}(t) + r_{CE}(t - t_{CE}) + r_{Header}(t - t_{Header}) + r_{Data}(t - t_{Data}) + r_{TRN}(t - t_{TRN})$$

where

$$t_{CE} = T_{STF}$$
$$t_{Header} = t_{CE} + T_{CE}$$
$$t_{Data} = t_{Header} + T_{Header}$$
$$t_{TRN} = t_{Data} + T_{Data}$$

The base band waveform for fields defined by time domain sequences or for single carrier transmission is

$$r_{Field}(nT_C) = x(n)$$

where

$x(n)$ is the constellation point n

Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

20.3.6 Common preamble

20.3.6.1 General

The preamble is the part of the PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, and channel estimation. The format of the preamble consists of a Short Training field followed by a Channel Estimation field. Figure 20-3 illustrates the SC packet preamble.

Figure 20-3—SC preamble

All numeric fields are transmitted in unsigned format, LSB first.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

20.3.6.2 Short Training field

The Short Training field is composed of 16 repetitions of sequences $Ga_{128}(n)$ of length 128 defined in 20.10, followed by a single repetition of $-Ga_{128}(n)$.

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} (Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right) & n = 0, 1, \ldots, 16 \times 128 - 1 \\ (-Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right) & n = 16 \times 128, \ldots, 17 \times 128 - 1 \end{cases}$$

where
mod is the modulus operation

20.3.6.3 Channel Estimation field

The Channel Estimation field is used for channel estimation, as well as indication of which modulation is going to be used for the packet. The Channel Estimation field is composed of a concatenation of two sequences $Gu_{512}(n)$ and $Gv_{512}(n)$, where the last 128 samples of $Gu_{512}(n)$ and $Gv_{512}(n)$ are equal to the last 128 samples used in the Short Training field. They are followed by a 128 samples sequence $Gv_{128}(n)$ equal to the first 128 samples of both $Gv_{512}(n)$ and $Gu_{512}(n)$.

The Gu_{512} and Gv_{512} sequences are defined as

$$G_{u_{512}} = \left[-Gb_{128} \quad -Ga_{128} \quad Gb_{128} \quad -Ga_{128}\right]$$

$$G_{v_{512}} = \left[-Gb_{128} \quad Ga_{128} \quad -Gb_{128} \quad -Ga_{128}\right]$$

where
Ga_{128} and Gb_{128} are as defined in 20.10

When the data field of the packet is modulated using single carrier, the Gu_{512} and Gv_{512} fields are concatenated in the order shown in Figure 20-4.

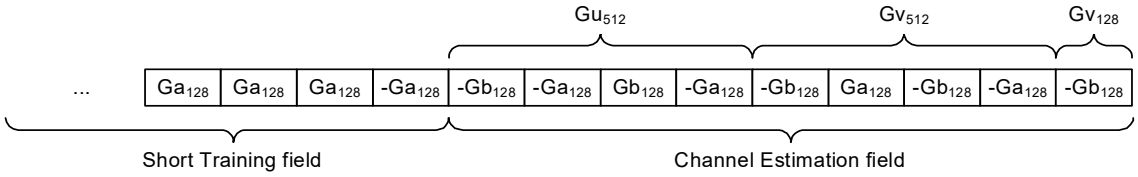

Figure 20-4—Channel Estimation field for SC PPDUs

The waveform for the channel estimation sequence is

$$r_{CE_{SC}}(nT_c) = (Gu_{512}(n) + Gv_{512}(n-512) + Gv_{128}(n-1024))\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 1151$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Note that sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ are defined for $0 \le n \le 511$. For other values of n, $Gu_{512}(n)$ and $Gv_{512}(n)$ are set to 0.

20.3.7 HCS calculation for headers of DMG control mode and DMG SC mode

The header check sequence (HCS) is a CRC of the header bits. The header is considered to be a stream of bits $B_0,...,B_{M-1}$. The CRC is based on CRC 16-CCITT. The value of the CRC field is the 1s complement of

$$CRC(D) = (M(D) \oplus I(D))D^{16} \bmod G(D)$$

where

$M(D) = B_0D^{M-1} + B_1D^{M-2} + \ldots + B_{M-1}$ is the header bits represented as polynomial (over the binary field) where B_0 is bit 0 of the header and B_{M-1} is bit $M-1$ of the header

$I(D) = \sum_{k=M-16}^{M-1} D^k$ is an initialization polynomial added to the first 16 bits of the header (setting the shift register bits to 1)

$G(D) = D^{16} + D^{12} + D^5 + 1$ is the CRC generating polynomial

$CRC(D) = x_0D^{15} + x_1D^{14} + \ldots x_{14}D + x_{15}$

The CRC field is transmitted with x_{15} first.

For a block diagram and an example of how to calculate the CRC, see 15.3.3.7.

20.3.8 Common LDPC parity matrices

20.3.8.1 General

Four low-density parity check (LDPC) codes are specified, each of a different rate but with a common codeword size of 672 bits.

Each of the parity-check matrices ***H*** is partitioned into square submatrices of size $Z \times Z$. The submatrices are either cyclic-permutations of the identity matrix, or null submatrices with all zero entries.

A location with integer i denotes the cyclic-permutation submatrix P_i obtained from the $Z \times Z$ identity matrix by cyclically shifting the columns to the right by i elements. The matrix P_0 is the $Z \times Z$ identity matrix. An empty location denotes a null submatrix of size $Z \times Z$.

Examples with $Z = 4$:

$$P_0 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad P_1 = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \end{bmatrix} \quad P_3 = \begin{bmatrix} 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

20.3.9 Scrambler

The header and data fields following the scrambler initialization field (including data padding bits) shall be scrambled by XORing each bit in turn with a length 127 periodic sequence generated by the polynomial $S(x) = x^7 + x^4 + 1$. The PHY header bits, with the exception of the first seven bits for SC and the first five bits for control mode, are placed one after the other, bit 7 first (bit 5 first for DMG control mode). The octets of the PSDU and the pad bits shall be placed into a bit stream with bit 0 (LSB) of each octet first and bit 7 of each octet (MSB) last. The generation of the sequence and the XOR operation are defined in Figure 20-5.

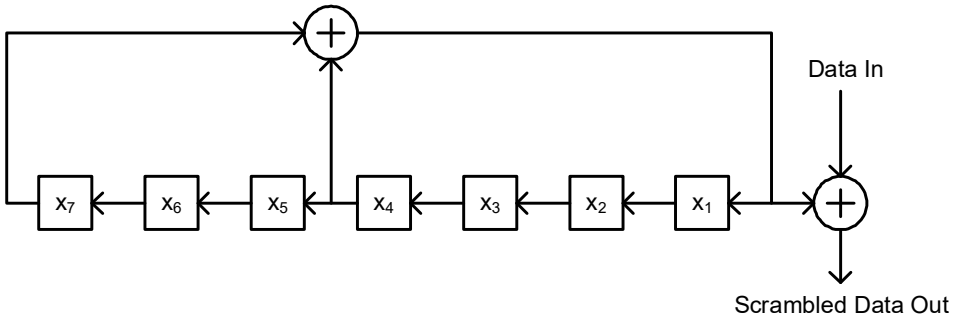

Figure 20-5—Data scrambler

For each PPDU, the transmitter shall select a nonzero seed value for the scrambler (bits x_1 to x_7). The seed value should be selected in a pseudorandom fashion. The seed value is sent in the Scrambler Initialization field of the PHY header. Each data bit in the data field of the PPDU is then XORed with the scrambler output ($x_4 \oplus x_7$) and then the scrambler content is shifted once.

20.3.10 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the preamble of the received frame.

The RCPI encoding is defined in 9.4.2.37.

RCPI shall equal the received RF power with an accuracy of ± 5 dB with 95% confidence interval within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel width multiplied by 1.1. The relative error between RF power measurements made within a 1 second interval should be less than ± 1 dB.

20.4 DMG control mode

20.4.1 Introduction

Transmission and reception of control mode PPDUs is mandatory. DMG control mode uses the same chip rate as the DMG SC mode. DMG control mode is transmitted when the TXVECTOR indicates MCS 0.

The modulation and coding scheme for the DMG control mode is shown in Table 20-10.

Table 20-10—DMG control mode modulation and coding scheme

MCS index	Modulation	Code rate	Data rate
0	DBPSK	1/2[a]	27.5 Mb/s[a]

[a] Code rate and data rate might be lower due to codeword shortening.

20.4.2 PPDU format

The DMG control mode PPDU is composed of the Preamble, Header, Data field, and possibly AGC and TRN subfields. This is shown in Figure 20-6.

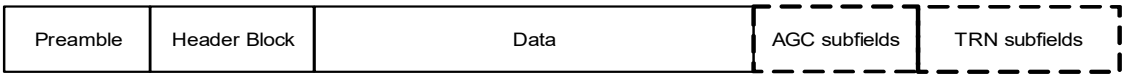

Figure 20-6—DMG control mode PPDU format

20.4.3 Transmission

20.4.3.1 Preamble

20.4.3.1.1 General

The preamble is the part of the DMG control mode PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, indication of frame type and channel estimation.

The preamble is composed of two parts as shown in Figure 20-7: the Short Training field and the Channel Estimation field.

Figure 20-7—DMG control mode preamble

20.4.3.1.2 Short Training field

The Short Training field is composed of 48 repetitions of the sequence $Gb_{128}(n)$ of length 128, followed by a single –Gb128(n) sequence (for synchronization) and then a single –Ga128(n) sequence. The sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined in 20.10.

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 0, 1, \ldots, 48 \times 128 - 1 \\ -Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 48 \times 128, \ldots, 49 \times 128 - 1 \\ -Ga_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 49 \times 128, \ldots, 50 \times 128 - 1 \end{cases}$$

where mod is the modulus operation. Note that sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined for $0 \le n \le 127$. For other n they are set to 0.

20.4.3.1.3 Channel Estimation field

The Channel Estimation field is the same as the Channel Estimation field of the DMG SC mode, as defined in Figure 20-4 of 20.3.6.3.

20.4.3.2 Header

20.4.3.2.1 General

In the DMG control mode, the preamble is followed by the header block. The header consists of several fields that define the details of the PPDU to be transmitted.

The header fields are described in Table 20-11.

Table 20-11—DMG control mode header fields

Field name	Bit	Description
Differential Encoder Initialization	B0	Used to initialize the differential encoding *c(0)* in 20.4.3.3.4. May be set to any value.
Scrambler Initialization	B1–B4	Bits X1–X4 of the initial scrambler state (see 20.4.3.3.2).
Length	B5–B14	Number of data octets in the PSDU. Range 14–1023.
PPDU Type	B15	As defined in Table 20-13.
Training Length	B16–B20	Length of the training field. The use of this field is defined in 20.9.2.2.3.
Turnaround	B21	Contains a copy of the parameter TURNAROUND from the TXVECTOR.
Reserved bits	B22–B23	
HCS	B24–B39	Header check sequence. Calculation of the header check sequence is defined in 20.3.7.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

20.4.3.2.2 Generation of HCS bits

The header check sequence (HCS) is calculated over bits 0-23 and uses CRC 16-CCITT as described in 20.3.7.

20.4.3.2.3 Header encoding and modulation

The header bits followed by the HCS bits are prepended to the data field bits and passed into the data field encoder per 20.4.3.3. The minimal payload length is 14 octets.

20.4.3.3 Data field

20.4.3.3.1 General

The Data field consists of the payload data of the PSDU. The PSDU is scrambled, encoded, modulated and spread as described in the following subclauses.

20.4.3.3.2 Scrambler

The operation of the scrambler is defined in 20.3.9. Bits x1, x2, x3, x4 of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the header, bits x5, x6, x7 are set to 1. The header is scrambled starting from bit 5. The scrambling of the data field continues the scrambling of the header with no reset.

20.4.3.3.3 Encoder

The DMG control mode header and data is encoded using an effective LDPC code rate less than or equal to 1/2, generated from the data PHY rate 3/4 LDPC parity check matrix, with shortening. The following steps are used for the encoding:

1) $L_{CWD} = 168$ is the maximal number of data bits in each LDPC codeword. L_{HDR}=5 is the length of the header (including HCS) in octets. L_{FDCW}=6 is the length of the additional data in the first LDPC codeword in octets.
2) The total (header and additional data) number of bits in the first LDPC codeword is $L_{DPFCW} = (L_{HDR} + L_{FDCW}) \times 8 = 88$.
3) The number of LDPC codewords is $N_{CW} = 1 + \left\lceil \frac{(Length - 6) \times 8}{L_{CWD}} \right\rceil$.
4) The number of bits in the second and any subsequent LDPC codeword (if present), except the last, is $L_{DPCW} = \left\lceil \frac{(Length - 6) \times 8}{N_{CW} - 1} \right\rceil$.
5) The number of bits in the last LDPC codeword is $L_{DPLCW} = (Length - 6) \times 8 - (N_{CW} - 2) \times L_{DPCW}$.

NOTE—For example, if $Length = 128$, then $N_{CW} = 1 + \left\lceil \frac{(128 - 6) \times 8}{L_{CWD}} \right\rceil = 7$, $L_{DPCW} = 163$, and $L_{DPLCW} = 161$. In the first LDPC block, the 88 bits of L_{DPFCW} consist of 40 header+HCS bits along with 48 bits of the data.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

20.4.3.3.4 Modulation

The scrambled and coded bit stream $c(k)$, $k = 0, 1, 2, ...$, is converted into a stream of complex constellation points $d(k)$ using differential binary phase shift keying (DBPSK) as follows.

$c(k)$ is converted to the nondifferential stream $s(k) = 2c(k) - 1$. This is converted to the differential stream $d(k) = s(k) \times d(k-1)$, where $d(-1)$ is defined to be 1. $c(0)$ is the Differential Encoder Initialization field of the DMG control mode header.

NOTE—The scrambling process does not affect the Differential Encoder Initialization field of the DMG control mode header.

20.4.3.3.5 Spreading

The constellation points are spread using the sequence $Ga_{32}(n)$, which is defined in 20.10.

The waveform for the modulated and spread data field is

$$r_{DATA}(nT_c) = \left(Ga_{32}(n \bmod 32) \cdot d\left(\left\lfloor \frac{n}{32} \right\rfloor\right)\right) \exp\left(j\pi\frac{n}{2}\right),\ n = 0, 1, 2, \ldots$$

where $d(k)$ is the modulated constellation point k.

20.4.4 Performance requirements

20.4.4.1 Transmit requirements

20.4.4.1.1 Introduction

Transmitter performance requirements of the DMG control mode are defined in 20.4.4.1.2.

20.4.4.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The instrumentation shall incorporate a rake receiver or equalizer to minimize error resulting from multipath. If used, the equalizer shall be trained using information in the preamble (STF and/or CEF). For the DMG control mode EVM, the signal is first despread using Ga_{32}. The EVM is then calculated on the resulting symbols according to the formula below:

$$EVM = 20\log_{10}\left(\sqrt{\left(\frac{1}{N_s P_{avg}} \sum_{i=1}^{N_s} [(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right)$$

where

N_S	is the number of symbols to be measured
N_S	should be greater than 511
P_{avg}	is the average power of the constellation
(I_i,Q_i)	is the complex coordinates of the measured symbol i

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

(I_i^*,Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i

(I_0,Q_0) is the complex DC term chosen to minimize EVM

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The EVM shall not exceed a data-rate dependent value according to Table 20-12.

Table 20-12—DMG control mode EVM requirements

MCS index	Description	EVM value [dB]
0	DMG control mode modulation	–6

20.4.4.2 Receive requirements

20.4.4.2.1 Introduction

Subclause 20.4.4.2 describes the performance requirement from the DMG control mode receiver.

20.4.4.2.2 CCA sensitivity

The start of a DMG control mode transmission at a receive level greater than –68 dBm shall cause CCA to indicate busy with a probability > 90% within 3 μs.

20.5 DMG SC mode

20.5.1 Introduction

Transmission and reception of DMG SC mode PPDUs is mandatory for selected MCSs.

20.5.2 PPDU format

A SC frame is composed of the Short Training field (STF), the channel estimation field (CE), the Header, SC blocks and optional training fields, as shown in Figure 20-8.

Figure 20-8—SC frame format

20.5.3 Transmission

20.5.3.1 Header

20.5.3.1.1 General

In the DMG SC mode, the preamble is followed by the header. The header consists of several fields that define the details of the PPDU to be transmitted. The encoding and modulation of the header is described in 20.5.3.1.4.

The header fields are described in Table 20-13.

Table 20-13—DMG SC mode header fields

Field name	Bit	Description
Scrambler Initialization	B0–B6	Bits X1–X7 of the initial scrambler state (see 20.3.9).
Base MCS	B7–B11	Modulation and Coding Scheme (see Table 20-15)
Length	B12–B29	If the Extended SC MCS Indication field is 0, indicates the number of data octets in the PSDU; range 1–262 143. If the Extended SC MCS Indication field is 1, the Length field value is set to $Base_Length1 - \lfloor (Base_Length2 - N)/4 \rfloor$, where N is the number of data octets in the PSDU in the range 1 to 262 143, and *Base_Length1* and *Base_Length2* are computed according to Table 20-14.
Additional PPDU	B30	Contains a copy of the parameter ADD_PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU.
PPDU Type	B31	Corresponds to the TXVECTOR parameter PPDU_TYPE. — PPDU Type = 0 (BRP-RX PPDU, see 20.9.2.2.3), indicates either a PPDU whose Data field is followed by one or more TRN subfields (when the Beam Tracking Request field is 0 or in DMG control mode), or a PPDU that contains a request for TRN subfields to be appended to a future response PPDU (when the Beam Tracking Request field is 1). — PPDU Type = 1 (BRP-TX PPDU, see 20.9.2.2.3), indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV at the beginning of each TRN subfield. The field is reserved when the Training Length field is 0.
Training Length	B32–B36	Corresponds to the TXVECTOR parameter TRN_LEN. If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 20.9.2.2.3. A value of 0 indicates that no training field is present in this PPDU. If the Beam Tracking Request field is 1 and the PPDU Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the PPDU Type field is 0, the Training Length field indicates the length of the training field requested for receive training.
Aggregation	B37	Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 20-13—DMG SC mode header fields *(continued)*

Field name	Bit	Description
Beam Tracking Request	B38	Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.42.7); otherwise, set to 0. The Beam Tracking Request field is reserved when the Training Length field is 0.
Last RSSI	B39–B42	Contains a copy of the parameter LAST_RSSI from the TXVECTOR. The value is an unsigned integer: Values 2 to 14 represent power levels (–71+value×2) dBm. A value of 15 represents a power greater than or equal to –42 dBm. A value of 1 represents a power less than or equal to –68 dBm. A value of 0 indicates that the previous packet was not received a SIFS before the current transmission.
Turnaround	B43	Contains a copy of the parameter TURNAROUND from the TXVECTOR.
Extended SC MCS Indication	B44	The Extended SC MCS Indication field combined with the Base MCS field indicates the MCS. The Extended SC MCS Indication field indicates whether the Length field shall be calculated according to Table 20-14.
π/2-8-PSK Applied	B45	Corresponds to TXVECTOR parameter PSK_APPLIED. If this field is set to 1, π/2-8-PSK with corresponding LDPC shortening code with rates 2/3 or 5/6 is applied at the transmitter for MCS 10 or 11, respectively. If set to 0, π/2-16-QAM with LDPC code with rates 1/2 or 5/8 is applied at the transmitter for MCS 10 or 11, respectively.
Reserved	B46–B47	
HCS	B48–B63	Header check sequence

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

When the MCS belongs to the set {9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6}, bits X6, X7 of the initial scrambler state are set so that $X6+X7\times 2 = (Base_Length2 - N) \bmod 4$, where N is the number of data octets in the PSDU, and *Base_Length2* is computed according to Table 20-14. Bits X1–X5 are selected in a pseudorandom fashion making sure that at least one bit in X1–X7 is nonzero.

NOTE—The combination of the values of the X6 and X7 in the Scrambler Initialization field and the Length field is unique for different PSDU lengths, i.e., there is a one-to-one mapping between a combination (X6, X7, Length) and a PSDU length, so the receiver can recover the actual PSDU length from the header fields. See 20.5.3.1.5 for an example algorithm for the length recovery.

X1–X7 are sent in the Scrambler Initialization field, as defined in 20.5.3.1.4 and 20.5.3.2.2.

Table 20-14—Parameters for computing Length field value in SC header when Extended SC MCS Indication field is set to 1

MCS	*Base_Length1* (See NOTEs 1 and 2)	*Base_Length2* (See NOTEs 1 and 3)
9.1	$\left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 42$	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 56}{39} \right\rfloor \times 68.25 \right\rfloor$
12.1	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 52.5 \right\rfloor$	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 68.25 \right\rfloor$
12.2	$\left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 63$	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 112}{39} \right\rfloor \times 68.25 \right\rfloor$
12.3	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 68.25 \right\rfloor$	$N_{BLKS} \times 210$
12.4	$\left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 42$	$N_{BLKS} \times 252$
12.5	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 52.5 \right\rfloor$	$N_{BLKS} \times 273$
12.6	$\left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 63$	$\left\lfloor \left\lfloor \frac{N_{BLKS} \times 56}{13} \right\rfloor \times 68.25 \right\rfloor$

NOTE 1—N_{BLKS} is the number of symbol blocks defined in 20.5.3.2.3.3.

NOTE 2—*Base_Length1* is the maximum Length value such that the packet with the base MCS specified in SC header has the given N_{BLKS}.

NOTE 3—*Base_Length2* is the maximum number of data octets in PSDU such that the packet with the extended MCS has the given N_{BLKS}.

20.5.3.1.2 Modulation and coding scheme

The modulation and coding scheme defines the modulation and code rate that is used in the PPDU. The modulation and coding schemes for SC are defined in Table 20-15 and Table 20-16. PPDUs that have the π/2-8-PSK Applied field set to 0 in Table 20-13 follow Table 20-15. PPDUs that have the π/2-8-PSK Applied field set to 1 in Table 20-13 follow Table 20-15, except that MCS 10 and MCS 11 in this table shall be replaced by those in Table 20-16.

NOTE—The LDPC code with rate 2/3 is generated by employing the LDPC code with rate 3/4 and applying the codeword shortening procedure to achieve the effective code rate. The LDPC code with rate 5/6 is generated by employing the LDPC code with rate 13/16 and applying the codeword shortening and puncturing procedure. See 20.5.3.2.3.3.

Transmit and receive support for MCS 4 and below is mandatory. Other MCSs are optional. For STAs that support MCS 10, the support for π/2-16-QAM for MCS 10 is mandatory and the support for π/2-8-PSK or MCS 10 is optional. For STAs that support MCS 11, the support for π/2-8-16-QAM for MCS 11 is mandatory and the support for π/2-8-PSK for MCS 11 is optional.

Table 20-15—DMG SC mode modulation and coding schemes

MCS	Base MCS field	Extended SC MCS Indication field	Modulation	N_{CBPS}	Repetition	Code rate	Data rate (Mb/s)
1	1	0	π/2-BPSK	1	2	1/2	385
2	2	0	π/2-BPSK	1	1	1/2	770
3	3	0	π/2-BPSK	1	1	5/8	962.5
4	4	0	π/2-BPSK	1	1	3/4	1155
5	5	0	π/2-BPSK	1	1	13/16	1251.25
6	6	0	π/2-QPSK	2	1	1/2	1540
7	7	0	π/2-QPSK	2	1	5/8	1925
8	8	0	π/2-QPSK	2	1	3/4	2310
9	9	0	π/2-QPSK	2	1	13/16	2502.5
9.1	6	1	π/2-QPSK	2	1	7/8	2695
10	10	0	π/2-16-QAM	4	1	1/2	3080
11	11	0	π/2-16-QAM	4	1	5/8	3850
12	12	0	π/2-16-QAM	4	1	3/4	4620
12.1	7	1	π/2-16-QAM	4	1	13/16	5005
12.2	8	1	π/2-16-QAM	4	1	7/8	5390
12.3	9	1	π/2-64-QAM	6	1	5/8	5775
12.4	10	1	π/2-64-QAM	6	1	3/4	6930
12.5	11	1	π/2-64-QAM	6	1	13/16	7507.5
12.6	12	1	π/2-64-QAM	6	1	7/8	8085

Table 20-16—DMG SC mode modulation and coding schemes when π/2-8-PSK Applied field is 1

MCS	Base MCS field	Extended SC MCS Indication field	Modulation	N_{CBPS}	Repetition	Code rate	Data rate (Mb/s)
10	10	0	π/2-8-PSK	3	1	2/3	3080
11	11	0	π/2-8-PSK	3	1	5/6	3850

20.5.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 20.3.7.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

20.5.3.1.4 Header encoding and modulation

The header is encoded using a two SC block of N_{SPB} symbols with N_{GI} guard symbols. The bits are scrambled and encoded as follows:

1) The input header bits (B_1, B_2, …, B_{LH}), where LH = 64, are scrambled as described in 20.3.9, starting from the eighth bit. to create $\mathbf{d_{1s}}=(q_1,q_2,\ldots,q_{LH})$
2) The LDPC codeword $\mathbf{c} = (q_1,q_2,\ldots,q_{LH},0_1,0_2,\ldots,0_{504-LH},p_1,p_2,\ldots,p_{168})$ is created by concatenating 504-LH zeros to the LH bits of $\mathbf{d_{1s}}$ and then generating the parity bits $p_1,p_2,\ldots,p_{168}$ such that $\mathbf{Hc}^{\mathbf{T}} = \mathbf{0}$, where **H** is the parity check matrix for the rate 3/4 LDPC code specified in 20.5.3.2.3.2.
3) Remove bits LH+1 to 504 and bits 665 to 672 of the codeword **c** to create the sequence $\mathbf{cs1}=(q_1,q_2,\ldots,q_{LH},p_1,p_2,\ldots,p_{160})$.
4) Remove bits LH+1 to 504 and bits 657 to 664 of the codeword **c** to create the sequence $\mathbf{cs2} = (q_1,q_2,\ldots,q_{LH},p_1,p_2,\ldots,p_{152},p_{161},p_{162},\ldots,p_{168})$ and then XOR with a PN sequence that is generated from the LFSR used for data scramblings defined in 20.3.9. The LFSR is initialized to the all 1s vector.
5) **cs1** and **cs2** are concatenated to form the sequence (**cs1**, **cs2**). The resulting 448 bits are then mapped as $\pi/2$-BPSK as described in 20.5.3.2.4.2. The N_{GI} guard symbols are then prepended to the resulting N_{CBPB} symbols as described in 20.5.3.2.5.

The same resulting N_{CBPB} symbols are multiplied by –1 and repeated, and then prepended with N_{GI} guard symbols as described in 20.5.3.2.5. The resulting sequence is then appended after the sequence created in step 5).

20.5.3.1.5 Length recovery for extended SC MCSs at receiver

This subclause describes an example steps to calculate the PSDU length *N* at the receiver when the Extended SC MCS Indication field of the received PPDU is set to 1.

1) Compute N_{BLKS} using the values of the Base MCS and Length fields in the PHY header as if the Extended SC MCS Indication field is set to 0.
2) Compute *Base_Length1* and *Base_Length2* using N_{BLKS} computed in step 1) as defined in Table 20-14
3) Compute the PSDU length *N* using the following equation:

$$N = Base_Length2 - (4 \cdot (Base_Length1 - Length) + (X6 + 2 \cdot X7))$$

where

Length is the value of the Length field in the PHY header

X6 and *X7* are the 6th and 7th bits of the Scrambler Initialization field in the PHY header

NOTE—The equation is derived by the following equations a) to c).

a) The equation that defines the Length field value in the PHY header (see Table 20-13),

$$Length = Base_Length1 - \lfloor (Base_Length2 - N)/4 \rfloor$$

where

N is the PSDU length.

b) The equation that defines the two MSBs of the Scrambler Initialization field, X6 and X7 (see 20.5.3.1.1),

$$X6 + 2 \cdot X7 = (Base_Length2 - N) \bmod 4$$

c) The equations a) and b) mean that (*Base_Length1 – Length*) and ($X6 + 2 \cdot X7$) are respectively the quotient and remainder of dividing (*Base_Length2 – N*) by 4. Thus, the following equation is obtained,

$$Base_Length2 - N = 4 \cdot (Base_Length1 - Length) + (X6 + 2 \cdot X7)$$

and the equation in step 3) of this subclause is obtained after applying simple rearrangement.

20.5.3.2 Data field

20.5.3.2.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded and modulated as described in the following subclauses. The amount of padding is defined in 20.5.3.2.3.

20.5.3.2.2 Scrambler

The operation of the scrambler is defined in 20.3.9. The scrambling of the PSDU continues the scrambling of the header with no reset of the scrambler.

20.5.3.2.3 Encoding

20.5.3.2.3.1 General

The data are encoded by a systematic LDPC encoder. The LDPC is a block code. Each block of information bits $(B_1, B_2,...,B_k)$ is concatenated with a block of parity bits $(p_1,p_2,....,p_{n-k})$ to create a codeword $\boldsymbol{c}=(B_1, B_2,...,B_k,p_1,p_2,....,p_{n-k})$ such that $\mathbf{Hc}^T=\mathbf{0}$, where **H** is the $(n-k)\times n$ parity check matrix. The block size n is 672 bits. The code rate, R, is equal to k/n. The set of code rates is defined in Table 20-18. The parity check matrices are defined in 20.5.3.2.3.2. The encoding process is defined in 20.5.3.2.3.3.

Table 20-18—LDPC code rates

Code rate	Codeword size	Number of data bits
1/2	672	336
5/8	672	420
2/3	504	336
3/4	672	504
13/16	672	546
5/6	468	390
7/8	624	546

20.5.3.2.3.2 Parity check matrices

See 20.3.8.

20.5.3.2.3.3 LDPC encoding process

The LDPC encoding process is composed of several steps that includes deciding the number of shortening/ repetition bits in every codeword, the shortening itself, the coding of each word and then any repetition of bits.

a) First the total number of data pad bits N_{DATA_PAD} is calculated, using the number of LDPC codewords N_{CW}:

$$N_{CW} = \left\lceil \frac{Length \cdot 8}{\frac{L_{CW}}{\rho} \cdot R} \right\rceil$$

if BRP packet and $N_{CW} < N_{CWmin}$; $N_{CW} = N_{CWmin}$

$$N_{DATA_PAD} = N_{CW} \cdot \frac{L_{CW}}{\rho} \cdot R - Length \cdot 8$$

where

L_{CW} is the LDPC codeword length , which is 624 for code rate R=7/8, 504 for code rate R=2/3, 468 for code rate R=5/6, or 672 for all other code rates

$Length$ is the length of the PSDU indicated by the TXVECTOR parameter LENGTH (in octets)

ρ is the repetition factor (1 or 2)

R is the code rate

N_{CWmin} is defined for BRP PPDUs in Table 20-22.

The scrambled PSDU is concatenated with N_{DATA_PAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

b) The procedure for converting the scrambled PSDU data to LDPC codewords depends on the repetition factor.

1) If $\rho = 1$ and the code rate is not one of 2/3, 5/6, 7/8,

i) The output stream of the scrambler is broken into blocks of $L_{CWD} = L_{CW} \times R$ bits such that the m^{th} data word is $(b_1^{(m)}, b_2^{(m)}, \ldots b_{L_{CWD}}^{(m)})$, $m \le N_{CW}$.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

ii) To each data word, $n\text{-}k=L_{CW}-R\times L_{CW}$ parity bits $(p_1^{(m)}, p_2^{(m)}, \ldots, p_{n-k}^{(m)})$ are added to create the codeword $\mathrm{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{L_{CWD}}^{(m)}, p_1^{(m)}, \ldots p_{n-k}^{(m)})$ such that $\mathbf{H}\boldsymbol{c}^{(m)^{\mathrm{T}}} = 0$

2) If ρ = 1 and the code rate is 7/8, 48 bits are punctured from the parity bits of the rate 13/16 parity bits:

i) The output stream of the scrambler is broken into blocks of 546 bits such that the m^{th} data word is $(b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)})$, $m \le N_{CW}$.

ii) To each data word, 126 parity bits $(p_1^{(m)}, p_2^{(m)}, \ldots, p_{126}^{(m)})$ are added to create the code word $\tilde{\boldsymbol{c}}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)}, p_1^{(m)}, \ldots p_{126}^{(m)})$ such that $\boldsymbol{H}\tilde{\boldsymbol{c}}^{(m)^{\mathrm{T}}} = \mathbf{0}$. The code word $\boldsymbol{c}^{(m)}$ is generated from $\tilde{\boldsymbol{c}}^{(m)}$ by removing the first 48 parity bits so that $\boldsymbol{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{546}^{(m)}, p_{49}^{(m)}, p_{50}^{(m)}, \ldots p_{126}^{(m)})$

3) If ρ = 1 and the code rate is 2/3,

i) The output stream of the scrambler is broken into blocks of L_{CWD} = 336 bits such that he m^{th} data word is $(b_1^{(m)}, b_2^{(m)}, \ldots b_{L_{CWD}}^{(m)})$, $m \le N_{CW}$.

ii) To each data word, 168 zero bits $\mathbf{0}^{(m)} = (0_1, 0_2, \ldots 0_{168})$ and parity bits $\mathbf{p}^{(m)} = (p_1, p_2, \ldots p_{168})$ are added to create the codeword $\mathbf{c}^{(m)} = (\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)})$ such that $\boldsymbol{H}\boldsymbol{c}^{(m)^{\mathrm{T}}} = \mathbf{0}$, applying the rate 3/4 LDPC code matrix.

iii) Finally, the zero bits are discarded to create the output codeword $\boldsymbol{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{LWD}^{(m)}, p_1^{(m)}, \ldots p_{n-k}^{(m)})$.

4) If ρ = 1 and the code rate is 5/6,

i) The output stream of the scrambler is broken into blocks of L_{CWD} = 390 bits such that he m^{th} data word is $(b_1^{(m)}, b_2^{(m)}, \ldots b_{L_{CWD}}^{(m)})$, $m \le N_{CW}$.

ii) To each data word, 156 zero bits $\mathbf{0}^{(m)} = (0_1, 0_2, \ldots 0_{156})$ and parity bits parity bits $\mathbf{p}^{(m)} = (p_1, p_2, \ldots p_{126})$ are added to create the codeword $\tilde{\boldsymbol{c}}^{(m)} = (\mathbf{b}^{(m)}, \mathbf{0}^{(m)}, \mathbf{p}^{(m)})$ such that $\boldsymbol{H}\tilde{\boldsymbol{c}}^{(m)^{\mathrm{T}}} = \mathbf{0}$, applying the rate 13/16 LDPC code matrix.

iii) Finally, the zero bits are discarded to create the output codeword $\boldsymbol{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \ldots, b_{390}^{(m)}, p_{49}^{(m)}, \ldots p_{126}^{(m)})$.

5) If ρ = 2,

i) The data bits in each codeword $(b_1, b_2, \ldots, b_{L_Z})$ where $L_Z = L_{CW}/2\rho$ are concatenated with $L_{CW}/2\rho$ zeros to produce a sequence of length of $2L_Z$ $(b_1, b_2, \ldots, b_{L_Z}, 0_1, 0_2, \ldots, 0_{L_Z})$.

ii) The LDPC codeword $\mathbf{c} = (b_1, b_2, \ldots, b_{L_Z}, 0_1, 0_2, \ldots, 0_{L_Z}, p_1, p_2, \ldots, p_{336})$ is created by generating the parity bits $p_1, p_2, \ldots, p_{336}$ such that $\mathbf{H}\mathbf{c}^{\boldsymbol{T}} = \mathbf{0}$, where $\mathbf{H}$ is the parity matrix for rate 1/2 LDPC coding specified in 20.3.8.

iii) Replace bits $L_Z + 1$ to 336 of the codeword $\mathbf{c}$ with bits from the sequence $b_1, b_2, \ldots, b_{L_Z}$ XORed by a PN sequence that is generated from the LFSR used for data scrambling as defined in 20.3.9. The LFSR is initialized to the all 1s vector and reinitialized to the same vector after every codeword.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

c) The codewords are then concatenated one after the other to create the coded bits stream $(c_1, c_2, \ldots, c_{L_{CW} \cdot N_{CW}})$.

d) The number of symbol blocks, N_{BLKS}, and the number of symbol block padding bits, N_{BLK_PAD}, are calculated:

$$N_{BLKS} = \left\lceil \frac{N_{CW} \cdot L_{CW}}{N_{CBPB}} \right\rceil$$

$$N_{BLK_PAD} = N_{BLKS} \cdot N_{CBPB} - N_{CW} \cdot L_{CW}$$

where N_{CBPB} is the number of coded bits per symbol block, per Table 20-19 in 20.5.3.2.5.

e) The coded bit stream is concatenated with N_{BLK_PAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

20.5.3.2.4 Modulation mapping

20.5.3.2.4.1 General

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

20.5.3.2.4.2 π/2-BPSK modulation

In π/2-BPSK modulation, the input bit stream is mapped according to the following equation: $\tilde{s}_k = 2 \cdot c_k - 1$, where c_k is the k^{th} input coded (or scrambled pad) bit. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$. The constellation bit encoding for BPSK is shown in Figure 20-9.

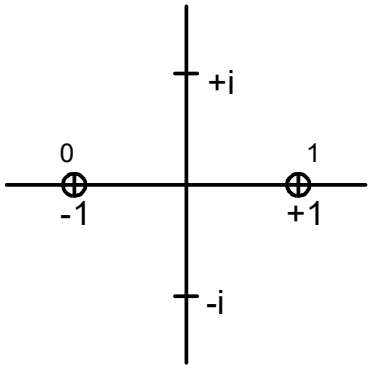

Figure 20-9—BPSK constellation bit encoding

NOTE—With appropriate choice of transmit filtering, π/2-BPSK is equivalent to a precoded pulse-shaped MSK (e.g., GMSK). The precoder is simply $b_{out,k} = b_{in,k} \oplus b_{in,k-1}$, $k = 0, 1, \ldots$, where $b_{in,k}$ is the scrambled input stream, $b_{in,-1}$ is 0, $b_{out,k}$ is the input to the (G)MSK modulator.

20.5.3.2.4.3 π/2-QPSK modulation

In π/2-QPSK modulation, the input bit stream is grouped into sets of 2 bits and mapped according to the following equation: $\tilde{s}_k = \frac{1}{\sqrt{2}}((2c_{2k} - 1) + j(2c_{2k+1} - 1)) \exp\left(-j\frac{\pi}{4}\right)$, where k is the output symbol index,

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

k = 0, 1, …. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$. The constellation bit encoding for QPSK is shown in Figure 20-10.

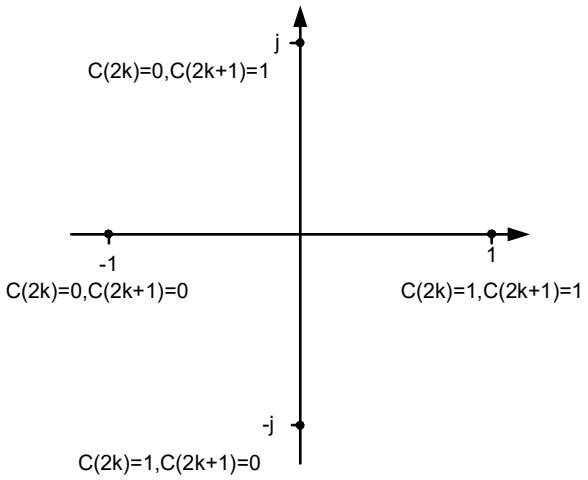

Figure 20-10—QPSK constellation bit encoding

20.5.3.2.4.4 π/2-8-PSK modulation

A DMG STA shall only apply π/2-8-PSK modulation to a PPDU transmitted to a peer STA if the π/2-8-PSK Supported field in the peer STA's DMG Capabilities element is equal to 1.

In π/2-8-PSK modulation, the input stream is grouped into sets of 3 bits and mapped according to the following equation:

$$\tilde{s}_k = \exp\left(j\frac{\pi}{4}(c_{3k} - 3c_{3k+1} - c_{3k+2} - 2c_{3k}c_{3k+1} + 2c_{3k+1}c_{3k+2} + 2c_{3k}c_{3k+2} + 4c_{3k}c_{3k+1}c_{3k+2} + 4)\right)$$

where k is the symbol output index, k = 0, 1, …. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$. The constellation bit encoding for 8-PSK before π/2 rotation is in Figure 20-11.

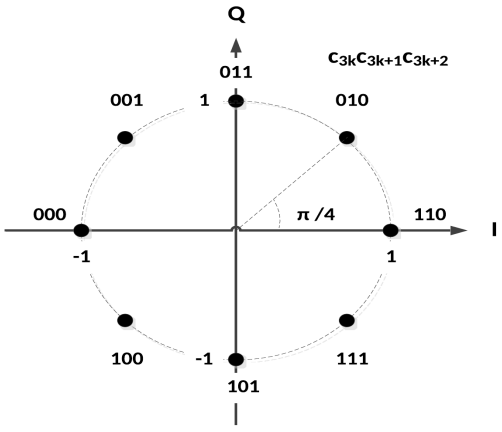

Figure 20-11—8-PSK constellation bit encoding (before π/2 rotation)

20.5.3.2.4.5 π/2-16-QAM modulation

In π/2-16-QAM modulation, the input bit stream is grouped into sets of 4 bits and mapped according to the following equation:

$$\tilde{s}_k = \frac{1}{\sqrt{10}}\{(4c_{4k}-2)-(2c_{4k}-1)(2c_{4k+1}-1)+j(4c_{4k+2}-2)-j(2c_{4k+2}-1)(2c_{4k+3}-1)\}$$

where k is the output symbol index, k =0, 1, …. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j \cdot \pi \cdot k/2}$. The constellation bit encoding for 16-QAM is shown in Figure 20-12.

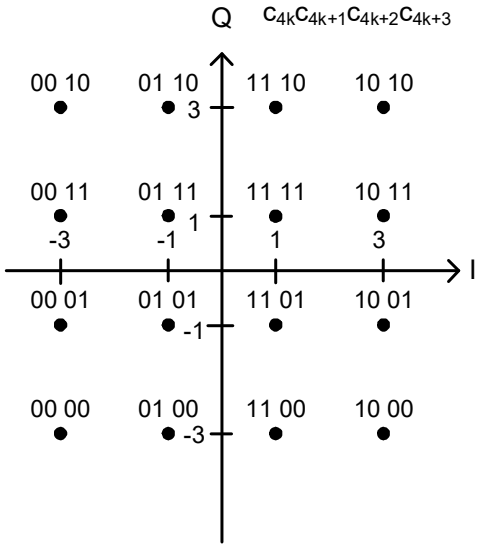

Figure 20-12—16-QAM constellation bit encoding

20.5.3.2.4.6 π/2-64-QAM modulation

In π/2-64-QAM modulation, the input bit stream is grouped in sets of 6 bits and mapped according to the following equation:

$$\tilde{s}_k =$$
$$\frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1))+$$
$$\frac{j}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6k+4}-1)(2c_{6k+5}-1))$$

where k is the output symbol index, k=0,1, …. Each output symbol is then rotated according to the following equation $s_k = \tilde{s}_k \cdot e^{\frac{j\pi k}{2}}$. The constellation bit encoding for 64-QAM is shown in Figure 20-13.

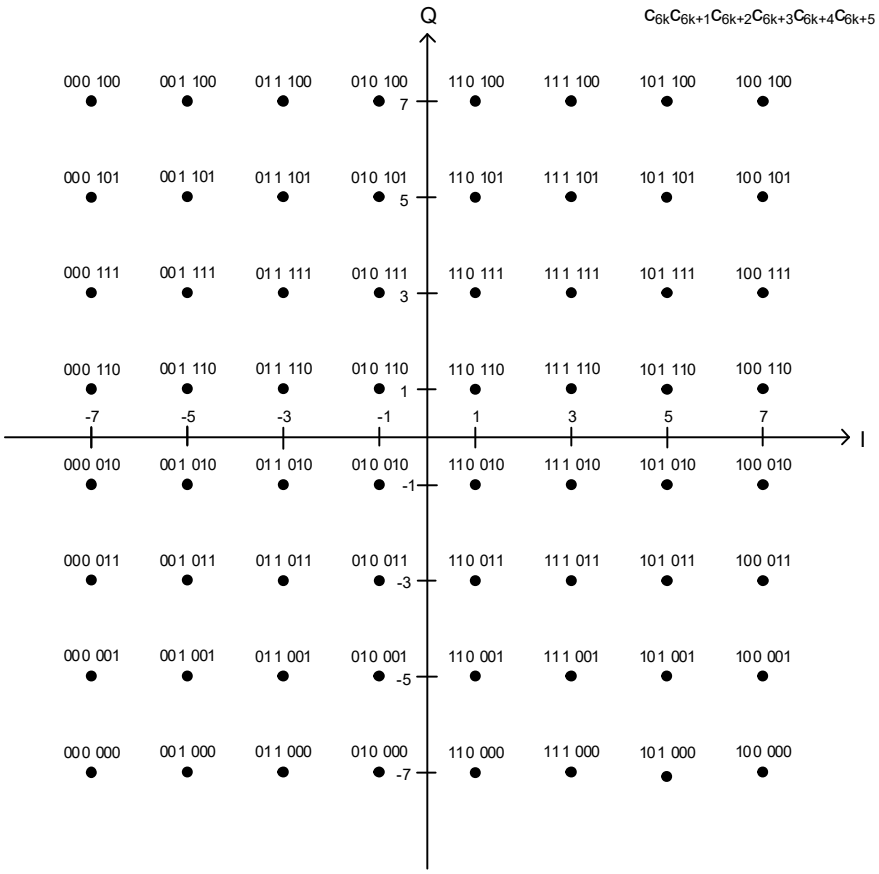

Figure 20-13—64-QAM constellation bit encoding

20.5.3.2.5 Symbol blocking and guard insertion

Each group of N_{CBPB} bits is prepended by π/2-BPSK symbols generated by the 64 point Golay sequence Ga_{64} defined in 20.10. N_{CBPB} values are shown in Table 20-19. The starting index for the first symbol for π/2 rotation is 0.

Table 20-19—Values of N_{CBPB}

Symbol mapping	N_{CBPB}
π/2-BPSK	448
π/2-QPSK	896
π/2-16-QAM	1792
π/2-64-QAM	2688

If the Additional PPDU field within the PHY header is equal to 0, the final block transmitted is followed by the same Golay sequence guard interval. See Figure 20-14. If the Additional PPDU field within the PHY header is equal to 1, the final block transmitted of the last PPDU in an A-PPDU is followed by the same Golay sequence guard interval.

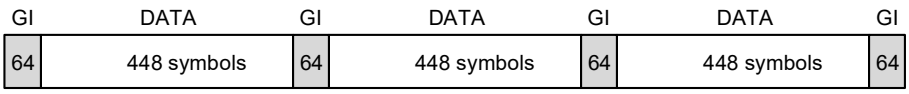

Figure 20-14—Block transmission

20.5.4 Performance requirements

20.5.4.1 Transmit requirements

20.5.4.1.1 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery and amplitude adjustment and equalization while making the measurements. The equalizer shall be trained using information in the SC preamble (STF and/or CEF). For the DMG SC mode EVM, measuring Ns samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given packet (ramp up/ down). The EVM is calculated according to the formula below:

$$EVM = 20\log_{10}\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_s}[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right)$$

where N_s is the number of samples to be measured and N_s shall be 1000, P_{avg} is the average power of the constellation, (I_i, Q_i) is the complex coordinates of the measured symbol i, (I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i, and (I_o, Q_o) is the complex DC term chosen to minimize EVM.

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 20-20.

Table 20-20—DMG SC mode EVM requirements

MCS	Modulation	Coding rate	EVM value [dB]
1	π/2-BPSK	1/2 with repetition	–6
2	π/2-BPSK	1/2	–7
3	π/2-BPSK	5/8	–9
4	π/2-BPSK	3/4	–10
5	π/2-BPSK	13/16	–12
6	π/2-QPSK	1/2	–11

Table 20-20—DMG SC mode EVM requirements *(continued)*

MCS	Modulation	Coding rate	EVM value [dB]
7	π/2-QPSK	5/8	–12
8	π/2-QPSK	3/4	–13
9	π/2-QPSK	13/16	–15
9.1	π/2-QPSK	7/8	–16
10	π/2-16-QAM	1/2	–19
11	π/2-16-QAM	5/8	–20
12	π/2-16-QAM	3/4	–21
12.1	π/2-16-QAM	13/16	–22
12.2	π/2-16-QAM	7/8	–23
12.3	π/2-64-QAM	5/8	–26
12.4	π/2-64-QAM	3/4	–27
12.5	π/2-64-QAM	13/16	–29
12.6	π/2-64-QAM	7/8	–31

20.5.4.1.2 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is 1760×10^6 sample/s
— FIRST_TRANSITION_FIELD is Short Training field
— SECOND_TRANSITION_FIELD is Channel Estimation field
— TRAINING_FIELD is Channel Estimation field
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

20.5.4.2 Receive requirements

20.5.4.2.1 Introduction

This subclause describes the receiver requirements of the DMG SC mode.

20.5.4.2.2 CCA sensitivity

The start of a DMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (–68 dBm) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 1.

20.6 DMG low-power SC mode

20.6.1 Introduction

The DMG low-power SC mode is obsolete, and support for this mode might be subject to removal in a future revision of the standard.

The DMG low-power SC mode is an optional SC mode that can provide lower processing power requirements for DMG transceivers.

20.6.2 Transmission

20.6.2.1 Preamble

The DMG low-power SC mode uses the same preamble as the DMG SC mode.

20.6.2.2 Header

20.6.2.2.1 General

The DMG low-power SC mode header fields are the same fields as in the DMG SC mode (see Table 20-13 in 20.5.3.1).

The DMG low-power SC mode modulation and coding schemes are listed in Table 20-21.

Table 20-21—DMG low-power SC mode modulation and coding schemes

MCS	Modulation	Effective code rate	Coding scheme	N_{CPB}	Rate (Mb/s)
25	π/2-BPSK	13/28	RS(224,208)+Block-Code(16,8)	392	626
26	π/2-BPSK	13/21	RS(224,208)+Block-Code(12,8)	392	834
27	π/2-BPSK	52/63	RS(224,208)+SPC(9,8)	392	1112
28	π/2-QPSK	13/28	RS(224,208)+Block-Code(16,8)	392	1251
29	π/2-QPSK	13/21	RS(224,208)+Block-Code(12,8)	392	1668
30	π/2-QPSK	52/63	RS(224,208)+SPC(9,8)	392	2224
31	π/2-QPSK	13/14	RS(224,208)+Block-Code(8,8)	392	2503

20.6.2.2.2 Header encoding and modulation

The DMG low-power SC mode header is encoded and modulated as defined in 20.5.3.1.4.

20.6.2.3 Data field

20.6.2.3.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded and modulated as described in the following subclauses.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

20.6.2.3.2 Scrambler

The operation of the scrambler is defined in 20.3.9. The scrambling of the PSDU continues the scrambling of the header with no reset of the scrambler. The padding bits are also scrambled.

20.6.2.3.3 Encoding

20.6.2.3.3.1 General

Data is encoded using an outer RS(224,208) block code and a short inner code. The inner code is a (16,8) block code for MCSs 25 and 28, a (12,8) block code for MCSs 26 and 29, and a (9,8) single parity check (SPC) block code for MCSs 27 and 30 and the identity block-code for MCS 31. The encoding is further detailed in the following steps:

1) First, the number of block padding bits is calculated:
   a) The total number of Reed Solomon codewords is $N_{RS} = \lceil (Length)/208 \rceil$ and the total number of RS encoded symbols is given by $Length + N_{RS} \times 16$;
   b) After Reed Solomon encoding, the data is encoded with a short block code (N,8) where N can take one of the following values 8, 9, 12, or 16 depending on the MCS as shown in Table 20-21. Therefore:
      i) The total number of encoded bits is $N_{EB} = N \times (Length + N_{RS} \times 16)$;
      ii) The total number of 512 (in length) blocks (each containing 392 data symbols) is $N_{BLKS} = \lceil N_{EB}/(N_{CBPS} \times 392) \rceil$. If BRP PPDU and $N_{BLKS} < N_{BLKS_MIN}$; $N_{BLKS} = N_{BLKS_MIN}$, where $N_{BLKS_MIN} = 18$. The total number of zero block padding bits is $N_{BLK_PAD} = N_{BLKS} \times N_{CBPS} \times 392 - N_{EB}$.
2) The data is broken into blocks of length 208×8 bits (except for possibly the last block).
3) Each block is encoded using the RS(224,208) block code as described in 20.6.2.3.3.2, except perhaps the last block, which is encoded by a shortened version of the code (i.e., if the last block length is K, the shortened block code is RS(16+K,K).
4) The Reed Solomon encoded data stream is further encoded using the block code(N,8) as described in 20.6.2.3.3.3.
5) The coded bit stream is concatenated with N_{BLK_PAD} zeros. They are scrambled with the continuation of the scrambler sequence that scrambled the PSDU input bits.
6) Each set of 7 octets is interleaved using a uniform interleaver of 7 rows and 8 columns. The 7 octets are written row wise and read column wise, i.e., the index i of a bit after interleaving is related to the index k of a bit before interleaving by the following rule:

   $i = 8 \times (k \bmod 7) + \lfloor k/7 \rfloor$, $k = 0, 1, \ldots, 55$

7) The resulting bit stream is modulated and then blocked as described in 20.6.2.3.4 and 20.6.2.3.5.

20.6.2.3.3.2 RS encoding

The RS block code is based on the polynomial

$$g(x) = \prod_{k=1}^{16} (x + a^k)$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where $a = 0x02$ is a root of the primitive polynomial $p(x) = 1 + x^2 + x^3 + x^4 + x^8$. Assume that an octet $b_0 b_1 b_2 b_3 b_4 b_5 b_6 b_7$ (b_0 is the LSB) represented by the polynomial

$$M = b_7 x^7 + b_6 x^6 + b_5 x^5 + b_4 x^4 + b_3 x^3 + b_2 x^2 + b_1 x + b_0 .$$

The RS is a systematic block code. Given a block of octets $\mathbf{m} = (m_{M-1}, m_{M-2}, \ldots m_0)$, the additional parity octets $\mathbf{r} = (r_{15}, r_{14}, \ldots r_0)$ are calculated by setting $r = x^{16}\mathbf{m}(x) \bmod g(x)$, where $\mathbf{r}(x) = \sum_{k=0}^{15} r_k x^k$ and $\mathbf{m}(x) = \sum_{k=0}^{M-1} m_k x^k$ and where the calculation is performed over $GF(2^8)$. The parity octets $\mathbf{r}$ are appended to the uncoded block $\mathbf{m}$ to generate the encoded RS block $m_{M-1}, m_{M-2}, \ldots m_0, r_{15}, r_{14}, \ldots, r_0$.

20.6.2.3.3.3 (N,8) Block-coding

Every octet $\mathbf{b}_{1\times 8} = [b_0 b_1 b_2 b_3 b_4 b_5 b_6 b_7]$ is encoded into an N-bit codeword $\mathbf{c}_{1\times N} = \left[\, \mathbf{b}_{1\times 8} \;\; \mathbf{p}_{1\times(N-8)} \,\right]$ such that $\mathbf{c}_{1\times N} = \mathbf{b}_{1\times 8}\mathbf{G}_{8\times N}$, where the generator matrix $\mathbf{G}_{8\times N}$ is given by the following expressions for $N = 8, 9, 12,$ *and* 16, respectively: G_{8x8} is the identity matrix.

$$\mathbf{G}_{8\times 9} = \begin{bmatrix} 1&0&0&0&0&0&0&0&1 \\ 0&1&0&0&0&0&0&0&1 \\ 0&0&1&0&0&0&0&0&1 \\ 0&0&0&1&0&0&0&0&1 \\ 0&0&0&0&1&0&0&0&1 \\ 0&0&0&0&0&1&0&0&1 \\ 0&0&0&0&0&0&1&0&1 \\ 0&0&0&0&0&0&0&1&1 \end{bmatrix}$$

$$\mathbf{G}_{8\times 12} = \begin{bmatrix} 1&0&0&0&0&0&0&0&1&1&0&0 \\ 0&1&0&0&0&0&0&0&1&0&1&0 \\ 0&0&1&0&0&0&0&0&0&1&0&1 \\ 0&0&0&1&0&0&0&0&0&0&1&1 \\ 0&0&0&0&1&0&0&0&1&0&1&1 \\ 0&0&0&0&0&1&0&0&1&1&0&1 \\ 0&0&0&0&0&0&1&0&1&1&1&0 \\ 0&0&0&0&0&0&0&1&0&1&1&1 \end{bmatrix}$$

$$\mathbf{G}_{8\times 16} = \begin{bmatrix} 1&0&0&0&0&0&0&0&0&1&1&0&1&0&1&0 \\ 0&1&0&0&0&0&0&0&0&0&1&1&0&1&0&1 \\ 0&0&1&0&0&0&0&0&1&0&0&1&1&0&1&0 \\ 0&0&0&1&0&0&0&0&0&1&0&0&1&1&0&1 \\ 0&0&0&0&1&0&0&0&1&0&1&0&0&1&1&0 \\ 0&0&0&0&0&1&0&0&0&1&0&1&0&0&1&1 \\ 0&0&0&0&0&0&1&0&1&0&1&0&1&0&0&1 \\ 0&0&0&0&0&0&0&1&1&1&0&1&0&1&0&0 \end{bmatrix}$$

20.6.2.3.4 Modulation

The same π/2-BPSK described in 20.5.3.2.4.2 and π/2-QPSK described in 20.5.3.2.4.2 are used in the DMG low-power SC mode.

20.6.2.3.5 Blocking

The blocking for the low-power SC is illustrated in Figure 20-15. The data is partitioned into blocks of length 512 wherein each 512-block is constructed from 8 subblocks. Each subblock is of length 64. The first subblock is a G_{64}, which is the π/2-BPSK symbols sequence generated by the 64 point Golay sequence Ga_{64} defined in 20.10. The starting index for the first symbol π/2 rotation is 0, and subblocks 2 to 8 are constructed in the same way, i.e., a data portion of 56 symbols followed by a guard interval of 8 symbols. Note that each 512-block carries 392 symbols of data and 120 symbols of guard.

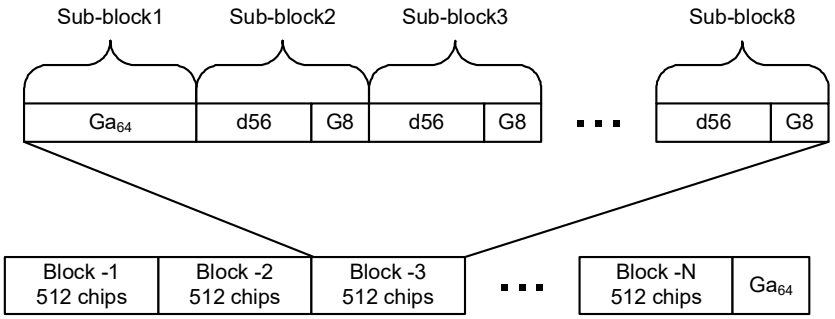

Figure 20-15—Blocking for DMG low-power SC mode

If the Additional PPDU field within the PHY header is equal to 0, the final block transmitted is followed by Ga_{64}. If the Additional PPDU field within the PHY header is equal to 1, the final block transmitted of the last PPDU in an A-PPDU is followed by Ga_{64}.

The G_8 guard interval is a copy of the last 8 samples of Ga_{64}.

NOTE—A STA might estimate the channel impulse response from the CEF, and decides whether to equalize using the 512-block or the short 64-subblock. For example, if the channel impulse response energy is almost concentrated in 8 taps, a 64-equalizer can be used; otherwise, a 512-equalizer is used.

20.7 PHY transmit procedure

The PHY transmit procedure is shown in Figure 20-16. In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 20.11. Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 20.2.2.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

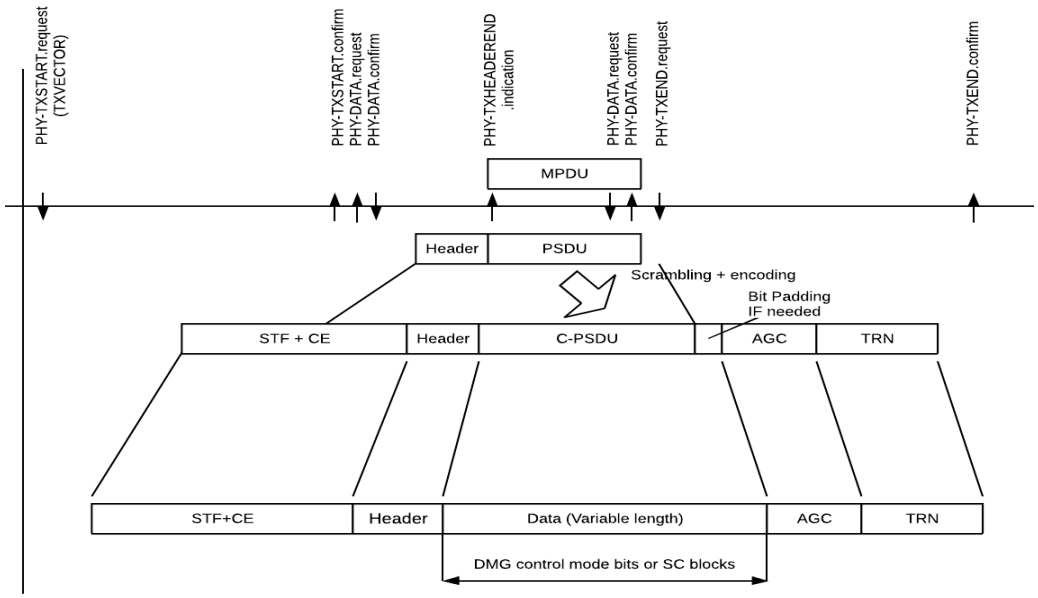

Figure 20-16—PHY transmit procedure

The preamble format (control or SC mode) depend on the MCS in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the packet according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the encoding and transmission of the header according to the parameters of the PHY-TXSTART.request(TXVECTOR) primitive. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 20.4.3.2.3 and 20.5.3.2.3. The encoded data are then modulated as described in 20.4, 20.5, and 20.6, depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN units are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN units. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN unit. The packet transmission shall be completed, and the PHY entity shall enter the receive state. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

A typical transmit state machine is shown in Figure 20-17.

20.8 PHY receive procedure

A typical PHY receive procedure is shown in Figure 20-18.

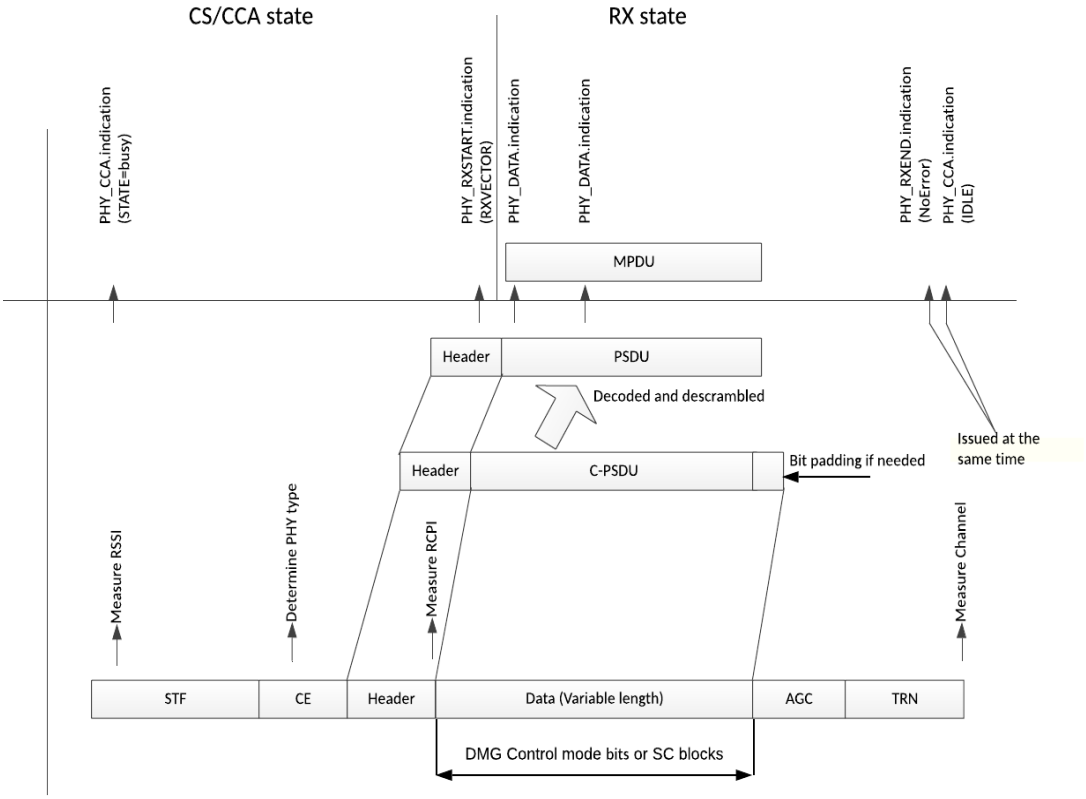

Figure 20-18—PHY receive procedure

Upon receiving the STF, the PHY measures signal strength. This activity is indicated by the PHY to the MAC by issuing a PHY-CCA.indication(BUSY) primitive.

After the PHY-CCA.indication(BUSY) primitive is issued, the PHY entity shall search for the CE field and begin receiving the CE field. The PHY demodulates the header following the reception of the CE field. If the receiver is capable of receiving low-power SC mode, and dot11LowPowerSCPHYActivated is true, then the PHY shall attempt to demodulate both a SC header and an SC low-power header. The PHY shall decode the header and determine the MCS, length and other parameters needed for the demodulation of the packet.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.55 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

At the end of the data portion of a packet that has the Training Length field in the PHY header equal to 0, the PHY shall issue a PHY-RXEND.indication(No_Error) primitive to the MAC. If the Training Length field in the PHY header is greater than 0, the PHY shall continue to receive these training fields after the data portion of the packet and measure the channel. After the end of the training fields, the PHY shall generate a PHY-CCA.indication(IDLE) primitive and the PHY-RXEND.indication(NoError) primitive.

In the case of signal loss before the decoding of the header or in the case of an invalid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below a value that is 20 dB higher than the receive sensitivity of MCS 1. In the case of signal loss after decoding of a valid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the expected end of the packet, including AGC and TRN fields.

A typical receive state machine is shown in Figure 20-19.

20.9 Beamforming

20.9.1 Beamforming concept

Beamforming enables a pair of STAs to train their transmit and receive antennas for subsequent communication. A beamformed link is established following the successful completion of BF training, which is described in 10.42.

DMG STAs use a quasi-omni antenna pattern. The antenna gain of the main beam of a quasi-omni antenna pattern shall be at most 15 dB lower than the antenna gain in the main beam for a directional pattern.

20.9.2 Beamforming frame format

20.9.2.1 Sector-level sweep

PPDUs transmitted during transmit sector sweep are DMG control mode PPDUs. PPDUs transmitted during receive sector sweep are DMG control mode or DMG SC mode PPDUs.

20.9.2.2 Beam refinement

20.9.2.2.1 General

Beam refinement is a process where a STA can improve its antenna configuration (or antenna weight vectors) both for transmission and reception. If the SLS beamforming training did not include an RSS, as in the case where both devices have more than one transmit sector per antenna, beam refinement can serve as the first receive antenna configuration training. The procedure of beam refinement is described in 10.42.6.4.

In the beam refinement procedure, BRP PPDUs are used to train the receiver and transmitter antenna. There are two types of BRP PPDUs: BRP-RX PPDUs and BRP-TX PPDUs:

— BRP-RX PPDUs are PPDUs that have an AGC field and a TRN field following the Data field. These PPDUs enable receiver antenna weight vector training. A BRP-RX PPDU has the header field Training Length greater than zero, PPDU Type equal to zero and Beam Tracking Request (if present) equal to 0.

— BRP-TX PPDUs are PPDUs that have an AGC field and a TRN field following the Data field. The transmitting STA may change antenna configuration at the beginning of each subfield. The receiving STA performs measurements on these subfields and sends feedback to the STA that transmits the BRP-TX PPDU. A BRP-RX PPDU has the header field Training Length greater than zero and PPDU Type equal to 1.

20.9.2.2.2 BRP PPDU structure

Each BRP PPDU is composed of an STF, a CE field, and a data field followed by an AGC field and a TRN field. This is shown in Figure 20-20.

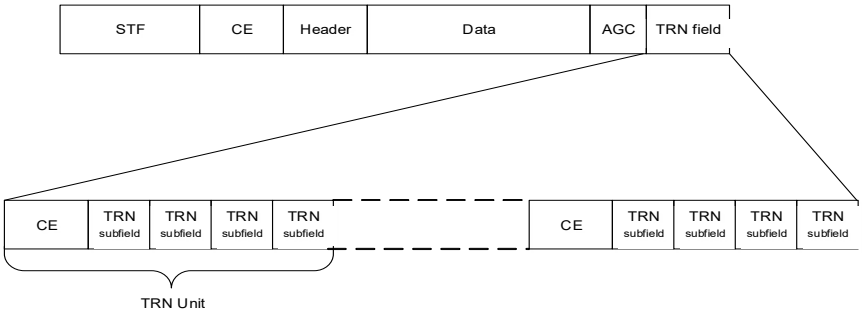

Figure 20-20—BRP PPDU structure

20.9.2.2.3 BRP PPDU header fields

The PPDU Type and Training Length fields present within the SC mode header, control mode header and LP SC mode header are used to indicate that a packet is BRP PPDU and the length of the training fields, respectively.

A value of 0 in both the PPDU Type field and the Beam Tracking Request field indicates a BRP-RX PPDU.

A value of 1 in the PPDU Type field indicates a BRP-TX PPDU.

A value of *N* in the Training Length field indicates 4×*N* AGC subfields and that the TRN-R/T field has *N* TRN Units.

The value *N* in the Training Length field of a BRP-RX PPDU is equal to the value of the L-RX field requested by the intended receiver of the BRP-RX PPDU at a previously received BRP Request field (see 9.5.4).

20.9.2.2.4 BRP PPDU duration

The minimum duration of the data field of a BRP PPDU when sent in an SC mode is aBRPminSCblocks SC blocks (see 20.5.3.2.5) and, if needed, the data field of the packet shall be extended by extra zero padding to generate the required number of SC blocks. Table 20-22 contains the values of N_{CWmin} for each MCS necessary to compute the padding described in 20.5.3.2.3.3.

The minimum duration of the data field of a BRP PPDU when sent with the low-power SC mode is N_{BLKS_MIN} low-power SC blocks (see 20.6.2.3.3).

9.1	π/2-QPSK	2	1	7/8	2695	25
10	π/2-16-QAM	4	1	1/2	3080	46
11	π/2-16-QAM	4	1	5/8	3850	46
12	π/2-16-QAM	4	1	3/4	4620	46
12.1	π/2-16-QAM	4	1	13/16	5005	46
12.2	π/2-16-QAM	4	1	7/8	5390	49
12.3	π/2-64-QAM	6	1	5/8	5775	69
12.4	π/2-64-QAM	6	1	3/4	6930	69
12.5	π/2-64-QAM	6	1	13/16	7507.5	69
12.6	π/2-64-QAM	6	1	7/8	8085	74

20.9.2.2.5 AGC field

The beam refinement AGC field is composed of 4*N* AGC subfields. Each AGC subfield consists of the sequence [Ga_{64} Ga_{64} Ga_{64} Ga_{64} Ga_{64}] when the packet is transmitted using the SC mode and [Gb_{64} Gb_{64} Gb_{64} Gb_{64} Gb_{64}] when the PPDU is transmitted using the control mode. The sequences Ga_{64} and Gb_{64} are defined in 20.10. The sequences are transmitted using rotated π/2-BPSK modulation.

In a BRP-TX PPDU, the transmitter may change the TX AWV configuration at the beginning of each AGC subfield. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Ga64 or Gb64 subsequence. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T subfields. In a BRP-RX PPDU, the transmitter shall use the same TX AWV as in the preamble and data fields of the packet.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

20.9.2.2.6 TRN field

The TRN field enables transmitter and receiver AWV training. The TRN field has the form shown in Figure 20-21.

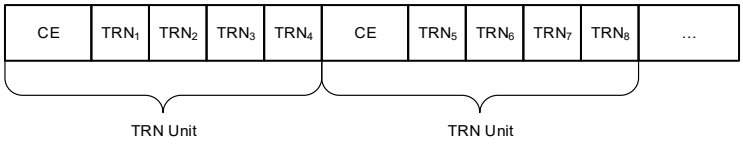

Figure 20-21—TRN field definition

The TRN field is composed of *N* TRN Units. Each TRN Unit is composed of a CE subfield and 4 TRN subfields. Each subfield CE matches the Channel Estimation field defined in 20.3.6.3. The 4N subfields TRN_1 to TRN_{4N} each consist of the sequence [Ga_{128} –Gb_{128} Ga_{128} Gb_{128} Ga_{128}]. The sequences Ga_{128} and Gb_{128} are defined in Table 20-23 and Table 20-24, respectively, in 20.10. The sequences are transmitted using rotated π/2-BPSK modulation.

In a BRP-RX PPDU, all of the TRN and CE subfields are transmitted using the same AWV as the preamble and data field of the packet. In a BRP-TX PPDU, the CE subfield shall be transmitted using the same AWV as the preamble and data field of the packet. In a BRP-TX PPDU, the transmitter may change AWV at the beginning of each TRN subfield. Any transmit signal transients that occur due to TX AWV configuration changes at the beginning of TRN subfields shall settle by the end of the first 64 samples of the subfield.

20.9.2.2.7 Channel measurement

The good autocorrelation properties of the Golay sequence enable reconstructing part of the impulse response of the channel between the transmitter and the receiver. The receiver should find the tap with largest amplitude in the channel during the CE field of the BRP-RX. It selects thereafter the set of taps that is measured around the tap with the largest amplitude, according to dot11ChanMeasFBCKNtaps. It can select a contiguous set of taps or select a noncontiguous set of taps, and include the tap delays subfield as part of the subfield measurement. It then measures the phase and amplitude of the corresponding channel taps in each of the TRN-T subfields (except for those using the CE AWV configuration). The beam refinement feedback subfield k-1 is the relative amplitude and phase of this tap in the k'th repetition compared to this tap in the first TRN-T subfield.

20.10 Golay sequences

The following Golay sequences are used in the preamble, in the single carrier guard interval and in beam refinement TRN-R/T and AGC fields: $Ga_{128}(n)$, $Gb_{128}(n)$, $Ga_{64}(n)$, $Gb_{64}(n)$, $Ga_{32}(n)$, $Gb_{32}(n)$. These are 3 pairs of complementary sequences. The subscript denotes the length of the sequences. These sequences are generated using the following recursive procedure:

$$A_0(n) = \delta(n)$$
$$B_0(n) = \delta(n)$$
$$A_k(n) = W_k A_{k-1}(n) + B_{k-1}(n - D_k)$$
$$B_k(n) = W_k A_{k-1}(n) - B_{k-1}(n - D_k)$$

Copyright © 2021 IEEE. All rights reserved.

where

$$\delta(n) = \begin{cases} 1 & n=0 \\ 0 & \text{otherwise} \end{cases}$$

Note that $A_k(n)$, $B_k(n)$ are zero for n < 0 and for $n \geq 2^k$.

$Ga_{128}(n)=A_7(127-n)$, $Gb_{128}(n)=B_7(127-n)$ when the procedure uses D_k = [1 8 2 4 16 32 64] (k=1,2,…,7) and W_k = [–1 –1 –1 –1 +1 –1 –1].

$Ga_{64}(n)=A_6(63-n)$, $Gb_{64}(n)=B_6(63-n)$ when the procedure uses D_k= [2 1 4 8 16 32] and W_k =[1 1 -1 -1 1 -1].

$Ga_{32}(n)=A_5(31-n)$, $Gb_{32}(n)=B_5(31-n)$ when the procedure uses D_k=[1 4 8 2 16] and W_k =[-1 1 -1 1 -1].

The sequences are defined in Table 20-23 through Table 20-28.

20.11 DMG PLME

20.11.1 PLME SAP sublayer management primitives

Table 20-29 lists the MIB attributes that may be accessed by the PHY entities and the intra-layer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

20.11.2 DMG PHY MIB

All DMG PHY MIB attributes are defined in Annex C, with specific values defined in Table 20-29. The column titled "Operational semantics" in Table 20-29 contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

Table 20-29—DMG PHY MIB attribute default values

dot11LowPowerSCPHYImplemented	Boolean	Static
dot11LowPowerSCPHYActivated	Boolean	Dynamic

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

20.11.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equations.

For the DMG SC mode (N_{TRN} is Training Length field defined in the header):

$$TXTIME = \begin{cases} T_{STF} + T_{CE} + T_{header} + T_{Data} & N_{TRN} = 0 \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, (\alpha \times \beta + \gamma) \times T_C\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and SC} \end{cases}$$

Copyright © 2021 IEEE. All rights reserved.

where

α = aBRPminSCblocks
β = aSCBlockSize
γ = aSCGILength
$T_{TRN-Unit}$ = aBRPTRNBlock $\times T_C$

For the DMG control mode:

$$TXTIME = T_{STF-CM} + T_{CE-CM} + (11 \times 8 + (Length - 6) \times 8 + N_{CW} \times 168) \times T_C \times 32 + N_{TRN} \times T_{TRN-Unit}$$

where N_{CW} calculation is defined in 20.4.3.3.3.

20.11.4 DMG PHY

The static DMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 20-30. The definitions for these characteristics are given in 6.5.4.

Table 20-30—DMG PHY characteristics

PHY parameter	Value
aRIFSTime	1 μs
aSIFSTime	3 μs

21. Very high throughput (VHT) PHY specification

21.1 Introduction

21.1.1 Introduction to the VHT PHY

Clause 21 specifies the PHY entity for a very high throughput (VHT) orthogonal frequency division multiplexing (OFDM) system operating in the 5 GHz band.

In addition to the requirements in Clause 21, a VHT STA shall be capable of transmitting and receiving PPDUs that are compliant with the mandatory PHY specifications defined in Clause 19 in the 5 GHz band.

The VHT PHY is based on the HT PHY defined in Clause 19, which in turn is based on the OFDM PHY defined in Clause 17. The VHT PHY extends the maximum number of space-time streams supported to eight and provides support for downlink multi-user (MU) transmissions. A downlink MU transmission supports up to four users with up to four space-time streams per user with the total number of space-time streams not exceeding eight.

NOTE—MU transmission is different from VHT SU group addressed transmission.

The VHT PHY provides support for 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous channel widths and support for 80+80 MHz noncontiguous channel width.

The VHT PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), 64-QAM, and 256-QAM. Forward error correction (FEC) coding (convolutional or LDPC coding) is used with coding rates of 1/2, 2/3, 3/4, and 5/6.

A VHT STA shall support the following features:

- Non-HT and non-HT duplicate formats (transmit and receive) for all channel widths supported by the VHT STA
- HT-mixed format (transmit and receive)
- VHT format (transmit and receive)
- 20 MHz, 40 MHz, and 80 MHz channel widths
- Single spatial stream VHT-MCSs 0 to 7 (transmit and receive) in all supported channel widths
- BCC coding

A VHT STA may support the following features:

- HT-greenfield format (transmit and receive)
- 2 or more spatial streams (transmit and receive)
- 400 ns short guard interval (transmit and receive)
- Beamforming sounding (by sending a VHT NDP)
- Responding to transmit beamforming sounding (by providing compressed beamforming feedback)
- STBC (transmit and receive)
- LDPC (transmit and receive)
- VHT MU PPDUs (transmit and receive)
- Support for 160 MHz channel width
- Support for 80+80 MHz channel width
- VHT-MCSs 8 and 9 (transmit and receive)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

21.1.2 Scope of VHT PHY services

The services provided to the MAC by the VHT PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of VHT, Clause 19 and Clause 17 PHYs.

21.1.3 VHT PHY functions

21.1.3.1 General

The VHT PHY contains two functional entities: the PHY function and the physical layer management function (i.e., the PLME). Both of these functions are described in detail in 21.3 and 21.4.

The VHT PHY service is provided to the MAC through the PHY service primitives defined in Clause 8. The VHT PHY service interface is described in 21.2.

21.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

21.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

21.1.4 PPDU formats

The structure of the PPDU transmitted by a VHT STA is determined by the TXVECTOR parameters as defined in Table 21-1.

In a VHT STA the FORMAT parameter determines the overall structure of the PPDU and can take one of the following values:

— Non-HT format (NON_HT), based on Clause 17 and including non-HT duplicate format.

— HT-mixed format (HT_MF) as specified in Clause 19.

— HT-greenfield format (HT_GF) as specified in Clause 19.

— VHT format (VHT). PPDUs of this format contain a preamble compatible with Clause 17 and Clause 19 STAs. The non-VHT portion of the VHT format preamble (the parts of VHT preamble preceding the VHT-SIG-A field) is defined so that it can be decoded by these STAs.

NOTE—Required support for these formats is defined in 11.38, 19.1.1, and 21.1.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A VHT PPDU can be further categorized as a VHT SU PPDU or a VHT MU PPDU. A VHT PPDU using a group ID value of 0 or 63 is a VHT SU PPDU and either carries only one PSDU or no PSDU. A VHT PPDU using a group ID value in the range 1 to 62 is a VHT MU PPDU and carries one or more PSDUs to one or more users.

21.2 VHT PHY service interface

21.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

21.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 21-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 21-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: NON_HT indicates OFDM or non-HT duplicate PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. HT_MF indicates HT-mixed format. HT_GF indicates HT-greenfield format. VHT indicates VHT format.	Y	Y
NON_HT_MODULATION	FORMAT is NON_HT	In TXVECTOR, indicates the format type of the transmitted non-HT PPDU. In RXVECTOR, indicates the estimated format type of the received non-HT PPDU. Enumerated type: OFDM indicates OFDM format. NON_HT_DUP_OFDM indicates non-HT duplicate format	Y	Y
	Otherwise	Not present	N	N

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
L_LENGTH	FORMAT is VHT	Not present NOTE—The Length field of the L-SIG in VHT PPDUs is defined in Equation (21-24) using the TXTIME value defined by Equation (21-109) and Equation (21-110), which in turn depend on other parameters including the TXVECTOR parameter APEP_LENGTH.	N	N
	Otherwise	See corresponding entry in Table 19-1		
L_DATARATE	FORMAT is VHT	Not present NOTE—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6.	N	N
	Otherwise	See corresponding entry in Table 19-1		
LSIGVALID	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
SERVICE	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
SMOOTHING	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
AGGREGATION	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NUM_EXTEN_SS	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
ANTENNA_SET	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
N_TX	FORMAT is VHT	Indicates the number of transmit chains.	Y	N
	Otherwise	See corresponding entry in Table 19-1		
EXPANSION_MAT_TYPE	FORMAT is VHT and EXPANSION_MAT is present.	Set to COMPRESSED_SV	Y	N
	Otherwise	See corresponding entry in Table 19-1		
EXPANSION_MAT	FORMAT is VHT	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 21.3.11.2 based on the channel measured during the training symbols of a previous VHT NDP.	M U	N
	Otherwise	See corresponding entry in Table 19-1

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CHAN_MAT_TYPE	FORMAT is VHT and PSDU_LENGTH equals 0	Set to COMPRESSED_SV	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than 0	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
CHAN_MAT	FORMAT is VHT and PSDU_LENGTH equals 0	Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 based on the channel measured during the training symbols of the received VHT NDP.	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than 0	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
DELTA_SNR	FORMAT is VHT	Contains an array of delta SNR values as defined in 9.4.1.51 based on the channel measured during the training symbols of the received VHT NDP. NOTE—In the RXVECTOR this parameter is present only for VHT NDPs for MU sounding.	M U	Y
	Otherwise	Not present	N	N
SNR	FORMAT is VHT	Contains an array of received SNR measurements for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.49	N	Y
	Otherwise	See corresponding entry in Table 19-1		
NO_SIG_EXTN	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
FEC_CODING	FORMAT is VHT	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	M U	Y
	Otherwise	See corresponding entry in Table 19-1		

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
STBC	FORMAT is VHT	Indicates whether STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field). This parameter is 0 for a VHT MU PPDU.	Y	Y
	Otherwise	See corresponding entry in Table 19-1		
GI_TYPE	FORMAT is VHT	Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU.	Y	Y
	Otherwise	See corresponding entry in Table 19-1		
TXPWR_LEVEL_INDEX	FORMAT is VHT	The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to *N*/2, where *N* is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission.	Y	N
	Otherwise	See corresponding entry in Table 19-1		
RSSI	FORMAT is VHT	The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the VHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
	Otherwise	See corresponding entry in Table 19-1		
MCS	FORMAT is VHT	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9	M U	Y
	Otherwise	See corresponding entry in Table 19-1		
REC_MCS	FORMAT is HT_MF, HT_GF or VHT	Indicates the MCS that the STA's receiver recommends.	N	O
	Otherwise	Not present	N	N

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH	FORMAT is HT_MF or HT_GF	See corresponding entry in Table 19-1		
	FORMAT is VHT	Indicates the channel width of the transmitted PPDU: Enumerated type: CBW20 for 20 MHz CBW40 for 40 MHz CBW80 for 80 MHz CBW160 for 160 MHz CBW80+80 for 80+80 MHz	Y	Y
	FORMAT is NON_HT	In TXVECTOR, indicates the channel width of the transmitted PPDU. In RXVECTOR, indicates the estimated channel width of the received PPDU. Enumerated type: CBW40, CBW80, CBW160, or CBW80+80 if NON_HT_MODULATION equals NON_HT_DUP_OFDM CBW20 if NON_HT_MODULATION equals OFDM NOTE—On reception, where valid, the CH_BANDWIDTH_IN_NON_HT parameter is likely to be a more reliable indication of subformat and channel width than the NON_HT_MODULATION and CH_BANDWIDTH parameters, since for non-HT or non-HT duplicate frames, CH_BANDWIDTH is a receiver estimate of the bandwidth, whereas CH_BANDWIDTH_IN_NON_HT is the signaled bandwidth.	Y	Y
DYN_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. In RXVECTOR, if valid, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. Enumerated type: Static if the transmitter is capable of Static bandwidth operation Dynamic if the transmitter is capable of Dynamic bandwidth operation NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present	N	N

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: CBW20, CBW40, CBW80, CBW160, CBW80+80 NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the currently received MPDU (e.g., RTS) or the previous MPDU in an exchange (e.g., the RTS preceding a CTS).	O	Y
	Otherwise	Not present	N	N
LENGTH	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
APEP_LENGTH	FORMAT is VHT	If equal to 0, indicates a VHT NDP for both RXVECTOR and TXVECTOR. If greater than 0 in the TXVECTOR, indicates the number of octets in the range 1 to 1 048 575 in the A-MPDU pre-EOF padding (see 10.12.2) carried in the PSDU. If greater than 0 in the RXVECTOR, this parameter is the value obtained from the VHT-SIG-B Length field multiplied by 4.	M U	O
	Otherwise	Not present	N	N
PSDU_LENGTH	FORMAT is VHT	Indicates the number of octets in the VHT PSDU in the range 0 to aPSDUMaxLength octets (see Table 21-28). A value of 0 indicates a VHT NDP.	N	Y
	Otherwise	Not present	N	N
USER_POSITION	FORMAT is VHT and $1 \leq$ GROUP_ID ≤ 62	User position in MU transmission using the group ID GROUP_ID. Integer range: 0-3. NOTE—The entries in the USER_POSITION array are in ascending order.	M U	O
	Otherwise	Not present	N	N

Copyright © 2021 IEEE. All rights reserved.

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NUM_STS	FORMAT is VHT	Indicates the number of space-time streams. Integer: range 1-8 for SU, 1-4 per user in the TXVECTOR and 0-4 in the RXVECTOR for MU. NUM_STS summed over all users is in the range 1 to 8.	M U	Y
	Otherwise	Not present	N	N
GROUP_ID	FORMAT is VHT	Indicates the group ID. Integer: range 0-63 (see Table 21-12) A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU.	Y	Y
	Otherwise	Not present	N	N
PARTIAL_AID	FORMAT is VHT and GROUP_ID is 0 or 63	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19). Integer: range 0-511.	Y	Y
	Otherwise	Not present	N	N
NUM_USERS	FORMAT is VHT	Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4.	Y	N
	Otherwise	Not present	N	N
BEAMFORMED	FORMAT is VHT and GROUP_ID is 0 or 63	Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise. NOTE—When BEAMFORMED is set to 1, frequency domain smoothing as part of channel estimation is not recommended.	Y	O
	Otherwise	Not present	N	N
TXOP_PS_NOT_ALLOWED	FORMAT is VHT	Indicates whether a VHT AP allows non-AP VHT STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the VHT AP allows non-AP VHT STAs to enter doze state during a TXOP. 1 indicates that the VHT AP does not allow non-AP VHT STAs to enter doze state during a TXOP.	Y	Y
	Otherwise	Not present	N	N

Table 21-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
TIME_OF_DEPARTURE_REQUESTED		See corresponding entry in Table 19-1		
RX_START_OF_FRAME_OFFSET	dot11TimingMsmtActivated is true	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	Y
	Otherwise	Not present	N	N

NOTE—In the TXVECTOR and RXVECTOR columns, the following apply:
Y indicates that the parameter is always present in that vector;
N indicates that the parameter is never present in that vector;
O indicates that the parameter's presence is an implementation option;
MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS-1.

21.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CHANNEL_WIDTH parameter, which identifies the operating channel width and takes one of the values 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz. The PHY shall set dot11CurrentChannelWidth to the value of this parameter.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CENTER_FREQUENCY_SEGMENT_0 parameter, which identifies the center frequency of the channel (or of segment 0 if the CHANNEL_WIDTH parameter indicates 80+80 MHz) and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex0 to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CENTER_FREQUENCY_SEGMENT_1 parameter, which takes the value 0 if the CHANNEL_WIDTH parameter does not indicate 80+80 MHz, and otherwise identifies the center frequency of segment 1 and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex1 to the value of this parameter.

21.2.4 Effects of CH_BANDWIDTH parameter on PPDU format

Table 21-2 shows the valid combinations of the FORMAT, NON_HT_MODULATION, and CH_BANDWIDTH parameters and the corresponding PPDU format and value of CH_OFFSET (if applicable). Other combinations are reserved.

Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
VHT	N/A	CBW20	N/A	The STA transmits a VHT PPDU (when FORMAT is VHT) of 20 MHz bandwidth. If the BSS bandwidth is wider than 20 MHz, then the transmission shall use the primary 20 MHz channel.
VHT	N/A	CBW40	N/A	The STA transmits a VHT PPDU (when FORMAT is VHT) of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel.
HT_MF or HT_GF	N/A	HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR > 20 MHz and $f_{S20, idx} < f_{P20, idx}$	CH_OFF_20U	The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. The transmission shall use the primary 20 MHz channel.
HT_MF or HT_GF	N/A	HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR > 20 MHz and $f_{S20, idx} > f_{P20, idx}$	CH_OFF_20L	The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. The transmission shall use the primary 20 MHz channel.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters *(continued)*

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
HT_MF or HT_GF	N/A	HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR = 20 MHz	CH_OFF_20	The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth.
HT_MF or HT_GF	N/A	HT_CBW40	CH_OFF_40	The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel.
VHT	N/A	CBW80		The STA transmits a VHT PPDU of 80 MHz bandwidth. If the BSS bandwidth is 160 MHz or 80+80 MHz, then the transmission shall use the primary 80 MHz channel.
VHT	N/A	CBW160		The STA transmits a VHT PPDU of 160 MHz bandwidth.
VHT	N/A	CBW80+80		The STA transmits a VHT PPDU of 80+80 MHz bandwidth.
NON_HT	OFDM	CBW20		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to OFDM using the primary 20 MHz channel as defined in Clause 17.
NON_HT	NON_HT_DUP_ OFDM	CBW40		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent 20 MHz channels as defined in 21.3.10.12. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel. The one 20 MHz channel higher in frequency is rotated +90º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-15).

Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters *(continued)*

FORMAT	NON_HT_ MODULATION	CH_BANDWIDTH	CH_OFFSET	PPDU format
NON_HT	NON_HT_DUP_ OFDM	CBW80		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent 20 MHz channels as defined in 21.3.10.12. If the BSS bandwidth is 160 MHz or 80+80 MHz, then the transmission shall use the primary 80 MHz channel. The three 20 MHz channels higher in frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-16).
NON_HT	NON_HT_DUP_ OFDM	CBW160		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using eight adjacent 20 MHz channels as defined in 21.3.10.12. The second, third, fourth, sixth, seventh, and eighth 20 MHz channels in the order of increasing frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-17).
NON_HT	NON_HT_DUP_ OFDM	CBW80+80		The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of four adjacent 20 MHz channels as defined in 21.3.10.12. In each frequency segment, the three 20 MHz channels higher in frequency are rotated +180º relative to the 20 MHz channel lowest in frequency as defined in Equation (21-16).

21.2.5 Support for NON_HT and HT formats

21.2.5.1 General

A VHT STA logically contains Clause 17, Clause 19, and Clause 21 PHYs. The MAC interfaces to the PHYs via the Clause 21 PHY service interface, which in turn interacts with the Clause 17 and Clause 19 PHY service interfaces as shown in Figure 21-1, Figure 21-2, and Figure 21-3.

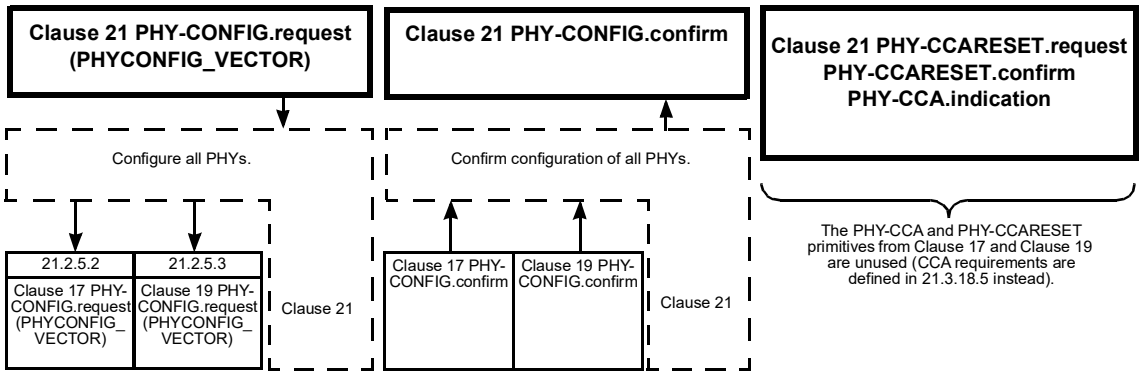

Figure 21-3—PHY-CONFIG and CCA interaction with Clause 17, Clause 19, and Clause 21 PHYs

21.2.5.2 Support for NON_HT format when NON_HT_MODULATION is OFDM

When a PHY-TXSTART.request(TXVECTOR) primitive with the FORMAT parameter equal to NON_HT and the NON_HT_MODULATION parameter equal to OFDM is issued, the behavior of the VHT PHY is defined in Clause 17 with additional requirements described in the following subclauses:

— 21.3.9.1
— 21.3.17.1 instead of 17.3.9.3
— 21.3.17.4.2 instead of 17.3.9.7.2

where the Clause 21 TXVECTOR parameters in Table 21-1 are mapped to Clause 17 TXVECTOR parameters in Table 17-1 according to Table 21-3.

NOTE—When the FORMAT parameter is set to NON_HT and the NON_HT_MODULATION parameter is set to NON_HT_DUP_OFDM in a PHY-TXSTART.request(TXVECTOR) primitive, the behavior of the VHT PHY is defined in Clause 21.

When the VHT PHY receives a Clause 21 PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the VHT PHY shall, for the purposes of OFDM PPDU transmission and reception, behave as if it were a Clause 17 PHY that had received a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but with the CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1 parameters discarded from PHYCONFIG_VECTOR.

As defined in 21.3.20, once a PPDU is received and detected as a NON_HT PPDU, the behavior of the VHT PHY is defined in Clause 17. The RXVECTOR parameters from the Clause 17 PHY-RXSTART.indication primitive are mapped to the Clause 21 RXVECTOR parameters as defined in Table 21-3. VHT PHY parameters not listed in the table are not present.

Table 21-3—Mapping of VHT PHY parameters for NON_HT operation

VHT PHY Parameter	5 GHz operation defined by Clause 17	Parameter List
L_LENGTH	LENGTH	TXVECTOR/RXVECTOR
L_DATARATE	DATARATE	TXVECTOR/RXVECTOR
TXPWR_LEVEL_INDEX	TXPWR_LEVEL_INDEX	TXVECTOR
RSSI	RSSI	RXVECTOR
SERVICE	SERVICE	TXVECTOR/RXVECTOR
CH_BANDWIDTH_IN_NON_HT	CH_BANDWIDTH_IN_NON_HT	TXVECTOR/RXVECTOR
DYN_BANDWIDTH_IN_NON_HT	DYN_BANDWIDTH_IN_NON_HT	TXVECTOR/RXVECTOR
OPERATING_CHANNEL	OPERATING_CHANNEL	PHYCONFIG_VECTOR
CHANNEL_WIDTH	discarded	PHYCONFIG_VECTOR
CENTER_FREQUENCY_SEGMENT_0	discarded	PHYCONFIG_VECTOR
CENTER_FREQUENCY_SEGMENT_1	discarded	PHYCONFIG_VECTOR

21.2.5.3 Support for HT formats

When a PHY-TXSTART.request(TXVECTOR) primitive is received with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, the behavior of the PHY is defined by Clause 19 with additional requirements defined in the following subclauses:

— 21.3.9.2
— 21.3.17.1 instead of 19.3.18.1
— 21.3.17.4.2 instead of 19.3.18.4

The Clause 21 TXVECTOR parameters in Table 21-1 are mapped directly to Clause 19 TXVECTOR parameters in Table 19-1 and the Clause 19 PHY-TXSTART.request(TXVECTOR) primitive is issued. The PHY shall use a value of CH_OFFSET in the Clause 19 TXVECTOR that is consistent with Table 21-2.

When the VHT PHY receives a Clause 21 PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the VHT PHY shall, for the purposes of HT PPDU transmission and reception, behave as if it were a Clause 19 PHY that had received PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but with the CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1 parameters discarded from the PHYCONFIG_VECTOR and the SECONDARY_CHANNEL_OFFSET parameter set to SECONDARY_CHANNEL_NONE if dot11CurrentChannelWidth indicates 20 MHz, to SECONDARY_CHANNEL_ABOVE if $f_{\mathrm{P20,\,idx}} < f_{\mathrm{S20,\,idx}}$, or to SECONDARY_CHANNEL_BELOW otherwise.

As defined in 21.3.20, once a PPDU is received and detected as an HT PPDU, the behavior of the VHT PHY is defined in Clause 19. The RXVECTOR parameters in Table 19-1 from the Clause 19 PHY-RXSTART.indication primitive are mapped directly to the RXVECTOR parameters in Table 21-1 and a Clause 21 PHY-RXSTART.indication primitive is issued.

21.2.6 TXSTATUS parameters

The parameters listed in Table 19-4 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

21.3 VHT PHY

21.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a PSDU (in the SU case) or one or more PSDUs (in the MU case) are processed (i.e., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in the detection, demodulation, and delivery of the PSDU.

Pre-VHT modulated fields refer to the L-STF, L-LTF, L-SIG, and VHT-SIG-A fields, while VHT modulated fields refer to the VHT-STF, VHT-LTF, VHT-SIG-B, and Data fields (see Figure 21-17).

21.3.2 VHT PPDU format

A single PPDU format is defined for this PHY: the VHT PPDU format. Figure 21-4 shows the VHT PPDU format.

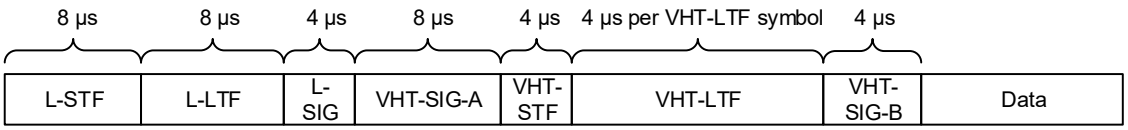

Figure 21-4—VHT PPDU format

The fields of the VHT PPDU format are summarized in Table 21-4.

Table 21-4—Fields of the VHT PPDU

Field	Description
L-STF	Non-HT Short Training field
L-LTF	Non-HT Long Training field
L-SIG	Non-HT SIGNAL field
VHT-SIG-A	VHT Signal A field
VHT-STF	VHT Short Training field
VHT-LTF	VHT Long Training field
VHT-SIG-B	VHT Signal B field
Data	The Data field carrying the PSDU(s)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields exist only in VHT PPDUs. In a VHT NDP the Data field is not present. The number of symbols in the VHT-LTF field, $N_{VHT\text{-}LTF}$, can be either 1, 2, 4, 6, or 8 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU (see Table 21-13).

21.3.3 Transmitter block diagram

The generation of each field in a VHT PPDU uses many of the following blocks:

a) PHY padding
b) Scrambler
c) BCC encoder parser
d) FEC (BCC or LDPC) encoders
e) Stream parser
f) Segment parser (for 160 MHz and 80+80 MHz transmissions)
g) BCC interleaver
h) Constellation mapper
i) Pilot insertion
j) Replicate over multiple 20 MHz (if BW > 20 MHz)
k) Multiply by first column of $P_{VHT\text{-}LTF}$
l) LDPC tone mapper
m) Segment deparser
n) Space time block code (STBC) encoder
o) Cyclic shift diversity (CSD) per STS insertion
p) Spatial mapper
q) Inverse discrete Fourier transform (IDFT)
r) Cyclic shift diversity (CSD) per chain insertion
s) Guard interval (GI) insertion
t) Windowing

Figure 21-5 to Figure 21-16 show example transmitter block diagrams. The actual structure of the transmitter is implementation dependent. In particular, Figure 21-5 shows the transmit process for the L-SIG and VHT-SIG-A fields of a VHT PPDU using one frequency segment. These transmit blocks are also used to generate L-STF and L-LTF fields, except that the BCC encoder and interleaver are not used for these fields.

Figure 21-6 and Figure 21-7 show the transmit process for generating the VHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU, respectively, in 20 MHz, 40 MHz, and 80 MHz channel widths. Figure 21-8 and Figure 21-9 show the transmit process for generating the VHT_SIG-B field of a 160 MHz and 80+80 MHz VHT SU PPDU, respectively.

Figure 21-10 shows the transmitter blocks used to generate the Data field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU with BCC encoding. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the VHT-LTF fields. This is illustrated in Figure 21-21. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the VHT-STF field but without the multiplication by $A^{k}_{VHT\text{-}LTF}$ [defined in Equation (21-40)].

21.3.4 Overview of the PPDU encoding process

21.3.4.1 General

This subclause provides an overview of the VHT PPDU encoding process.

21.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 21.3.8.2.2 with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the L-STF sequence over the CH_BANDWIDTH as described in 21.3.8.2.2.

c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

d) IDFT: Compute the inverse discrete Fourier transform.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in 21.3.8.2.3 with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the L-LTF sequence over the CH_BANDWIDTH as described in 21.3.8.2.3.

c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

d) IDFT: Compute the inverse discrete Fourier transform.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.

f) Insert GI and apply windowing: Prepend a GI ($2 \times$ LONG_GI) and apply windowing as described in 21.3.7.4.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 21.3.8.2.4 with the following highlights:

a) In a VHT PPDU set the RATE subfield in the SIGNAL field to 6 Mb/s. Set the Length, Parity, and Tail bits in the SIGNAL field as described in 21.3.8.2.4.

b) BCC encoder: Encode the SIGNAL field by a convolutional encoder at the rate of R=1/2 as described in 21.3.10.5.3.

c) BCC interleaver: Interleave as described in 21.3.10.8.

d) Constellation Mapper: BPSK modulate as described in 21.3.10.9.

e) Pilot insertion: Insert pilots as described in 21.3.10.11.

f) Duplication and phase rotation: Duplicate the L-SIG field over each 20 MHz of the CH_BANDWIDTH. Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

21.3.4.5 Construction of VHT-SIG-A

The VHT-SIG-A field consists of two symbols, VHT-SIG-A1 and VHT-SIG-A2, as defined in 21.3.8.3.3 and is constructed as follows:

a) Obtain the CH_BANDWIDTH, STBC, GROUP_ID, PARTIAL_AID (SU only), NUM_STS, GI_TYPE, FEC_CODING, MCS (SU only), BEAMFORMED (SU only), NUM_USERS, and TXOP_PS_NOT_ALLOWED from the TXVECTOR. Add the reserved bits, append the calculated CRC, then append the N_{tail} tail bits as shown in 21.3.8.3.3. This results in 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6

c) BCC interleaver: Interleave as described in 17.3.5.7.

d) Constellation mapper: BPSK modulate the first 48 interleaved bits as described in 17.3.5.8 to form the first symbol of VHT-SIG-A. BPSK modulate the second 48 interleaved bits and rotate by 90° counter-clockwise relative to the first symbol to form the second symbol of VHT-SIG-A.

e) Pilot insertion: Insert pilots as described in 17.3.5.9.

f) Duplication and phase rotation: Duplicate VHT-SIG-A1 and VHT-SIG-A2 over each 20 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.6 Construction of VHT-STF

The VHT-STF field is defined in 21.3.8.3.4 and is constructed as follows:

a) Sequence generation: Generate the VHT-STF in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 21.3.8.3.4.

b) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.

d) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.

e) IDFT: Compute the inverse discrete Fourier transform.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.7 Construction of VHT-LTF

The VHT-LTF field is defined in 21.3.8.3.5 and constructed as follows:

a) Sequence generation: Generate the VHT-LTF sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 21.3.8.3.5.

b) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

c) $A_{VHT\text{-}LTF}$ matrix mapping: Apply the $P_{VHT\text{-}LTF}$ matrix to the data tones of the VHT-LTF sequence and apply the $R_{VHT\text{-}LTF}$ matrix to the pilot tones as described in 21.3.8.3.5.

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.

e) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.8 Construction of VHT-SIG-B

The VHT-SIG-B field is constructed per-user as follows:

a) Obtain the VHT-MCS (for MU only) and APEP_LENGTH from the TXVECTOR.

b) VHT-SIG-B bits: Set the VHT-MCS (for MU only) and VHT-SIG-B Length field as described in 21.3.8.3.6. Add the reserved bits (for SU only) and N_{tail} bits of tail. In an NDP set VHT-SIG-B to the fixed bit pattern for the bandwidth used as described in 21.3.8.3.6.

c) VHT-SIG-B Bit Repetition: Repeat the VHT-SIG-B bits as a function of CH_BANDWIDTH as defined in 21.3.8.3.6.

d) BCC encoder: Encode the VHT-SIG-B field using BCC at rate R=1/2 as described in 17.3.5.6.

e) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of the BCC encoder into two frequency subblocks as described in 21.3.10.7. This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

f) BCC interleaver: Interleave as described in 21.3.10.8.

g) Constellation mapper: Map to a BPSK constellation as defined in 17.3.5.8.

h) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3. This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

i) Pilot insertion: Insert pilots following the steps described in 21.3.10.10.

j) $P_{VHT\text{-}LTF}$ matrix mapping: Apply the mapping of the first column of the $P_{VHT\text{-}LTF}$ matrix to the data subcarriers as described in 21.3.8.3.6. The total number of data and pilot subcarriers is the same as in the Data field.

k) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.

l) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.

m) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

n) IDFT: Compute the inverse discrete Fourier transform.

o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

p) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.9 Construction of the Data field in a VHT SU PPDU

21.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as follows:

a) Insert the CRC calculated for VHT-SIG-B in the SERVICE field as described in 21.3.10.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits and tail bits to the PSDU.

c) Scrambler: Scramble the PHY padded data.

d) BCC encoder: Divide the scrambled bits between the encoders by sending bits to different encoders in a round robin manner. The number of encoders is determined by rate-dependent parameters described in 21.5. BCC encode as described in 21.3.10.5.2 and 21.3.10.5.3.

e) Stream parser: Rearrange the output of the BCC encoders into blocks as described in 21.3.10.6.

f) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 21.3.10.7. This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

g) BCC interleaver: Interleave as described in 21.3.10.8.

h) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, or 256-QAM constellation points as described in 21.3.10.9.

i) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3. This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

j) STBC: Apply STBC as described in 21.3.10.9.4.

k) Pilot insertion: Insert pilots following the steps described in 21.3.10.10.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.

m) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.

n) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4.

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as follows:

a) Insert the CRC calculated for VHT-SIG-B in the SERVICE field as described in 21.3.10.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU. There are no tail bits.

c) Scrambler: Scramble the PHY padded data.

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the APEP_LENGTH in the TXVECTOR as described in 21.3.10.5.4.

e) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 21.3.10.6.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

f) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 21.3.10.7. This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.

g) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM or 256-QAM constellation points as described in 21.3.10.9.

h) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 21.3.10.9.2.

i) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3. This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.

j) STBC: Apply STBC as described in 21.3.10.9.4.

k) Pilot insertion: Insert pilots following the steps described in 21.3.10.10.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.

m) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.

n) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4.

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.10 Construction of the Data field in a VHT MU PPDU

21.3.4.10.1 General

In an MU transmission, the PPDU encoding process is performed independently on a per-user basis up to the input of the Spatial Mapping block, except that CSD is performed with a knowledge of the space time stream starting index for that user. All user data is combined and mapped to the transmit chains in the Spatial Mapping block.

21.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using steps a) to k) in 21.3.4.9.1, then applying CSD for a VHT MU PPDU (as described in 21.3.8.3.2).

21.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using steps a) to k) in 21.3.4.9.2, then applying CSD as for a VHT MU PPDU (as described in 21.3.8.3.2).

21.3.4.10.4 Combining to form a VHT MU PPDU

The per-user data is combined as follows:

a) Spatial Mapping: The Q matrix is applied as described in 21.3.10.11.1. The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

c) IDFT: Compute the inverse discrete Fourier transform.

d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4.

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.5 VHT modulation and coding scheme (VHT-MCS)

The VHT-MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the VHT-SIG-A field for VHT SU PPDUs and in the VHT-SIG-B field for VHT MU PPDUs. Rate-dependent parameters for the full set of VHT-MCSs are shown in Table 21-29 to Table 21-60 (in 21.5). These tables give rate-dependent parameters for VHT-MCSs with indices 0 to 9, with number of spatial streams from 1 to 8 and bandwidth options of 20 MHz, 40 MHz, 80 MHz, and either 160 MHz or 80+80 MHz. Equal modulation (EQM) is applied to all streams for a particular user.

21.3.6 Timing-related parameters

Refer to Table 19-6 for timing-related parameters for non-VHT formats.

Table 21-5 defines the timing-related parameters for VHT format.

Table 21-5—Timing-related constants

Parameter	CBW20	CBW40	CBW80	CBW80+80	CBW160	Description
N_{SD}	52	108	234	234	468	Number of complex data numbers per frequency segment
N_{SP}	4	6	8	8	16	Number of pilot values per frequency segment
N_{ST}	56	114	242	242	484	Total number of subcarriers per frequency segment. See NOTE.
N_{SR}	28	58	122	122	250	Highest data subcarrier index per frequency segment
N_{Seg}	1	1	1	2	1	Number of frequency segments
Δ_F	312.5 kHz					Subcarrier frequency spacing
T_{DFT}	3.2 μs					IDFT/DFT period
T_{GI}	0.8 μs = T_{DFT}/4					Guard interval duration
T_{GI2}	1.6 μs					Double guard interval

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 21-5—Timing-related constants *(continued)*

Parameter	CBW20	CBW40	CBW80	CBW80+80	CBW160	Description
T_{GIS}	0.4 μs = T_{DFT}/8					Short guard interval duration
T_{SYML}	4 μs = T_{DFT} + T_{GI} = 1.25 × T_{DFT}					Long GI symbol interval
T_{SYMS}	3.6 μs = T_{DFT} + T_{GIS} = 1.125 × T_{DFT}					Short GI symbol interval
T_{SYM}	T_{SYML} or T_{SYMS} depending on the GI used (see Table 21-8)					Symbol interval
$T_{L\text{-}STF}$	8 μs = 10 x T_{DFT}/4					Non-HT Short Training field duration
$T_{L\text{-}LTF}$	8 μs = 2 x T_{DFT} + T_{GI2}					Non-HT Long Training field duration
$T_{L\text{-}SIG}$	4 μs = T_{SYML}					Non-HT SIGNAL field duration
$T_{VHT\text{-}SIG\text{-}A}$	8 μs = 2T_{SYML}					VHT Signal A field duration
$T_{VHT\text{-}STF}$	4 μs = T_{SYML}					VHT Short Training field duration
$T_{VHT\text{-}LTF}$	4 μs = T_{SYML}					Duration of each VHT-LTF symbol
$T_{VHT\text{-}SIG\text{-}B}$	4 μs = T_{SYML}					VHT Signal B field duration
$N_{service}$	16					Number of bits in the SERVICE field
N_{tail}	6					Number of tail bits per BCC encoder

NOTE—$N_{ST} = N_{SD} + N_{SP}$

Table 21-6 defines parameters used frequently in Clause 21.

Table 21-6—Frequently used parameters

Symbol	Explanation
N_{CBPS}, $N_{CBPS,u}$	Number of coded bits per symbol for user u, $u = 0, ..., N_{user}–1$. For a VHT SU PPDU, $N_{CBPS} = N_{CBPS,0}$ For a VHT MU PPDU, N_{CBPS} is undefined
N_{CBPSS}, $N_{CBPSS,u}$	Number of coded bits per symbol per spatial stream. For the VHT-SIG-B field, N_{CBPSS} is common for all users. $N_{CBPSS} = \begin{cases} N_{SD}, \text{ for a 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDU} \\ 2N_{SD}, \text{ for an 80+80 MHz PPDU} \end{cases}$ for all users. For the Data field, $N_{CBPSS,u}$ equals the number of coded bits per symbol per spatial stream for user u, $u = 0, ..., N_{user}–1$. For the Data field of a VHT SU PPDU, $N_{CBPSS} = N_{CBPSS,0}$ For the Data field of a VHT MU PPDU, N_{CBPSS} is undefined
N_{CBPSSI}, $N_{CBPSSI,u}$	Number of coded bits per symbol per spatial stream per BCC interleaver block. For a VHT SU PPDU, $N_{CBPSSI} = \begin{cases} N_{CBPSS}, \text{ for a 20 MHz, 40 MHz, or 80 MHz PPDU} \\ \frac{N_{CBPSS}}{2}, \text{ for a 160 MHz or 80+80 MHz PPDU} \end{cases}$ For a VHT MU PPDU for user u, $u = 0, ..., N_{user}–1$ $N_{CBPSSI,u} = \begin{cases} N_{CBPSS,u}, \text{ for a 20 MHz, 40 MHz, or 80 MHz PPDU} \\ \frac{N_{CBPSS,u}}{2}, \text{ for a 160 MHz or 80+80 MHz PPDU} \end{cases}$ For a VHT MU PPDU, N_{CBPSSI} is undefined.
N_{DBPS}, $N_{DBPS,u}$	Number of data bits per symbol for user u, $u = 0, ..., N_{user}–1$. For a VHT SU PPDU, $N_{DBPS} = N_{DBPS,0}$ For a VHT MU PPDU, N_{DBPS} is undefined
N_{BPSCS}, $N_{BPSCS,u}$	Number of coded bits per subcarrier per spatial stream for user u, $u = 0, ..., N_{user}–1$. For a VHT SU PPDU, $N_{BPSCS} = N_{BPSCS,0}$ For a VHT MU PPDU, N_{BPSCS} is undefined
N_{RX}	Number of receive chains
N_{user}	For pre-VHT modulated fields, $N_{user} = 1$. For VHT modulated fields, N_{user} represents the number of users in the transmission (equal to the TXVECTOR parameter NUM_USERS).
N_{STS}, $N_{STS,u}$	For pre-VHT modulated fields, $N_{STS,u} = 1$ (see NOTE). For VHT modulated fields, $N_{STS,u}$ is the number of space-time streams for user u, $u = 0, ..., N_{user}–1$. For a VHT SU PPDU, $N_{STS} = N_{STS,0}$. For a VHT MU PPDU, N_{STS} is undefined.

Table 21-6—Frequently used parameters *(continued)*

Symbol	Explanation
$N_{STS,total}$	For VHT modulated fields, $N_{STS,total}$ is the total number of space-time streams in a PPDU. $N_{STS,\,total} = \sum_{u=0}^{N_{user}-1} N_{STS,\,u}$ For pre-VHT modulated fields, $N_{STS,total}$ is undefined. Note that $N_{STS,total} = N_{STS}$ for a VHT SU PPDU.
N_{SS}, $N_{SS,u}$	Number of spatial streams. For the VHT-SIG-B field, $N_{SS} = 1$ for each user. For the Data field, $N_{SS,u}$ is the number of spatial streams for user u, $u = 0,\ldots, N_{user}-1$. For the Data field of a VHT SU PPDU, $N_{SS} = N_{SS,0}$. For the Data field of a VHT MU PPDU, N_{SS} is undefined.
N_{TX}	Number of transmit chains
N_{ES}, $N_{ES,u}$	The number of BCC encoders. For the VHT-SIG-B field, $N_{ES} = 1$ for each user. For a Data field encoded using BCC, $N_{ES,u}$ is the number of BCC encoders for user u, $u = 0,\ldots, N_{user}-1$. For the Data field encoded using LDPC, $N_{ES} = 1$ for a VHT SU PPDU and $N_{ES,u} = 1$ for a VHT MU PPDU for user u, $u = 0, \ldots N_{user}-1$. For the Data field of a VHT SU PPDU, $N_{ES} = N_{ES,0}$. For the Data field of a VHT MU PPDU, N_{ES} is undefined.
$N_{VHT\text{-}LTF}$	Number of VHT-LTF symbols (see 21.3.8.3.5)
R, R_u	R_u is the coding rate for user u, $u = 0, \ldots, N_{user}-1$. For a VHT SU PPDU, $R = R_0$ For a VHT MU PPDU, R is undefined
M_u	For pre-VHT modulated fields, $M_u = 0$. For VHT modulated fields, $M_0 = 0$ for $u = 0$ and $M_u = \sum_{u'=0}^{u-1} N_{STS,\,u'}$ for $u = 1, \ldots N_{user}-1$.
NOTE—For pre-VHT modulated fields, u is 0 only since $N_{user} = 1$.	

21.3.7 Mathematical description of signals

21.3.7.1 Notation

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5. In addition, the following notational conventions are used in Clause 21:

$[Q]_{m,\,n}$ indicates the element in row m and column n of matrix Q, where $1 \le m \le N_{row}$ and $1 \le n \le N_{col}$

N_{row} and N_{col} are the number of rows and columns, respectively, of the matrix Q

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$[Q]_{M:N}$ indicates a matrix consisting of columns M to N of matrix Q

21.3.7.2 Subcarrier indices in use

For description on subcarrier indices over which the signal is transmitted for non-HT and HT PPDUs, see 19.3.7.

For a 20 MHz VHT PPDU transmission, the 20 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –28 to –1 and 1 to 28, with 0 being the center (DC) subcarrier.

For a 40 MHz VHT PPDU transmission, the 40 MHz is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

For an 80 MHz VHT PPDU transmission, the 80 MHz is divided into 256 subcarriers. The signal is transmitted on subcarriers –122 to –2 and 2 to 122.

For a 160 MHz VHT PPDU transmission, the 160 MHz is divided into 512 subcarriers. The signal is transmitted on subcarriers –250 to –130, –126 to –6, 6 to 126, and 130 to 250.

For an 80+80 MHz VHT PPDU transmission, each 80 MHz frequency segment is divided into 256 subcarriers. In each frequency segment, the signal is transmitted on subcarriers –122 to –2 and 2 to 122.

21.3.7.3 Channel frequencies

Let

$$f_{c,\,\mathrm{idx0}} = \mathrm{dot11CurrentChannelCenterFrequencyIndex0} \tag{21-1}$$

$$f_{c,\,\mathrm{idx1}} = \mathrm{dot11CurrentChannelCenterFrequencyIndex1} \tag{21-2}$$

$$f_{\mathrm{P20,\,idx}} = \mathrm{dot11CurrentPrimaryChannel} \tag{21-3}$$

$$f_{\mathrm{CH,\,start}} = \mathrm{dot11ChannelStartingFactor} \times 500\ \mathrm{kHz} \tag{21-4}$$

where

dot11CurrentChannelCenterFrequencyIndex0, dot11CurrentChannelCenterFrequencyIndex1, and dot11CurrentPrimaryChannel are defined in Table 21-22.

When dot11CurrentChannelWidth (see Table 21-22) is 20 MHz, $f_{\mathrm{P20,\,idx}} = f_{c,\,\mathrm{idx0}}$. For dot11CurrentChannelWidth greater than 20 MHz, $f_{\mathrm{P20,\,idx}}$ and $f_{c,\,\mathrm{idx0}}$ shall have the relationship specified in Equation (21-5).

$$f_{\mathrm{P20,\,idx}} = f_{c,\,\mathrm{idx0}} - 4 \cdot \left(\frac{N_{\mathrm{20MHz}}}{2} - n_{\mathrm{P20}} \right) + 2 \tag{21-5}$$

where

$$N_{\mathrm{20MHz}} = \begin{cases} 2, \text{ if dot11CurrentChannelWidth indicates 40 MHz} \\ 4, \text{ if dot11CurrentChannelWidth indicates 80 MHz and 80+80 MHz} \\ 8, \text{ if dot11CurrentChannelWidth indicates 160 MHz} \end{cases}$$

n_{P20} is an integer with possible range $0 \le n_{\mathrm{P20}} \le N_{\mathrm{20MHz}} - 1$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When dot11CurrentChannelWidth is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz,

— The primary 20 MHz channel is the channel with 20 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{P20, idx}}$ MHz.
— The secondary 20 MHz channel is the channel with 20 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{S\text{20, idx}}$, where $f_{S\text{20, idx}}$ is given in Equation (21-6).

$$f_{\text{S20, idx}} = \begin{cases} f_{\text{P20, idx}} + 4, & \text{if } n_{\text{P20}} \text{ is even} \\ f_{\text{P20, idx}} - 4, & \text{if } n_{\text{P20}} \text{ is odd} \end{cases} \tag{21-6}$$

When dot11CurrentChannelWidth is 80 MHz, 160 MHz, or 80+80 MHz,

— The primary 40 MHz channel is the channel with 40 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{P40, idx}}$ MHz, where $f_{\text{P40, idx}}$ is given in Equation (21-7).
— The secondary 40 MHz channel is the channel with 40 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{S\text{40, idx}}$ MHz, where $f_{S\text{40, idx}}$ is given in Equation (21-8).

$$f_{\text{P40, idx}} = f_{c,\text{ idx0}} - 8 \cdot \left(\frac{N_{\text{20MHz}}}{4} - n_{\text{P40}} \right) + 4 \tag{21-7}$$

$$f_{\text{S40, idx}} = \begin{cases} f_{\text{P40, idx}} + 8, & \text{if } n_{\text{P40}} \text{ is even} \\ f_{\text{P40, idx}} - 8, & \text{if } n_{\text{P40}} \text{ is odd} \end{cases} \tag{21-8}$$

where $n_{\text{P40}} = \lfloor n_{\text{P20}} / 2 \rfloor$.

When dot11CurrentChannelWidth is 160 MHz,

— The primary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{P80, idx}}$ MHz, where $f_{\text{P80, idx}}$ is given in Equation (21-9).
— The secondary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{S80, idx}}$ MHz where $f_{\text{S80, idx}}$ is given in Equation (21-10).

$$f_{\text{P80, idx}} = f_{c,\text{ idx0}} - 16 \cdot \left(\frac{N_{\text{20MHz}}}{8} - n_{\text{P80}} \right) + 8 \tag{21-9}$$

$$f_{\text{S80, idx}} = \begin{cases} f_{\text{P80, idx}} + 16, & \text{if } n_{\text{P80}} \text{ is even} \\ f_{\text{P80, idx}} - 16, & \text{if } n_{\text{P80}} \text{ is odd} \end{cases} \tag{21-10}$$

where $n_{\text{P80}} = \lfloor n_{\text{P20}} / 4 \rfloor$.

When dot11CurrentChannelWidth is 80+80 MHz,

— The primary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{P80, idx}}$ MHz, where $f_{\text{P80, idx}} = f_{c,\text{ idx0}}$.
— The secondary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{\text{S80, idx}}$ MHz where $f_{\text{S80, idx}} = f_{c,\text{ idx1}}$.

21.3.7.4 Transmitted signal

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11).

$$r_{RF}^{(i_{Seg}, i_{TX})}(t) = \mathrm{Re}\left\{ \frac{1}{\sqrt{N_{Seg}}} r_{\mathrm{PPDU}}^{(i_{Seg}, i_{TX})}(t) \exp(j2\pi f_c^{(i_{Seg})} t) \right\}, \quad i_{Seg} = 0, \ldots, N_{Seg} - 1; \quad i_{TX} = 1, \ldots, N_{TX} \tag{21-11}$$

where

N_{Seg} represents the number of frequency segments in the transmit signal, as defined in Table 21-5

$r_{\mathrm{PPDU}}^{(i_{Seg}, i_{TX})}(t)$ represents the complex baseband signal of frequency segment i_{Seg} and transmit chain i_{TX}

$f_c^{(i_{Seg})}$ represents the center frequency of the portion of the PPDU transmitted in frequency segment i_{Seg}. Table 21-7 shows $f_c^{(i_{Seg})}$ as a function of the channel starting frequency and dot11CurrentChannelWidth (see Table 21-22) where $f_{\mathrm{P20,\,idx}}$, $f_{\mathrm{P40,\,idx}}$, and $f_{\mathrm{P80,\,idx}}$ are given in Equation (21-4), Equation (21-5), Equation (21-7), and Equation (21-9), respectively.

Table 21-7—Center frequency of the portion of the PPDU transmitted in frequency segment i_{Seg}

dot11CurrentChannelWidth	CH_BANDWIDTH	$f_c^{(i_{Seg})} = f_{\mathrm{CH,\,start}} + 5 \times f_{(i_{Seg})}$	
		$f_{(0)}$	$f_{(1)}$

Table 21-7—Center frequency of the portion of the PPDU transmitted in frequency segment i_{Seg} *(continued)*

dot11CurrentChannel Width	CH_BANDWIDTH	$f_c^{(i_{Seg})} = f_{\text{CH, start}} + 5 \times f_{(i_{Seg})}$	
		$f_{(0)}$	$f_{(1)}$
80+80 MHz	CBW20	$f_{\text{P20, idx}}$	—
	CBW40	$f_{\text{P40, idx}}$	—
	CBW80	$f_{\text{P80, idx}}$	—
	CBW80+80	$\min(f_{c,\text{ idx0}},\ f_{c,\text{ idx1}})$	$\max(f_{c,\text{ idx0}},\ f_{c,\text{ idx1}})$

NOTE—Transmitted signals might have different impairments such as phase offset or phase noise between the two frequency segments, which is not shown in Equation (21-11) for simplicity. See 21.3.17.3.

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 21-17 where $N_{VHT\text{-}LTF}$ is the number of VHT-LTF symbols and is defined in Table 21-13.

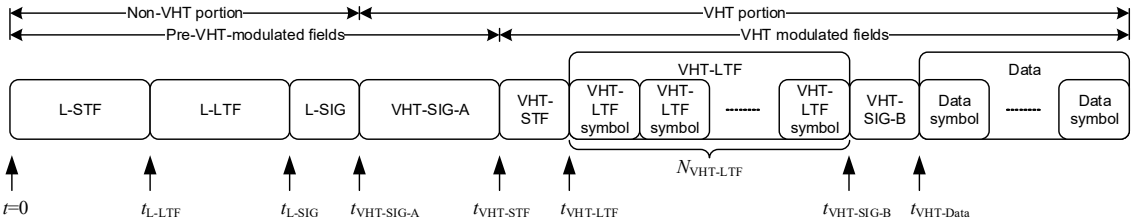

Figure 21-17—Timing boundaries for VHT PPDU fields

The time offset, t_{Field}, determines the starting time of the corresponding field relative to the start of L-STF ($t = 0$).

The signal transmitted on frequency segment i_{Seg} and transmit chain i_{TX} shall be as shown in Equation (21-12).

$$\begin{aligned} r_{\text{PPDU}}^{(i_{Seg}, i_{TX})}(t) = {} & r_{\text{L-STF}}^{(i_{Seg}, i_{TX})}(t) + r_{\text{L-LTF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{L-LTF}}) \\ & + r_{\text{L-SIG}}^{(i_{Seg}, i_{TX})}(t - t_{\text{L-SIG}}) + r_{\text{VHT-SIG-A}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-SIG-A}}) \\ & + r_{\text{VHT-STF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-STF}}) + r_{\text{VHT-LTF}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-LTF}}) \\ & + r_{\text{VHT-SIG-B}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-SIG-B}}) + r_{\text{VHT-Data}}^{(i_{Seg}, i_{TX})}(t - t_{\text{VHT-Data}}) \end{aligned} \tag{21-12}$$

where

$0 \le i_{Seg} \le N_{Seg} - 1$

$1 \le i_{TX} \le N_{TX}$

$t_{\text{L-LTF}} = T_{\text{L-STF}}$

$t_{\text{L-SIG}} = t_{\text{L-LTF}} + T_{\text{L-LTF}}$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$t_{\text{VHT-SIG-A}} = t_{\text{L-SIG}} + T_{\text{L-SIG}}$$
$$t_{\text{VHT-STF}} = t_{\text{VHT-SIG-A}} + T_{\text{VHT-SIG-A}}$$
$$t_{\text{VHT-LTF}} = t_{\text{VHT-STF}} + T_{\text{VHT-STF}}$$
$$t_{\text{VHT-SIG-B}} = t_{\text{VHT-LTF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}}$$
$$t_{\text{VHT-Data}} = t_{\text{VHT-SIG-B}} + T_{\text{VHT-SIG-B}}$$

Each field, $r_{Field}^{(i_{Seg}, i_{TX})}(t)$, is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13).

$$r_{\text{Subfield}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} N_{\text{Norm}}}} w_{T_{\text{Subfield}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left[Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_u + m)} \Upsilon_{k, BW} X_{k,u}^{(i_{Seg}, m)} \exp(j2\pi k \Delta_F (t - T_{\text{GI, Field}} - T_{\text{CS, VHT}}(M_u + m))) \quad (21\text{-}13)$$

This general representation holds for all subfields. The total power of the time domain VHT modulated field signals summed over all transmit chains should not exceed the total power of the time domain pre-VHT modulated field signals summed over all transmit chains. For notational simplicity, the parameter BW is omitted from some bandwidth dependent terms.

In Equation (21-13) the following notions are used:

$N_{\text{Field}}^{\text{Tone}}$ Table 21-8 summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment.

Table 21-8—Tone scaling factor and guard interval duration values for PHY fields

Field	$N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment				Guard interval duration
	20 MHz	40 MHz	80 MHz	160 MHz	
L-STF	12	24	48	96	—
L-LTF	52	104	208	416	T_{GI2}
L-SIG	52	104	208	416	T_{GI}
VHT-SIG-A	52	104	208	416	T_{GI}
VHT-STF	12	24	48	96	—
VHT-LTF	56	114	242	484	T_{GI}
VHT-SIG-B	56	114	242	484	T_{GI}
VHT-Data	56	114	242	484	T_{GI} or T_{GIS} (see NOTE 2)
NON_HT_DUP_OFDM-Data (see NOTE 1)	—	104	208	416	T_{GI}

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a NON_HT PPDU with format type NON_HT_DUP_OFDM.

NOTE 2—T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

N_{Norm} For pre-VHT modulated fields, $N_{\text{Norm}} = N_{TX}$. For VHT modulated fields, $N_{\text{Norm}} = N_{STS,\,total}$ where $N_{STS,\,total}$ is given in Table 21-6.

$w_{T_{\text{Subfield}}}(t)$ is a windowing function. An example function, $w_{T_{\text{Subfield}}}(t)$, is given in 17.3.2.5. T_{Subfield} is $T_{L\text{-}STF}$ for L-STF, $T_{L\text{-}LTF}$ for L-LTF, $T_{L\text{-}SIG}$ for L-SIG, T_{SYML} for VHT-SIG-A, $T_{VHT\text{-}STF}$ for VHT-STF, $T_{VHT\text{-}LTF}$ for VHT-LTF and $T_{VHT\text{-}SIG\text{-}B}$ for VHT-SIG-B. T_{Subfield} is T_{SYM} for VHT-Data, that is T_{SYML} when not using the short guard interval (Short GI field of VHT-SIG-A is 0) and T_{SYMS} when using the short guard interval (Short GI field of VHT-SIG-A is 1).

$Q_k^{(i_{Seg})}$ is the spatial mapping matrix for the subcarrier k in frequency segment i_{Seg}. For pre-VHT modulated fields, $Q_k^{(i_{Seg})}$ is a column vector with N_{TX} elements with element i_{TX} being $\exp(-j2\pi k\Delta_F T_{\text{CS}}^{i_{TX}})$, where $T_{\text{CS}}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} whose values are given in Table 21-10. For VHT modulated fields, $Q_k^{(i_{Seg})}$ is a matrix with N_{TX} rows and $N_{STS,\,total}$ columns.

$\Upsilon_{k,\,\text{BW}}$ is defined in 21.3.7.5

Δ_F is the subcarrier frequency spacing given in Table 21-5.

$X_{k,\,u}^{(i_{Seg},\,m)}$ is the frequency domain symbol in subcarrier k of user u for frequency segment i_{Seg} of space-time stream m. Some of the $X_{k,\,u}^{(i_{Seg},\,m)}$ within $-N_{SR} \le k \le N_{SR}$ have a value of 0. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, as well as the unmodulated tones of L-STF and VHT-STF fields. Note that the multiplication matrices $A_{VHT\text{-}LTF}^k$ and $P_{VHT\text{-}LTF}$ are included in the calculation of $X_{k,\,u}^{(i_{Seg},\,m)}$ for the VHT-LTF and VHT-SIG-B fields, respectively.

$T_{\text{GI, Field}}$ is the guard interval duration used for each OFDM symbol in the field. For L-STF and VHT-STF, $T_{\text{GI, Field}} = T_{\text{GI}}$ but it can be omitted from Equation (21-13) due to the periodic property of L-STF and VHT-STF over every 0.8 μs. For the L-SIG, VHT-SIG-A, VHT-LTF, and VHT-SIG-B fields, $T_{\text{GI, Field}}$ is defined in the "Guard interval duration" column of Table 21-8.

$T_{\text{CS, VHT}}(l)$ For pre-VHT modulated fields, $T_{\text{CS, VHT}}(l) = 0$. For VHT modulated fields, $T_{\text{CS, VHT}}(l)$ represents the cyclic shift per space-time stream, whose value is defined in Table 21-11.

M_u is defined in Table 21-6.

21.3.7.5 Definition of tone rotation

The function $\Upsilon_{k,\mathrm{BW}}$ is used to represent a rotation of the tones. BW in $\Upsilon_{k,\mathrm{BW}}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 21-9.

Table 21-9—CH_BANDWIDTH and $\Upsilon_{k,\mathrm{BW}}$

CH_BANDWIDTH	$\Upsilon_{k,\mathrm{BW}}$
CBW20	$\Upsilon_{k,20}$
CBW40	$\Upsilon_{k,40}$
CBW80	$\Upsilon_{k,80}$
CBW160	$\Upsilon_{k,160}$
CBW80+80	$\Upsilon_{k,80}$ per frequency segment

For a 20 MHz PPDU transmission,

$$\Upsilon_{k,20} = 1 \tag{21-14}$$

For a 40 MHz PPDU transmission,

$$\Upsilon_{k,40} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \tag{21-15}$$

For an 80 MHz PPDU transmission,

$$\Upsilon_{k,80} = \begin{cases} 1, & k < -64 \\ -1, & k \geq -64 \end{cases} \tag{21-16}$$

For an 80+80 MHz PPDU transmission, each 80 MHz frequency segment shall use the phase rotation for 80 MHz PPDU transmissions as defined in Equation (21-16).

For a 160 MHz PPDU transmission,

$$\Upsilon_{k,160} = \begin{cases} 1, & k < -192 \\ -1, & -192 \leq k < 0 \\ 1, & 0 \leq k < 64 \\ -1, & k \geq 64 \end{cases} \tag{21-17}$$

21.3.8 VHT preamble

21.3.8.1 Introduction

A VHT preamble is defined to carry the required information to operate in either single user or multi-user mode. To maintain compatibility with non-VHT STAs, specific non-VHT fields are defined that can be received by non-VHT STAs compliant with Clause 17 or Clause 19. The non-VHT fields are followed by VHT fields specific to VHT STAs.

21.3.8.2 Non-VHT portion of VHT format preamble

21.3.8.2.1 Cyclic shift for pre-VHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} are defined in Table 21-10.

Table 21-10—Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU

$T_{CS}^{i_{TX}}$ values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU									
Total number of transmit chains (N_{TX}) per frequency segment	**Cyclic shift for transmit chain i_{TX} (in units of ns)**								
	1	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**>8**
1	0	–	–	–	–	–	–	–	–
2	0	–200	–	–	–	–	–	–	–
3	0	–100	–200	–	–	–	–	–	–

>8	0	–175	–150	–125	–25	–100	–50	–200	Between –200 and 0

21.3.8.2.2 L-STF definition

The L-STF field for a 20 MHz or 40 MHz transmission is defined by Equation (19-8) and Equation (19-9), respectively, in 19.3.9.3.3. For 80 MHz, the L-STF field is defined by Equation (21-18). Note that these equations do not include the phase rotation per 20 MHz subchannel.

$$S_{-122,122} = \{S_{-58,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, S_{-58,58}\} \quad (21\text{-}18)$$

where

$S_{-58,58}$ is defined in Equation (19-9)

For 160 MHz, the L-STF is defined by Equation (21-19).

$$S_{-250,250} = \{S_{-122,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, S_{-122,122}\} \quad (21\text{-}19)$$

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the L-STF pattern for the 80 MHz ($S_{-122,122}$) defined in Equation (21-18).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as specified in Equation (21-20).

$$r_{\text{L-STF}}^{(i_{Seg},\, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-STF}}^{\text{Tone}} N_{\text{TX}}}} w_{T_{\text{L-STF}}}(t) \sum_{k=-26}^{26} \Upsilon_{k,\,\text{BW}} S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{TX}})) \quad (21\text{-}20)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in Table 21-10

$\Upsilon_{k,\,\text{BW}}$ is defined by Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$N_{\text{L-STF}}^{\text{Tone}}$ has the value given in Table 21-8

21.3.8.2.3 L-LTF definition

For a 20 MHz or 40 MHz transmission, the L-LTF pattern in the VHT preamble is defined by Equation (19-11) and Equation (19-12) in 19.3.9.3.4, respectively. For an 80 MHz transmission, the L-LTF pattern is defined by Equation (21-21). Note that these equations do not include the phase rotation per 20 MHz subchannel.

$$L_{-122,\,122} = \{L_{-58,\,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, L_{-58,\,58}\} \quad (21\text{-}21)$$

where

$L_{-58,\,58}$ is defined in Equation (19-12)

For a 160 MHz transmission, the L-LTF is defined by Equation (21-22). Note that this equation does not include the phase rotations per 20 MHz subchannel.

$$L_{-250,\,250} = \{L_{-122,\,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, L_{-122,\,122}\} \quad (21\text{-}22)$$

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the L-LTF pattern for the 80 MHz L-LTF pattern ($L_{-122,\,122}$) defined in Equation (21-21).

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as defined in Equation (21-23).

$$r_{\text{L-LTF}}^{(i_{Seg},\, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-LTF}}^{\text{Tone}} N_{\text{TX}}}} w_{T_{\text{L-LTF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_{k,\,\text{BW}} L_k \exp(j2\pi k \Delta_F (t - T_{\text{GI2}} - T_{CS}^{i_{TX}})) \quad (21\text{-}23)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10

$\Upsilon_{k,\,\text{BW}}$ is defined by Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$N_{\text{L-LTF}}^{\text{Tone}}$ has the value given in Table 21-8

21.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate rate and length information. The structure of the L-SIG field is defined in Figure 17-5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In a VHT PPDU, the RATE field shall be set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6. In a non-HT duplicate PPDU, the RATE field is defined in 17.3.4.2 using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (21-24).

$$\text{Length} = \frac{\text{TXTIME} - 20}{4} \times 3 - 3 \tag{21-24}$$

where
TXTIME (in μs) is defined in 21.4.3

The LSB of the binary expression of the Length value shall be mapped to B5. In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 using the L_LENGTH parameter in the TXVECTOR.

The Reserved (R) field shall be set to 0.

The Parity (P) field has the even parity of bits 0-16.

The SIGNAL TAIL field shall be set to 0.

The L-SIG field shall be encoded, interleaved, and mapped following the steps described in 17.3.5.6, 17.3.5.7, and 17.3.5.8. The stream of 48 complex numbers generated by these steps is denoted by $d_k, k = 0, \ldots, 47$. Pilots shall be inserted as described in 17.3.5.9. The time domain waveform of the L-SIG field shall be as given by Equation (21-25).

$$\begin{aligned} r_{\text{L-SIG}}^{(i_{Seg}, i_{TX})}(t) = {} & \frac{1}{\sqrt{N_{\text{L-SIG}}^{\text{Tone}} N_{TX}}} w_{T_{\text{L-SIG}}}(t) \\ & \cdot \sum_{i_{\text{BW}}=0}^{N_{20\text{MHz}}-1} \sum_{k=-26}^{26} \left(\Upsilon_{(k - K_{\text{Shift}}(i_{\text{BW}})), \text{BW}}(D_{k,20} + p_0 P_k) \right. \\ & \left. \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) \right) \end{aligned} \tag{21-25}$$

where

$N_{20\text{MHz}}$ is defined in 21.3.7.3

$K_{\text{Shift}}(i) = (N_{20\text{MHz}} - 1 - 2i) \cdot 32$

$$D_{k,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k)}, \text{otherwise} \end{cases} \tag{21-26}$$

$$M_{20}^r(k) = \begin{cases} k + 26, -26 \le k \le -22 \\ k + 25, -20 \le k \le -8 \\ k + 24, -6 \le k \le -1 \\ k + 23, 1 \le k \le 6 \\ k + 22, 8 \le k \le 20 \\ k + 21, 22 \le k \le 26 \end{cases} \tag{21-27}$$

P_k is defined in 17.3.5.10

p_0 is the first pilot value in the sequence defined in 17.3.5.10

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$N_{\text{L-SIG}}^{\text{Tone}}$ has the value given in Table 21-8

$\Upsilon_{k,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10

NOTE—$M_{20}^{r}(k)$ is a "reverse" function of the function $M(k)$ defined in 17.3.5.10.

21.3.8.3 VHT portion of VHT format preamble

21.3.8.3.1 Introduction

The VHT portion of the VHT format preamble consists of the VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields.

All numeric fields are transmitted in unsigned format, LSB first.

21.3.8.3.2 Cyclic shift for VHT modulated fields

The cyclic shift values defined in this subclause apply to the VHT-STF, VHT-LTF, VHT-SIG-B, and Data fields of the VHT PPDU. The cyclic shift values defined in 21.3.8.2.1 apply to VHT-SIG-A field in the VHT format preamble.

Throughout the VHT modulated fields of the preamble, cyclic shifts are applied to prevent unintended beamforming when correlated signals are transmitted in multiple space-time streams. The same cyclic shift is also applied to these streams during the transmission of the Data field of the VHT PPDU. The cyclic shift value $T_{CS,VHT}(n)$ for the VHT modulated fields for space-time stream n out of $N_{STS,total}$ total space-time streams is shown in Table 21-11.

Table 21-11—Cyclic shift values for the VHT modulated fields of a PPDU

$T_{CS,VHT}(n)$ values for the VHT modulated fields of a PPDU								
Total number of space-time streams ($N_{STS,total}$)	**Cyclic shift for space-time stream n (ns)**							
	1	**2**	**3**	**4**	**5**	**6**	**7**	**8**
1	0	–	–	–	–	–	–	–
2	0	–400	–	–	–	–	–	–
3	0	–400	–200	–	–	–	–	–
4	0	–400	–200	–600	–	–	–	–
5	0	–400	–200	–600	–350	–	–	–
6	0	–400	–200	–600	–350	–650	–	–
7	0	–400	–200	–600	–350	–650	–100	–
8	0	–400	–200	–600	–350	–650	–100	–750

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In a VHT MU PPDU, the cyclic shifts are applied sequentially across the space-time streams as follows: the cyclic shift of the space-time stream number m of user u is given by $T_{CS,VHT}(M_u + m)$ of the row corresponding to $N_{STS,total}$ in Table 21-11.

21.3.8.3.3 VHT-SIG-A definition

The VHT-SIG-A field carries information required to interpret VHT PPDUs. The structure of the VHT-SIG-A field for the first part (VHT-SIG-A1) is shown in Figure 21-18 and for the second part (VHT-SIG-A2) is shown in Figure 21-19.

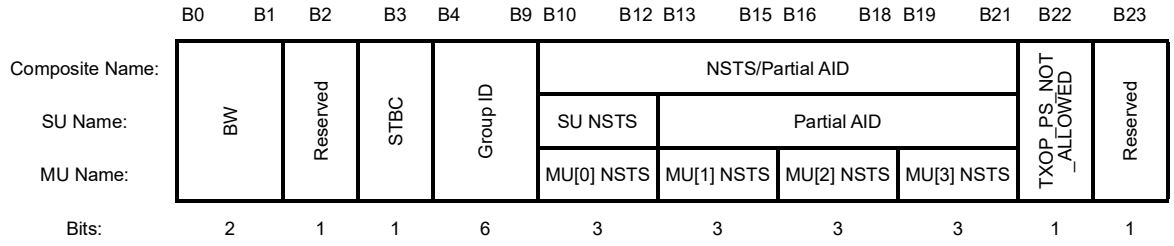

Figure 21-18—VHT-SIG-A1 structure

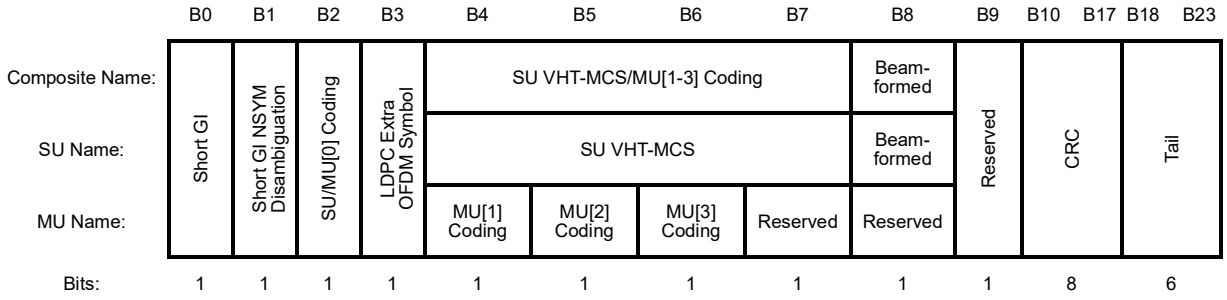

Figure 21-19—VHT-SIG-A2 structure

The VHT-SIG-A field contains the fields listed in Table 21-12. The mapping of the fields is also described in Table 21-12. Note that the mapping of the STBC field, the NSTS/Partial AID field, the SU/MU[0] Coding field, the SU VHT-MCS/MU[1-3] Coding field, and the Beamformed field is different for VHT SU and MU PPDUs.

The VHT-SIG-A field is composed of two parts, VHT-SIG-A1 and VHT-SIG-A2, each containing 24 data bits, as shown in Table 21-12. VHT-SIG-A1 is transmitted before VHT-SIG-A2. The VHT-SIG-A symbols shall be BCC encoded at rate, R = 1/2, be interleaved, be mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9, respectively. The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}, k = 0 \ldots 47$, where $n = 0, 1$, respectively. The first 48 complex numbers form the first symbol of VHT-SIG-A and the second 48 complex numbers form the second symbol of VHT-SIG-A after rotating by 90° counter-clockwise relative to the first symbol. The first symbol of VHT-SIG-A, which does not have the 90° rotation, is used to differentiate VHT PPDUs from HT PPDUs, while the second symbol of VHT-SIG-A, which has the 90° rotation, is used to differentiate VHT PPDUs from non-HT PPDUs.

Table 21-12—Fields in the VHT-SIG-A field

Two parts of VHT-SIG-A	Bit	Field	Description
VHT-SIG-A1	B0-B1	BW	Set to 0 for 20 MHz, 1 for 40 MHz, 2 for 80 MHz, and 3 for 160 MHz and 80+80 MHz
	B2	Reserved	Reserved. Set to 1.
	B3	STBC	For a VHT SU PPDU: Set to 1 if space-time block coding (see 21.3.10.9.4) is used and set to 0 otherwise. For a VHT MU PPDU: Set to 0.
	B4-B9	Group ID	A value of 0 or 63 indicates a VHT SU PPDU; otherwise, indicates a VHT MU PPDU. (See TXVECTOR parameter GROUP_ID.)
	B10-B21	NSTS/Partial AID	For a VHT MU PPDU: NSTS is divided into 4 user positions of 3 bits each. User position p, where $0 \le p \le 3$, uses bits B($10 + 3p$) to B($12 + 3p$). The number of space-time streams for user u are indicated at user position p = USER_POSITION[u] where u = 0, 1, …, NUM_USERS – 1 and the notation A[b] denotes the value of array A at index b. Zero space-time streams are indicated at positions not listed in the USER_POSITION array. Each user position is set as follows: Set to 0 for 0 space-time streams Set to 1 for 1 space-time stream Set to 2 for 2 space-time streams Set to 3 for 3 space-time streams Set to 4 for 4 space-time streams Values 5-7 are reserved For a VHT SU PPDU: B10-B12 Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams Set to 4 for 5 space-time streams Set to 5 for 6 space-time streams Set to 6 for 7 space-time streams Set to 7 for 8 space-time streams B13-B21 Partial AID: Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see TXVECTOR parameter PARTIAL_AID and 10.19).
	B22	TXOP_PS_NOT_ALLOWED	Set to 0 by VHT AP if it allows non-AP VHT STAs in TXOP power save mode to enter doze state during a TXOP. Set to 1 otherwise. The bit is reserved and set to 1 in VHT PPDUs transmitted by a non-AP VHT STA.
	B23	Reserved	Set to 1

Table 21-12—Fields in the VHT-SIG-A field *(continued)*

Two parts of VHT-SIG-A	Bit	Field	Description
VHT-SIG-A2	B0	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B1	Short GI N_{SYM} Disambiguation	Set to 1 if short guard interval is used and N_{SYM} mod 10 = 9; otherwise, set to 0. N_{SYM} is defined in 21.4.3.
	B2	SU/MU[0] Coding	For a VHT SU PPDU, B2 is set to 0 for BCC, 1 for LDPC For a VHT MU PPDU, if the MU[0] NSTS field is nonzero, then B2 indicates the coding used for user u with USER_POSITION[u] = 0; set to 0 for BCC and 1 for LDPC. If the MU[0] NSTS field is 0, then this field is reserved and set to 1.
	B3	LDPC Extra OFDM Symbol	Set to 1 if the LDPC PPDU encoding process (if an SU PPDU), or at least one LDPC user's PPDU encoding process (if a VHT MU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 and 21.3.10.5.5. Set to 0 otherwise.
	B4-B7	SU VHT-MCS/MU[1-3] Coding	For a VHT SU PPDU: VHT-MCS index For a VHT MU PPDU: If the MU[1] NSTS field is nonzero, then B4 indicates coding for user u with USER_POSITION[u] = 1: set to 0 for BCC, 1 for LDPC. If the MU[1] NSTS field is 0, then B4 is reserved and set to 1. If the MU[2] NSTS field is nonzero, then B5 indicates coding for user u with USER_POSITION[u] = 2: set to 0 for BCC, 1 for LDPC. If the MU[2] NSTS field is 0, then B5 is reserved and set to 1. If the MU[3] NSTS field is nonzero, then B6 indicates coding for user u with USER_POSITION[u] = 3: set to 0 for BCC, 1 for LDPC. If the MU[3] NSTS field is 0, then B6 is reserved and set to 1. B7 is reserved and set to 1
	B8	Beamformed	For a VHT SU PPDU: Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission, set to 0 otherwise. For a VHT MU PPDU: Reserved and set to 1 NOTE—If equal to 1 smoothing is not recommended.
	B9	Reserved	Reserved and set to 1
	B10-B17	CRC	CRC calculated as in 19.3.9.4.4 with c7 in B10. Bits 0-23 of HT-SIG1 and bits 0-9 of HT-SIG2 are replaced by bits 0-23 of VHT-SIG-A1 and bits 0-9 of VHT-SIG-A2, respectively.
	B18-B23	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.

The time domain waveform for the VHT-SIG-A field in a VHT PPDU shall be as specified in Equation (21-28).

$$r_{\text{VHT-SIG-A}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-SIG-A}}^{\text{Tone}} N_{\text{TX}}}} \sum_{n=0}^{1} w_{T_{SYML}}(t - nT_{SYML}) \cdot \sum_{i_{\text{BW}}=0}^{N_{20\text{MHz}}-1} \left(\sum_{k=-26}^{26} \Upsilon_{(k-K_{\text{Shift}}(i_{\text{BW}})),\,\text{BW}} (j^n D_{k,n,20} + p_{n+1} P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_F(t - nT_{SYML} - T_{\text{GI}} - T_{CS}^{i_{TX}})) \right) \quad (21\text{-}28)$$

where

$N_{20\text{MHz}}$ and $K_{\text{Shift}}(i)$ are defined in 21.3.8.2.4

$$D_{k,n,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k),n}, \text{otherwise} \end{cases}$$

$M_{20}^r(k)$ is defined in Equation (21-27)

P_k and p_n are defined in 17.3.5.10

$N_{\text{VHT-SIG-A}}^{\text{Tone}}$ has the value given in Table 21-8

$\Upsilon_{k,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10

NOTE—This definition results in a QBPSK modulation on the second symbol of VHT-SIG-A where the constellation of the data tones is rotated by 90º counter-clockwise relative to the first symbol of VHT-SIG-A and relative to the non-HT signal field in VHT PPDUs (Figure 21-20). In VHT PPDUs, the VHT-SIG-A is transmitted with the same number of subcarriers and the same cyclic shifts as the preceding non-HT portion of the preamble.

For an 80+80 MHz transmission, each frequency segment shall use the time domain waveform for 80 MHz transmissions.

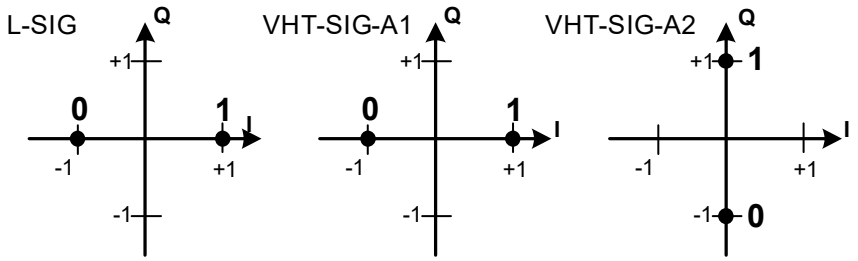

Figure 21-20—Data tone constellation in the VHT PPDU pre-VHT modulated fields

21.3.8.3.4 VHT-STF definition

The main purpose of the VHT-STF field is to improve automatic gain control estimation in a MIMO transmission. The duration of the VHT-STF field is $T_{VHT\text{-}STF}$ regardless of the Short GI field setting in VHT-SIG-A. The frequency domain sequence used to construct the VHT-STF field in a 20 MHz

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

transmission is identical to the HT-STF field. In a 40 MHz and an 80 MHz transmission, the VHT-STF field is constructed from the 20 MHz version by frequency shifting a duplicate of it to each 20 MHz subchannel and applying appropriate phase rotations per 20 MHz subchannel.

For a 20 MHz transmission, the frequency domain sequence is given by Equation (21-29).

$$VHTS_{-28,28} = HTS_{-28,28} \tag{21-29}$$

where

$HTS_{-28,28}$ is defined in Equation (19-19)

For a 40 MHz transmission, the frequency domain sequence is given by Equation (21-30).

$$VHTS_{-58,58} = HTS_{-58,58} \tag{21-30}$$

where

$HTS_{-58,58}$ is defined in Equation (19-20)

For an 80 MHz transmission, the frequency domain sequence is given by Equation (21-31).

$$VHTS_{-122,122} = \{VHTS_{-58,58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHTS_{-58,58}\} \tag{21-31}$$

For a 160 MHz transmission, the frequency domain sequence is given by Equation (21-32).

$$VHTS_{-250,250} = \{VHTS_{-122,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHTS_{-122,122}\} \tag{21-32}$$

NOTE—Equation (21-29), Equation (21-30), Equation (21-31), and Equation (21-32) do not show the phase rotation per 20 MHz subchannel.

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the VHT-STF pattern for the 80 MHz ($VHTS_{-122,122}$) defined in Equation (21-31).

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as specified in Equation (21-33).

$$\begin{aligned} r_{\text{VHT-STF}}^{(i_{Seg}, i_{TX})}(t) = {} & \frac{1}{\sqrt{N_{\text{VHT-STF}}^{\text{Tone}} N_{STS,total}}} w_{T_{\text{VHT-STF}}}(t) \\ & \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left(\left[Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_u+m)} \Upsilon_{k,\text{BW}} VHTS_k \right. \\ & \left. \cdot \exp(j2\pi k \Delta_F (t - T_{\text{CS,VHT}}(M_u + m))) \right) \end{aligned} \tag{21-33}$$

where

$N_{\text{VHT-STF}}^{\text{Tone}}$ has the value given in Table 21-8

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11

$Q_k^{(i_{Seg})}$ is defined in 21.3.10.11.1

$\Upsilon_{k,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

21.3.8.3.5 VHT-LTF definition

The VHT Long Training field (VHT-LTF) field provides a means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for $N_{STS,total}$ space-time streams (spatial mapper inputs) used for the transmission of the PSDU(s). For each tone, the MIMO channel that can be estimated is an $N_{RX} \times N_{STS,total}$ matrix. A VHT transmission has a preamble that contains VHT-LTF symbols, where the data tones of each VHT-LTF symbol are multiplied by entries belonging to a matrix $P_{VHT\text{-}LTF}$, to enable channel estimation at the receiver. The pilot tones of each VHT-LTF symbol are multiplied by the entries of a matrix $R_{VHT\text{-}LTF}$ defined in the following text. The multiplication of the pilot tones in the VHT-LTF symbol by the $R_{VHT\text{-}LTF}$ matrix instead of the $P_{VHT\text{-}LTF}$ matrix allows receivers to track phase and frequency offset during MIMO channel estimation using the VHT-LTF. The number of VHT-LTF symbols, $N_{VHT\text{-}LTF}$, is a function of the total number of space-time streams $N_{STS,total}$ as shown in Table 21-13. As a result the VHT-LTF field consists of one, two, four, six or eight symbols.

Table 21-13—Number of VHT-LTFs required for different numbers of space-time streams

$N_{STS,total}$	$N_{VHT\text{-}LTF}$
1	1
2	2
3	4
4	4
5	6
6	6
7	8
8	8

Let LTF_{left} and LTF_{right} be the sequences defined in Equation (21-34) and Equation (21-35), respectively.

$$LTF_{\text{left}} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (21\text{-}34)$$

$$LTF_{\text{right}} = \{1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (21\text{-}35)$$

NOTE 1—LTF_{left} is identical to the leftmost 26 elements of Equation (17-8), and LTF_{right} is identical to the rightmost 26 elements of Equation (17-8).

In a 20 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-36).

$$\begin{aligned} VHT\text{-}LTF_{-28,28} &= \{1, 1, LTF_{\text{left}}, 0, LTF_{\text{right}}, -1, -1\} \\ &= HT\text{-}LTF_{-28,28} \end{aligned} \quad (21\text{-}36)$$

where

$HT\text{-}LTF_{-28,28}$ is defined in Equation (19-23)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In a 40 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-37).

$$\begin{aligned} VHT\text{-}LTF_{-58,58} &= \{LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 0, 0, 0, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}\} \\ &= HT\text{-}LTF_{-58,58} \end{aligned} \quad (21\text{-}37)$$

where

$HT\text{-}LTF_{-58,58}$ is defined in Equation (19-24)

In an 80 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-38).

$$\begin{aligned} VHT\text{-}LTF_{-122,122} = \{&LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 1, -1, 1, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}, \\ &1, -1, 1, -1, 0, 0, 0, 1, -1, -1, 1, \\ &LTF_{\text{left}}, 1, LTF_{\text{right}}, -1, -1, -1, 1, 1, -1, 1, -1, 1, 1, -1, LTF_{\text{left}}, 1, LTF_{\text{right}}\} \end{aligned} \quad (21\text{-}38)$$

In a 160 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-39).

$$VHT\text{-}LTF_{-250,250} = \{VHT\text{-}LTF_{-122,122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHT\text{-}LTF_{-122,122}\} \quad (21\text{-}39)$$

where

$VHT\text{-}LTF_{-122,122}$ is given in Equation (21-38)

NOTE 2—Equation (21-36), Equation (21-37), Equation (21-38), and Equation (21-39) do not show the phase rotation per 20 MHz subchannel.

For a 80+80 MHz transmission, each 80 MHz frequency segment shall use the 80 MHz VHT-LTF sequence, $VHT\text{-}LTF_{-122,122}$, defined in Equation (21-38).

The generation of the time domain VHT-LTF symbols per frequency segment is shown in Figure 21-21 where $A^{k}_{VHT\text{-}LTF}$ is given in Equation (21-40).

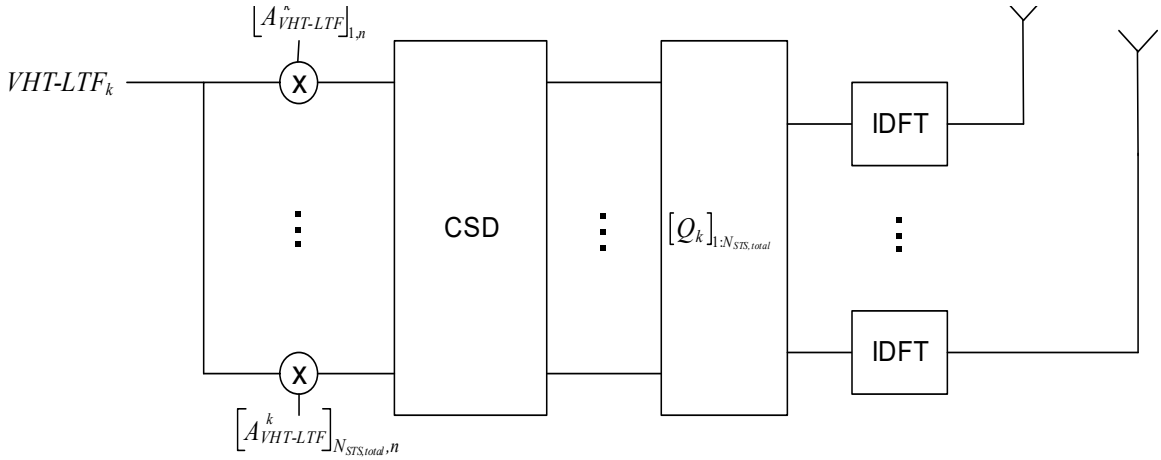

Figure 21-21—Generation of VHT-LTF symbols per frequency segment

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$A^{k}_{VHT\text{-}LTF} = \begin{cases} R_{VHT\text{-}LTF}, \text{ if } k \in K_{\text{Pilot}} \\ P_{VHT\text{-}LTF}, \text{ otherwise} \end{cases} \quad (21\text{-}40)$$

where

K_{Pilot} is the set of subcarrier indices for the pilot tones:

For a 20 MHz transmission, $K_{\text{Pilot}} = \{\pm 7, \pm 21\}$.

For a 40 MHz transmission, $K_{\text{Pilot}} = \{\pm 11, \pm 25, \pm 53\}$.

For an 80 MHz transmission, $K_{\text{Pilot}} = \{\pm 11, \pm 39, \pm 75, \pm 103\}$.

For a 160 MHz transmission,
$K_{\text{Pilot}} = \{\pm 25, \pm 53, \pm 89, \pm 117, \pm 139, \pm 167, \pm 203, \pm 231\}$.

For an 80+80 MHz transmission, K_{Pilot} for each 80 MHz frequency segment is identical to K_{Pilot} for an 80 MHz transmission.

$R_{VHT\text{-}LTF}$ is a $N_{VHT\text{-}LTF} \times N_{VHT\text{-}LTF}$ matrix whose elements are defined in Equation (21-41).

$$\left[R_{VHT\text{-}LTF}\right]_{m,\,n} = \left[P_{VHT\text{-}LTF}\right]_{1,\,n},\ 1 \le m, n \le N_{VHT\text{-}LTF} \quad (21\text{-}41)$$

$P_{VHT\text{-}LTF}$ is defined in Equation (21-42)

The time domain representation of the waveform transmitted on frequency segment i_{Seg} of transmit chain i_{TX} shall be as described by Equation (21-42).

$$r^{(i_{Seg},\,i_{TX})}_{\text{VHT-LTF}}(t) = \frac{1}{\sqrt{N^{\text{Tone}}_{\text{VHT-LTF}} N_{STS,\,total}}} \sum_{n=0}^{N_{VHT\text{-}LTF}-1} w_{T_{\text{VHT-LTF}}}(t - nT_{\text{VHT-LTF}}) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left(\left[Q^{(i_{Seg})}_{k}\right]_{i_{TX},\,(M_u+m)} \Upsilon_{k,\,\text{BW}} \left[A^{k}_{VHT\text{-}LTF}\right]_{(M_u+m),\,(n+1)} VHT\text{-}LTF_k \cdot \exp(j2\pi k\Delta_F(t - nT_{\text{VHT-LTF}} - T_{\text{GI}} - T_{\text{CS,VHT}}(M_u+m))) \right) \quad (21\text{-}42)$$

where

$N^{\text{Tone}}_{\text{VHT-LTF}}$ has the value given in Table 21-8

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11

$Q^{(i_{Seg})}_{k}$ is defined in 21.3.10.11.1

$\Upsilon_{k,\,\text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$A^{k}_{VHT\text{-}LTF}$ is defined in Equation (21-40)

$$P_{VHT\text{-}LTF} = \begin{cases} P_{4\times 4}, N_{STS,\,total} \le 4 \\ P_{6\times 6}, N_{STS,\,total} = 5, 6 \\ P_{8\times 8}, N_{STS,\,total} = 7, 8 \end{cases} \quad (21\text{-}43)$$

where

$P_{4\times 4}$ is defined in Equation (19-27)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The VHT-LTF mapping matrix for six VHT-LTF symbols, $P_{6\times 6}$, is defined in Equation (21-44).

$$P_{6\times 6} = \begin{bmatrix} 1 & -1 & 1 & 1 & 1 & -1 \\ 1 & -w^1 & w^2 & w^3 & w^4 & -w^5 \\ 1 & -w^2 & w^4 & w^6 & w^8 & -w^{10} \\ 1 & -w^3 & w^6 & w^9 & w^{12} & -w^{15} \\ 1 & -w^4 & w^8 & w^{12} & w^{16} & -w^{20} \\ 1 & -w^5 & w^{10} & w^{15} & w^{20} & -w^{25} \end{bmatrix} \quad (21\text{-}44)$$

where

$w = \exp(-j2\pi/6)$

The VHT-LTF mapping matrix for eight VHT-LTF symbols, $P_{8\times 8}$, is defined in Equation (21-45).

$$P_{8\times 8} = \begin{bmatrix} P_{4\times 4} & P_{4\times 4} \\ P_{4\times 4} & -P_{4\times 4} \end{bmatrix} \quad (21\text{-}45)$$

where

$P_{4\times 4}$ is defined in Equation (19-27)

As defined in Table 21-5, the duration of each VHT-LTF symbol is $T_{\text{VHT-LTF}}$ regardless of the Short GI field setting in VHT-SIG-A.

21.3.8.3.6 VHT-SIG-B definition

The VHT-SIG-B field is one symbol and contains 26 bits in a 20 MHz PPDU, 27 bits in a 40 MHz PPDU, and 29 bits in 80 MHz, 160 MHz, and 80+80 MHz PPDUs for each user. The fields in the VHT-SIG-B field are listed in Table 21-14. For example, for an MU transmission using VHT-MCS 5 (0101 in binary) in 20 MHz bandwidth, the VHT-SIG-B field bits are set as follows: B16=1, B17=0, B18=1, and B19=0.

Table 21-14—Fields in the VHT-SIG-B field

Field	VHT MU PPDU Allocation (bits)			VHT SU PPDU Allocation (bits)			Description
	20 MHz	40 MHz	80 MHz, 160 MHz, 80+80 MHz	20 MHz	40 MHz	80 MHz, 160 MHz, 80+80 MHz	
VHT-SIG-B Length	B0-B15 (16)	B0-B16 (17)	B0-B18 (19)	B0-B16 (17)	B0-B18 (19)	B0-B20 (21)	Length of A-MPDU pre-EOF padding in units of four octets
VHT-MCS	B16-B19 (4)	B17-B20 (4)	B19-B22 (4)	N/A	N/A	N/A	
Reserved	N/A	N/A	N/A	B17-B19 (3)	B19-B20 (2)	B21-B22 (2)	All 1s
Tail	B20-B25 (6)	B21-B26 (6)	B23-B28 (6)	B20-B25 (6)	B21-B26 (6)	B23-B28 (6)	All 0s
Total # bits	26	27	29	26	27	29

NOTE—Due to the limitations in the maximum A-MPDU length, B19-20 are always 0 for an 80 MHz, 160 MHz, and 80+80 MHz VHT SU PPDU.

The VHT-SIG-B Length field for user u shall be set using Equation (21-46).

$$\text{VHT-SIG-B Length (for user } u \text{ in units of 4 octets)} = \left\lceil \frac{\text{APEP_LENGTH}_u}{4} \right\rceil \quad (21\text{-}46)$$

where
APEP_LENGTH_u is the TXVECTOR parameter APEP_LENGTH for user u (in octets)

The VHT-SIG-B bits for an NDP transmission in various channel widths shall be set as defined in Table 21-15.

Table 21-15—VHT-SIG-B bits (before Tail field) in NDP for various channel widths

Channel width	B0	B1	B2	B3	B4	B5	B6	B7	B8	B9	B10	B11	B12	B13	B14	B15	B16	B17	B18	B19	B20	B21	B22
20 MHz	0	0	0	0	0	1	1	1	0	1	0	0	0	1	0	0	0	0	1	0	–	–	–
40 MHz	1	0	1	0	0	1	0	1	1	0	1	0	0	0	1	0	0	0	0	1	1	—	–
80 MHz, 160 MHz, or 80+80 MHz	0	1	0	1	0	0	1	1	0	0	1	0	1	1	1	1	1	1	1	0	0	1	0

For a 40 MHz transmission, the VHT-SIG-B bits are repeated twice. For an 80 MHz transmission, the VHT-SIG-B bits are repeated four times and a pad bit appended that is set to 0. For a 160 MHz and 80+80 MHz transmission, the VHT-SIG-B bits are first repeated four times and a pad bit appended that is set to 0 as in the 80 MHz transmission. Then, the resulting 117 bits are repeated again to fill the 234 available bits. The repetition of the VHT-SIG-B bits for various channel width PPDUs is shown in Figure 21-22.

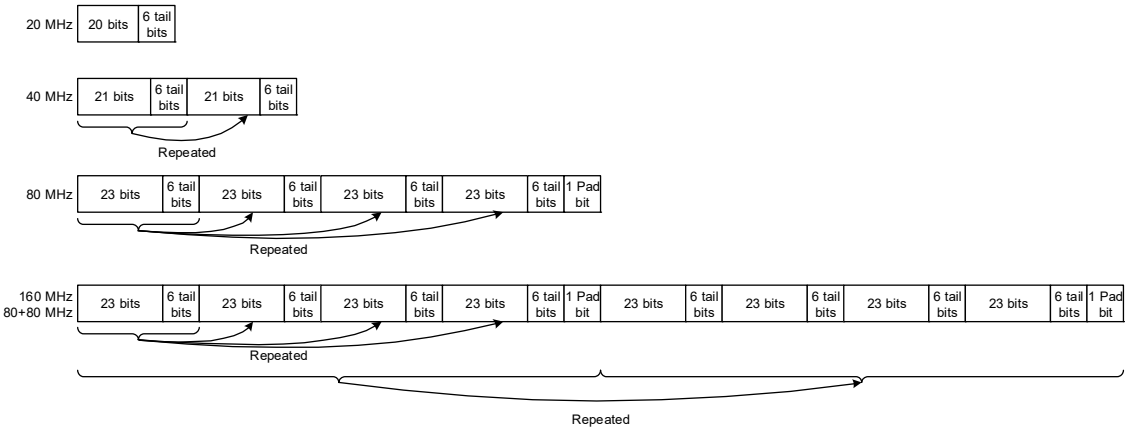

Figure 21-22—VHT-SIG-B bits in 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmissions

For each user u, the VHT-SIG-B field shall be BCC encoded at rate R = 1/2 as defined in 17.3.5.6, be segment parsed as defined in 21.3.10.7, be interleaved as defined in 21.3.10.8, be mapped to a BPSK

constellation as defined in 17.3.5.8, be segment deparsed as defined in 21.3.10.9.3, and have pilots inserted following the steps described in 21.3.10.10. The VHT-SIG-B field constellation points are mapped to $N_{STS,u}$ space-time streams by the user-specific elements of the first column of the $P_{VHT\text{-}LTF}$ matrix, which is defined in 21.3.8.3.5. The total number of data subcarriers and pilot subcarriers are the same as in the Data field. The space-time streams per each frequency segment are input into the CSD block, which is defined in Table 21-11 and follow the same transmission flow as the Data field from there on. The duration of the VHT-SIG-B field is $T_{VHT\text{-}SIG\text{-}B}$, regardless of the value of the TXVECTOR parameter GI_TYPE. The time domain waveform for the VHT-SIG-B field in a VHT PPDU is specified by Equation (21-47).

$$r_{\text{VHT-SIG-B}}^{(i_{Seg},\, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-SIG-B}}^{\text{Tone}} N_{STS,\,total}}} w_{T_{\text{VHT-SIG-B}}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left(\begin{array}{c} \left[Q_k^{(i_{Seg})} \right]_{i_{TX},\,(M_u+m)} \Upsilon_{k,\,\text{BW}} \left(\left[P_{VHT\text{-}LTF} \right]_{(M_u+m),\,1} D_{k,\,BW}^{(i_{Seg},\,u)} + p_3 P_0^k \right) \\ \cdot \exp(j2\pi k \Delta_F (t - T_{\text{GI}} - T_{\text{CS,VHT}}(M_u+m))) \end{array} \right) \tag{21-47}$$

where

$N_{\text{VHT-SIG-B}}^{\text{Tone}}$	has the value given in Table 21-8
$T_{\text{CS,VHT}}(n)$	is given in Table 21-11
$Q_k^{(i_{Seg})}$	is defined in 21.3.10.11.1
p_n	is defined in 17.3.5.10
P_n^k	is defined in 21.3.10.10
$\Upsilon_{k,\,\text{BW}}$	is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)
$P_{VHT\text{-}LTF}$	is given in Equation (21-43)

Let $d_k^{(i_{Seg},\,u)}$ be the stream of complex numbers generated for VHT-SIG-B for user u at subcarrier k (logical index, starting with 0) on frequency segment i_{Seg} (prior to multiplication by $P_{VHT\text{-}LTF}$). For a 20 MHz VHT transmission,

$$D_{k,\,20}^{(i_{Seg},\,u)} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k)}^{(i_{Seg},\,u)}, \text{otherwise} \end{cases} \tag{21-48}$$

$$M_{20}^r(k) = \begin{cases} k + 28, -28 \le k \le -22 \\ k + 27, -20 \le k \le -8 \\ k + 26, -6 \le k \le -1 \\ k + 25, 1 \le k \le 6 \\ k + 24, 8 \le k \le 20 \\ k + 23, 22 \le k \le 28 \end{cases} \tag{21-49}$$

$$M^{r}_{160}(k) = \begin{cases} k+250, & -250 \le k \le -232 \\ k+249, & -230 \le k \le -204 \\ k+248, & -202 \le k \le -168 \\ k+247, & -166 \le k \le -140 \\ k+246, & -138 \le k \le -130 \\ k+243, & -126 \le k \le -118 \\ k+242, & -116 \le k \le -90 \\ k+241, & -88 \le k \le -54 \\ k+240, & -52 \le k \le -26 \\ k+239, & -24 \le k \le -6 \\ k+228, & 6 \le k \le 24 \\ k+227, & 26 \le k \le 52 \\ k+226, & 54 \le k \le 88 \\ k+225, & 90 \le k \le 116 \\ k+224, & 118 \le k \le 126 \\ k+221, & 130 \le k \le 138 \\ k+220, & 140 \le k \le 166 \\ k+219, & 168 \le k \le 202 \\ k+218, & 204 \le k \le 230 \\ k+217, & 232 \le k \le 250 \end{cases} \quad \text{(21-55)}$$

For an 80+80 MHz VHT transmission, each frequency segment shall follow the 80 MHz VHT transmission format as specified in Equation (21-52) and Equation (21-53).

21.3.9 Transmission of NON_HT and HT PPDUs with multiple transmit chains

21.3.9.1 Transmission of 20 MHz NON_HT PPDUs with more than one transmit chain

A VHT STA that transmits a NON_HT PPDU shall apply the cyclic shifts defined in Table 21-10 to the preamble and Data field.

21.3.9.2 Transmission of HT PPDUs with more than four transmit chains

A VHT STA that transmits an HT PPDU with FORMAT equal to HT_MF shall apply the cyclic shifts defined in Table 21-10 for the non-HT portion of the PPDU, including the HT-SIG field.

21.3.10 Data field

21.3.10.1 General

The number of OFDM symbols in the Data field is determined by the Length field in L-SIG [see Equation (21-24)], the preamble duration and the setting of the Short GI field in VHT-SIG-A (see 21.3.8.3.3).

When BCC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the PHY pad bits, and the tail bits ($N_{tail}N_{ES}$ bits for SU and $N_{tail}N_{ES,u}$ bits for each user u in MU). When LDPC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, and the PHY pad bits. No tail bits are present when LDPC encoding is used.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The padding flow is as follows. The MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user *u*. The PHY determines the number of pad bits to add and appends them to the PSDU. The number of pad bits added will always be 0 to 7 per user. When user *u* of a VHT MU PPDU uses BCC encoding, the number of pad bits is calculated using Equation (21-56). In the case of SU ignore *u* in Equation (21-56).

$$N_{PAD,u} = N_{SYM}N_{DBPS,u} - 8 \cdot \text{PSDU_LENGTH}_u - N_{service} - N_{tail}N_{ES,u} \quad (21\text{-}56)$$

where

PSDU_LENGTH_u is defined in 21.4.3

N_{SYM} is the number of symbols in the Data field and is given by Equation (21-111) for a VHT SU PPDU and by Equation (21-67) for a VHT MU PPDU

For an SU PPDU, if LDPC encoding is used then the PHY padding bits are calculated using Equation (21-57).

$$N_{PAD} = N_{SYM,init}N_{DBPS} - 8 \cdot \text{PSDU_LENGTH} - N_{service} \quad (21\text{-}57)$$

where

PSDU_LENGTH is defined in 21.4.3

$N_{SYM,init}$ is given by Equation (21-62)

For a VHT MU PPDU, if LDPC encoding is used for user *u* then the PHY padding bits are calculated using Equation (21-58).

$$N_{PAD,u} = N_{\text{SYM_max_init}}N_{DBPS,u} - 8 \cdot \text{PSDU_LENGTH}_u - N_{service} \quad (21\text{-}58)$$

where

PSDU_LENGTH_u is defined in 21.4.3

$N_{\text{SYM_max_init}}$ is given by Equation (21-65)

The Data field of the VHT PPDU contains data for one or more users. For a VHT MU PPDU, the data processing, from scrambling to constellation mapping shall happen on a per-user basis. In the following subclauses, this process is described from a single user's point of view.

21.3.10.2 SERVICE field

The SERVICE field is as shown in Table 21-16.

Table 21-16—SERVICE field

Bits	Field	Description
B0-B6	Scrambler Initialization	Set to 0
B7	Reserved	Set to 0
B8-B15	CRC	CRC calculated over VHT-SIG-B (excluding tail bits)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

21.3.10.3 CRC calculation for VHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23.

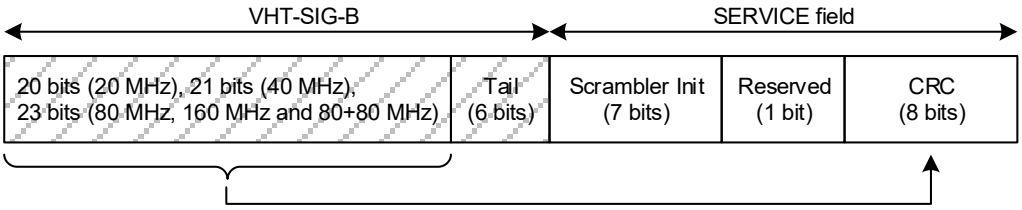

Figure 21-23—VHT-SIG-B and SERVICE field relationship

The value of the CRC field shall be the 1s complement of Equation (21-59).

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \tag{21-59}$$

where

$M(D) = m_0 D^{N-1} + m_1 D^{N-2} + \ldots + m_{N-2} D + m_{N-1}$

N is the number of bits over which the CRC is generated; 20 for 20 MHz, 21 for 40 MHz, and 23 for 80 MHz/160 MHz/80+80 MHz

m_i is bit i of VHT-SIG-B

$I(D) = \sum_{i=N-8}^{N-1} D^i$ are initialized values that are added modulo 2 to the first 8 bits of VHT-SIG-B

$G(D) = D^8 + D^2 + D + 1$ is the CRC generating polynomial

$crc(D) = c_0 D^7 + c_1 D^6 + \ldots + c_6 D + c_7$

Figure 19-8 shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, c_7 first, through an inverter.

As an example, if bits $\{m_0, \ldots m_{22}\}$ are given by {1 0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 1}, the CRC bits $\{c_7, \ldots c_0\}$ are {0 0 0 1 1 1 0 0}.

The CRC field is transmitted with c_7 first. Hence, c_7 is mapped to B8 of the SERVICE field, c_6 is mapped to B9, …, and c_0 is mapped to B15 of the SERVICE field.

21.3.10.4 Scrambler

The SERVICE, PSDU, and PHY pad parts of the Data field shall be scrambled by the scrambler defined in 17.3.5.5. The Clause 17 TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT are not present; therefore, the initial state of the scrambler is set to a pseudorandom nonzero seed. Different users in a VHT MU PPDU may use different pseudorandom nonzero seeds.

21.3.10.5 Coding

21.3.10.5.1 General

The Data field shall be encoded using either the binary convolutional code (BCC) defined in 21.3.10.5.2 and 21.3.10.5.3 or the low-density parity check (LDPC) code defined in 21.3.10.5.4. The encoder is selected by the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding, or MU[3] Coding fields in VHT-SIG-A, as defined in 21.3.8.3.3. When BCC FEC encoding is used, the number of encoders is determined by rate-dependent parameters as defined in 21.5. The operation of the BCC FEC is described in 21.3.10.5.2 and 21.3.10.5.3. The operation of the LDPC coder is described in 21.3.10.5.4. Support for the reception of a BCC encoded Data field is mandatory.

21.3.10.5.2 BCC encoder parsing operation

If multiple encoders are used, the scrambled SERVICE, PSDU, and PHY pad bits are divided between the encoders by sending bits to different encoders in a round robin manner. Bit i to encoder j of user u, denoted $x_{i,u}^{(j)}$, is as specified in Equation (21-60).

$$x_{i,u}^{(j)} = \begin{cases} b_{N_{ES}\cdot i+j,u}; & 0 \le i < N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}} - N_{tail}, \quad 0 \le j \le N_{ES,u} - 1 \\ 0; & N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}} - N_{tail} \le i < N_{SYM}\dfrac{N_{DBPS,u}}{N_{ES,u}}, \quad 0 \le j \le N_{ES,u} - 1 \end{cases} \tag{21-60}$$

where

$b_{k,u}$ is bit k of the scrambled SERVICE, PSDU, and pad bits of user u

N_{SYM} is the number of symbols in the Data field and is given by Equation (21-111) for a VHT SU PPDU and by Equation (21-67) for a VHT MU PPDU

NOTE—Tail bits with value 0 are being appended to each BCC encoder parser output sequence in Equation (21-60).

21.3.10.5.3 BCC coding and puncturing

The BCC encoder parser output sequences of user u $\{x_{i,u}^{(j)}\}$, $0 \le i < N_{SYM}N_{DBPS,u}/N_{ES,u}$, $0 \le j \le N_{ES,u} - 1$ each of which is separately encoded by a rate R = ½ convolutional encoder defined in 17.3.5.6. After encoding, the encoded data is punctured by the method defined in 17.3.5.6 (except for rate 5/6), to achieve the rate selected by the modulation and coding scheme. In the case that rate 5/6 coding is selected, the puncturing scheme will be the same as described in 19.3.11.6.

21.3.10.5.4 LDPC coding

For a VHT SU PPDU using LDPC coding to encode the Data field, the LDPC code and encoding process described in 19.3.11.7 shall be used with the following modifications. First, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits are encoded. Thus, N_{pld} for VHT PPDUs shall be computed using Equation (21-61) instead of Equation (19-35).

$$N_{pld} = N_{SYM,init}N_{DBPS} \tag{21-61}$$

where

$N_{SYM,init}$ is given by Equation (21-62)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$N_{SYM,\,init} = m_{STBC} \times \left\lceil \frac{8 \cdot \text{APEP_LENGTH} + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \tag{21-62}$$

where

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

APEP_LENGTH is the TXVECTOR parameter APEP_LENGTH

Following the calculation of N_{pld}, N_{avbits} shall be computed using Equation (21-63) instead of Equation (19-36).

$$N_{avbits} = N_{SYM,\,init} N_{CBPS} \tag{21-63}$$

In addition, if N_{SYM} computed in Equation (19-41) in step d) of 19.3.11.7.5 is greater than $N_{SYM,\,init}$, then the LDPC Extra OFDM Symbol field of VHT-SIG-A shall be set to 1. Otherwise, the LDPC Extra OFDM Symbol field of VHT-SIG-A shall be set to 0.

LDPC codes used in VHT MU PPDUs shall also follow the definitions in 19.3.11.7. Refer to 21.3.10.5.5 for a description of the LDPC encoding process for VHT MU PPDUs.

21.3.10.5.5 Encoding process for VHT MU PPDUs

For a VHT MU PPDU, first compute the initial number of OFDM symbols for each user using Equation (21-64).

$$N_{\text{SYM_init},\,u} = \begin{cases} \left\lceil \dfrac{8 \cdot \text{APEP_LENGTH}_u + N_{service} + N_{tail} \cdot N_{ES,\,u}}{N_{DBPS,\,u}} \right\rceil & \text{when user } u \text{ uses BCC} \\ \left\lceil \dfrac{8 \cdot \text{APEP_LENGTH}_u + N_{service}}{N_{DBPS,\,u}} \right\rceil & \text{when user } u \text{ uses LDPC} \end{cases} \tag{21-64}$$

where

APEP_LENGTH_u is the TXVECTOR parameter APEP_LENGTH for user u

Based on the above equation, compute the largest initial number of symbols over all users using Equation (21-65).

$$N_{\text{SYM_max_init}} = \max\{N_{\text{SYM_init},\,u}\}_{u=0}^{N_{user}-1} \tag{21-65}$$

Then, for each user u that uses LDPC in the VHT MU PPDU, the final number of symbols in the Data field ($N_{SYM,u}$) shall be computed as follows. First, perform step a) in 19.3.11.7.5 with the exception that N_{pld} is computed using Equation (21-66) instead of Equation (19-35).

$$N_{pld} = N_{\text{SYM_max_init}} N_{DBPS,\,u} \tag{21-66}$$

Then, perform steps b) to d) in 19.3.11.7.5 with N_{CBPS} and R replaced with $N_{CBPS,u}$ and R_u, respectively. $N_{SYM,u}$ for user u shall then be equal to the value of N_{SYM} obtained at the end of step d) using Equation (19-41).

The purpose of going through steps a) to d) in 19.3.11.7.5 in the above paragraph is to compute $N_{SYM,u}$. Thus, at this stage $N_{SYM,u}$ for each user may be calculated without actually encoding the data using LDPC.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For BCC users, $N_{SYM,u} = N_{\text{SYM_init},u}$.

Then, compute the number of symbols in the Data field using Equation (21-67).

$$N_{SYM} = \max\{N_{SYM,u}\}_{u=0}^{N_{user}-1} \quad (21\text{-}67)$$

When constructing the Data field for user u encoded using LDPC code, the MAC follows the padding procedure described in 10.12.6 and delivers a PSDU that contains PSDU_LENGTH_u octets (see 21.4.3). The PHY follows the padding procedure described in 21.3.10.1 to fill $N_{\text{SYM_max_init}}$ symbols, where $N_{\text{SYM_max_init}}$ is defined in Equation (21-65). Then, for each user, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits shall be encoded using the LDPC encoding process specified in 19.3.11.7.5 with the following modifications. First, N_{pld} shall be computed using Equation (21-66) instead of Equation (19-35). Also, replace N_{CBPS} and R with $N_{CBPS,u}$ and R_u, respectively. Next, step d) in 19.3.11.7.5 is replaced with step d) below:

d) If N_{SYM} computed in Equation (21-67) is equal to $N_{\text{SYM_max_init}}$, then the number of bits to be punctured, N_{punc}, from the codewords after encoding is computed as shown in Equation (19-38).

   If N_{SYM} computed in Equation (21-67) is greater than $N_{\text{SYM_max_init}}$, then the number of bits to be punctured, N_{punc}, from the codewords after encoding is computed using Equation (19-39) and Equation (19-40). Note also that N_{avbits} has now been updated in Equation (19-39) in this case.

   The punctured bits shall be equally distributed over all N_{CW} codewords with the first $\text{rem}(N_{punc}, N_{CW})$ codewords punctured 1 bit more than the remaining codewords. Define $N_{ppcw} = \lfloor N_{punc}/N_{CW} \rfloor$. When $N_{ppcw} > 0$, the puncturing is performed by discarding parity bits $p_{n-k-N_{ppcw}-1}, \ldots, p_{n-k-1}$ of the first $\text{rem}(N_{punc}, N_{CW})$ codewords and discarding parity bits $p_{n-k-N_{ppcw}}, \ldots, p_{n-k-1}$ of the remaining codewords after encoding.

When constructing the Data field for users encoded using BCC, the MAC follows the padding procedure described in 10.12.6 and delivers a PSDU that contains PSDU_LENGTH_u octets. The PHY follows the padding procedure described in 21.3.10.1 to fill up N_{SYM} symbols computed in Equation (21-67). Then, for each user, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits shall be encoded using the BCC encoding process specified in 21.3.10.5.2 and 21.3.10.5.3. Note that this process results in the BCC tail bits being placed at the very end of the PPDU.

In addition, if N_{SYM} computed in Equation (21-67) is greater than $N_{\text{SYM_max_init}}$ computed in Equation (21-65), then the LDPC Extra OFDM Symbol field of VHT-SIG-A2 shall be set to 1. Otherwise, the LDPC Extra OFDM Symbol field of VHT-SIG-A2 shall be set to 0.

21.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as *stream parsing* and is described in this subclause.

The description is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (21-68).

$$s = \max\left\{1, \frac{N_{BPSCS}}{2}\right\} \tag{21-68}$$

The sum of these over all streams is $S = N_{SS} \cdot s$

Consecutive blocks of s bits are assigned to different spatial streams in a round robin fashion.

Let

$$N_{\text{Block}} = \left\lfloor \frac{N_{CBPS}}{N_{ES} \cdot S} \right\rfloor \tag{21-69}$$

and

$$M = \frac{N_{CBPS} - N_{\text{Block}} \cdot N_{ES} \cdot S}{s \cdot N_{ES}} \tag{21-70}$$

For the first $N_{\text{Block}} \cdot N_{ES} \cdot S$ bits of each OFDM symbol, S bits from the output of first encoder are divided among all spatial streams, s bits per stream. Then, S bits from the output of next encoder are used, and so on. If N_{CBPS} is greater than $N_{\text{Block}} \cdot N_{ES} \cdot S$, then for the last $N_{CBPS} - N_{\text{Block}} \cdot N_{ES} \cdot S$ bits of each OFDM symbol, $M \cdot s$ bits from the output of the first encoder are fed into spatial streams 1 to M (s bits per spatial stream), and then $M \cdot s$ bits from the output of the next encoder are used for spatial stream $M + 1$ to $[(2M - 1) \bmod N_{SS}] + 1$, and so on, where $z \bmod t$ is the remainder resulting from the division of integer z by integer t.

The following equations are an equivalent description to the above procedure. Bit i at the output of encoder j is assigned to input bit k of spatial stream i_{SS} where

$$j = \begin{cases} \left\lfloor \frac{k}{s} \right\rfloor \bmod N_{ES}, & k = 0, 1, \ldots, N_{\text{Block}} \cdot N_{ES} \cdot s - 1 \\ \left\lfloor \frac{L}{M} \right\rfloor, & k = N_{\text{Block}} \cdot N_{ES} \cdot s, \ldots, N_{CBPSS} - 1 \end{cases} \tag{21-71}$$

and

$$i = \begin{cases} (i_{SS} - 1)s + S \cdot \left\lfloor \frac{k}{N_{ES} \cdot s} \right\rfloor + k \bmod s, & k = 0, 1, \ldots, N_{\text{Block}} \cdot N_{ES} \cdot s - 1 \\ (L \bmod M) \cdot s + N_{\text{Block}} \cdot S + k \bmod s, & k = N_{\text{Block}} \cdot N_{ES} \cdot s, \ldots, N_{CBPSS} - 1 \end{cases} \tag{21-72}$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$

$i = 0, 1, \ldots, N_{CBPS}/N_{ES} - 1$

$j = 0, 1, \ldots, N_{ES} - 1$

$k = 0, 1, \ldots, N_{CBPSS} - 1$

$L = \left\lfloor \frac{k'}{s} \right\rfloor N_{SS} + (i_{SS} - 1)$

$k' = k - N_{\text{Block}} \cdot N_{ES} \cdot s$

NOTE—N_{CBPS} is greater than $N_{\text{Block}} \cdot N_{ES} \cdot S$ in only the following cases:

a) 160 MHz and 80+80 MHz, $N_{SS} = 5$, VHT-MCS = 5
b) 160 MHz and 80+80 MHz, $N_{SS} = 5$, VHT-MCS = 6
c) 160 MHz and 80+80 MHz, $N_{SS} = 7$, VHT-MCS = 5
d) 160 MHz and 80+80 MHz, $N_{SS} = 7$, VHT-MCS = 6

21.3.10.7 Segment parser

The description in this subclause is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

For a 160 MHz or an 80+80 MHz transmission, the output bits of each stream parser are first divided into blocks of N_{CBPSS} bits ($N_{CBPSS,u}$ bits in the case of an MU transmission). Then, each block is further divided into two frequency subblocks of $N_{CBPSS}/2$ bits as shown in Equation (21-73).

$$y_{k,l} = x_{2s \cdot N_{ES}\left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + l \cdot s \cdot N_{ES} + k \bmod (s \cdot N_{ES})}, \qquad k = 0, 1, \ldots, \frac{N_{CBPSS}}{2} - 1 \tag{21-73}$$

where

x_m is the m th bit of a block of N_{CBPSS} bits, m= 0 to $N_{CBPSS} - 1$
l is the frequency subblock index, $l = 0, 1$
$y_{k,l}$ is bit k of the frequency subblock l
s is defined in Equation (21-68)

If N_{CBPSS} is not divisible by $2s \cdot N_{ES}$, then apply the segment parsing method described in Equation (21-73) for $\lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor$ sets of $2s \cdot N_{ES}$ segment parser input bits. At this point, each stream parser output has $2s \cdot N_{res}$ ($N_{res} = \frac{N_{CBPSS} \bmod (2s \cdot N_{ES})}{2s} < N_{ES}$, integer) residue bits. Then, the residue bits are divided into subsets of s bits, with each subset being assigned to different subblock ($l = 0, 1$) in a round robin fashion. The first s bits are assigned to the subblock with index $l = 0$. Repeat N_{res} times (until all bits are distributed to the two subblocks). That is, if N_{CBPSS} is not divisible by $2s \cdot N_{ES}$, each block is further divided into two subblocks of $N_{CBPSS}/2$ bits as shown in Equation (21-74).

$$y_{k,l} = \begin{cases} x_{2s \cdot N_{ES}\left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + l \cdot s \cdot N_{ES} + k \bmod (s \cdot N_{ES})}, & k = 0, 1, \ldots, \lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor \cdot s \cdot N_{ES} - 1 \\ x_{2s \cdot N_{ES}\left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + 2s \cdot \left\lfloor \frac{k \bmod (s \cdot N_{ES})}{s} \right\rfloor + l \cdot s + k \bmod s}, & k = \lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor \cdot s \cdot N_{ES}, \ldots, \frac{N_{CBPSS}}{2} - 1 \end{cases} \tag{21-74}$$

Segment parser is bypassed for a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, i.e., as specified in Equation (21-75).

$$y_{k,l} = x_k, \quad k = 0, 1, \ldots, N_{CBPSS} - 1 \tag{21-75}$$

where

l is the frequency subblock index. $l = 0$ for a 20, 40 or 80 MHz VHT PPDU transmission.
$y_{k,l}$ is bit k of the frequency subblock l
x_m is bit m of a block of N_{CBPSS} bits, $m = 0$ to $N_{CBPSS} - 1$

21.3.10.8 BCC interleaver

For ease of explanation, the operation of the interleaver is described for the SU case. For user u of an MU transmission, the interleaver operates in the same way on the output bits for the user from the stream parser by replacing N_{SS}, N_{CBPSS}, N_{CBPSSI}, and N_{BPSCS} with $N_{SS,u}$, $N_{CBPSS,u}$, $N_{CBPSSI,u}$, and $N_{BPSCS,u}$, respectively. That is, the operation of the interleaver is the same as if the transmission were an SU one, consisting of bits from only that user.

This subclause describes the interleaver used in the case of BCC encoding. The interleaver described in this subclause shall be bypassed in the case of LDPC encoding.

In a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, the bits at the output of the stream parser are processed in groups of N_{CBPS} bits. Each of these groups is divided into N_{SS} blocks of N_{CBPSS} bits, and each block shall be interleaved by an interleaver based on the Clause 17 interleaver. In a 160 MHz or an 80+80 MHz VHT PPDU transmission, each frequency subblock of $N_{CBPSS}/2$ output bits from the segment parser is interleaved by the interleaver for 80 MHz defined in this subclause. This interleaver, which is based on entering the data in rows, and reading it out in columns, has a different number of columns N_{COL} and rows N_{ROW} for different bandwidths. The values of N_{COL} and N_{ROW} are given in Table 21-17.

Table 21-17—Number of rows and columns in the interleaver

Parameter	20 MHz	40 MHz	80 MHz
N_{COL}	13	18	26
N_{ROW}	$4 \times N_{BPSCS}$	$6 \times N_{BPSCS}$	$9 \times N_{BPSCS}$
N_{ROT} ($N_{SS} \leq 4$)	11	29	58
N_{ROT} ($N_{SS} > 4$)	6	13	28

After the operations based on the Clause 17 interleaver have been applied and if more than one spatial stream exists, a third operation called *frequency rotation* is applied to the additional spatial streams. The parameter for the frequency rotation is N_{ROT}. The values of N_{ROT} are given in Table 21-17.

An additional parameter is the spatial stream index $i_{SS} = 1, 2, \ldots, N_{SS}$. The output of the third operation is a function of the spatial stream index.

The interleaving is defined using three permutations. The first permutation is given by the rule shown in Equation (21-76).

$$i = N_{ROW}(k \bmod N_{COL}) + \left\lfloor \frac{k}{N_{COL}} \right\rfloor, k = 0, 1, \ldots, N_{CBPSSI} - 1 \quad (21\text{-}76)$$

The second permutation is defined by the rule shown in Equation (21-77).

$$j = s\left\lfloor \frac{i}{s} \right\rfloor + \left(i + N_{CBPSSI} - \left\lfloor \frac{N_{COL} \cdot i}{N_{CBPSSI}} \right\rfloor \right) \bmod s, \quad i = 0, 1, \ldots, N_{CBPSSI} - 1 \quad (21\text{-}77)$$

where

s is defined in Equation (21-68)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If $2 \le N_{SS} \le 4$, a frequency rotation is applied to the output of the second permutation as shown in Equation (21-78).

$$r = \left\{ j - \left[(2(i_{SS} - 1)) \bmod 3 + 3 \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right] \cdot N_{ROT} \cdot N_{BPSCS} \right\} \bmod N_{CBPSSI}, \quad j = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-78}$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the spatial steam index on which this interleaver is operating

If $N_{SS} > 4$, a frequency rotation is applied to the output of the second permutation as shown in Equation (21-79).

$$r = \{ j - J(i_{SS}) \cdot N_{ROT} \cdot N_{BPSCS} \} \bmod N_{CBPSSI}, j = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-79}$$

where

$i_{SS} = 1, 2, \ldots, N_{SS}$ is the spatial steam index on which this interleaver is operating, and $J(i_{SS})$ is an integer as defined in Table 21-18.

Table 21-18—$J(i_{SS})$ values

i_{SS}	$J(i_{SS})$
1	0
2	5
3	2
4	7
5	3
6	6
7	1
8	4

The deinterleaver uses the following three operations to perform the inverse permutations. Let r denote the index of the bit in the received block (per spatial stream). The first operation reverses the third (frequency rotation) permutation of the interleaver. When $N_{SS} = 1$, this reversal is performed by $j = r$ ($r = 0, 1, \ldots, N_{CBPSSI} - 1$). When $2 \le N_{SS} \le 4$, this reversal is performed by as shown in Equation (21-80).

$$j = \left\{ r + \left[(2(i_{SS} - 1)) \bmod 3 + 3 \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right] \cdot N_{ROT} \cdot N_{BPSCS} \right\} \bmod N_{CBPSSI}, \quad r = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-80}$$

When $N_{SS} > 4$, this reversal is performed by Equation (21-81).

$$j = \{ r + J(i_{SS}) \cdot N_{ROT} \cdot N_{BPSCS} \} \bmod N_{CBPSSI}, \quad r = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-81}$$

where

$J(i_{SS})$ is defined in Table 21-18

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The second operation defined by Equation (21-82) reverses the second permutation in the interleaver.

$$i = s\left\lfloor \frac{j}{s} \right\rfloor + \left(j + \left\lfloor \frac{N_{COL} \cdot j}{N_{CBPSSI}} \right\rfloor \right) \bmod s, \quad j = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-82}$$

where

s is defined in Equation (21-68)

The third operation defined in Equation (21-83) reverses the first permutation of the interleaver.

$$k = N_{COL} \cdot i - (N_{CBPSSI} - 1)\left\lfloor \frac{i}{N_{ROW}} \right\rfloor, \quad i = 0, 1, \ldots, N_{CBPSSI} - 1 \tag{21-83}$$

21.3.10.9 Constellation mapping

21.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8. For 256-QAM, the mapping is shown in Figure 21-24 through Figure 21-27.

The bit string convention in Figure 21-24 through Figure 21-27 follows the bit string convention outlined in 17.3.5.8.

The streams of complex numbers in frequency subblock l for user u are denoted as follows:

$d_{k,i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$ for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz; (21-84)

$k = 0, 1, \ldots, \frac{N_{SD}}{2} - 1$ for 160 MHz;

$i = 1, \ldots, N_{SS,u}$;

$n = 0, 1, \ldots, N_{SYM} - 1$;

$l = 0$ for 20 MHz, 40 MHz, and 80 MHz;

$l = 0, 1$ for 160 MHz and 80+80 MHz;

$u = 0, \ldots, N_{user} - 1$

The normalization factor, K_{MOD}, for 256-QAM is $1/\sqrt{170}$.

21.3.10.9.2 LDPC tone mapping

The LDPC tone mapping shall be performed on all LDPC encoded streams as described in this subclause and using an LDPC tone-mapping distance parameter D_{TM}. D_{TM} is constant for each bandwidth and its value for different bandwidths is given in Table 21-19. LDPC tone mapping shall not be performed on streams that are encoded using BCC.

Table 21-19—LDPC tone mapping distance for each bandwidth

Parameter	20 MHz	40 MHz	80 MHz	160 MHz, 80+80 MHz
D_{TM}	4	6	9	9

For a VHT PPDU transmission, the LDPC tone mapping for LDPC-coded streams corresponding to user u is done by permuting the stream of complex numbers generated by the constellation mappers [see Equation (21-84)] to obtain

$$d''_{t(k),\,i,\,n,\,l,\,u} = d'_{k,\,i,\,n,\,l,\,u};\quad k = 0, 1, \ldots, N_{SD} - 1 \text{ for 20 MHz, 40 MHz, 80 MHz and 80+80 MHz;} \quad (21\text{-}85)$$

$$k = 0, 1, \ldots, \frac{N_{SD}}{2} - 1 \text{ for 160 MHz;}$$

$$i = 1, \ldots, N_{SS,\,u};$$

$$n = 0, 1, \ldots, N_{SYM} - 1;$$

$$l = 0 \text{ for 20 MHz, 40 MHz, and 80 MHz;}$$

$$l = 0, 1 \text{ for 160 MHz and 80+80 MHz;}$$

$$u = 0, \ldots, N_{user} - 1$$

where

$$t(k) = \begin{cases} D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}} \right\rfloor, & \text{for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz} \\ D_{TM}\left(k \bmod \frac{N_{SD}/2}{D_{TM}}\right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}/2} \right\rfloor, & \text{for 160 MHz} \end{cases} \quad (21\text{-}86)$$

As a result of the LDPC tone mapping operation above, each two consecutively generated complex constellation numbers $d'_{k,\,i,\,n,\,l,\,u}$ and $d'_{k+1,\,i,\,n,\,l,\,u}$ will be transmitted on two data tones that are separated by at least $D_{TM} - 1$ other data tones. Note that the operation above is equivalent to block-interleaving the complex numbers $d'_{0,\,i,\,n,\,l,\,u}, \ldots, d'_{N_{SD}-1,\,i,\,n,\,l,\,u}$ for each i, n, and u using a matrix with D_{TM} rows and N_{SD}/D_{TM} (for 20 MHz, 40 MHz, 80 MHz, or 80+80 MHz) or $\frac{N_{SD}}{2 \cdot D_{TM}}$ (for 160 MHz) columns, where $d'_{0,\,i,\,n,\,l,\,u}, \ldots, d'_{N_{SD}-1,\,i,\,n,\,l,\,u}$ are written row-wise into the matrix, and $d''_{0,\,i,\,n,\,l,\,u}, \ldots, d''_{N_{SD}-1,\,i,\,n,\,l,\,u}$ are read column-wise from the matrix.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE—LDPC tone mapping is performed separately for the upper and lower 80 MHz frequency subblocks of a 160 MHz or 80+80 MHz transmission as indicated by the frequency subblock index l in Equation (21-85) and Equation (21-86).

Since LDPC tone mapping is not performed on BCC-coded streams, for BCC-coded streams, the following applies:

$$d''_{k,i,n,l,u} = d'_{k,i,n,l,u};\quad k = 0, 1, \ldots, N_{SD} - 1 \text{ for 20 MHz, 40 MHz, 80 MHz and 80+80 MHz;} \tag{21-87}$$

$$k = 0, 1, \ldots, \frac{\dot{N}_{SD}}{2}\dot{-}1 \text{ for 160 MHz;}$$

$$i = 1, \ldots, N_{SS,u};$$

$$n = 0, 1, \ldots, N_{SYM} - 1;$$

$$l = 0 \text{ for 20 MHz, 40 MHz, and 80 MHz;}$$

$$l = 0, 1 \text{ for 160 MHz and 80+80 MHz;}$$

$$u = 0, \ldots, N_{user} - 1$$

21.3.10.9.3 Segment deparser

In a 160 MHz VHT PPDU transmission, the two frequency subblocks at the output of the LDPC tone mapper for LDPC or constellation mapper for BCC are combined into one frequency segment as shown in Equation (21-88).

$$d^{(i_{Seg})}_{k,i,n,u} = \begin{cases} d''_{k,i,n,0,u}, & \text{if } 0 \le k \le \frac{N_{SD}}{2} - 1 \\ d''_{k - N_{SD}/2,i,n,1,u}, & \text{if } \frac{N_{SD}}{2} \le k \le N_{SD} - 1 \end{cases}, \quad i_{Seg} = 0 \tag{21-88}$$

In a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, the segment deparsing is not performed. Hence,

$$d^{(i_{Seg})}_{k,i,n,u} = d''_{k,i,n,0,u}, \quad 0 \le k \le N_{SD} - 1, \quad i_{Seg} = 0 \tag{21-89}$$

In an 80+80 MHz VHT PPDU transmission, the segment deparsing is not performed. Hence,

$$d^{(i_{Seg})}_{k,i,n,u} = d''_{k,i,n,i_{Seg},u}, \quad 0 \le k \le N_{SD} - 1, \quad i_{Seg} = 0, 1 \tag{21-90}$$

NOTE—As per Table 21-7, $f_c^{(0)}$ (center frequency for frequency segment i_{Seg}=0) is always less than $f_c^{(1)}$ in case of 80+80 MHz VHT PPDU transmissions. Hence, $d''_{k,i,n,0,u}$ (frequency subblock 0) is always transmitted in the frequency segment lower in frequency, while $d''_{k,i,n,1,u}$ (frequency subblock 1) is always transmitted in the frequency segment higher in frequency.

21.3.10.9.4 Space-time block coding

This subclause defines a set of optional robust transmission techniques that are applicable only when using STBC coding for VHT SU PPDUs. In this case, $N_{SS,0}$ spatial streams are mapped to $N_{STS,0}$ space-time streams. These techniques are based on STBC. When the VHT-SIG-A STBC field is 1, a symbol operation shall occur between the constellation mapper and the spatial mapper as defined in this subclause. STBC shall not be applied in a VHT MU PPDU. Hence, the user subscript *u* is 0 in this subclause.

If STBC is applied, the stream of complex numbers, $d^{(i_{Seg})}_{k,\,i,\,n,\,0};\ \ k = 0, \ldots, N_{SD}-1;\ \ i = 1, \ldots, N_{SS,\,0};\ \ n = 0, \ldots, N_{SYM}-1$, generated by the segment deparser, is the input to the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}^{(i_{Seg})}_{k,\,i_{STS},\,n,\,0};\ \ k = 0, \ldots, N_{SD}-1;\ \ i_{STS} = 1, \ldots, N_{STS,\,0};\ \ n = 0, \ldots, N_{SYM}-1$. For given values of *k* and *i*, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the value of $\tilde{d}^{(i_{Seg})}_{k,\,2i-1,\,2m,\,0}$ and $\tilde{d}^{(i_{Seg})}_{k,\,2i,\,2m,\,0}$ depend on $d^{(i_{Seg})}_{k,\,i,\,2m,\,0}$ and $d^{(i_{Seg})}_{k,\,i,\,2m+1,\,0}$. Also, $\tilde{d}^{(i_{Seg})}_{k,\,2i-1,\,2m+1,\,0}$ and $\tilde{d}^{(i_{Seg})}_{k,\,2i,\,2m+1,\,0}$ depend on $d^{(i_{Seg})}_{k,\,i,\,2m,\,0}$ and $d^{(i_{Seg})}_{k,\,i,\,2m+1,\,0}$. This is defined in Table 21-20. Note that the segment index i_{Seg} is omitted in Table 21-20 for simplicity.

Table 21-20—Constellation mapper output to spatial mapper input for STBC

N_{STS}	N_{SS}	i_{STS}	$\tilde{d}_{k, i_{STS}, 2m, 0}$	$\tilde{d}_{k, i_{STS}, 2m+1, 0}$
8	4	1	$d_{k, 1, 2m, 0}$	$d_{k, 1, 2m+1, 0}$
		2	$-d^*_{k, 1, 2m+1, 0}$	$d^*_{k, 1, 2m, 0}$
		3	$d_{k, 2, 2m, 0}$	$d_{k, 2, 2m+1, 0}$
		4	$-d^*_{k, 2, 2m+1, 0}$	$d^*_{k, 2, 2m, 0}$
		5	$d_{k, 3, 2m, 0}$	$d_{k, 3, 2m+1, 0}$
		6	$-d^*_{k, 3, 2m+1, 0}$	$d^*_{k, 3, 2m, 0}$
		7	$d_{k, 4, 2m, 0}$	$d_{k, 4, 2m+1, 0}$
		8	$-d^*_{k, 4, 2m+1, 0}$	$d^*_{k, 4, 2m, 0}$

If STBC is not applied, $\tilde{d}^{(i_{Seg})}_{k, i, n, 0} = d^{(i_{Seg})}_{k, i, n, 0}$ and $N_{STS, 0} = N_{SS, 0}$.

NOTE—When STBC is applied, an odd number of space-time streams is not allowed, and $N_{STS, 0} = 2N_{SS, 0}$.

21.3.10.10 Pilot subcarriers

In a 20 MHz transmission, four pilot tones shall be inserted in subcarriers $k \in \{-21, -7, 7, 21\}$. The pilot mapping P^k_n for subcarrier *k* for symbol *n* shall be as specified in Equation (21-91).

$$\begin{aligned} P^{\{-21,-7,7,21\}}_n &= \{\Psi^{(1)}_{1, n \bmod 4}, \Psi^{(1)}_{1, (n+1) \bmod 4}, \Psi^{(1)}_{1, (n+2) \bmod 4}, \Psi^{(1)}_{1, (n+3) \bmod 4}\} \\ P^{k \notin \{-21,-7,7,21\}}_n &= 0 \end{aligned} \tag{21-91}$$

where

$\Psi^{(1)}_{1, m}$ is given by the $N_{STS} = 1$ row of Table 19-19

In a 40 MHz transmission, six pilot tones shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilot mapping P^k_n for subcarrier *k* for symbol *n* shall be as specified in Equation (21-92).

$$\begin{aligned} P^{\{-53,-25,-11,11,25,53\}}_n &= \{\Psi^{(1)}_{1, n \bmod 6}, \Psi^{(1)}_{1, (n+1) \bmod 6}, \ldots, \Psi^{(1)}_{1, (n+5) \bmod 6}\} \\ P^{k \notin \{-53,-25,-11,11,25,53\}}_n &= 0 \end{aligned} \tag{21-92}$$

where

$\Psi^{(1)}_{1, m}$ is given by the $N_{STS} = 1$ row of Table 19-20

In an 80 MHz transmission, eight pilot tones shall be inserted in subcarriers –103, –75, –39, –11, 11, 39, 75, and 103. The pilot mapping P^k_n for subcarrier *k* for symbol *n* shall be as specified in Equation (21-93).

$$P_n^{\{-103,-75,-39,-11,11,39,75,103\}} = \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \ldots, \Psi_{(n+7) \bmod 8}\}$$
$$P_n^{k \notin \{-103,-75,-39,-11,11,39,75,103\}} = 0 \quad (21\text{-}93)$$

where

Ψ_m is defined in Table 21-21

Table 21-21—Pilot values for 80 MHz transmission

Ψ_0	Ψ_1	Ψ_2	Ψ_3	Ψ_4	Ψ_5	Ψ_6	Ψ_7
1	1	1	−1	−1	1	1	1

In a 160 MHz transmission, the 80 MHz pilot mapping is replicated in the two 80 MHz subchannels of the 160 MHz transmission. Specifically, 16 pilot tones shall be inserted in subcarriers –231, –203, –167, –139, –117, –89, –53, –25, 25, 53, 89, 117, 139, 167, 203, and 231. The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (21-94).

$$P_n^{\{-231,-203,-167,-139,-117,-89,-53,-25,25,53,89,117,139,167,203,231\}} \quad (21\text{-}94)$$
$$= \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \Psi_{(n+2) \bmod 8}, \Psi_{(n+3) \bmod 8}, \Psi_{(n+4) \bmod 8}, \Psi_{(n+5) \bmod 8}, \Psi_{(n+6) \bmod 8}, \Psi_{(n+7) \bmod 8},$$
$$\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \Psi_{(n+2) \bmod 8}, \Psi_{(n+3) \bmod 8}, \Psi_{(n+4) \bmod 8}, \Psi_{(n+5) \bmod 8}, \Psi_{(n+6) \bmod 8}, \Psi_{(n+7) \bmod 8}\}$$
$$P_n^{k \notin \{-231,-203,-167,-139,-117,-89,-53,-25,25,53,89,117,139,167,203,231\}} = 0$$

where

Ψ_m is given in Table 21-21

In an 80+80 MHz transmission, each frequency segment shall follow the 80 MHz pilot tone allocation and values defined for 80 MHz transmission as specified in Equation (21-93) and Table 21-21.

The above pilot mapping shall be copied to all space-time streams before the space-time stream cyclic shifts are applied.

21.3.10.11 OFDM modulation

21.3.10.11.1 Transmission in VHT format

The time domain waveform of the Data field of a VHT PPDU from frequency segment i_{Seg} and transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$ shall be as defined in Equation (21-95).

$$r_{\text{VHT-Data}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{VHT-Data}}^{\text{Tone}} N_{STS,\,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{\text{SYM}}}(t - nT_{SYM}) \quad (21\text{-}95)$$
$$\cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left(\left[Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_u+m)} \Upsilon_{k,\,\text{BW}} (\tilde{D}_{k,m,n,BW}^{(i_{Seg},u)} + p_{n+4} P_n^k) \cdot \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{\text{GI, Data}} - T_{\text{CS,VHT}}(M_u+m))) \right)$$

where

p_n is defined in 17.3.5.10

P_n^k is defined in 21.3.10.10

Copyright © 2021 IEEE. All rights reserved.

$\Upsilon_{k,\,\mathrm{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16). and Equation (21-17)

$\tilde{D}^{(i_{Seg},\,u)}_{k,\,m,\,n,\,BW}$ is the transmitted constellation for user u at subcarrier k, space-time stream m, and Data field OFDM symbol n and is defined in Equation (21-96) to Equation (21-99)

$N^{\mathrm{Tone}}_{\mathrm{VHT\text{-}Data}}$ has the value given in Table 21-8

$T_{\mathrm{CS,VHT}}(n)$ is given in Table 21-11

$T_{\mathrm{GI,\,Data}}$ is the guard interval duration. $T_{\mathrm{GI,\,Data}} = T_{\mathrm{GI}}$ when not using the short guard interval (Short GI field of VHT-SIG-A2 is 0) and $T_{\mathrm{GI,\,Data}} = T_{\mathrm{GIS}}$ when using the short guard interval (Short GI field of VHT-SIG-A2 is 1). T_{GI} and T_{GIS} are given in Table 21-5

In a 20 MHz VHT transmission,

$$\tilde{D}^{(i_{Seg},\,u)}_{k,\,m,\,n,\,20} = \begin{cases} 0,\ k = 0, \pm 7, \pm 21 \\ \tilde{d}^{(i_{Seg})}_{M^r_{20}(k),\,m,\,n,\,u},\ \text{otherwise} \end{cases} \tag{21-96}$$

where

$M^r_{20}(k)$ is defined in Equation (21-49)

In a 40 MHz VHT transmission,

$$\tilde{D}^{(i_{Seg},\,u)}_{k,\,m,\,n,\,40} = \begin{cases} 0,\ k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ \tilde{d}^{(i_{Seg})}_{M^r_{40}(k),\,m,\,n,\,u},\ \text{otherwise} \end{cases} \tag{21-97}$$

where

$M^r_{40}(k)$ is defined in Equation (21-51)

In an 80 MHz transmission,

$$\tilde{D}^{(i_{Seg},\,u)}_{k,\,m,\,n,\,80} = \begin{cases} 0,\ k = 0, \pm 1, \pm 11, \pm 39, \pm 75, \pm 103 \\ \tilde{d}^{(i_{Seg})}_{M^r_{80}(k),\,m,\,n,\,u},\ \text{otherwise} \end{cases} \tag{21-98}$$

where

$M^r_{80}(k)$ is defined in Equation (21-53)

In a 160 MHz transmission,

$$\tilde{D}^{(i_{Seg},\,u)}_{k,\,m,\,n,\,160} = \begin{cases} 0,\ k = 0, \pm 1, \pm 2, \pm 3, \pm 4, \pm 5, \pm 25, \pm 53, \pm 89, \pm 117, \pm 127, \pm 128, \pm 129, \pm 139, \pm 167, \pm 203, \pm 231 \\ \tilde{d}^{(i_{Seg})}_{M^r_{160}(k),\,m,\,n,\,u},\ \text{otherwise} \end{cases} \tag{21-99}$$

where

$M^r_{160}(k)$ is defined in Equation (21-55)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In an 80+80 MHz transmission, each frequency segment shall follow the 80 MHz VHT subcarrier mapping as specified in Equation (21-98) and Equation (21-53).

$Q_k^{(i_{Seg})}$ is a spatial mapping/steering matrix with N_{TX} rows and $N_{STS,total}$ columns for subcarrier k in frequency segment i_{Seg}. $Q_k^{(i_{Seg})}$ may be frequency dependent. Refer to the examples of Q_k listed in 19.3.11.11.2 for examples of $Q_k^{(i_{Seg})}$ that could be used for VHT SU PPDUs. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 and the number of transmit chains N_{TX} could be greater than 4. For VHT SU PPDUs to which beamforming is applied, $Q_k^{(i_{Seg})}$ is a beamforming steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. For VHT MU PPDUs, $Q_k^{(i_{Seg})}$ is the DL-MU-MIMO steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. The beamforming steering matrices and DL-MU-MIMO steering matrices are implementation specific.

21.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU is a non-HT duplicate. Non-HT duplicate transmission is used to transmit to non-HT OFDM STAs, HT STAs, or VHT STAs that may be present in a part of a 40 MHz, 80 MHz, or 160 MHz channel (see Table 21-2). The VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields are not transmitted. The L-STF, L-LTF, and L-SIG fields shall be transmitted in the same way as in the VHT transmission, with the exceptions for the Rate and Length fields which shall follow 17.3.4.

In a 40 MHz non-HT duplicate transmission, the Data field shall be as defined by Equation (19-61).

For 80 MHz and 160 MHz non-HT duplicate transmissions, the Data field shall be as defined by Equation (21-100).

$$r^{i_{TX}}_{\text{non-HT},\,BW}(t) = \frac{1}{\sqrt{N^{\text{Tone}}_{\text{NON_HT_DUP_OFDM-Data}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \cdot \sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \left(\sum_{k=-26}^{26} \Upsilon_{(k-K_{\text{Shift}}(i_{BW})),\,BW}(D_{k,\,n} + p_{n+1}P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{BW}))\Delta_F(t - nT_{SYM} - T_{GI} - T^{i_{TX}}_{\text{CS}})) \right) \quad (21\text{-}100)$$

where

$N_{20\text{MHz}}$ and $K_{\text{Shift}}(i)$	are defined in 21.3.8.2.4
P_k and p_n	are defined in 17.3.5.10
$D_{k,n}$	is defined in Equation (21-26)
$\Upsilon_{k,\,BW}$	is defined in Equation (21-16) and Equation (21-17)
$T^{i_{TX}}_{\text{CS}}$	represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10
$N^{\text{Tone}}_{\text{NON_HT_DUP_OFDM-Data}}$	has the value given in Table 21-8

In an 80+80 MHz non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for an 80 MHz non-HT duplicate transmission in Equation (21-100).

21.3.11 SU-MIMO and DL-MU-MIMO Beamforming

21.3.11.1 General

SU-MIMO and DL-MU-MIMO beamforming are techniques used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. With SU-MIMO beamforming all space-time streams in the transmitted signal are intended for reception at a single STA. With DL-MU-MIMO beamforming, disjoint subsets of the space-time streams are intended for reception at different STAs.

For SU-MIMO beamforming, the steering matrix Q_k can be determined from the beamforming feedback matrix V_k that is sent back to the beamformer by the beamformee using the compressed beamforming feedback matrix format as defined in 19.3.12.3.6. The feedback report format is described in 9.4.1.49.

For DL-MU-MIMO beamforming, the receive signal vector in subcarrier k at beamformee u, $\boldsymbol{y}_{k,u} = [y_{k,0}, y_{k,1}, \ldots, y_{k,N_{RX_u}-1}]^T$, is shown in Equation (21-101), where $\boldsymbol{x}_k = [\boldsymbol{x}_{k,0}^T, \boldsymbol{x}_{k,1}^T, \ldots, \boldsymbol{x}_{k,N_{user}-1}^T]^T$ denotes the transmit signal vector in subcarrier k for all N_{user} beamformees, with $\boldsymbol{x}_{k,u} = [x_{k,0}, x_{k,1}, \ldots, x_{k,N_{STS,u}-1}]^T$ being the transmit signal for beamformee u.

$$\boldsymbol{y}_{k,u} = \boldsymbol{H}_{k,u} \times [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user}-1}] \times \boldsymbol{x}_k + \boldsymbol{n} \quad (21\text{-}101)$$

where

$\boldsymbol{H}_{k,u}$ is the channel matrix from the beamformer to beamformee u in subcarrier k with dimensions $N_{RX_u} \times N_{TX}$

N_{RX_u} is the number of receive antennas at beamformee u

$Q_{k,u}$ is a steering matrix for beamformee u in subcarrier k with dimensions $N_{TX} \times N_{STS_u}$

N_{user} is the number of VHT MU PPDU recipients (see Table 21-6)

$\boldsymbol{n}$ is a vector of additive noise and may include interference

The DL-MU-MIMO steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user}-1}]$ can be determined by the beamformer using the beamforming feedback matrices for subcarrier k from beamformee u, $V_{k,u,}$ and SNR information for subcarrier k from beamformee u, $SNR_{k,u}$, where $u = 0, 1, \ldots, N_{user} - 1$. The steering matrix that is computed (or updated) using new beamforming feedback matrices and new SNR information from some or all of participating beamformees might replace the existing steering matrix Q_k for the next DL-MU-MIMO data transmission. The beamformee group for the MU transmission is signaled using the Group ID field in VHT-SIG-A (see 21.3.8.3.3 and 21.3.11.4).

21.3.11.2 Beamforming Feedback Matrix *V*

Upon receipt of a VHT NDP sounding PPDU, the beamformee shall remove the space-time stream CSD in Table 21-11 from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrix, $V_{k,u}$, found by the beamformee u for subcarrier k shall be compressed in the form of angles using the method described in 19.3.12.3.6. The angles, $\phi(k,u)$ and $\psi(k,u)$, are quantized according to Table 9-74. The number of bits for quantization is chosen by the beamformee, based on the indication from the beamformer as to whether the feedback is requested for SU-MIMO beamforming or

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

DL-MU-MIMO beamforming. The compressed beamforming feedback using 19.3.12.3.6 is the only Clause 21 beamforming feedback format defined.

The beamformee shall generate the beamforming feedback matrices with the number of rows (*Nr*) equal to the N_{STS} of the NDP.

After receiving the angle information, $\phi(k,u)$ and $\psi(k,u)$, the beamformer reconstructs $V_{k,u}$ using Equation (19-79). For SU-MIMO beamforming, the beamformer can use this $V_{k,0}$ matrix to determine the steering matrix Q_k. For DL-MU-MIMO beamforming, the beamformer may calculate a steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \ldots, Q_{k,N_{user}-1}]$ using $V_{k,u}$ and $SNR_{k,u}$ $(0 \le u \le N_{user} - 1)$ in order to suppress crosstalk between participating beamformees. The method used by the beamformer to calculate the steering matrix Q_k is implementation specific.

The beamformee decides the tone grouping and codebook size to be used in the beamforming feedback matrix *V*. A beamformer shall support all tone groups and codebook sizes.

21.3.11.3 Maximum Number of Total Spatial Streams in VHT MU PPDUs

An MU beamformee capable STA shall support reception of VHT MU PPDUs with the total number of space-time streams across the N_user users being less than or equal to the value indicated in the Maximum $N_{STS,total}$ subfield of the Supported VHT-MCS and NSS Set field of the VHT Capabilities element.

21.3.11.4 Group ID

A value in the Group ID field in VHT-SIG-A (see 21.3.8.3.3) in the range 1 to 62 indicates a VHT MU PPDU. Prior to transmitting a VHT MU PPDU, group assignments have been established by the AP for DL-MU-MIMO capable STAs using the Group ID Management frame as defined in 9.6.22.3.

After the PHY is configured using the PHYCONFIG_VECTOR parameter GROUP_ID_MANAGEMENT, the following lookup tables are populated:

a) Group ID to Membership Status, denoted by MembershipStatusInGroupID[*g*] for $1 \le g \le 62$
b) Group ID to User Position, denoted by UserPositionInGroupID[*g*] for $1 \le g \le 62$

When a STA receives a VHT MU PPDU where the Group ID field in VHT-SIG-A has the value *k* and where MembershipStatusInGroupID[*k*] is equal to 1, then the number of space-time streams for that STA is indicated in the MU[UserPositionInGroupID[*k*]] NSTS field in VHT-SIG-A. The space-time streams of different users are ordered in accordance to user position values, i.e., the space-time streams for the user in user position 0 come first, followed by the space-time streams for the user in position 1, followed by the space-time streams for the user in position 2, and followed by the space-time streams for the user in position 3.

A STA is also able to identify the space-time streams intended for other STAs that act as interference. VHT-LTF symbols in the VHT MU PPDU are used to measure the channel for the space-time streams intended for the STA and can also be used to measure the channel for the interfering space-time streams. To successfully demodulate the space-time streams intended for the STA, the STA may use the channel state information for all space-time streams to reduce the effect of interfering space-time streams.

If a STA finds that it is not a member of the group, or the STA is a member of the group but the corresponding MU NSTS field in VHT-SIG-A indicates that there are zero space-time streams for the STA in the PPDU, then the STA may elect to not process the remainder of the PPDU.

21.3.12 VHT preamble format for sounding PPDUs

NDP is the only VHT sounding format.

The format of a VHT NDP is shown in Figure 21-28.

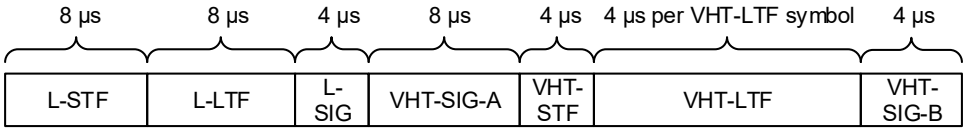

Figure 21-28—VHT NDP format

NOTE—The number of VHT-LTF symbols in the NDP is determined by the SU NSTS field in VHT-SIG-A.

The VHT NDP has the following properties:

— Uses the VHT PPDU format but without the Data field.
— Is a VHT SU PPDU as indicated by the VHT-SIG-A field.
— Has the data bits of the VHT-SIG-B field set to a fixed bit pattern (see 21.3.8.3.6).

21.3.13 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains might be subject to additional or alternative national regulations.

21.3.14 Channelization

A VHT channel is specified by the four PLME MIB fields specified in Table 21-22.

Given dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1, the respective channel center frequency is given by Equation (21-102).

$$\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + 5 \times \text{dot11CurrentChannelCenterFrequencyIndex} \quad (21\text{-}102)$$

where
Channel starting frequency is given by the operating class (Annex E)
dot11CurrentChannelCenterFrequencyIndex is either dot11CurrentChannelCenterFrequencyIndex0 or dot11CurrentChannelCenterFrequencyIndex1

The center frequency of the primary 20 MHz channel is given by Equation (21-103).

$$\text{Primary 20 MHz channel center frequency [MHz]} = \text{Channel starting frequency} + 5 \times \text{dot11CurrentPrimaryChannel} \quad (21\text{-}103)$$

where
Channel starting frequency is defined as dot11ChannelStartingFactor × 500 kHz.

Table 21-22—Fields to specify VHT channels

Field	Meaning
dot11CurrentChannelWidth	Channel width. Possible values represent 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channels.
dot11CurrentChannelCenterFrequencyIndex0	For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, denotes the channel center frequency. For an 80+80 MHz channel, denotes the center frequency of the frequency segment 0, which is the frequency segment containing the primary channel. Valid range is 1 to 200. See Equation (21-102).
dot11CurrentChannelCenterFrequencyIndex1	For an 80+80 MHz channel, denotes the center frequency of the frequency segment 1, which is the frequency segment that does not contain the primary channel. Valid range is 1 to 200. See Equation (21-102). For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, set to 0.
dot11CurrentPrimaryChannel	Denotes the location of the primary 20 MHz channel. Valid range is 1 to 200. See Equation (21-103).

A channel center frequency of 5 GHz shall be indicated by dot11ChannelStartingFactor = 8000 and dot11CurrentPrimaryChannel = 200.

For an 80+80 MHz channel, any two channels that would each be allowed as 80 MHz channels and whose center frequencies are separated by greater than 80 MHz (difference between dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 80 MHz) may be used.

For example, a channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 42
dot11CurrentPrimaryChannel = 36

is an 80 MHz channel with a center frequency of 5210 MHz and the primary 20 MHz channel centered at 5180 MHz.

A channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 160 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 50
dot11CurrentPrimaryChannel = 56

is a 160 MHz channel with a center frequency of 5250 MHz and the primary 20 MHz channel centered at 5280 MHz.

A channel specified by

Channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80+80 MHz
dot11CurrentChannelCenterFrequencyIndex0 =155
dot11CurrentChannelCenterFrequencyIndex1 = 106
dot11CurrentPrimaryChannel = 161

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

is an 80+80 MHz channel in which frequency segment 0 has 80 MHz bandwidth and center frequency of 5775 MHz. Frequency segment 1 also has 80 MHz bandwidth and center frequency of 5530 MHz. The primary 20 MHz channel is centered at 5805 MHz.

21.3.15 Slot time

The slot time for the VHT PHY shall be 9 μs for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channel spacing.

21.3.16 Transmit and receive port impedance

Transmit and receive antenna connector impedance for each transmit and receive antenna is defined in 17.3.8.7.

21.3.17 VHT transmit specification

21.3.17.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels, see 21.3.17.4.2. The spectral mask requirements in this subclause do not apply to the RF LO.

For a 20 MHz mask PPDU of non-HT, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 18 MHz, –20 dBr at 11 MHz frequency offset, –28 dBr at 20 MHz frequency offset, and –40 dBr at 30 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 9 and 11 MHz, 11 and 20 MHz, and 20 and 30 MHz shall be linearly interpolated in dB domain from the requirements for 9 MHz, 11 MHz, 20 MHz, and 30 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –53 dBm/MHz at any frequency offset. Figure 21-29 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –53 dBm/MHz.

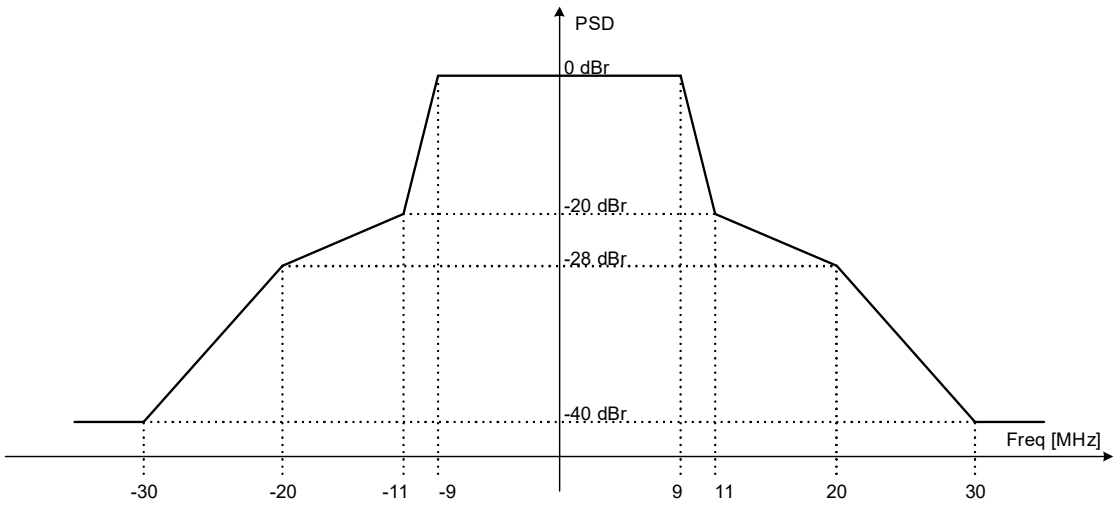

Figure 21-29—Example transmit spectral mask for 20 MHz mask PPDU

Copyright © 2021 IEEE. All rights reserved.

For a 40 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 19 and 21 MHz, 21 and 40 MHz, and 40 and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –56 dBm/MHz at any frequency offset greater than 19 MHz. Figure 21-30 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –56 dBm/MHz.

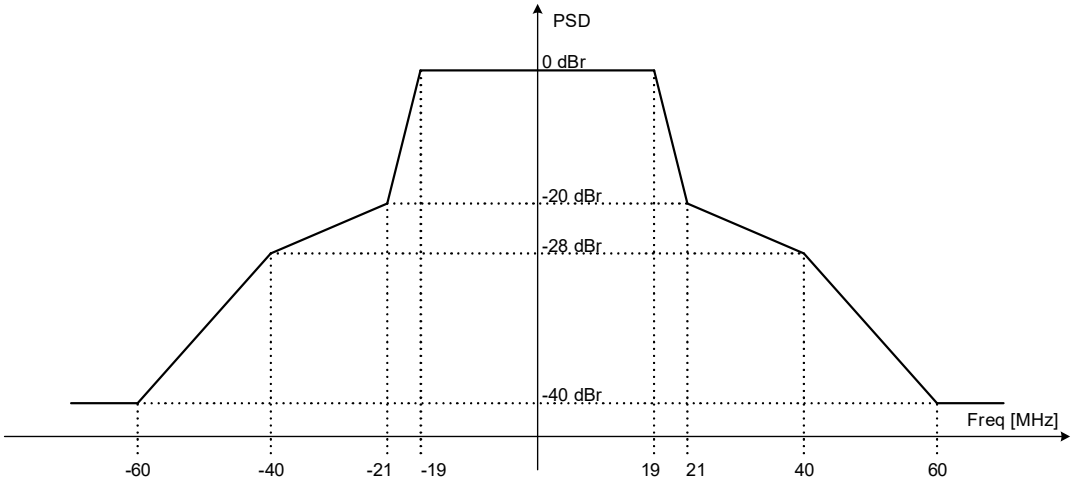

Figure 21-30—Example transmit spectral mask for 40 MHz mask PPDU

For an 80 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 78 MHz, –20 dBr at 41 MHz frequency offset, –28 dBr at 80 MHz frequency offset, and –40 dBr at 120 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 39 and 41 MHz, 41 and 80 MHz, and 80 and 120 MHz shall be linearly interpolated in dB domain from the requirements for 39 MHz, 41 MHz, 80 MHz, and 120 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –59 dBm/MHz at any frequency offset. Figure 21-31 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –59 dBm/MHz.

For a 160 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 158 MHz, –20 dBr at 81 MHz frequency offset, –28 dBr at 160 MHz frequency offset, and –40 dBr at 240 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 79 and 81 MHz, 81 and 160 MHz, and 160 and 240 MHz shall be linearly interpolated in dB domain from the requirements for 79 MHz, 81 MHz, 160 MHz, and 240 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –59 dBm/MHz at any frequency offset. Figure 21-32 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –59 dBm/MHz.

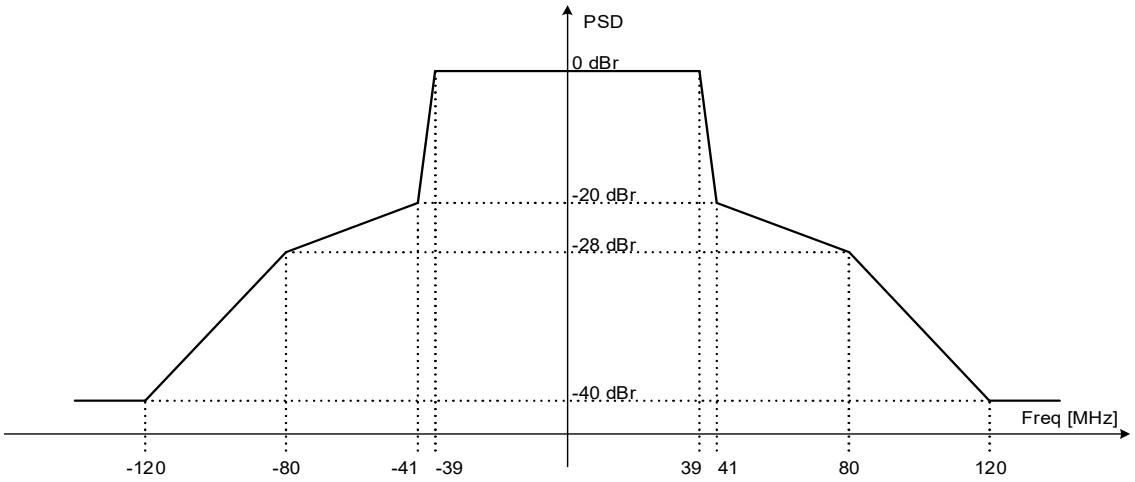

Figure 21-31—Example transmit spectral mask for 80 MHz mask PPDU

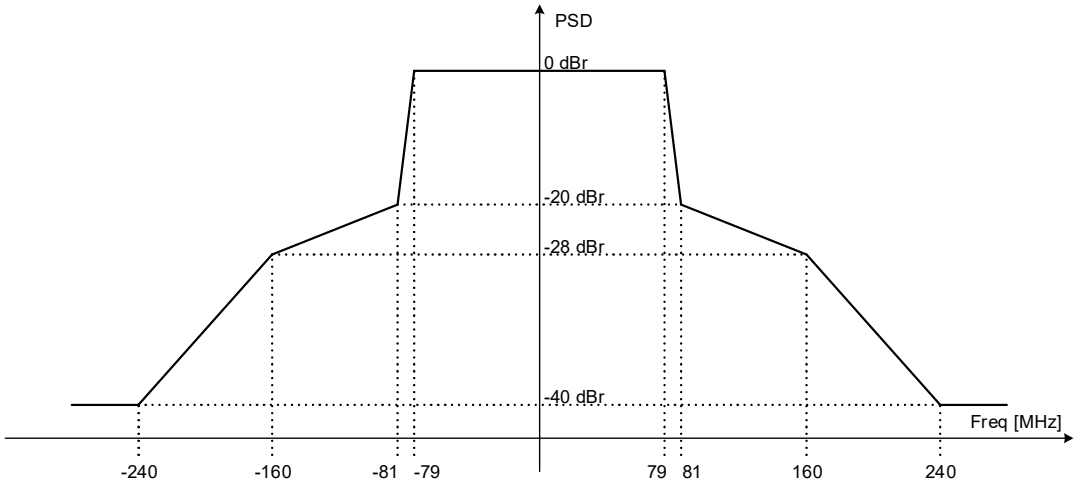

Figure 21-32—Example transmit spectral mask for 160 MHz mask PPDU

For an 80+80 MHz mask PPDU of non-HT duplicate or VHT format, the overall transmit spectral mask is constructed in the following manner. First, the 80 MHz interim spectral mask is placed on each of the two 80 MHz frequency segments. Then, for each frequency at which both of the 80 MHz interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two interim mask values (summed in linear domain) shall be taken as the overall spectral mask value. Next, for each frequency at which neither of the two 80 MHz interim masks have values greater than or equal to –20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall interim spectral value. Finally, for any frequency region where the mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the interim spectral mask value defined shall be used to define the interim spectral mask value. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and –59 dBm/MHz at any frequency offset. Figure 21-33 shows an example of a transmit spectral mask for a noncontiguous transmission using two 80 MHz channels where the center frequency of the two 80 MHz channels are separated by 160 MHz and the –40 dBr spectrum level is above –59 dBm/MHz.

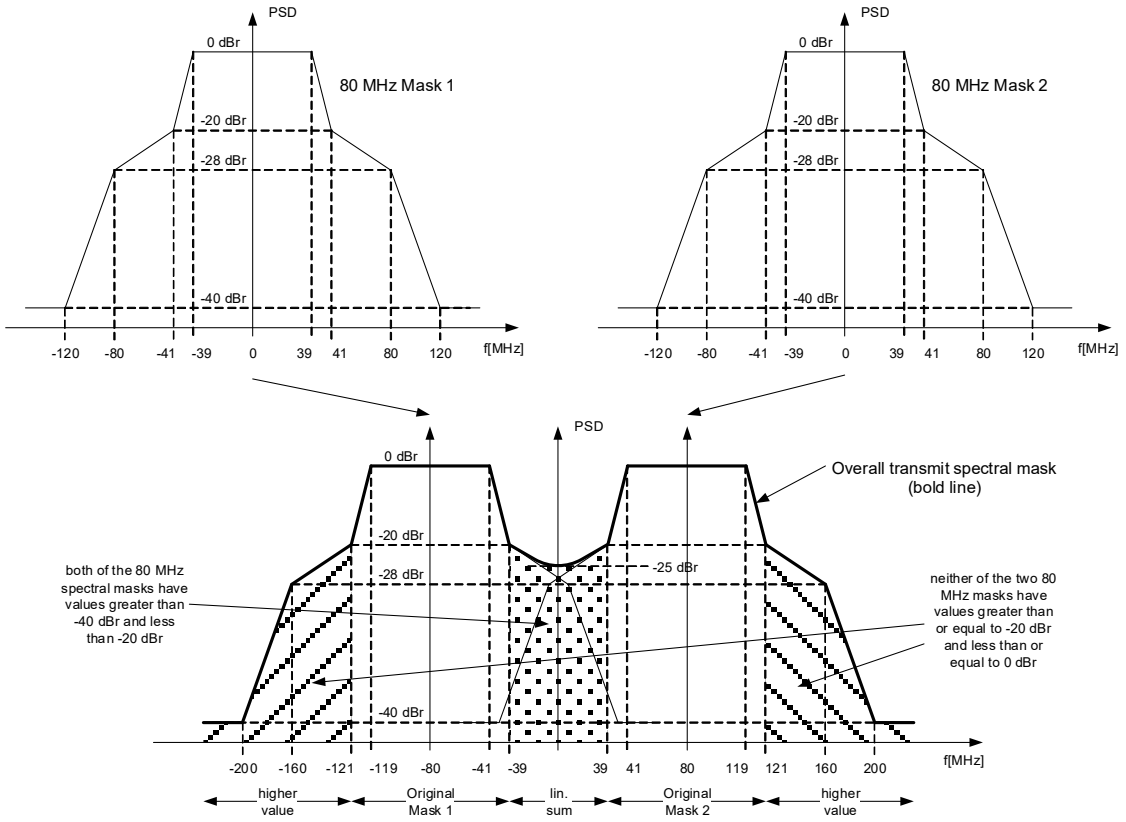

Figure 21-33—Example transmit spectral mask for 80+80 MHz mask PPDU

Different center frequency separation between the two 80 MHz frequency segments of the spectral mask as well as different peak levels of each 80 MHz frequency segment of the spectral mask are possible, in which case a similar procedure in determining the spectral mask as in Figure 21-33 is followed.

The transmit spectral mask for noncontiguous transmissions using two nonadjacent 80 MHz channels is applicable only in regulatory domains that allow for such transmissions.

Measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

21.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. Demodulate the PPDUs according to the following (or equivalent) procedure:

a) Start of PPDU shall be detected.
b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
f) For each of the data OFDM symbols: transform the symbol into subcarrier received values.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The spectral flatness test shall be performed over at least 20 PPDUs. The PPDUs under test shall be at least 16 data OFDM symbols long.

Evaluate spectral flatness using the subcarrier received values or the magnitude of the channel estimation.

Let $E_{i,\,avg}$ denote the magnitude of the channel estimation on subcarrier *i* or the average constellation energy of a BPSK modulated subcarrier *i* in a VHT data symbol.

In a contiguous non-HT duplicate or VHT transmission having a bandwidth listed in Table 21-23, $E_{i,\,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 21-23 from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

Table 21-23—Maximum transmit spectral flatness deviations

Format	Bandwidth of transmission (MHz)	Averaging subcarrier indices	Tested subcarrier indices	Maximum deviation (dB)
VHT	20	–16 to –1 and +1 to +16	–16 to –1 and +1 to +16	± 4
			–28 to –17 and +17 to +28	+4/–6
	40	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	± 4
			–58 to –43 and +43 to +58	+4/–6
	80	–84 to –2 and +2 to +84	–84 to –2 and +2 to +84	± 4
			–122 to –85 and +85 to +122	+4/–6
	160	–172 to –130, –126 to –44, +44 to +126, and +130 to +172	–172 to –130, –126 to –44, +44 to +126, and +130 to +172	± 4
			–250 to –173, –43 to –6, +6 to +43, and +173 to +250	+4/–6
non-HT duplicate	40	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	± 4
			–43 to –58 and +43 to +58	+4/–6
	80	–84 to –70, –58 to –33, –31 to –6, +6 to +31, +33 to +58, +70 to +84	–84 to –70,–58 to –33, –31 to –6, +6 to +31, +33 to +58, +70 to +84	± 4
			–122 to –97, –95 to –85 and +85 to +95, +97 to +122	+4/–6
	160	–172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172	–172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172	± 4
			–250 to –225, –223 to –198, –186 to –173, –43 to –33, –31 to –6, +6 to +31, +33 to +43, +173 to +186, +198 to +223, +225 to +250	+4/–6

In an 80+80 MHz transmission, each segment shall meet the spectral flatness requirement for an 80 MHz transmission.

Copyright © 2021 IEEE. All rights reserved.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 21.3.10.11) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz transmissions.

21.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ± 20 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator. Transmit signals with the TXVECTOR parameter CH_BANDWIDTH set to CBW160 or CBW80+80 may be generated using two separate RF LOs, one for each of the lower and upper 80 MHz frequency portions.

NOTE—The signal phase of the two 80 MHz frequency portions might not be correlated.

21.3.17.4 Modulation accuracy

21.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 21.3.17.4.2 and 21.3.17.4.3. The test method is described in 21.3.17.4.4.

21.3.17.4.2 Transmit center frequency leakage

TX LO leakage shall meet the following requirements for all formats and bandwidths except 80+80 MHz where the RF LO falls outside both frequency segments:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 312.5 kHz shall not exceed the maximum of the average power per-subcarrier of the transmitted PPDU and –20 dBm, or equivalently, $max(P - 10\log 10(N_{ST}), -20)$, where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 21-5.

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 312.5 kHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $max(P - 32, -20)$, where P is the transmit power per antenna in dBm.

For an 80+80 MHz transmission where the RF LO falls outside both frequency segments, the RF LO shall follow the spectral mask requirements as defined in 21.3.17.1.

The transmit center frequency leakage is specified per antenna.

21.3.17.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, frequency segments, VHT PPDUs, and spatial streams [see Equation (19-89)] shall not exceed a data-rate dependent value according to Table 21-24. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ (no STBC) shall be used and no beamforming steering matrix shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz noncontiguous transmissions.

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 apply to each 20 MHz subchannel.

Table 21-24—Allowed relative constellation error versus constellation size and coding rate

Modulation	Coding rate	Relative constellation error (dB)
BPSK	1/2	–5
QPSK	1/2	–10
QPSK	3/4	–13
16-QAM	1/2	–16
16-QAM	3/4	–19
64-QAM	2/3	–22
64-QAM	3/4	–25
64-QAM	5/6	–27
256-QAM	3/4	–30
256-QAM	5/6	–32

21.3.17.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the bandwidth of the signal being transmitted; except that

— For non-HT duplicate transmissions, each 20 MHz subchannel may be tested independently while all subchannels are being transmitted and

— For noncontiguous transmissions, each frequency segment may be tested independently while both segments are being transmitted.

In this case, transmit modulation accuracy of each segment shall meet the required value in Table 21-24 using only the subcarriers within the corresponding segment.

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

a) Start of PPDU shall be detected.
b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.

h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.

i) Compute the average across PPDUs of the RMS of all errors per PPDU as given by Equation (19-89).

NOTE—In the case the transmit modulation accuracy test is performed simultaneously for the two frequency segments of the 80+80 MHz transmissions, N_{ST} in Equation (19-89) represents the total number of subcarriers of both 80 MHz frequency segments.

The test shall be performed over at least 20 PPDUs [N_f as defined in Equation (19-89)]. The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

21.3.17.5 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is

$20 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{20\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW20

$40 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{40\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW40

$80 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{80\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW80

$160 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{160\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW160 or CBW80+80

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \leq 50$ MHz

— FIRST_TRANSITION_FIELD is L-STF.

— SECOND_TRANSITION_FIELD is L-LTF.

— TRAINING_FIELD is L-LTF windowed in a manner which should approximate the windowing described in 17.3.2.5 with TTR = 100 ns.

— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

21.3.18 VHT receiver specification

For tests in this subclause, the input levels are measured at the antenna connector and are referenced as the average power per receive antenna. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized Device Under Test input ports. Each output port of the transmitting STA shall be connected through a cable to one input port of the Device Under Test.

21.3.18.1 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 21-25. The test in this subclause and the minimum sensitivity levels specified in Table 21-25 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

Table 21-25—Receiver minimum input level sensitivity

Modulation	Rate (R)	Minimum sensitivity (20 MHz PPDU) (dBm)	Minimum sensitivity (40 MHz PPDU) (dBm)	Minimum sensitivity (80 MHz PPDU) (dBm)	Minimum sensitivity (160 MHz or 80+80 MHz PPDU) (dBm)
BPSK	1/2	–82	–79	–76	–73
QPSK	1/2	–79	–76	–73	–70
QPSK	3/4	–77	–74	–71	–68
16-QAM	1/2	–74	–71	–68	–65
16-QAM	3/4	–70	–67	–64	–61
64-QAM	2/3	–66	–63	–60	–57
64-QAM	3/4	–65	–62	–59	–56
64-QAM	5/6	–64	–61	–58	–55
256-QAM	3/4	–59	–56	–53	–50
256-QAM	5/6	–57	–54	–51	–48

21.3.18.2 Adjacent channel rejection

Adjacent channel rejection for W MHz channels (where W is 20, 40, 80 or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 and raising the power of the interfering signal of W MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed W MHz away from the center frequency of the desired signal.

Adjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25. Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed 80 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_1

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is 80 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_2 be the power difference between the interfering and desired signal. The smaller value between ΔP_1 and ΔP_2 is the corresponding adjacent channel rejection.

The interfering signal in the adjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26.

The test in this subclause and the adjacent sensitivity levels specified in Table 21-26 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

Table 21-26—Minimum required adjacent and nonadjacent channel rejection levels

Modulation	Rate (R)	Adjacent channel rejection (dB)		Nonadjacent channel rejection (dB)	
		20/40/80/ 160 MHz Channel	80+80 MHz Channel	20/40/80/ 160 MHz Channel	80+80 MHz Channel
BPSK	1/2	16	13	32	29
QPSK	1/2	13	10	29	26
QPSK	3/4	11	8	27	24
16-QAM	1/2	8	5	24	21
16-QAM	3/4	4	1	20	17
64-QAM	2/3	0	–3	16	13
64-QAM	3/4	–1	–4	15	12
64-QAM	5/6	–2	–5	14	11
256-QAM	3/4	–7	–10	9	6
256-QAM	5/6	–9	–12	7	4

The measurement of adjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

21.3.18.3 Nonadjacent channel rejection

Nonadjacent channel rejection for W MHz channels (where W is 20, 40, 80, or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25, and raising the power of the interfering signal of W MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel rejection shall be met with any nonadjacent channels located at least $2\times W$ MHz away from the center frequency of the desired signal.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Nonadjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25. Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_1 be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_2 be the difference in power between the signals in the interfering channel and the desired channel. The smaller value between ΔP_1 and ΔP_2 is the corresponding nonadjacent channel rejection.

The interfering signal in the nonadjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26.

The test in this subclause and the nonadjacent sensitivity levels specified in Table 21-26 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

The measurement of nonadjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

21.3.18.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm, measured at each antenna for any baseband VHT modulation.

21.3.18.5 CCA sensitivity

21.3.18.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

21.3.18.5.2 CCA sensitivity for operating classes requiring CCA-ED

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2. The operating classes requiring the corresponding CCA-ED behavior class are given in E.1. The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel, dot11OFDMEDThreshold for the secondary 20 MHz channel (if present), dot11OFDMEDThreshold + 3 dB for the secondary 40 MHz channel (if present), and dot11OFDMEDThreshold + 6 dB for the secondary 80 MHz channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE—The requirement to detect a channel busy condition as stated in 21.3.18.5.3 and 21.3.18.5.4 is a mandatory energy detect requirement on all Clause 21 receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

21.3.18.5.3 CCA sensitivity for signals occupying the primary 20 MHz channel

A VHT STA with a *W* MHz operating channel width shall detect, with >90% probability, the start of a PPDU that occupies at least the primary 20 MHz channel in an otherwise idle *W* MHz operating channel width, and issue a PHY-CCA.indication(BUSY, {primary}) primitive within a period of aCCATime (see 21.4.4) if one of the following conditions is met:

— The start of a non-HT PPDU as defined in 17.3.10.6.
— The start of an HT PPDU as defined in 19.3.19.5.
— The start of a non-HT duplicate or VHT PPDU for which the power measured within the primary 20 MHz channel is or above –82 dBm.

The CCA signal shall be held busy (PHY-CCA.indication(BUSY, {primary}) primitive) for the duration of the PPDU.

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity (–82 + 20 = –62 dBm) in the primary 20 MHz channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

21.3.18.5.4 CCA sensitivity for signals not occupying the primary 20 MHz channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions are present in an otherwise idle 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

— Any signal within the secondary 20 MHz channel at or above a threshold of –62 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.
— A 20 MHz NON_HT, HT_MF, HT_GF or VHT PPDU detected in the secondary 20 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary40}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) and PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions are present in an otherwise idle 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

— Any signal within the secondary 40 MHz channel at or above a threshold of –59 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY, {secondary80}) primitive or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.
— A 40 MHz non-HT duplicate, HT_MF, HT_GF or VHT PPDU detected in the secondary 40 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).
— A 20 MHz non-HT, HT_MF, HT_GF or VHT PPDU detected in any 20 MHz subchannel of the secondary 40 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary80}) primitive if the conditions for PHYCCA.indication(BUSY, {primary}), PHY-CCA.indication(BUSY, {secondary}), and PHY-CCA.indication(BUSY, {secondary40}) primitive are not present and one of the following conditions are present in an otherwise idle 160 MHz or 80+80 MHz operating channel width:

— Any signal within the secondary 80 MHz channel at or above –56 dBm.

— An 80 MHz non-HT duplicate or VHT PPDU detected in the secondary 80 MHz channel at or above –69 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).

— A 40 MHz non-HT duplicate, HT_MF, HT_GF or VHT PPDU detected in any 40 MHz subchannel of the secondary 80 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

— A 20 MHz NON_HT, HT_MF, HT_GF or VHT PPDU detected in any 20 MHz subchannel of the secondary 80 MHz channel at or above –72 dBm with >90% probability within a period aCCAMidTime.

21.3.18.6 RSSI

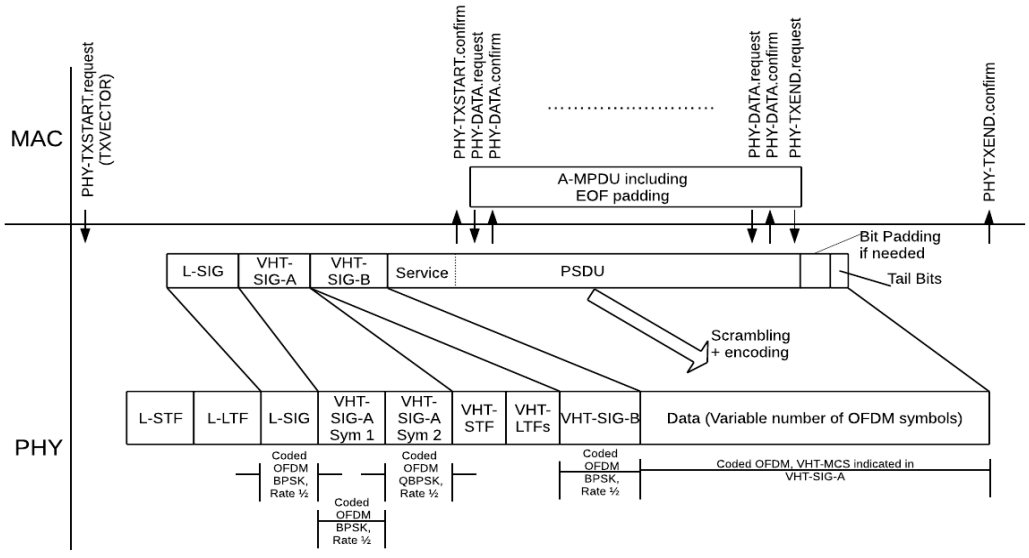
The RSSI parameter returned in the RXVECTOR shall be calculated during the reception of the VHT-LTFs and shall be a monotonically increasing function of the received power.

21.3.19 PHY transmit procedure

There are two paths for the transmit PHY procedure:

— The first path, for which typical transmit procedures are shown in Figure 21-34, is selected if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is VHT. These transmit procedures do not describe the operation of optional features, such as LDPC, STBC or MU.

— The second path is to follow the transmit procedure in Clause 17 if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is NON_HT and the NON_HT_MODULATION parameter is set to NON_HT_DUP_OFDM except that the signal referred to in Clause 17 is instead generated simultaneously on each of the 20 MHz channels that are indicated by the CH_BANDWIDTH parameter as defined in 21.3.8 and 21.3.10.12.



NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 21-34—PHY transmit procedure for SU transmission

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE 1—For a VHT MU PPDU the A-MPDU is per user in the MAC sublayer and the VHT-STF, VHT-LTFs, VHT-SIG-B, and Data are per user in the PHY in Figure 21-34, with the number of VHT-LTF symbols depending on the total number of space-time streams across all users.

NOTE 2—The transmit procedure for NON_HT format where NON_HT_MODULATION is OFDM is specified in 21.2.5.2. The transmit procedure for HT_MF and HT_GF formats is specified in 21.2.5.3.

In both paths, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 21.4. Other transmit parameters, such as VHT-MCS Coding types and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 21.2.2. The remainder of the clause applies to the first path.

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 21.3.18.5 and 8.3.5.12). Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 21-1.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

If all of the following conditions are met:

— If dot11TODImplemented and dot11TODActivated are true or if dot11TimingMsmtActivated is true,
— The TXVECTOR parameter TIME_OF_DEPARTURE_REQUESTED is true,

then the PHY shall issue a PHY-TXSTART.confirm primitive to the MAC, forwarding the TIME_OF_DEPARTURE corresponding to the time when the first frame energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameter within the TXSTATUS. If dot11TimingMsmtActivated is true, then the PHY shall forward the value of TX_START_OF_FRAME_OFFSET in the TXSTATUS.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the FEC_CODING, CH_BANDWIDTH, NUM_STS, STBC, MCS, and NUM_USERS parameter of the TXVECTOR, as described in 21.3.2.

The SERVICE field and PSDU are encoded as described in 21.3.3. The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. Zero to seven PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integer multiple of the number of coded bits per OFDM symbol.

Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In an SU transmission, normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by N_{SYM} (see 21.4.3).

In the PHY, the GI or short GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

When the PPDU transmission is completed the PHY entity enters the receive state.

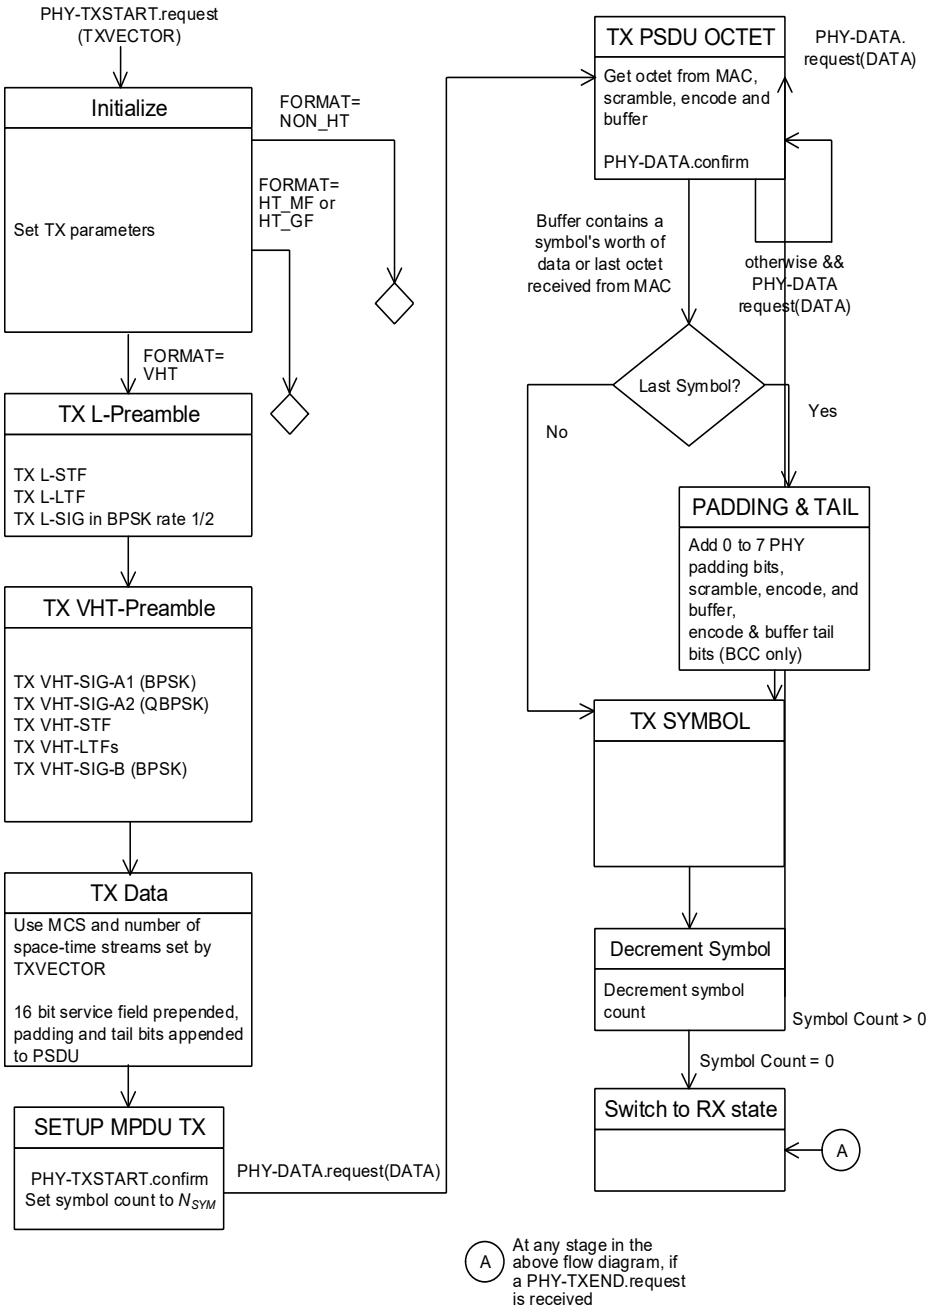
Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

A typical state machine implementation of the transmit PHY for an SU transmission is provided in Figure 21-35. Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as multi-user, LDPC or STBC. If the TXVECTOR parameter FORMAT is equal to NON_HT, refer to the transmit procedure and state machine in 17.3.11. If the TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF, refer to the transmit procedure and state machine in 19.3.20.



NOTE—This state machine does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 21-35—PHY transmit state machine for SU transmission

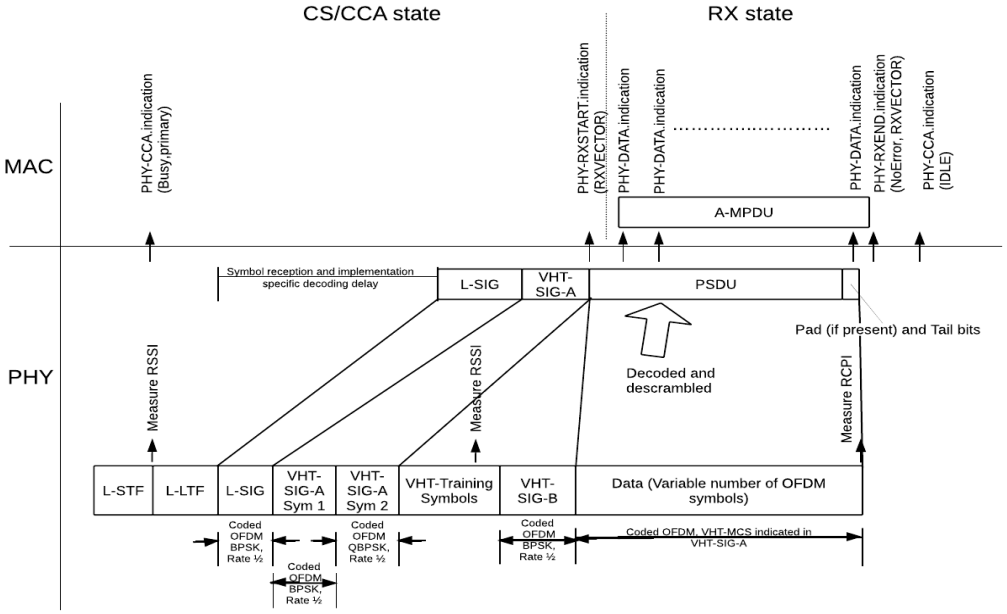
21.3.20 PHY receive procedure

A typical PHY receive procedure is shown in Figure 21-36 for VHT format. A typical state machine implementation of the receive PHY is given in Figure 21-37. This receive procedure and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates a NON_HT PPDU format (denoted "Not VHT-SIG-A" in Figure 21-37), refer to the receive procedure and state machine in 17.3.12. If the detected format indicates an HT PPDU format (denoted "HT_SIG (HT GF preamble)" and "HT_SIG (HT MF preamble)" in Figure 21-37), refer to the receive procedure and state machine in 19.3.21. Further, through station management (via the PLME) the PHY is set to the appropriate frequency, as specified in 21.4. The PHY has also been configured with group information (i.e., group membership and position in group) so that it can receive data intended for the STA. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC. This procedure describes the case where VHT-SIG-A indicates a mode not requiring decoding of VHT-SIG-B.

Figure 21-36—PHY receive procedure for SU transmission

Upon receiving the transmitted PHY preamble overlapping the primary 20 MHz channel, the PHY measures a receive signal strength. The PHY indicates this activity to the MAC by issuing a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 21.3.18.5. The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 20 MHz. The channel-list parameter is present and includes the entry primary when the operating channel width is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz.

The PHY shall not issue a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary 20 MHz channel.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for L-SIG in order to set the maximum duration of the data stream. If the check of the L-SIG parity bit is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If a valid L-SIG parity bit is indicated, the VHT PHY shall maintain PHY-CCA.indication(BUSY, channel-list) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (21-105), for all supported modes, unsupported modes, Reserved VHT-SIG-A Indication, invalid VHT-SIG-A CRC and invalid L-SIG Length field value. The L-SIG Length field value of a VHT PPDU is invalid if it is not divisible by 3. Reserved VHT-SIG-A Indication is defined as a VHT-SIG-A with Reserved bits equal to 0 or MU[u] NSTS fields (u = 0, 1, 2, 3) set to 5-7 or Short GI field set to 0 and Short GI NSYM Disambiguation field set to 1, or a combination of VHT-MCS and N_{STS} not included in 21.5 or any other VHT-SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 21. If the VHT-SIG-A indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive. If the VHT-SIG-A indicates an invalid CRC or Reserved VHT-SIG-A Indication or if the L-SIG Length field is invalid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive.

After receiving a valid L-SIG and VHT-SIG-A indicating a supported mode, the PHY entity shall begin receiving the VHT-STF, VHT-LTFs and VHT-SIG-B. If the received group ID in VHT-SIG-A has a value indicating a VHT SU PPDU (see 10.19), the PHY entity may choose not to decode VHT-SIG-B. If VHT-SIG-B is not decoded, subsequent to an indication of a valid VHT-SIG-A CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.55 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

If the Group ID field in VHT-SIG-A has a value indicating a VHT MU PPDU (see 10.19), the PHY, in a STA that is MU beamformee capable, shall decode VHT-SIG-B. If the VHT-SIG-B indicates an unsupported mode, the PHY shall issue the error condition PHY-RXEND.indication(UnsupportedRate) primitive.

If VHT-SIG-B was decoded the PHY may check the VHT-SIG-B CRC in the SERVICE field. If the VHT-SIG-B CRC in the SERVICE field is not checked a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

The PHY optionally filters out the PPDU based on the GroupID, MU[0-3] NSTS and Partial AID fields of VHT-SIG-A and the contents of the PHYCONFIG_VECTOR as follows:

- The PHY shall not filter out the PPDU if one of the following is true:
  - (g = 0) and (l_{00} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID00)
  - (g = 63) and (l_{63} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID63)
  - ($1 \le g \le 62$) and (MembershipStatusInGroupID[g] = 1) and (n_{STS}[UserPositionInGroupID[g]] > 0)

Copyright © 2021 IEEE. All rights reserved.

— where
  — l_{NN} is the one of the LISTEN_TO_GID*NN* parameters of the PHYCONFIG_VECTOR
  — MembershipStatusInGroupID[g] is the Membership Status Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
  — g is the value of the GroupID field of VHT-SIG-A
  — $n_{STS}[u]$ is the value of the MU[u] NSTS field of VHT-SIG-A
  — UserPositionInGroupID[g] is the User Position Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
  — *partialaid* is the value of the Partial AID field of VHT-SIG-A
— Otherwise, the PHY may filter out the PPDU.

If the PPDU is filtered out, the PHY shall issue a PHY-RXEND.indication(Filtered) primitive.

Following training and signal fields, the Data field shall be received. The number of symbols in the Data field is determined by Equation (21-104).

$$N_{SYM} = \begin{cases} N'_{SYM} - 1, \text{ if Short GI = 1 and Short GI NSYM Disambiguation = 1} \\ N'_{SYM}, \text{ otherwise} \end{cases} \quad (21\text{-}104)$$

where

$$N'_{SYM} = \left\lfloor \frac{\text{RXTIME} - \left(\begin{array}{c} T_{\text{L-STF}} + T_{\text{L-LTF}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + \\ T_{\text{VHT-STF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}} + T_{\text{VHT-SIG-B}} \end{array} \right)}{T_{SYM}} \right\rfloor$$

$$\text{RXTIME}(\mu s) = \left\lceil \frac{\text{LENGTH} + 3}{3} \right\rceil \cdot 4 + 20 \quad (21\text{-}105)$$

where LENGTH is the LENGTH field in L-SIG.

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using BCC encoding is calculated using Equation (21-106).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM} N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21\text{-}106)$$

For a VHT SU PPDU, the SU/MU[0] Coding field of VHT-SIG-A2 indicates the type of coding. The PHY entity shall use an LDPC decoder to decode the C-PSDU if this bit is 1; otherwise, BCC decoding shall be used. For an MU transmission, the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding and MU[3] Coding fields of VHT-SIG-A2 indicate the type of coding for user u with USER_POSITION[u] = 0, 1, 2, and 3, respectively. The PHY entity shall use an LDPC decoder to decode the C-PSDU for the respective user if its bit for its C-PSDU is 1. BCC decoding shall be used otherwise. When an LDPC decoder is to be used, $N_{SYM,init}$ is obtained from Equation (21-107).

$$N_{SYM,init} = \begin{cases} N_{SYM,init}, \text{ if LDPC Extra OFDM Symbol = 0} \\ N_{SYM,init} - 1, \text{ if LDPC Extra OFDM Symbol = 1 and STBC = 0} \\ N_{SYM,init} - 2, \text{ if LDPC Extra OFDM Symbol = 1 and STBC = 1} \end{cases} \quad (21\text{-}107)$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

where

LDPC Extra OFDM Symbol and STBC are fields in VHT-SIG-A (see Table 21-12)

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using LDPC encoding is calculated using Equation (21-108).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM,init} N_{DBPS} - N_{service}}{8} \right\rfloor \quad (21\text{-}108)$$

The value of the PSDU_LENGTH parameter returned in the RXVECTOR for an NDP is 0.

If VHT-SIG-B is decoded and the VHT-SIG-B CRC in the SERVICE field is checked and not valid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If the VHT-SIG-B field is decoded and the VHT-SIG-B CRC field is checked and valid, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU as determined by Equation (21-105), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the receiver shall be returned to the RX IDLE state, as shown in Figure 21-37. A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

21.4 VHT PLME

21.4.1 PLME SAP sublayer management primitives

Table 21-27 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

21.4.2 PHY MIB

VHT PHY MIB attributes are defined in Annex C with specific values defined in Table 21-27. The "Operational semantics" column in Table 21-27 contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.
— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

21.4.3 TXTIME and PSDU_LENGTH calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for a VHT PPDU using Equation (21-109) for short GI and Equation (21-110) for long GI.

$$\text{TXTIME} = T_{\text{LEG_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{SYML} \times \left\lceil \frac{T_{SYMS} \times N_{SYM}}{T_{SYML}} \right\rceil \quad (21\text{-}109)$$

$$\text{TXTIME} = T_{\text{LEG_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{SYML} \times N_{SYM} \quad (21\text{-}110)$$

where

$T_{\text{LEG_PREAMBLE}} = T_{\text{L-STF}} + T_{\text{L-LTF}}$

$T_{\text{VHT_PREAMBLE}} = T_{\text{VHT-STF}} + N_{VHT\text{-}LTF} T_{\text{VHT-LTF}}$

T_{SYML}, T_{SYMS}, $T_{\text{VHT-SIG-A}}$, $T_{\text{VHT-SIG-B}}$, $T_{\text{L-STF}}$, $T_{\text{VHT-STF}}$, $T_{\text{L-LTF}}$, and $T_{\text{VHT-LTF}}$ are defined in Table 21-5

$N_{VHT\text{-}LTF}$ is defined in Table 21-13

For an NDP, there is no Data field and $N_{SYM} = 0$.

For a VHT SU PPDU using BCC encoding, the total number of data symbols in the Data field is given by Equation (21-111).

$$N_{SYM} = m_{\text{STBC}} \times \left\lceil \frac{8 \cdot \text{APEP_LENGTH} + N_{service} + N_{tail} \cdot N_{ES}}{m_{\text{STBC}} \cdot N_{DBPS}} \right\rceil \quad (21\text{-}111)$$

where

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

For a VHT SU PPDU using LDPC encoding, the total number of data symbols in the Data field, N_{SYM}, is given in 21.3.10.5.4 (computed using Equation (19-41) in step d) of 19.3.11.7.5).

For a VHT MU PPDU, the total number of data symbols in the Data field, N_{SYM}, is given by Equation (21-67).

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using BCC encoding is calculated using Equation (21-112).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM} N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21\text{-}112)$$

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using LDPC encoding is calculated using Equation (21-113).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM,init} N_{DBPS} - N_{service}}{8} \right\rfloor \quad (21\text{-}113)$$

where

$N_{SYM,init}$ is given by Equation (21-62)

The value of the PSDU_LENGTH parameter for user u returned in the PLME-TXTIME.confirm primitive and in the RXVECTOR for a VHT MU PPDU is calculated using Equation (21-114).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$\text{PSDU_LENGTH}_u = \begin{cases} \left\lfloor \dfrac{N_{SYM} N_{DBPS,u} - N_{service} - N_{tail} \cdot N_{ES,u}}{8} \right\rfloor & \text{when BCC is used for user } u \\ \left\lfloor \dfrac{N_{\text{SYM_max_init}} N_{DBPS,u} - N_{service}}{8} \right\rfloor & \text{when LDPC is used for user } u \end{cases} \quad (21\text{-}114)$$

where

N_{SYM} is given by Equation (21-67)

$N_{\text{SYM_max_init}}$ is given by Equation (21-65)

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NDP is 0.

21.4.4 VHT PHY

The static VHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25 unless otherwise listed in Table 21-28. The definitions for these characteristics are given in 6.5.4.

Table 21-28—VHT PHY characteristics

Characteristics	Value
aCCAMidTime	25 μs
aPPDUMaxTime	5.484 ms
aPSDUMaxLength	4 692 480 octets (see NOTE 1)
aRxPHYStartDelay	36 + 4 × the maximum possible value for $N_{\text{VHT-LTF}}$ supported + 4 (see NOTE 2)
aAPEPMaxLengthVHTMU20	262 140 octets (see NOTE 3)
aAPEPMaxLengthVHTMU40	524 284 octets (see NOTE 3)
aAPEPMaxLengthVHTMU80orMore	2 097 148 octets (see NOTE 3 and NOTE 4)

NOTE 1—This is the maximum length in octets for a VHT SU PPDU with a bandwidth of 160 MHz or 80+80 MHz, VHT-MCS 9, and 8 spatial streams, and limited by 1504 possible Short GI data symbols in aPPDUMaxTime. This is the maximum PSDU length a VHT PHY could support assuming no restrictions in MAC. See 10.3.2 and 9.2.4.7.1 for additional restrictions on the maximum number of octets the MAC could support.

NOTE 2—This value arises from the time to the end of VHT-SIG-B (see Figure 21-4) plus the need to decode the first symbol of the Data field in order to extract the SERVICE field and check the CRC it contains.

NOTE 3—This value is derived inversely from Equation (21-46) using corresponding VHT-SIG-B Length in Table 21-14.

NOTE 4—This value is larger than the constraint by the Maximum A-MPDU Length Exponent of 7 and the maximum A-MPDU length will be limited by the Maximum A-MPDU Length Exponent (see 10.12.2 and 10.13).

21.5 Parameters for VHT-MCSs

The rate-dependent parameters for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz N_{SS} = 1, …, 8 are given in Table 21-29 to Table 21-60. Support for 400 ns GI is optional in all cases. Support for VHT-MCS 8 and 9 (when valid) is optional in all cases. A VHT STA shall support single spatial stream VHT-MCSs within the range VHT-MCS 0 to VHT-MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field may result in a reduced VHT-MCS range (cut-off) for N_{SS} = 2, …, 8 . Support for 20 MHz, 40 MHz, and 80 MHz with N_{SS} = 1 is mandatory. Support for 20 MHz, 40 MHz, and 80 MHz with N_{SS} = 2, …, 8 is optional. Support for 160 MHz and 80+80 MHz with N_{SS} = 1, …, 8 is optional. N_{ES} values were chosen to yield an integer number of punctured blocks for each BCC encoder per OFDM symbol.

Table 21-29 to Table 21-32, Table 21-37 to Table 21-40, Table 21-45 to Table 21-48, and Table 21-53 to Table 21-56 define VHT-MCSs not only for SU transmission but also for user *u* of MU transmission. In the case of VHT-MCSs for MU transmission, the parameters, N_{SS}, R, N_{BPSCS}, N_{CBPS}, N_{DBPS}, and N_{ES} are replaced with $N_{SS,u}$, R_u, $N_{BPSCS,u}$, $N_{CBPS,u}$, $N_{DBPS,u}$, and $N_{ES,u}$, respectively. Note that the 400 ns GI rate values are rounded to 1 decimal place.

Table 21-29—VHT-MCSs for mandatory 20 MHz, N_{SS} = 1

22. Television very high throughput (TVHT) PHY specification

22.1 Introduction

22.1.1 Introduction to the TVHT PHY

Clause 22 specifies the PHY entity for a television very high throughput (TVHT) orthogonal frequency division multiplexing (OFDM) system.

Three basic channel units (BCUs) are defined as 6 MHz, 7 MHz, or 8 MHz, depending on the regulatory domain, and denoted in the rest of this clause as a BCU or TVHT_W. Many of the terms used in this clause refer to different bands, depending on the regulatory domain. These terms include

— TVHT_2W, which represents two contiguous BCUs (12 MHz, 14 MHz, or 16 MHz)
— TVHT_W+W, which represents two noncontiguous BCU (6+6 MHz, 7+7 MHz, or 8+8 MHz)
— TVHT_4W, which represents four contiguous BCUs (24 MHz, 28 MHz, or 32 MHz)
— TVHT_2W+2W, which represents two noncontiguous frequency segments, each of which is composed of two BCUs (12+12 MHz, 14+14 MHz, or 16+16 MHz)

The TVHT PHY is based on the VHT PHY, as defined in 21.3, 21.4, and 21.5, and on Clause 17.

All TVHT transmissions in one BCU shall use the VHT PHY parameters for 40 MHz channel defined in 21.3, 21.4, and 21.5 with a sampling clock change to fit into each of the BCU bandwidths and with the number of encoders (N_{ES}) always being 1 (for SU-MIMO and per user in MU-MIMO).

Table 22-8 describes the sampling clock for each of the BCUs and the basic PHY parameters for transmission over one BCU.

For all VHT PPDUs and non-HT PPDUs in TVWS band, timing-related parameters shall be used as defined in Table 22-5 and Table 22-8; frequently used parameters shall be used as defined in Table 22-6 and Table 22-9; phase rotation parameter $\Upsilon_{k,\mathrm{BW}}$ shall be replaced by $\Upsilon_{k,\mathrm{M}}$, which is defined in Table 22-12; and cyclic shift parameters shall be used as defined in 22.3.8.3.2.

As shown in Table 22-8, the design is based on defining 144 OFDM tones in the 6 MHz and 8 MHz channel units and using up to tone 58 on each side of the DC tone for data and pilots, exactly matching the VHT 40 MHz PHY parameters. The 7 MHz channel unit is split into 168 tones to maintain the same tone spacing and PHY design as used for 6 MHz channels (note the ratio of 168 to 144 is identical to the ratio of 7 to 6). The choice of 144 and not 128 was made to reduce the PHY channel BW from 6 MHz to 5 1/3 MHz in order to allow sharper filtering to achieve 55 dB ACLR.

The TVHT PHY defines the following transmission modes that incorporate transmission on one, two, or four BCUs:

a) Mandatory transmission mode - one BCU (TVHT_MODE_1)
b) Optional transmission modes - multi-BCUs
    1) Two contiguous BCUs (TVHT_MODE_2C)
    2) Two noncontiguous BCUs (TVHT_MODE_2N)
    3) Four contiguous BCUs (TVHT_MODE_4C)
    4) Two noncontiguous frequency segments, each of which comprises two contiguous BCUs (TVHT_MODE_4N)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The tone spacing, DFT duration, and other timing parameters remain unchanged for all optional modes compared with the definition in Table 22-8.

The number of occupied tones in each BCU of any optional mode is the same as the number defined in Table 22-8.

The location of the occupied tones in each BCU of any optional mode is shown in Table 22-9.

The DATA encoding process for multi-BCUs transmission is similar to one BCU transmission and is defined in 22.3.10.

A TVHT STA shall support the following features:

- TVHT_MODE_1 (one BCU)
- Single spatial stream MCSs 0 to 7 (transmit and receive)
- BCC coding
- Normal and short guard interval (transmit and receive)

A TVHT STA may support the following features:

- TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, or TVHT_MODE_4N (two or four BCUs)
- Two or more spatial streams (transmit and receive)
- Beamforming sounding (by sending a VHT NDP)
- Respond to transmit beamforming sounding (provide compressed beamforming feedback)
- STBC (transmit and receive)
- LDPC (transmit and receive)
- VHT MU PPDUs (transmit and receive)
- MCSs 8 and 9 (transmit and receive)

22.1.2 Scope of TVHT PHY services

The services provided to the MAC by the TVHT PHY consist of a protocol function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. These STAs support a TVHT PHY.

22.1.3 TVHT PHY functions

22.1.3.1 General

See 21.1.3.1 with “TVHT” replacing “VHT”.

22.1.3.2 PHY management entity (PLME)

See 21.1.3.2.

22.1.3.3 Service specification method

See 21.1.3.3 with “TVHT” replacing “VHT”.

22.1.4 PPDU formats

The structure of the PPDU transmitted by a TVHT STA is determined by the TXVECTOR parameters as defined in 22.2.2.

The FORMAT parameter determines the overall structure of the PPDU and includes the following:

— Non-HT format (NON_HT), based on Clause 17. Support for non-HT format is mandatory.
— VHT format (VHT). Support for TVHT_W VHT format is mandatory.

22.2 TVHT PHY service interface

22.2.1 Introduction

See 21.2.1.

22.2.2 TXVECTOR and RXVECTOR parameters

The TXVECTOR and RXVECTOR parameters are defined in Table 22-1.

The TXVECTOR parameter FORMAT shall be set to NON_HT or VHT. When the TXVECTOR parameter FORMAT equals NON_HT, then NON_HT_MODULATION shall be set to NON_HT_DUP_OFDM.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter L_DATARATE indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6 Mb/s, 9 Mb/s, 12 Mb/s, 18 Mb/s, 24 Mb/s, 36 Mb/s, 48 Mb/s, and 54 Mb/s divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels.

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU:

Enumerated type:

— TVHT_W for one BCU
— TVHT_2W for two contiguous BCUs
— TVHT_W+W for two noncontiguous BCUs
— TVHT_4W for four contiguous BCUs
— TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs

Note that TVHT_W represents the broadcast channel bandwidth for the regulatory domain, e.g., TVHT_W is 6 MHz, 7 MHz, or 8 MHz. TVHT_2W represents two contiguous BCUs with the same regulatory domain, e.g., TVHT_2W is 12 MHz, 14 MHz, or 16 MHz.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU on transmission and the estimated channel width of the received PPDU on reception:

Enumerated type:

— TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter NUM_STS indicates the number of space-time streams: range 1 to 4 for SU, 1 to 3 per user for MU. NUM_STS summed over all users shall be less than or equal to 4. The TXVECTOR parameter NUM_STS is not present when the TXVECTOR parameter FORMAT equals to NON_HT.

Table 22-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: NON_HT indicates non-HT duplicated PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. VHT indicates VHT format.	Y	Y
NON_HT_MODULATION	FORMAT is NON_HT	In TXVECTOR, indicates the format type of the transmitted non-HT PPDU. In RXVECTOR, indicates the estimated format type of the received non-HT PPDU. Enumerated type: NON_HT_DUP_OFDM indicates non-HT duplicate format.	Y	Y
	Otherwise	Not present	N	N
L_LENGTH	FORMAT is NON_HT	Indicates the length of the PSDU in octets in the range 1 to 4095. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY.	Y	Y
	FORMAT is VHT	Not present NOTE—The Length field of the L-SIG in VHT PPDUs is defined in Equation (22-9) using the scaling factor defined in 22.3.8.2.1.	N	N
L_DATARATE	FORMAT is NON_HT	Indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6, 9, 12, 18, 24, 36, 48, and 54 divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels.	Y	Y
	FORMAT is VHT	Not present NOTE—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing 6/*X* Mb/s in TVWS band "Modulation BPSK and Coding rate 1/2" row of Table 22-4.	N	N
N_TX	FORMAT is VHT	Indicates the number of transmit chains.	Y	N
	Otherwise	Not present	N	N

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
EXPANSION_MAT_TYPE	FORMAT is VHT and EXPANSION_MAT is present.	Set to COMPRESSED_SV	Y	N
	Otherwise	See corresponding entry in Table 19-1		
EXPANSION_MAT	FORMAT is VHT	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 22.3.11.2 based on the channel measured during the training symbols of a previous VHT NDP.	M U	N
	Otherwise	See corresponding entry in Table 19-1		
CHAN_MAT_TYPE	FORMAT is VHT and PSDU_LENGTH equals zero	Set to COMPRESSED_SV NOTE—This parameter is present only for TVHT NDPs.	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than zero	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
CHAN_MAT	FORMAT is VHT and PSDU_LENGTH equals zero	Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 based on the channel measured during the training symbols of the received VHT NDP.	N	Y
	FORMAT is VHT and PSDU_LENGTH is greater than zero	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
DELTA_SNR	FORMAT is VHT	Contains an array of delta SNR values as defined in 9.4.1.52 based on the channel measured during the training symbols of the received VHT NDP. NOTE—In the RXVECTOR this parameter is present only for VHT NDPs for MU sounding.	M U	Y
	Otherwise	Not present	N	N

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
SNR	FORMAT is VHT	Contains an array of measures of the received SNR for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.50.	N	Y
	Otherwise	See corresponding entry in Table 19-1		
NO_SIG_EXTN	FORMAT is VHT	Not present	N	N
	Otherwise	See corresponding entry in Table 19-1		
FEC_CODING	FORMAT is HT	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	M U	Y
	Otherwise	See corresponding entry in Table 19-1		
STBC	FORMAT is VHT	Indicates whether STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field).	Y	Y
	Otherwise	See corresponding entry in Table 19-1		
GI_TYPE	FORMAT is VHT	Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU.	Y	Y
	Otherwise	Not present	N	N
TXPWR_LEVEL_INDEX	FORMAT is VHT	The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to $N/2$, where N is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission.	Y	N
	Otherwise	See corresponding entry in Table 19-1

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RSSI	FORMAT is VHT	The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the TVHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
	Otherwise	See corresponding entry in Table 19-1		
MCS	FORMAT is VHT	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9	M U	Y
	Otherwise	See corresponding entry in Table 19-1		
REC_MCS	FORMAT is VHT	Indicates the MCS that the STA's receiver recommends.	N	O
	Otherwise	Not present	N	N
CH_BANDWIDTH	FORMAT is VHT	Indicates the channel width of the transmitted PPDU: Enumerated type: TVHT_W for one BCU TVHT_2W for two contiguous BCUs TVHT_W+W for two noncontiguous BCUs TVHT_4W for four contiguous BCUs TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs	Y	Y
	FORMAT is NON_HT	In TXVECTOR, indicates the channel width of the transmitted PPDU. In RXVECTOR, indicates the estimated channel width of the received PPDU. Enumerated type: TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W if NON_HT_MODULATION equals NON_HT_DUP_OFDM	Y	Y
DYN_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. In RXVECTOR, if valid, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. Enumerated type: Static if the transmitter is capable of Static bandwidth operation Dynamic if the transmitter is capable of Dynamic bandwidth operation NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present	N	N

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH_IN_NON_HT	FORMAT is NON_HT	In TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
	Otherwise	Not present	N	N
APEP_LENGTH	FORMAT is VHT	If equal to 0, indicates a TVHT NDP for both RXVECTOR and TXVECTOR. If greater than zero, in the TXVECTOR, indicates the number of octets in the range 1 to 1 048 575 in the A-MPDU pre-EOF padding (see 10.12.2) carried in the PSDU. If greater than zero, in the RXVECTOR, is the value obtained from the VHT-SIG-B Length field multiplied by 4.	M U	O
	Otherwise	Not present	N	N
PSDU_LENGTH	FORMAT is VHT	Indicates the number of octets in the VHT PSDU in the range 0 to 1 065 600 octets. A value of 0 indicates a VHT NDP.	N	Y
	Otherwise	Not present	N	N
USER_POSITION	FORMAT is VHT and $1 \leq$ GROUP_ID ≤ 62	Index for user in MU transmission. Integer: range 0 to 3. NOTE—The entries in the USER_POSITION array are in ascending order.	M U	O
	Otherwise	Not present	N	N
NUM_STS	FORMAT is VHT	Indicates the number of space-time streams. Integer: range 1 to 4 for SU, 1 to 3 per user in the TXVECTOR, and 0 to 4 in the RXVECTOR for MU. NUM_STS summed over all users is between 1 and 4.	M U	Y
	Otherwise	Not present	N	N
GROUP_ID	FORMAT is VHT	Indicates the group ID. Integer: range 0 to 63 (see Table 22-12) A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU.	Y	Y
	Otherwise	Not present	N	N

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
PARTIAL_AID	FORMAT is VHT and GROUP_ID is 0 or 63	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19). Integer: range 0 to 511.	Y	Y
	Otherwise	Not present	N	N
NUM_USERS	FORMAT is VHT	Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4.	Y	N
	Otherwise	Not present	N	N
BEAMFORMED	FORMAT is VHT and GROUP_ID is 0 or 63	Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise. NOTE—When BEAMFORMED is set to 1, smoothing is not recommended.	Y	O
	Otherwise	Not present	N	N
TXOP_PS_NOT_ALLOWED	FORMAT is VHT	Indicates whether a TVHT AP allows non-AP TVHT STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the TVHT AP allows non-AP TVHT STAs to enter doze state during a TXOP. 1 indicates that the TVHT AP does not allow non-AP TVHT STAs to enter doze state during a TXOP.	Y	Y
	Otherwise	Not present	N	N
TIME_OF_DEPARTURE_REQUESTED		Boolean value: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first PPDU energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.	O	N

Table 22-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
RX_START_OF_FRAME_OFFSET	dot11TimingMsmtActivated is true	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	Y
	Otherwise	Not present	N	N

NOTE 1—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present;
N = Not present;
O = Optional;
MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS – 1.

NOTE 2—On reception, where valid, the CH_BANDWIDTH_IN_NON_HT parameter is likely to be a more reliable indication of subformat and channel width than the NON_HT_MODULATION and CH_BANDWIDTH parameters, since for non-HT or non-HT duplicate frames, CH_BANDWIDTH is a receiver estimate of the bandwidth, whereas CH_BANDWIDTH_IN_NON_HT is the signaled bandwidth.

22.2.3 Effects of CH_BANDWIDTH parameter on PPDU format

Table 22-2 shows the PPDU format as a function of the CH_BANDWIDTH and FORMAT parameters.

Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter

FORMAT	CH_BANDWIDTH	PPDU format
VHT	TVHT_W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_1.
VHT	TVHT_2W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2C.
VHT	TVHT_4W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4C.
VHT	TVHT_W+W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2N.
VHT	TVHT_2W+2W	The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4N.

Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter *(continued)*

FORMAT	CH_BANDWIDTH	PPDU format
NON_HT	TVHT_W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using one TVHT_W channel as defined in 22.3.10.12. If the BSS bandwidth is wider than TVHT_W, then the transmission shall use the primary TVHT_W channel.
NON_HT	TVHT_2W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent TVHT_W channels as defined in 22.3.10.12. If the BSS bandwidth is wider than TVHT_2W, then the transmission shall use the primary TVHT_2W channel.
NON_HT	TVHT_4W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent TVHT_W channels as defined in 22.3.10.12.
NON_HT	TVHT_W+W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of single TVHT_W channels as defined in 22.3.10.12.
NON_HT	TVHT_2W+2W	The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of two adjacent TVHT_W channels as defined in 22.3.10.12.

22.2.4 Support for NON_HT and HT formats

Transmission of HT PPDUs is not supported in Clause 22. Except for Non-HT duplicate transmission defined in 22.3.10.12, transmission of NON_HT is not supported in Clause 22.

Non-HT duplicate transmission is based on Clause 17, unless otherwise stated in Clause 22.

Non-HT PPDU format is same as in Figure 17-1. Overview of the PPDU encoding process is defined in 17.3.2.2 except for following modifications:

Modulation-dependent parameters for Non-HT duplicate mode in TVWS band is defined in Table 22-3. Timing related parameters are defined in Table 22-5. t_{SIGNAL} in Equation (17-2) is equal to 16 multiplied by X μs, and t_{DATA} in Equation (17-2) is equal to 20 multiplied by X μs where X is 7.5 for 6 MHz and 7 MHz unit channels and X is 5.625 for 8 MHz channels.

The timings for preamble are multiplied by X where X is 7.5 for 6 MHz and 7 MHz unit channels and X is 5.625 for 8 MHz channels.

Constructions of L-STF, L-LTF, and L-SIG are same as in 22.3.4.2, 22.3.4.3, and 22.3.4.4 except for the value field parameters in L-SIG.

Table 22-3—Modulation-dependent parameters for Non-HT duplicate mode in TVWS band

Modulation	Coding rate (R)	Coded bits per subcarrier (N_{BPSC})	Coded bits per OFDM symbol (N_{CBPS})	Data bits per OFDM symbol (N_{DBPS})	Data rate (Mb/s) (TVWS band)
BPSK	1/2	1	48	24	6/X (see NOTE)
BPSK	3/4	1	48	36	9/X (see NOTE)
QPSK	1/2	2	96	48	12/X (see NOTE)
QPSK	3/4	2	96	72	18/X (see NOTE)
16-QAM	1/2	4	192	96	24/X (see NOTE)
16-QAM	3/4	4	192	144	36/X (see NOTE)
64-QAM	2/3	6	288	192	48/X (see NOTE)
64-QAM	3/4	6	288	216	54/X (see NOTE)
NOTE—In TVWS band, X depends on regulatory domain, i.e., 7.5 for 6 MHz and 7 MHz unit channels and 5.625 for 8 MHz channels.					

Interpretation of the bits R1-R4 in the SIGNAL field is modified as in Table 22-4.

Table 22-4—RATE field in L-SIG

R1-R4	Modulation	Coding rate
1101	BPSK	1/2
1111	BPSK	3/4
0101	QPSK	1/2
0111	QPSK	3/4
1001	16-QAM	1/2
1011	16-QAM	3/4
0001	64-QAM	2/3
0011	64-QAM	3/4

Table 22-5 and Table 22-6 define the timing-related parameters for Non-HT format and location of occupied tones.

Other timing parameters are derived as in Table 17-5 using the definition of T_{FFT} in Table 22-5. Table 22-6 defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Refer to Table 21-6 for parameters definition. The definitions in the table are applicable to Clause 22 with the exception that in each transmission mode in Clause 22 $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

22.3 TVHT PHY sublayer

22.3.1 Introduction

See 21.3.1.

22.3.2 VHT PPDU format in TVWS bands

A single PPDU format is defined for this PHY: the VHT PPDU format in TVWS bands. Figure 22-1 shows the VHT PPDU format in TVWS bands, with the timing parameters (8 μs and 4 μs) in Figure 21-4 replaced by numbers from Table 22-8.

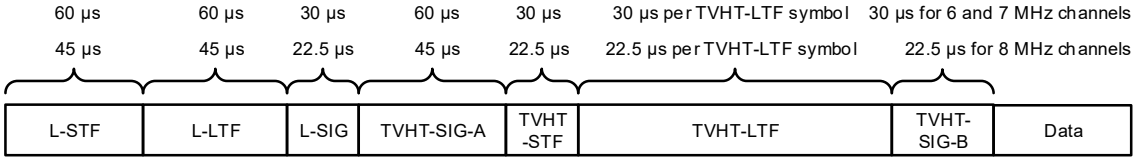

Figure 22-1—VHT PPDU format in TVWS bands

The fields of the VHT PPDU format in TVWS bands are summarized in Table 22-7.

The TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields exist only in VHT PPDU in TVWS bands. In a TVHT NDP, the Data field is not present. The number of symbols in the TVHT-LTF field, $N_{TVHT\text{-}LTF}$, can be 1, 2, or 4 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU in TVWS bands (see Table 21-13).

Table 22-7—Fields of the VHT PPDU in TVWS bands

Field	Description
L-STF	Non-HT Short Training field
L-LTF	Non-HT Long Training field
L-SIG	Non-HT SIGNAL field
TVHT-SIG-A	TVHT Signal A field
TVHT-STF	TVHT Short Training field
TVHT-LTF	TVHT Long Training field
TVHT-SIG-B	TVHT Signal B field
Data	The Data field includes the PSDU

22.3.3 Transmitter block diagram

The transmit process for the L-SIG and TVHT-SIG-A fields of a VHT PPDU using one BCU is shown in Figure 21-5, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth.

The transmit process for generating the TVHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU using one frequency segment is shown in Figure 21-5 and Figure 21-7, respectively, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth.

The transmit process for generating the Data field of an SU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encodings, using one BCU, is shown Figure 21-10 and Figure 21-11, respectively, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth. Single BCC encoder shall be assumed in Figure 21-10.

The transmit process for generating the Data field of an MU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encoding is shown in Figure 21-12, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth. In the case of BCC encoding, single BCC encoder shall be assumed in Figure 21-12.

Figure 22-2 and Figure 22-3 show the transmit process for generating the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC and LDPC encoding, respectively, where the subcarrier allocation block allocates the subcarriers for the two IDFTs in each transmit path by the subcarrier mapper as described in 22.3.10.11.

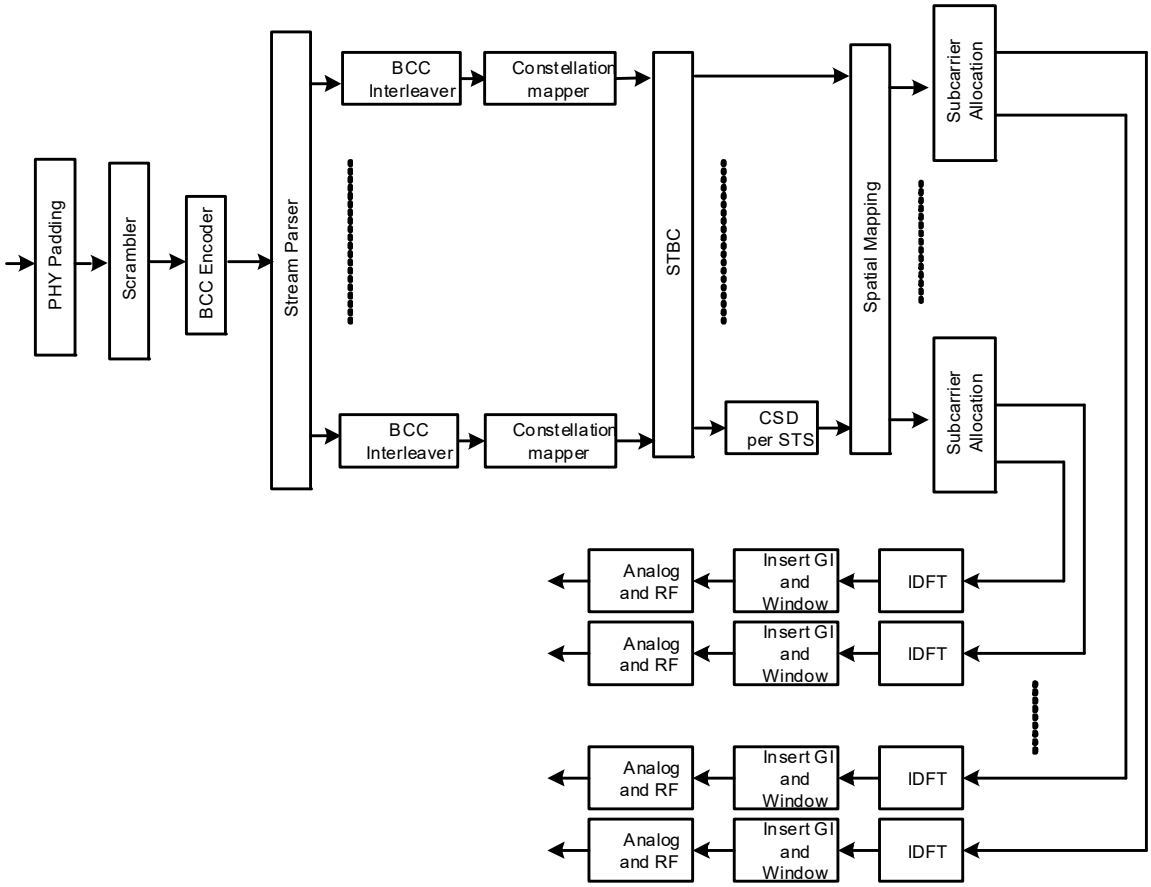

Figure 22-2—Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC encoding

22.3.4 Overview of the PPDU encoding process

22.3.4.1 General

This subclause provides an overview of the VHT PPDU in TVWS bands encoding process.

22.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 22.3.8.2.2 following the procedure in 21.3.4.2 reading "Clause 22" for references to "Clause 21" except the following:

c) Duplication and phase rotation: Duplicate the L-STF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

22.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in L-LTF definition following the procedure in 21.3.4.3 reading "Clause 22" for references to "Clause 21" except the following:

c) Duplication and phase rotation: Duplicate the L-LTF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

Copyright © 2021 IEEE. All rights reserved.

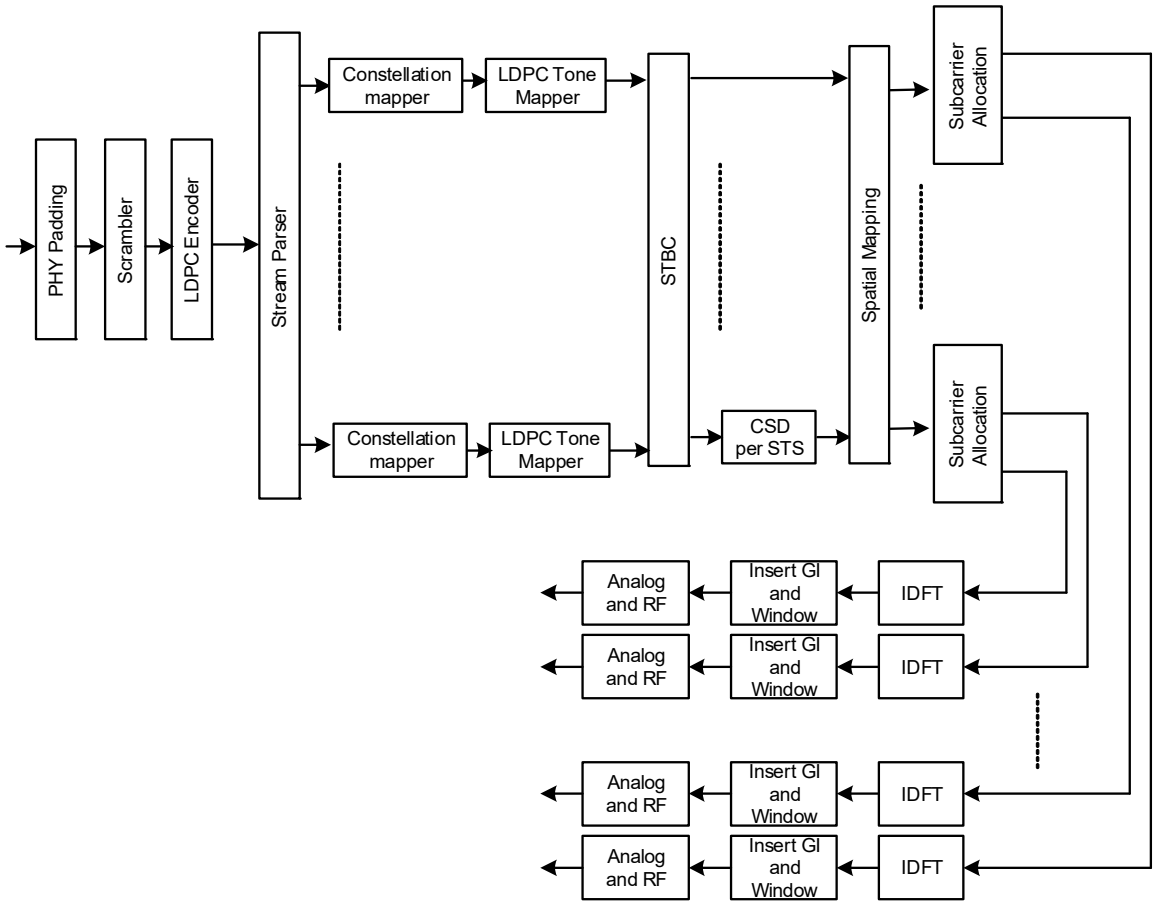

Figure 22-3—Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with LDPC encoding

22.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 22.3.8.2.4 following the procedure in 21.3.4.4 reading "Clause 22" for references to "Clause 21" except the following:

a) For a VHT PPDU in TVWS bands, set the RATE subfield in the SIGNAL field R1-R4 to 1101. Set the Length, Parity, and Tail bits in the SIGNAL field as defined in 22.3.8.2.4. Add calculated one bit parity and N_{tail} bits into the L-SIG symbol.

f) Duplication and phase rotation: Duplicate the L-SIG field over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

22.3.4.5 Construction of TVHT-SIG-A

The TVHT-SIG-A field consists of two symbols, TVHT-SIG-A1 and TVHT-SIG-A2, constructed as defined in 22.3.8.3.3 following the procedure in 21.3.4.5 reading "Clause 22" for references to "Clause 21" except the following:

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

e) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10.

f) Duplication and phase rotation: Duplicate TVHT-SIG-A1 and TVHT-SIG-A2 over of the BCUs of the CH_BANDWIDTH. Apply the appropriate phase rotation as defined in 22.3.7.

i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.6 Construction of TVHT-STF

Construct the TVHT-STF field for each BCU as defined in 22.3.8.3.4 with channel bandwidth being 40 MHz, following the procedure in 21.3.4.6 reading "Clause 22" for references to "Clause 21" except the following:

b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-STF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.4.

22.3.4.7 Construction of TVHT-LTF

Construct the TVHT-LTF field for each BCU as defined in 22.3.8.3.5 with channel bandwidth being 40 MHz, following the procedure in 21.3.4.7 reading "Clause 22" for references to "Clause 21" except the following:

b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-LTF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.5.

22.3.4.8 Construction of TVHT-SIG-B

The TVHT-SIG-B field is constructed per-user for each BCU as defined in 21.3.4.8 with channel bandwidth being 40 MHz, reading "Clause 22" for references to "Clause 21" except the following:

i) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10.

m) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.

o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-SIG-B subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.6.

22.3.4.9 Construction of the Data field in an SU PPDU

22.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as defined in 21.3.4.9.1 reading "Clause 22" for references to "Clause 21" except the following:

d) BCC encoder: Only one encoder is used.

f) Segment parser is omitted.

i) Segment deparser is omitted.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2.

n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.

o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as defined in 21.3.4.9.2 reading "Clause 22" for references to "Clause 21" except the following:

f) Segment parser is omitted.

i) Segment deparser is omitted.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2.

n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7. When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 21.3.10.11.1.

o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11.

p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.10 Construction of the Data field in an MU PPDU

22.3.4.10.1 General

See 21.3.4.10.1.

22.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using the process defined in 22.3.4.9.1 before the spatial mapping block and repeated for each user that uses BCC encoding.

22.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using the process defined in 22.3.4.9.2 before the spatial mapping block and repeated for each user that uses LDPC encoding.

22.3.4.10.4 Combining to form an MU PPDU

The per-user data is combined as defined in 21.3.4.10.4 except the following:

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

a) Spatial mapping: The Q matrix is applied as defined in 22.3.10.11. The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.

d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 22.3.7 and 22.3.8 for details.

22.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the TVHT-SIG-A field for SU PPDUs and in the TVHT-SIG-B field for MU PPDUs. Rate-dependent parameters for the full set of MCSs are shown in Table 22-26 to Table 22-37 (in 22.5). These tables give rate-dependent parameters for MCSs with indices 0 to 9, with number of spatial streams from 1 to 4 and bandwidth options of one, two, or four BCUs. Equal modulation (EQM) is applied to all streams for a particular user.

Table 22-26 to Table 22-29 show rate-dependent parameters for MCSs for one to four streams for one BCU operation. Table 22-30 to Table 22-33 show rate-dependent parameters for MCSs for one to four streams for dual BCU operation. Table 22-34 to Table 22-37 show rate-dependent parameters for MCSs for one to four streams for quad BCU operation.

22.3.6 Timing-related parameters

Table 22-8 and Table 22-9 define the timing-related parameters for VHT format and location of occupied tones in TVWS bands.

Table 22-8—Timing-related parameters

Parameter	6 MHz	7 MHz	8 MHz	Description
N_{SD}	108	108	108	Number of complex data numbers per BCU
N_{SP}	6	6	6	Number of pilot values per BCU
N_{ST}	114	114	114	Total number of subcarriers per BCU
N_{SR}	58	58	58	Highest data subcarrier index per BCU
Δ_F	$\frac{6\text{ MHz}}{144} = 41\frac{2}{3}$ kHz	$\frac{7\text{ MHz}}{168} = 41\frac{2}{3}$ kHz	$\frac{8\text{ MHz}}{144} = 55\frac{5}{9}$ kHz	Subcarrier frequency spacing
T_{DFT}	24 μs	24 μs	18 μs	IDFT/DFT period
T_{GI}	6 μs = T_{DFT}/4	6 μs = T_{DFT}/4	4.5 μs = T_{DFT}/4	Guard interval duration

Table 22-9—Tone location

Parameter	TVHT_ MODE_1	TVHT_ MODE_2C	TVHT_ MODE_2N	TVHT_ MODE_4C	TVHT_ MODE_4N	Description
N_{ST}	114	114	114	114	114	Total number of occupied subcarriers per BCU
N_{TT}	114	228	228	456	456	Total number of occupied subcarriers across all BCUs
Subcarrier index	–58 to –2 and +2 to +58	–130 to –74, –70 to –14, +14 to +70, and +74 to +130	–58 to –2 and +2 to +58 for each BCU	–274 to –218, –214 to –158, –130 to –74, –70 to –14, +14 to +70, +74 to +130, +158 to +214, and +218 to +274	–130 to –74, –70 to –14, +14 to +70, and +74 to +130 for each BCU	Location of occupied subcarriers for 6 MHz and 8 MHz channel units
Subcarrier index	–58 to –2 and +2 to +58	–142 to –86, –82 to –26, +26 to +82, and +86 to +142	–58 to –2 and +2 to +58 for each BCU	–310 to –254, –250 to –194, –142 to –86, –82 to –26, +26 to +82, +86 to +142, +194 to +250, and +254 to +310	–142 to –86, –82 to –26, +26 to +82, and +86 to +142 for each BCU	Location of occupied subcarriers for 7 MHz

The rest of the timing parameters are derived as in Table 21-5 using the definition of T_{DFT} in Table 22-8. Table 22-9 defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Refer to Table 21-6 for the frequency parameters. The definitions in the table are applicable to Clause 22 with the exception that in each transmission mode in Clause 22 $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

22.3.7 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5.

For all VHT PPDU in TVWS bands transmission modes the signal is transmitted on subcarriers as defined in Table 22-9.

Let

$f_{c,\text{idx0}}$ = dot11CurrentTVHTChannelCenterFrequencyIndex0 (see Table 22-17)

$f_{c,\text{idx1}}$ = dot11CurrentTVHTChannelCenterFrequencyIndex1 (see Table 22-17)

$f_{\text{PW, idx}}$ = dot11CurrentPrimaryChannel (see Table 22-17), where TVHT_W refers to a BCU of 6 MHz, 7 MHz, or 8 MHz

$f_{\text{CH, start}}$ = Channel starting frequency given in the operation class (E.1)

When dot11CurrentTVHTChannelWidth is TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, or TVHT_2W+2W, $f_{PW,idx}$ and $f_{c,idx1}$ shall have the relationship specified in Equation (22-1).

$$f_{\text{PW, idx}} = f_{c,\text{idx0}} + n_{\text{PW}} \tag{22-1}$$

where

$$N_{PW} = \begin{cases} 1 \text{ in TVHT_W and TVHT_W+W} \\ 2 \text{ in TVHT_2W and TVHT_2W+2W} \\ 4 \text{ in TVHT_4W} \end{cases}$$

n_{PW} is an integer with possible range $0 \le n_{\text{PW}} \le N_{PW} - 1$

When dot11CurrentTVHTChannelWidth is TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, or TVHT_2W+2W,

— The primary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{\text{PW, idx}}$, where $f_{\text{PW, idx}}$ is given in Equation (22-1).

When dot11CurrentTVHTChannelWidth is TVHT_2W, TVHT_4W, or TVHT_2W+2W,

— The secondary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{\text{SW, idx}}$, where $f_{\text{SW, idx}}$ is given in Equation (22-2).

$$f_{\text{SW, idx}} = \begin{cases} f_{\text{PW, idx}} + 1, & \text{if } n_{\text{PW}} \text{ is even} \\ f_{\text{PW, idx}} - 1, & \text{if } n_{\text{PW}} \text{ is odd} \end{cases} \tag{22-2}$$

When dot11CurrentTVHTChannelWidth is TVHT_W+W,

— The secondary TVHT_W channel is the channel with TVHT_W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{\text{SW, idx}}$, where $f_{\text{SW, idx}}$ is given in Equation (22-3).

$$f_{\text{SW, idx}} = f_{c,\text{idx1}} \tag{22-3}$$

When dot11CurrentTVHTChannelWidth is TVHT_2W, TVHT_4W, or TVHT_2W+2W,

— The primary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{\text{P2W, idx}} + 0.5 \times \text{TVHT_W}$ MHz, where $f_{\text{P2W, idx}}$ is given in Equation (22-4).

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{S2W,\text{idx}} + 0.5 \times \text{TVHT_W}$ MHz, where $f_{S2W,\text{idx}}$ is given in Equation (22-5).

$$f_{\text{P2W, idx}} = f_{c,\text{idx0}} + 2 \times n_{\text{P2W}} \quad 0 \le n_{\text{P2W}} \le N_{P2W} - 1 \quad N_{P2W} = \begin{cases} 1 \text{ in TVHT_2W and TVHT_2W+2W} \\ 2 \text{ in TVHT_4W} \end{cases} \tag{22-4}$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When dot11CurrentTVHTChannelWidth is TVHT_4W,

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{S2W, \text{idx}} + 0.5 \times \text{TVHT_W}$ MHz, where $f_{S2W, \text{idx}}$ is given in Equation (22-5).

$$f_{\text{S2W, idx}} = \begin{cases} f_{\text{P2W, idx}} + 2, & \text{if } n_{\text{P2W}} \text{ is even} \\ f_{\text{P2W, idx}} - 2, & \text{if } n_{\text{P2W}} \text{ is odd} \end{cases} \quad (22\text{-}5)$$

When dot11CurrentTVHTChannelWidth is TVHT_2W+2W,

— The secondary TVHT_2W channel is the channel with TVHT_2W bandwidth centered at $f_{\text{CH, start}} + \text{TVHT_W} \times f_{S2W, \text{idx}} + 0.5 \times \text{TVHT_W}$ MHz, where $f_{S2W, \text{idx}}$ is given in Equation (22-3).

The transmitted signal is defined in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11) in Clause 21.

$f_c^{(i_{Seg})}$ represents the center frequency of the PPDU transmitted in frequency segment i_{Seg} in each transmission mode in Clause 22.

Note that in TVHT_MODE_2C and TVHT_MODE_4C, the gap between the center frequencies of the adjacent segments is as shown in Table 22-9.

Table 22-10 shows $f_c^{(i_{Seg})}$ as a function of dot11CurrentTVHTChannelWidth.

Table 22-10—Center frequency of a PPDU transmitted in frequency segment i_{Seg}

dot11CurrentTVHTChannelWidth	CH_BANDWIDTH	$f_c^{(i_{Seg})} = f_{\text{CH, start}} + \text{TVHT_W} \times f_{(i_{Seg})} + Correction$	
		$(f_{(0)}, Correction)$	$(f_{(1)}, Correction)$
TVHT_W	TVHT_W	$(f_{c, \text{idx0}}, 0)$	—
TVHT_2W	TVHT_W	$(f_{\text{PW, idx}}, 0)$	—
	TVHT_2W	$(f_{c, \text{idx0}}, 0.5 \times \text{TVHT_W})$	—
TVHT_W+W	TVHT_W	$(f_{\text{PW, idx}}, 0)$	
	TVHT_W+W	$(f_{c, \text{idx0}}, 0)$	$(f_{c, \text{idx1}}, 0)$
TVHT_4W	TVHT_W	$(f_{\text{PW, idx}}, 0)$	—
	TVHT_2W	$(f_{\text{P2W, idx}}, 0.5 \times \text{TVHT_W})$	—
	TVHT_4W	$(f_{c, \text{idx0}}, 1.5 \times \text{TVHT_W})$	—
TVHT_2W+2W	TVHT_W	$(f_{c, \text{idx0}}, 0)$	
	TVHT_2W	$(f_{c, \text{idx0}}, 0.5 \times \text{TVHT_W})$	
	TVHT_2W+2W	$(f_{c, \text{idx0}}, 0.5 \times \text{TVHT_W})$	$(f_{c, \text{idx1}}, 0.5 \times \text{TVHT_W})$

NOTE—Transmitted signals in TVHT_MODE_2N and TVHT_MODE_4N might have different impairments such as phase offset or phase noise between the two frequency segments in TVHT_MODE_2N or TVHT_MODE_4N, which is not shown in Equation (21-11) for simplicity. See 22.3.17.3.

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The signal transmitted on frequency segment i_{Seg} of transmit chain i_{TX} is described by Equation (21-12) in 21.3.7. The timing boundaries for the various fields are shown in Figure 21-17.

Each field is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13) and where references to Table 21-5, Table 21-6, Table 21-8, Table 21-9, Table 21-10, and Table 21-11 are replaced by the corresponding descriptions in Clause 22 including Table 22-8, Table 22-9, Table 22-11, and Table 22-12.

Table 22-11 summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of number of BCUs (TVHT_MODE_1 has one BCU, TVHT_MODE_2C and TVHT_MODE_2N have two BCUs, and TVHT_MODE_4C and TVHT_MODE_4N have four BCUs).

Table 22-11—Tone scaling factor and guard interval duration values for PHY fields

Field	$N_{\text{Field}}^{\text{Tone}}$ as a function of the number of BCUs			Guard interval duration
	One	Two	Four	
L-STF	24	48	96	—
L-LTF	104	208	416	T_{GI2}
L-SIG	104	208	416	T_{GI}
TVHT-SIG-A	104	208	416	T_{GI}
TVHT-STF	24	48	96	-
TVHT-LTF	114	228	456	T_{GI}
TVHT-SIG-	114	228	456	T_{GI}
VHT-Data	114	228	484	T_{GI} or T_{GIS} (see NOTE 2)
NON_HT_DUP_OFDM-Data (see NOTE 1)	104	208	416	T_{GI}

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a NON_HT PPDU with format type NON_HT_DUP_OFDM.

NOTE 2—T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

In addition, the parameter $\Upsilon_{k,\text{BW}}$ in Equation (21-13) is replaced by $\Upsilon_{k,\text{M}}$ as defined in Table 22-12.

Table 22-12—Transmission mode and Gamma sub$_{k,M}$

Transmission mode	$\Upsilon_{k,\text{M}}$
TVHT_MODE_1, TVHT_MODE_2N	$\Upsilon_{k,1}$ per segment
TVHT_MODE_2C, TVHT_MODE_4N	$\Upsilon_{k,2}$ per two contiguous segments
TVHT_MODE_4C	$\Upsilon_{k,4}$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For TVHT_MODE_1 and TVHT_MODE_2N PPDU transmission,

$$\Upsilon_{k,1} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \quad (22\text{-}6)$$

For TVHT_MODE_2C and TVHT_MODE_4N PPDU transmission,

$$\Upsilon_{k,2} = \begin{cases} 1, & k < -72 \text{ for 6 MHz and 8 MHz channels, } k < -84 \text{ for 7 MHz channels} \\ -1, & k \geq -72 \text{ for 6 MHz and 8 MHz channels, } k \geq -84 \text{ for 7 MHz channels} \end{cases} \quad (22\text{-}7)$$

For TVHT_MODE_4C PPDU transmission,

$$\Upsilon_{k,4} = \begin{cases} 1, & k < -216 \text{ for 6 MHz and 8 MHz channels, } k < -252 \text{ for 7 MHz channels} \\ -1, & -216 \leq k < 0 \text{ for 6 MHz and 8 MHz channels, } -252 \leq k < 0 \text{ for 7 MHz channels} \\ 1, & 0 \leq k < 72 \text{ for 6 MHz and 8 MHz channels, } 0 \leq k < 84 \text{ for 7 MHz channels} \\ -1, & k \geq 72 \text{ for 6 MHz and 8 MHz channels, } k \geq 84 \text{ for 7 MHz channels} \end{cases} \quad (22\text{-}8)$$

22.3.8 TVHT preamble

22.3.8.1 Introduction

A TVHT preamble is defined to carry the required information to operate in either single user or multi-user mode.

22.3.8.2 Non-TVHT portion of TVHT format preamble

22.3.8.2.1 Cyclic shift definition for pre-TVHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and TVHT-SIG-A fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} is defined in Table 21-10 with a scaling factor to account for the change in sampling clock frequency. The CSD delay values shall be multiplied by the corresponding correction values for the 6 MHz, 7 MHz, and 8 MHz channels, respectively.

The scaling factor for transmissions over 6 MHz and 7 MHz channels is 7.5.

The scaling factor for transmissions over 8 MHz channels is 5.625.

As an example, the CSD value for antenna-2 with 2-transmit antennas is –200 ns, and the corresponding CSD value for 6 MHz channels is –1.5 μs.

22.3.8.2.2 L-STF definition

The L-STF field for each BCU in any transmission mode is defined by Equation (19-9) in 19.3.9.3.3.

The time domain representation of the signal on BCU i_{Seg} in transmit chain i_{TX} is specified in Equation (21-20), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} and Δ_F are defined in Table 22-8.

22.3.8.2.3 L-LTF definition

The L-LTF field for each BCU in any transmission mode is defined by Equation (19-12) in 19.3.9.3.4.

Note that these equations do not include the phase rotations as defined in Table 22-12.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The time domain representation of the signal in transmit chain i_{TX} is specified in Equation (21-23), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate data rate and length information. The structure of the L-SIG field is defined in Figure 17-5.

In a VHT PPDU, the RATE field shall be set to the value corresponding to 6 Mb/s in the 20 MHz channel spacing column of Table 17-6.

In a NON_HT_DUP PPDU, the RATE field is defined in 17.3.4.2 using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (22-9).

$$\text{LENGTH} = [(\text{TXTIME} - (20 \times \text{scaling factor}))/(4 \times \text{scaling factor})] \times 3 - 3 \quad (22\text{-}9)$$

where the scaling factor is defined in 22.3.8.2.1 and TXTIME is defined in 22.4.3. In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 using the L_LENGTH parameter in the TXVECTOR.

The time domain waveform of the L-SIG field in each BCU is specified in Equation (21-25) using $N_{20\mathrm{MHz}} = 2$, where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where the rest of the parameters are specified in 22.3.7.

22.3.8.3 TVHT portion of TVHT format preamble

22.3.8.3.1 Introduction

The TVHT portion of the VHT format preamble consists of the TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields.

Notational conventions are specified in 21.3.8.3.1.

22.3.8.3.2 Cyclic shift for TVHT modulated fields

The definition, application, and CSD values are defined in 21.3.8.3.2 with scaling factors as defined in 22.3.8.2.1.

22.3.8.3.3 TVHT-SIG-A definition

The TVHT-SIG-A field carries information required to interpret VHT PPDU in TVWS bands and is defined in 21.3.8.3.3.

The time domain waveform of the TVHT-SIG-A field in each BCU is specified in Equation (21-28), where $N_{20\mathrm{MHz}} = 2$ and where the rest of the parameters are specified in 22.3.7.

Fields in the TVHT-SIG-A fields are the same as in Table 21-12 except for the description B0-B1 (BW) and B10-B21 in TVHT-SIG-A1. Description of B0-B1 is specified in Table 22-13.

Table 22-13—B0-B1 (BW) in TVHT-SIG-A1

B0-B1	TVHT_MODE
00	Not used
10	TVHT_MODE_1
01	TVHT_MODE_2C and TVHT_MODE_2N
11	TVHT_MODE_4C and TVHT_MODE_4N

Description of B10-B21 (N_{STS}/Partial AID) is specified as follows:

For an MU PPDU:

N_{STS} is divided into 4 user positions of 3 bits each. User position p, where $0 \le p \le 3$, uses bits B(10+3p)-B(12+3p). The number of space-time streams for user u is indicated at user position p = USER_POSITION[u] where u = 0, 1, ..., NUM_USER − 1 and where the notation A[b] denotes the value of array A at index b. Zero space-time streams are indicated at positions not listed in the USER_POSITION array.

Set to 0 for 0 space-time streams
Set to 1 for 1 space-time stream
Set to 2 for 2 space-time streams
Set to 3 for 3 space-time streams
Values 4 to 7 are reserved

For an SU PPDU:

B10-B12

Set to 0 for 1 space-time stream
Set to 1 for 2 space-time streams
Set to 2 for 3 space-time streams
Set to 3 for 4 space-time streams
Values 4 to 7 are reserved

B13-B21

Partial AID: Set to the value of the TXVECTOR parameter PARTIAL_AID. Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19).

22.3.8.3.4 TVHT-STF definition

The TVHT-STF field for each BCU in any transmission mode is defined by Equation (21-30) in 21.3.8.3.4.

The time domain waveform of the TVHT-STF field in each BCU is specified in Equation (21-33), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.3.5 TVHT-LTF definition

The TVHT-LTF field is defined in 21.3.8.3.5.

The TVHT-LTF sequence transmitted for each BCU in any transmission mode is defined by Equation (21-37).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The time domain waveform of the TVHT-LTF field in each BCU is specified in Equation (21-42), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.3.6 TVHT-SIG-B definition

The TVHT-SIG-B field for each BCU in any transmission mode is defined in 21.3.8.3.6 for 40 MHz bandwidth.

The 27 TVHT-SIG-B bits are first repeated twice, then BCC encoded, interleaved, and made into constellations as described by Figure 21-22 and the corresponding text in 21.3.8.3.6. If the channel bandwidth of the current PPDU is TVHT_W, then the IDFT is conducted as defined in 21.3.8.3.6.

The time domain waveform for the TVHT-SIG-B field in each BCU in a VHT PPDU is the same as Equation (21-47) with channel bandwidth being 40 MHz. If the channel bandwidth of the current PPDU is larger than TVHT_W, then the TVHT-SIG-B subcarriers as described above are repeated in each BCU, with appropriate phase rotation factors $\Upsilon_{k,\mathrm{M}}$ being applied as shown in Table 22-12, before conducting IDFT.

22.3.9 Transmission of NON_HT and HT PPDUs with multiple antennas

A TVHT STA that transmits a NON_HT PPDU shall apply the cyclic shifts defined in 22.3.8.2.1 for L-STF, L-LTF, and L-SIG fields of the PPDU.

22.3.10 Data field

22.3.10.1 General

See 21.3.10.1, with “TVHT” replacing “VHT”.

22.3.10.2 SERVICE field

See 21.3.10.2, with “TVHT” replacing “VHT”.

22.3.10.3 CRC calculation for TVHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23.

The value of the CRC field shall be the 1s complement of Equation (21-59) with the values of N set to 21 for all Modes.

22.3.10.4 Scrambler

See 21.3.10.4 with “TVHT” replacing “VHT”.

22.3.10.5 Coding

See 21.3.10.5 with “TVHT” replacing “VHT”.

22.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as *stream parsing* and is described in 21.3.10.6.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

22.3.10.7 Segment parser

The segment parser as described in 21.3.10.7 is not used in Clause 22. All modes of operation use a common interleaver in the case of BCC or use a common tone mapper in the case of LDPC.

22.3.10.8 BCC interleaver

The BCC interleaver and deinterleaver for one BCU (TVHT_MODE_1) is defined in 21.3.10.8 for 40 MHz.

The BCC interleaver and deinterleaver for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuse the same formulas as described in 21.3.10.8 for 40 MHz with new values for N_{COL} , N_{ROW}, and N_{ROT} as defined in Table 22-14.

Table 22-14—Number of rows and columns in the interleaver

Parameter	TVHT_MODE_1	TVHT_MODE_2C, TVHT_MODE_2N	TVHT_MODE_4C, TVTH_MODE_4N
N_{COL}	18	27	48
N_{ROW}	$6 \times N_{BPSCS}$	$8 \times N_{BPSCS}$	$9 \times N_{BPSCS}$
N_{ROT} ($N_{SS} \leq 4$)	29	46	78

22.3.10.9 Constellation mapping

22.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points is as described in 21.3.10.9.1.

The streams of complex numbers in frequency subblock *l* for user *u* are denoted

$d'_{k,i,n,l,u}$; $k = 0, 1, \ldots, N_{SD} - 1$; $i = 1, \ldots, N_{SS,u}$; $n = 0, 1, \ldots, N_{SYM} - 1$;
$l = 0$ for all transmission modes.

22.3.10.9.2 LDPC tone mapping

The LDPC tone mapping for one BCU (TVHT_MODE_1) is defined in 21.3.10.9.2 for 40 MHz.

The LDPC tone mapping for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuses the same formulas as described in 21.3.10.9.2 for 40 MHz with values for D_{TM} as defined in Table 22-15.

Table 22-15—LDPC Tone Mapping Distance for each transmission mode

Parameter	TVHT_MODE_1	TVHT_MODE_2C, TVHT_MODE_2N	TVHT_MODE_4C, TVHT_MODE_4N
D_{TM}	6	8	9

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For all Clause 22 transmission Modes, the LDPC tone mapping for LDPC-coded streams corresponding to user u is done by permuting the stream of complex numbers

$$d''_{k,i,n,l,u};\quad k = 0, 1, \ldots, N_{SD}-1;\quad i = 1, \ldots, N_{SS,u};\quad n = 0, 1, \ldots, N_{SYM}-1;$$
$$l = 0 \text{ for all transmission modes.}$$

generated by the constellation mappers, to obtain

$$d''_{t(k),i,n,l,u};\quad k = 0, 1, \ldots, N_{SD}-1;\quad i = 1, \ldots, N_{SS,u};\quad n = 0, 1, \ldots, N_{SYM}-1;$$
$$l = 0 \text{ for all transmission modes.}$$

where

$$t(k) = D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{k \times D_{TM}}{N_{SD}} \right\rfloor \quad \text{for all transmission modes}$$

22.3.10.9.3 Segment deparser

The segment deparser is not used in Clause 22 as no segment parser is used in Clause 22.

22.3.10.9.4 Space-time block coding

See 21.3.10.9.4 with “TVHT” replacing “VHT”.

22.3.10.10 Pilot subcarriers

For TVHT_MODE_1 transmission, six pilot tones shall be inserted in subcarriers –53, –25, –11, 11, 25, and 53. The pilots are generated as described in 21.3.10.10 for 40 MHz transmission.

When multiple BCUs are used (TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N), each BCU shall use the same pilot tones, which are generated as described in 21.3.10.10 for 40 MHz transmission.

22.3.10.11 OFDM modulation transmission in VHT format

For TVHT transmissions, the signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$ shall be as specified in Equation (21-95), where $\Upsilon_{k,\mathrm{BW}}$ is replaced by $\Upsilon_{k,\mathrm{M}}$ as defined in Table 22-12 and where N_{SR} and Δ_F are defined in Table 22-8.

For TVHT_MODE_1 transmission, parameters shall be selected to be the same with 40 MHz VHT transmission as defined in 21.3.10.11.1.

For multi-segment transmissions TVHT_MODE_2C and TVHT_MODE_4C, each frequency segment shall follow the waveform as described in Equation (21-95), and the data and pilot subcarriers are allocated to the IDFT block according to the subcarrier mapping as specified in Table 22-9 in consecutive order from the lowest subcarrier to the highest subcarrier.

For multi-segment transmissions TVHT_MODE_2N and TVHT_MODE_4N, each frequency segment shall follow the waveform as described in Equation (21-95), and the data and pilot subcarriers are allocated by the subcarrier allocation block, as shown in Figure 22-2, to the two IDFT blocks according to the subcarrier mapping as specified in Equation (21-95) and Table 22-9 in consecutive order from the lowest subcarrier to the highest subcarrier in each of the two frequency segments, the lower half of the subcarriers are mapped to the IDFT corresponding to the lower frequency segment, and the upper half of the subcarriers are mapped to the IDFT corresponding to the upper frequency segment.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

22.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU shall be a non-HT duplicate. Multiple BCUs non-HT duplicate transmission is used to transmit to TVHT STAs that may be present in a part of a channel.

For non-HT duplicate transmission, the Data field shall be as defined in 21.3.10.12, with "TVHT" replacing "VHT" and with references to "Clause 22" replacing references to "Clause 21", using the parameter values defined in Table 22-16. The Data field shall be as defined by Equation (21-100) with following modifications. $N_{20\text{MHz}}$ is defined in Table 22-16. $K_{\text{Shift}}(i)$ in Equation (21-100) is replaced by $K_{\text{Shift}}(i) = (N_{20\text{MHz}} - 1 - 2i) \times 32 + 8 \cdot \lfloor N_{20\text{MHz}}/4 \rfloor + 8 \times \lfloor N_{20\text{MHz}}/8 \rfloor - (16 \times \lfloor i/2 \rfloor)$.

$T_{\text{CS}}^{i_{TX}}$ represents the cyclic shift of the transmit chain i_{TX} and is defined in 22.3.8.2.1. $N_{\text{NON_HT_DUP_OFDM-Data}}^{\text{Tone}}$ is defined in Table 22-16.

Table 22-16—Parameters for Non-HT duplicate transmissions

Parameter	TVHT_MODE_1	TVHT_MODE_2C	TVHT_MODE_2N	TVHT_MODE_4C	TVHT_MODE_4N
$N_{20\text{MHz}}$	2	4	2	8	4
$N_{\text{NON_HT_DUP_OFDM-Data}}^{\text{Tone}}$	104	208	104	416	208

In addition, the parameter $\Upsilon_{k,BW}$ is replaced by $\Upsilon_{k,M}$ as defined in Table 22-12. For a noncontiguous TVHT_W+W or TVHT_2W+2W non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for a TVHT_W or TVHT_2W non-HT duplicate transmission, respectively.

22.3.11 SU-MIMO and MU-MIMO Beamforming

22.3.11.1 General

SU-MIMO and DL-MU-MIMO beamforming in TVWS band is used as defined in 21.3.11.1 reading "Clause 22" for references to "Clause 21" except for feedback report format described in 9.4.1.50.

22.3.11.2 Beamforming Feedback Matrix V

Beamforming Feedback Matrix V is constructed as defined in 21.3.11.2 reading "Clause 22" for reference to "Clause 21" except for CSD values defined in 22.3.8.3.2.

22.3.11.3 Group ID

See 21.3.11.4 with "TVHT" replacing "VHT".

22.3.12 TVHT preamble format for sounding PPDUs

The format of a VHT NDP in TVWS bands is constructed as defined Figure 22-1.

NOTE—The number of TVHT-LTF symbols in the NDP is determined by the SU N_{STS} field in TVHT-SIG-A.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The TVHT NDP has the following properties:

— Uses the TVHT PPDU format but without the Data field.
— Is a TVHT SU PPDU as indicated by the TVHT-SIG-A field.
— Has the data bits of the TVHT-SIG-B field set to a fixed bit pattern (see 22.3.8.3.6).

22.3.13 Regulatory requirements

See 21.3.13.

22.3.14 Channelization

A TVHT channel is specified by the four PLME MIB fields specified in Table 22-17.

Table 22-17—Fields to specify TVHT channels

Field	Meaning
dot11CurrentTVHTChannelWidth	Channel width. Possible values represent TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W.
dot11CurrentTVHTChannelCenterFrequencyIndex0	In TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation denotes the center frequency of the lowest TV channel. In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that contains the primary channel. Valid range is 1 to 200. See Equation (22-10).
dot11CurrentTVHTChannelCenterFrequencyIndex1	In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that does not contain the primary channel. Valid range is 1 to 200. See Equation (22-10). Undefined for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation.
dot11CurrentPrimaryChannel	Denotes the location of the primary TVHT_W channel. Valid range is 1 to 200. See Equation (22-11).

Given dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1, the respective channel center frequency is given by Equation (22-10).

$$\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT_W} \times \text{dot11CurrentChannelCenterFrequencyIndex} + \text{ChannelCenterFrequencyCorrection} \quad (22\text{-}10)$$

where
Channel starting frequency is given by the Operating Class (E.1)
dot11CurrentTVHTChannelCenterFrequencyIndex is either
dot11CurrentTVHTChannelCenterFrequencyIndex0 or
dot11CurrentTVHTChannelCenterFrequencyIndex1 and
ChannelCenterFrequencyCorrection is
0 for TVHT_MODE_1 and TVHT_MODE_2N
0.5 × TVHT_W for TVHT_MODE_2C and TVHT+MODE_4N
1.5 × TVHT_W for TVHT_MODE_4C.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE—Channel starting frequency is the frequency that results in the regulatory domain's channel number being the RLAN channel number, i.e., the center frequency of the channel for index 0. For example, the center frequency of U.S. TV channel 2 is 57 MHz. The center frequency of U.S. TV channel 2 is obtained by Equation (22-10) as follows:

Channel center frequency [MHz] = Channel starting frequency + TVHT_W × dot11CurrentTVHTChannelCenterFrequencyIndex + ChannelCenterFrequencyCorrection = (0.045 × 1000) + 6 × 2 + 0 = 57 MHz.

The center frequency of the primary TVHT_W channel is given by Equation (22-11).

$$\text{Primary channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT_W} \times \text{dot11CurrentPrimaryChannel} \quad (22\text{-}11)$$

where

Channel starting frequency is given by the Operating Class (see E.1)

For TVHT_MODE_2N operation, any two nonidentical channels may be used.

For TVHT_MODE_4N operation, any two channels that would each be allowed as TVHT_2W channels and whose center frequencies are separated by greater than TVHT_2W (difference between dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 2) may be used.

For example, in the United States, a channel specified by

dot11CurrentTVHTChannelWidth = TVHT_2W (12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 15
dot11CurrentPrimaryChannel = 16

is a 12 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 485 MHz.

A channel specified by

dot11CurrentTVHTChannelWidth = TVHT_4W (24 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 14
dot11CurrentPrimaryChannel = 17

is a 24 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 491 MHz.

A channel specified by

dot11CurrentTVHTChannelWidth = TVHT_2W+2W (12+12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 =15
dot11CurrentTVHTChannelCenterFrequencyIndex1 = 40
dot11CurrentPrimaryChannel = 16

is an 12+12 MHz channel in which frequency segment 0 has 12 MHz bandwidth and center frequency of 482 MHz. Frequency segment 1 also has 12 MHz bandwidth and center frequency of 632 MHz. The primary 6 MHz channel is centered at 485 MHz.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

22.3.15 Slot time

The slot time for the TVHT PHY shall be 24 μs for 6 MHz and 7 MHz channel units and 20 μs for 8 MHz channel units.

22.3.16 Transmit and receive port impedance

Transmit and receive antenna connector impedance for each transmit and receive antenna is defined in 17.3.8.7.

22.3.17 TVHT transmit specification

22.3.17.1 Transmit spectrum mask

For transmission in TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C, the transmit spectral mask shall be as described for 40 MHz mask PPDU in 21.3.17.1 with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-18.

Table 22-18—Spectral mask frequency scaling factor for contiguous transmission

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_1	6 / 40	7 / 40	8 / 40
TVHT_MODE_2C	12 / 40	14 / 40	16 / 40
TVHT_MODE_4C	24 / 40	28 / 40	32 / 40

For transmission in mode TVHT_MODE_4N, the transmit spectral mask shall be as described for 80+80 MHz mask PPDU in 21.3.17.1 with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-19.

Table 22-19—Spectral mask frequency scaling factor for TVHT_MODE_4N

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_4N	12 / 80	14 / 80	16 / 80

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements (measured as defined in the relevant regulation) and the mask defined in this subclause.

NOTE 2—For rules regarding TX center frequency leakage levels, see 22.3.17.4.2.

For a TVHT_W+W mask PPDU of VHT or non-HT duplicate format, the overall transmit spectral mask is constructed in the following manner. First, the 40 MHz interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, –20 dBr at 21 MHz frequency offset, –28 dBr at 40 MHz frequency offset, and –40 dBr at 60 MHz frequency offset and above. The 40 MHz interim transmit spectral mask for frequency offsets in between 19 MHz and 21 MHz, 21 MHz and 40 MHz, and 40 MHz and 60 MHz shall be linearly interpolated in dB domain from the requirements

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. Then the 40 MHz interim spectral mask frequency points are scaled as defined in Table 22-20 to produce a TVHT_W interim spectral mask. Then, the TVHT_W interim spectral mask is placed on each of the two segments to produce the TVHT_W+W interim spectral mask. Then, for each frequency at which both of the TVHT_W interim spectral masks have values greater than –40 dBr and less than –20 dBr, the sum of the two TVHT_W interim mask values (summed in linear domain) shall be taken as the overall TVHT_W+W interim spectral mask value. Next, for each frequency at which neither of the two TVHT_W interim masks has values greater than or equal to –20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall TVHT_W+W interim mask spectral value. Finally, for any frequency region where the TVHT_W+W interim mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the TVHT_W+W interim spectral mask value defined shall be used to define the TVHT_W+W interim spectral mask value. The transmit spectrum shall not exceed the maximum of the TVHT_W+W interim transmit spectrum mask and –59 dBm/MHz at any frequency offset.

Table 22-20—Spectral mask frequency scaling factor for TVHT_MODE_2N

Mode	Scaling for 6 MHz channels	Scaling for 7 MHz channels	Scaling for 8 MHz channels
TVHT_MODE_2N	6 / 40	7 / 40	8 / 40

Example transmit spectral mask for a TVHT_W+W mask PPDU for BCU of 6 MHz and spacing of 12 MHz is shown in Figure 22-4.

22.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. See 22.3.17.4.4 for the demodulation procedure of the PPDUs as well as the number of PPDUs and OFDM symbols to be used for testing.

Let $E_{i,\,avg}$ denote the average constellation energy of a BPSK modulated subcarrier i in a TVHT data symbol.

For TVHT_MODE_1 contiguous non-HT duplicate or TVHT transmission having a bandwidth listed in Table 22-21, $E_{i,\,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 22-21 from the average of $E_{i,\,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\,avg}$ is done in the linear domain.

Table 22-21—Maximum transmit spectral flatness deviations

Format	Bandwidth of transmission (MHz)	Averaging subcarrier indices	Tested subcarrier indices	Maximum deviation (dB)
VHT	TVHT_W	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	± 4
			–58 to –43 and +43 to +58	+4/–6
non-HT duplicate	TVHT_W	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	–42 to –33, –31 to –6, +6 to +31, and +33 to +42	± 4
			–43 to –58 and +43 to +58	+4/–6

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

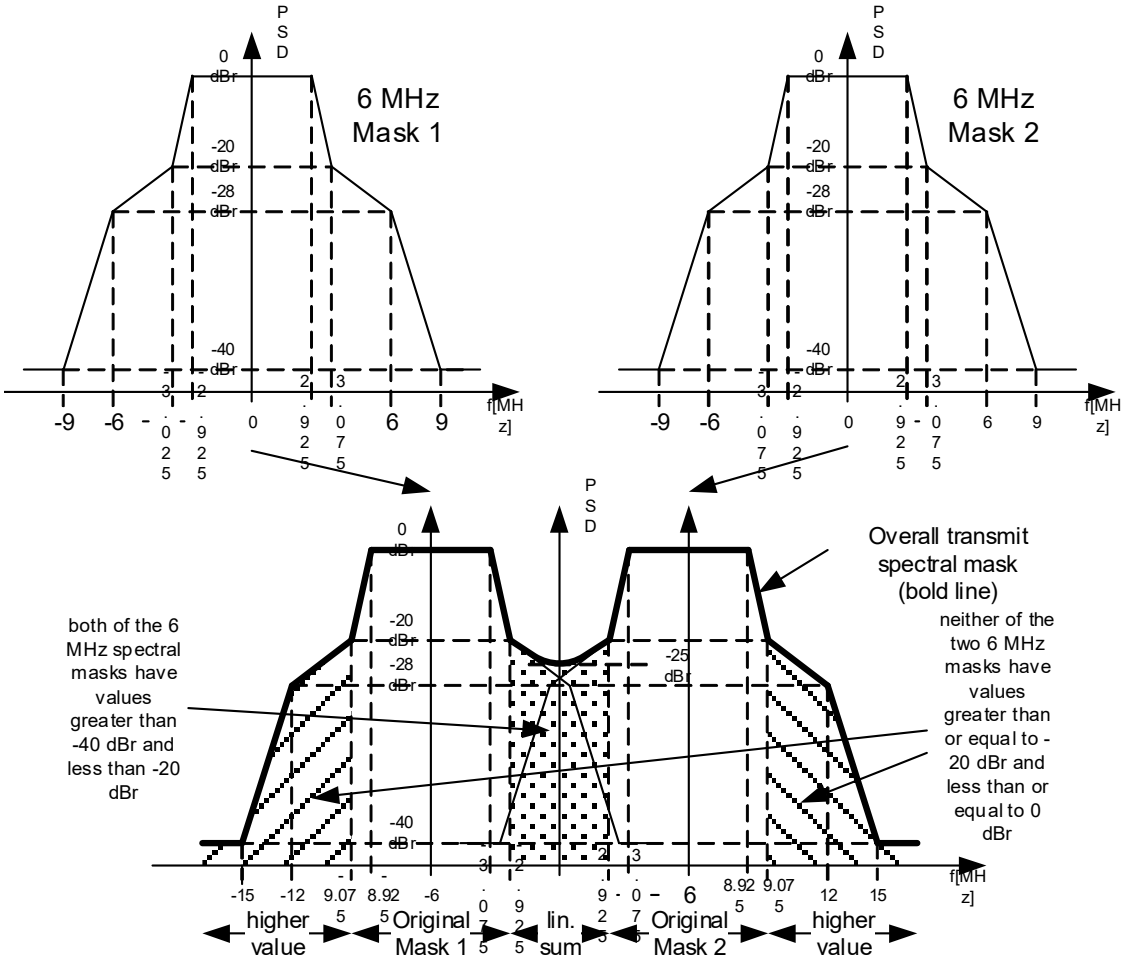

Figure 22-4—Example transmit spectral mask for an 6+6 MHz mask PPDU

For transmissions consisting of multiple contiguous or noncontiguous BCUs, each BCU shall meet the spectral flatness requirement for TVHT_MODE_1 transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 22.3.10.11) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation.

22.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The transmitter center frequency tolerance shall be ± 25 ppm. Carrier (LO) and symbol clock frequencies for the all transmit chains and BCUs shall be derived from the same reference oscillator.

NOTE—For multichannel operation, the signal phase of each BCU might be uncorrelated.

The symbol clock frequency tolerance shall be ± 25 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and contiguous BCUs shall be derived from the same reference oscillator.

22.3.17.4 Modulation accuracy

22.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are defined in 22.3.17.4.2 and 22.3.17.4.3. The test method is described in 21.3.17.4.4.

22.3.17.4.2 Transmit center frequency leakage

For transmissions using all formats except noncontiguous where the RF LO falls outside both BCUs, TX LO leakage shall meet the following requirements:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW (6/144 or 8/144) MHz shall not exceed the average power per subcarrier of the transmitted PPDU, or equivalently $(P - 10\log 10(N_{ST}))$, where P is the transmit power per antenna in dBm and N_{ST} is defined in Table 22-8.

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW (6/144 or 8/144) MHz shall not exceed the maximum of –32 dB relative to the total transmit power and –20 dBm, or equivalently $max(P - 32, -20)$, where P is the transmit power per antenna in dBm.

For transmissions using TVHT_MODE_2N and TVHT_MODE_4N, where the RF LO falls outside both BCUs, the RF LO shall follow the spectral mask requirements as defined in 22.3.17.1.

22.3.17.4.3 Transmitter constellation error

For all modes defined in TVHT PHY, the requirements for transmit constellation RMS error are same as defined in 21.3.17.4.3.

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 apply to all parts of the channel bandwidth. The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

22.3.17.4.4 Transmitter modulation accuracy (EVM) test

For the transmit modulation accuracy test, the same methodology as that defined in 21.3.17.4.4 shall be applied per BCU (termed frequency segment in Clause 21). The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

22.3.17.5 Time of Departure accuracy

For Time of Departure accuracy test, the test parameters defined in 21.3.17.5 shall be used for evaluation of TOD except the channel bandwidth, TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH. The channel bandwidth is determined by TXVECTOR parameter CH_BANDWIDTH in 22.2.2. TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH shall be multiplied by the corresponding scaling factor for the 6 MHz, 7 MHz, and 8 MHz channels, where the scaling factor is defined in 22.3.8.2.1.

22.3.18 TVHT receiver specification

22.3.18.1 General

See 21.3.18.

22.3.18.2 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 22-22. The test in this subclause and the minimum sensitivity levels specified in Table 22-22 apply only to non-STBC modes, long GI, BCC, and VHT PPDU in TVWS bands.

Table 22-22—Receiver minimum input level sensitivity

Modulation	Rate (R)	Minimum sensitivity (dBm)					
		6 or 7 MHz (TVHT_ MODE_1)	12/14 MHz (TVHT_ MODE_2C) or 6+6/7+7 MHz (TVHT_ MODE_2N)	24/28 MHz (TVHT_ MODE_4C or 12+12/ 14+14 MHz (TVHT_ MODE_4N)	8 MHz (TVHT_ MODE_1)	16 MHz (TVHT_ MODE_2C) or 8+8 MHz (TVHT_ MODE_2N)	32 MHz (TVHT_ MODE_4C) or 16+16/ 16+16 MHz (TVHT_ MODE_4N)
BPSK	1/2	–88	–85	–82	–87	–84	–81
QPSK	1/2	–85	–82	–79	–84	–81	–78
QPSK	3/4	–83	–80	–77	–82	–79	–76
16-QAM	1/2	–80	–77	–74	–79	–76	–73
16-QAM	3/4	–76	–73	–70	–75	–72	–69
64-QAM	2/3	–72	–69	–66	–71	–68	–65
64-QAM	3/4	–71	–68	–65	–70	–67	–64
64-QAM	5/6	–70	–67	–64	–69	–66	–63
256-QAM	3/4	–65	–62	–59	–64	–61	–58
256-QAM	5/6	–63	–60	–57	–62	–59	–56

22.3.18.3 Adjacent channel rejection

Adjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C follow the definition in the first paragraph of 21.3.18.2 and use the values in Table 22-23.

Adjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.2, where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23.

The definitions in the rest of 21.3.18.2 apply to Clause 22 using the values in Table 22-23.

Table 22-23—Minimum required adjacent and nonadjacent channel rejection levels

Modulation	Rate (R)	Adjacent channel rejection (dB)		Nonadjacent channel rejection (dB)	
		6 MHz, 7 MHz, 8 MHz, 12 MHz (TVHT_MODE_2C), 14 MHz (TVHT_MODE_2C), 16 MHz (TVHT_MODE_2C), 24 MHz (TVHT_MODE_4C), 28 MHz (TVHT_MODE_4C), 32 MHz (TVHT_MODE_4C)	6+6 MHz (TVHT_MODE_2N), 7+7 MHz (TVHT_MODE_2N), 8+8 MHz (TVHT_MODE_2N), 12+12 MHz (TVHT_MODE_4N), 14+14 MHz (TVHT_MODE_4N), 16+16 MHz (TVHT_MODE_4N)	6 MHz, 7 MHz, 8 MHz, 12 MHz (TVHT_MODE_2C), 14 MHz (TVHT_MODE_2C), 16 MHz (MTVHT_MODE_2C), 24 MHz (TVHT_MODE_4C), 28 MHz (TVHT_MODE_4C), 32 MHz (TVHT_MODE_4C)	6+6 MHz (TVHT_MODE_2N), 7+7 MHz (TVHT_MODE_2N), 8+8 MHz (TVHT_MODE_2N), 12+12 MHz (TVHT_MODE_4N), 14+14 MHz (TVHT_MODE_4N), 16+16 MHz (TVHT_MODE_4N)
BPSK	1/2	16	13	32	29
QPSK	1/2	13	10	29	26
QPSK	3/4	11	8	27	24
16-QAM	1/2	8	5	24	21
16-QAM	3/4	4	1	20	17
64-QAM	2/3	0	–3	16	13
64-QAM	3/4	–1	–4	15	12
64-QAM	5/6	–2	–5	14	11
256-QAM	3/4	–7	–10	9	6
256-QAM	5/6	–9	–12	7	4

22.3.18.4 Nonadjacent channel rejection

Nonadjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C channels follows the definition in the first paragraph of 21.3.18.3 and use the values in Table 22-23.

Nonadjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.3, where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23.

The definitions in the rest of 21.3.18.3 apply to Clause 22 using the values in Table 22-23.

22.3.18.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –20 dBm, measured at each antenna for any baseband TVHT modulation.

22.3.18.6 CCA sensitivity

22.3.18.6.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

22.3.18.6.2 CCA sensitivity for operating classes requiring CCA-ED

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2. The operating classes requiring the corresponding CCA-ED behavior class are given in E.1. The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary TVHT_W channel, dot11OFDMEDThreshold for the secondary TVHT_W channel (if present) and dot11OFDMEDThreshold + 3 dB for the secondary TVHT_2W channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5.

NOTE—The requirement to detect a channel busy condition as stated in 22.3.18.6.3 and 22.3.18.6.4 is a mandatory energy detect requirement on all Clause 22 receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

22.3.18.6.3 CCA sensitivity for signals occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {primary}) primitive if one of the conditions listed in Table 22-24 is met in an otherwise idle TVHT_W (TVHT_MODE_1), TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width. With >90% probability, the PHY shall detect the start of a PPDU that occupies at least the primary TVHT_W channel under the conditions listed in Table 22-24 within a period of aCCATime (see 22.4.4) and hold the CCA signal busy [PHY-CCA.indication(BUSY, channel-list)] for the duration of the PPDU.

Table 22-24—Conditions for CCA BUSY on the primary channel

Frequency segment width	Conditions
6 MHz	The start of a 6 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 6 MHz channel at or above –88 dBm.
7 MHz	The start of a 7 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 7 MHz channel at or above –88 dBm.
8 MHz	The start of a 8 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 8 MHz channel at or above –87 dBm.

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity (–88 + 20 = –68 dBm in the case of 6 MHz channel) in the primary TVHT_W channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondaryTVHT_2W}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

22.3.18.6.4 CCA sensitivity for signals not occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

— Any signal within the secondary channel at or above a threshold (–68 dBm for 6 MHz, –68 dBm for 7 MHz, and –67 dBm for 8 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondaryTVHT_2W}) or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary channel at or above a threshold (–81 dBm for 6 MHz, –81 dBm for 7 MHz, and –80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondaryTVHT_2W}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive and a PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_4W (TVHT_MODE_4C) and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

— Any signal within the secondary TVHT_2W channel at or above a threshold (–65 dBm for 12 MHz, –65 dBm for 14 MHz, and –64 dBm for 16 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

— A TVHT_2W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary TVHT_2W channel at or above a threshold (–78 dBm for 6+6 MHz, –78 dBm for 7+7 MHz, and –77 dBm for 8+8 MHz or 16 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4).

— A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in any TVHT_W subchannel of the secondary TVHT_2W channel at or above a threshold (–81 dBm for 6 MHz, –81 dBm for 7 MHz, and –80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime.

22.4.3 TXTIME and PSDU_LENGTH calculation

See 21.4.3 with "TVHT" replacing "VHT".

22.4.4 TVHT PHY

The static TVHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25, unless otherwise listed in Table 22-25. The definitions for these characteristics are given in 6.5.4.

Table 22-25—TVHT PHY characteristics

Characteristics	Value
aSlotTime	24 μs (BCUs: 6 MHz or 7 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-95) 20 μs (BCUs: 8 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-95)
aSIFSTime	120 μs (BCUs: 6 MHz or 7 MHz) 90 μs (BCUs: 8 MHz)
aSignalExtension	0 μs
aCCATime	< 15 μs (6 MHz or 7 MHz) < 11.25 μs (8 MHz)
aCCAMidTime	< 94 μs (6 MHz or 7 MHz) < 70 μs (8 MHz)
aAirPropagationTime	As indicated by the coverage class (see 10.22.5)
aPPDUMaxTime	20 ms
aPSDUMaxLength	1 401 120 octets (see NOTE 1)
aRxPHYStartDelay	(36 + 4 × the maximum possible value for $N_{VHT-LTF}$ supported + 4) × 7.5 (6 and 7 MHz channels) or 5.625 (8 MHz channels) (see NOTE 2)
NOTE 1—This is the maximum length in octets for SU PPDUs with a bandwidth of 32 MHz or 16+16 MHz, MCS 9 and 4 spatial streams, limited by 973 possible Short GI data symbols in aPPDUMaxTime. NOTE 2—This value arises from the time to the end of TVHT-SIG-B (see Figure 22-1) plus the need to decode the first symbol of the Data field in order to extract the SERVICE field and check the CRC it contains.

22.5 Parameters for TVHT-MCSs

The rate-dependent parameters for one BCU mode (6 MHz, 7 MHz, and/or 8 MHz) and corresponding two and four BCU modes with $N_{SS} = 1, \ldots, 4$ are given in Table 22-26 to Table 22-37. Support for MCS 8 and 9 (when valid) is optional in all cases. A TVHT STA shall support single spatial stream MCSs within the range MCS 0 to MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field may result in a reduced MCS range (cut-off) for $N_{SS} = 2, \ldots, 4$. Support for 6 MHz, 7 MHz, or 8 MHz with $N_{SS} = 1$ is mandatory. Support for 6 MHz, 7 MHz, and 8 MHz with $N_{SS} = 2, \ldots, 4$ is optional. Support for two BCU modes with 12 MHz, 14 MHz, and 16 MHz or with 6+6 MHz, 7+7 MHz, and 8+8 MHz with $N_{SS} = 1, \ldots, 4$ is optional. Support for four BCU modes with 24 MHz, 28 MHz, and 32 MHz or with 12+12 MHz, 14+14 MHz, and 16+16 MHz with $N_{SS} = 1, \ldots, 4$ is optional. N_{ES} values were chosen to yield an integer number of punctured blocks per OFDM symbol. Note that N_{ES} values are 1 for all Clause 22 modulations.

Table 22-26 to Table 22-37 define TVHT-MCSs not only for SU transmission but also for user u of MU transmission. In the case of TVHT-MCSs for MU transmission, the parameters, N_{SS}, R, N_{BPSCS}, N_{CBPS}, and N_{DBPS} are replaced with $N_{SS,u}$, R_u, $N_{BPSCS,u}$, $N_{CBPS,u}$, and $N_{DBPS,u}$, respectively.

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

23. Sub 1 GHz (S1G) PHY specification

23.1 Introduction

23.1.1 Introduction to the S1G PHY

Clause 23 specifies the PHY entity for an S1G orthogonal frequency division multiplexing (OFDM) system.

The S1G PHY is based on the VHT PHY defined in Clause 21, which in turn is based on HT PHY defined in Clause 19 and the OFDM PHY defined in Clause 17. The S1G PHY defines an OFDM PHY in the sub-1 GHz bands using narrower bandwidths than those in 2.4 GHz and 5 GHz bands, with maximum number of space-time streams supported being four, and with support for downlink multi-user (MU) transmissions. A downlink MU transmission supports up to four users with up to three space-time streams per user with the total number of space-time streams not exceeding four.

The S1G PHY provides support for 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz contiguous channel widths. A tone spacing of 31.25 kHz is used in all the bandwidths.

Transmissions of PPDUs with channel bandwidth 2 MHz, 4 MHz, 8 MHz, and 16 MHz are in general modulated the same way as 20 MHz, 40 MHz, 80 MHz and 160 MHz contiguous mode as specified in Clause 21, respectively, except with a 1/10 clock rate. For details refer to Table 23-4 (in 23.3.6). Transmissions of PPDUs with 1 MHz channel bandwidth are modulated as described in 23.3.4.4.

The S1G PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), 64-QAM and 256-QAM. Forward error correction (FEC) coding (convolutional or LDPC coding) is used with coding rates of 1/2, 2/3, 3/4, and 5/6.

An S1G non-AP STA shall support the following Clause 23 features:

— 1 MHz and 2 MHz channel width
— S1G_1M, S1G_SHORT PPDU
— S1G_LONG PPDU, if ≥ 4 MHz channel width is supported
— Detect and decode SIG-A field of the S1G_LONG preamble.
— Single spatial stream MCSs 0 to 2, and MCS 10 (for 1 MHz PPDU only)
— BCC coding
— Normal Guard Interval T_{GI} as defined in Table 23-4 (in 23.3.6)
— Fixed Pilots

An S1G AP shall support the following Clause 23 features:

— 1 MHz and 2 MHz channel width
— S1G_1M, S1G_SHORT PPDU
— S1G_LONG PPDU, if ≥4 MHz channel width is supported
— Detect and decode SIG-A field of the S1G_LONG preamble.
— Single spatial stream MCSs 0 to 7, and MCS 10 (for 1 MHz PPDU only)
— BCC coding
— Normal Guard Interval T_{GI} as defined in Table 23-4 (in 23.3.6)
— Fixed Pilots

An S1G STA may support the following Clause 23 features:

- 2 or more spatial streams (transmit and receive)
- S1G_LONG preamble when maximum channel width supported is less than 4 MHz
- Beamforming sounding (through S1G NDP) for an AP
- Beamforming sounding response (i.e., providing compressed beamforming feedback) for a non-AP STA
- STBC (transmit and receive)
- LDPC (transmit and receive)
- S1G MU PPDUs (transmit and receive)
- 4 MHz channel widths
- 8 MHz channel widths
- 16 MHz channel widths
- S1G-MCSs 8 and 9 (transmit and receive) for an AP, and S1G-MCSs 3-9 (transmit and receive) for a non-AP STA
- Short Guard Interval
- Traveling Pilots

23.1.2 Scope of S1G PHY services

The services provided to the MAC by the S1G PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs.

23.1.3 S1G PHY features

23.1.3.1 General

The S1G PHY contains two functional entities: the PHY function, and the physical layer management function (i.e., the PLME). Both of these functions are described in detail in 23.3 and 23.4.

The S1G PHY service is provided to the MAC through the PHY service primitives defined in Clause 8. The S1G PHY service interface is described in 23.2.

23.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

23.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation; the actual method of implementation is left to the discretion of the developer.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

23.1.4 PPDU formats

The structure of the PPDU transmitted by an S1G STA is determined by the TXVECTOR parameters as defined in Table 23-1 (in 23.2.2).

The FORMAT parameter determines the overall structure of the PPDU, and the allowed values are:

- S1G, for S1G non-duplicate PPDUs
- S1G_DUP_2M, for S1G 2 MHz duplicate PPDUs
- S1G_DUP_1M, for S1G 1 MHz duplicate PPDUs

The PPDU bandwidth is determined by the CH_BANDWIDTH parameter, and the preamble type (i.e., S1G_1M preamble, S1G_SHORT preamble, and S1G_LONG preamble) is determined by the PREAMBLE_TYPE parameter.

- The 1 MHz format PPDU (S1G_1M) is used for non-duplicate S1G transmissions at 1 MHz bandwidth (i.e., CH_BANDWIDTH = CBW1), and for S1G_DUP_1M transmissions of any bandwidth (i.e., CH_BANDWIDTH = CBW1, CBW2, CBW4, CBW8, or CBW16). The S1G_1M preamble (see 23.3.8.3) is used. Support for the S1G_1M is mandatory.
- The greater than or equal to 2 MHz short format (S1G_SHORT) is used for non-duplicate S1G transmissions and for S1G_DUP_2M transmissions, at bandwidths of 2 MHz and higher (i.e., CH_BANDWIDTH = CBW2, CBW4, CBW8, or CBW16). The S1G_SHORT preamble (see 23.3.8.2.1) is used. This PPDU format is similar to the HT-greenfield format in Clause 19, which does not contain a legacy portion in the preamble. Support for S1G_SHORT is mandatory.
- The greater than or equal to 2 MHz long format (S1G_LONG) is used for non-duplicate S1G transmissions at bandwidths of 2 MHz and higher (i.e., CH_BANDWIDTH = CBW2, CBW4, CBW8, or CBW16). The S1G_LONG format is not used for S1G_DUP_2M transmissions. The S1G_LONG preamble (see 23.3.8.2.2) is used. This PPDU format is similar to the HT-mixed format in Clause 19. Support for S1G_LONG is optional if a STA supports only 1 MHz and 2 MHz PPDUs, and is mandatory if a STA supports wider than 2 MHz PPDUs. All S1G STAs shall support detecting and decoding up to the SIG-A field of S1G_LONG PPDUs.

An S1G_LONG PPDU can be further categorized as an S1G SU PPDU or an S1G MU PPDU. An S1G_LONG PPDU with MU_SU = MU is an S1G MU PPDU, otherwise it is an S1G SU PPDU. An S1G MU PPDU carries one or more PSDUs to one or more STAs and shall be an S1G_LONG PPDU.

23.2 S1G PHY service interface

23.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

The TXVECTOR supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

23.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 23-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 23-1—TXVECTOR and RXVECTOR parameters

Parameter	Condition	Value	TXVECTOR	RXVECTOR
FORMAT		Determines the format of the PPDU. Enumerated type: S1G indicates S1G PPDU format. S1G_DUP_1M indicates S1G 1 MHz Duplicate PPDU format S1G_DUP_2M indicates S1G 2 MHz Duplicate PPDU format	Y	Y
PREAMBLE_TYPE	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)	Determine the type of preamble of the S1G PPDU. Enumerated type: S1G_SHORT_PREAMBLE indicates the short preamble defined in 23.3.8.2.2. S1G_LONG_PREAMBLE indicates the long preamble defined in 23.3.8.2.3.	Y	Y
	FORMAT is S1G_DUP_2M	Set to S1G_SHORT_PREAMBLE.	Y	Y
	Otherwise	Not present	N	N
MU_SU	FORMAT is S1G and PREAMBLE_TYPE is S1G_LONG_PREAMBLE and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)	Determine whether MU or SU of the S1G PPDU Enumerated type: Set to MU if NUM_USERS is 2 to 4. Set to SU if NUM_USERS is 1.	Y	Y
	Otherwise	Not present	N	N
NDP_INDICATION		Determine the type of S1G frame. Set to 1 if this packet is one of NDP CMAC PPDUs as defined in 23.3.12. Set to 0 otherwise.	Y	Y

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NDP_CMAC_PPDU_BODY	NDP_INDICATION is 1	Set to concatenated bit fields, which describe the NDP CMAC PPDU body content in one of NDP CMAC PPDU types defined in Table 23-29. (See 23.3.12).	Y	Y
	Otherwise	Not present	N	N
SMOOTHING	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and PREAMBLE_TYPE is S1G_LONG_PREAMBLE and NUM_STS is larger than 1	Indicates whether frequency domain smoothing is recommended as part of channel estimation. Set to 1 if frequency domain smoothing is recommended. Set to 0 otherwise.	Y	Y
	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and PREAMBLE_TYPE is S1G_LONG_PREAMBLE and NUM_STS is 1	Not present	N	N
	Otherwise	Indicates whether frequency domain smoothing is recommended as part of channel estimation. Set to 1 if frequency domain smoothing is recommended. Set to 0 otherwise.	Y	Y
AGGREGATION		Indicates whether the PSDU contains an A-MPDU. Enumerated type: AGGREGATED indicates this packet has A-MPDU aggregation. NOT_AGGREGATED indicates this packet does not have A-MPDU aggregation.	Y	Y
SECTOR_ID	FORMAT is S1G and PREMABLE_TYPE is S1G_LONG_PREAMBLE	Indicates which sectorized beam of the available sectorized beams are used in the transmission. The length of the parameter is 8 bits. A 1 in bit position n, relative to the LSB, indicates that Sector n is used. This parameter is present only if sectorization is applied.	O	N
	Otherwise	Not present	N	N

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
N_TX		Indicates the number of transmit chains.	Y	N
EXPANSION_MAT	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 23.3.10.2 based on the channel measured during the training symbols of a previous S1G NDP.	M U	N
	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is SU	Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 23.3.10.2 based on the channel measured during the training symbols of a previous S1G NDP.	O	N
	Otherwise	Not present	N	N
CHAN_MAT	PSDU_LENGTH equals 0 and NDP_INDICATION is 0	Contains a set of compressed beamforming feedback matrices as defined in 23.3.10.2 based on the channel measured during the training symbols of the received S1G NDP.	N	Y
	Otherwise	Not present	N	N
DELTA_SNR	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)	Contains an array of delta SNR values as defined in 9.4.1.51 based on the channel measured during the training symbols of the received S1G NDP. NOTE—In the RXVECTOR this parameter is present only for S1G NDPs for MU sounding.	M U	Y
	Otherwise	Not present	N	N
SNR		Contains an array of measures of the received SNR for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.49.	N	Y
FEC_CODING	FORMAT is S1G	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	M U	Y
	FORMAT is S1G_DUP_2M or S1G_DUP_1M	Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code.	Y	Y

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
STBC		Indicates whether or not STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field).	Y	Y
GI_TYPE		Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU.	Y	Y
TXPWR_LEVEL		The allowed values for the TXPWR_LEVEL parameter are in the range from 1 to $N/2$, where N is the number of octets in dot11TxPowerLevelExtended. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission.	Y	N
RSSI		The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the antenna connector used to receive the current PPDU measured during the reception of the LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power.	N	Y
MCS	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9	M U	Y
	FORMAT is S1G_DUP_2M	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9	Y	Y
	Otherwise	Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 10	Y	Y
REC_MCS	FORMAT is [S1G with (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16)] or S1G_DUP_2M	Indicates the MCS that the STA's receiver recommends. Integer: range 0 to 9	N	O
	Otherwise	Indicates the MCS that the STA's receiver recommends. Integer: range 0 to 10	N	O

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
CH_BANDWIDTH	FORMAT is S1G	Indicates the channel width of the transmitted PPDU: Enumerated type: CBW1 for 1 MHz CBW2 for 2 MHz CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz	Y	Y
	FORMAT is S1G_DUP_2M	In TXVECTOR, indicates the channel width of the transmitted S1G 2 MHz Duplicate PPDU. In RXVECTOR, indicates the estimated channel width of the received S1G 2 MHz Duplicate PPDU. Enumerated type: CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz	Y	Y
	FORMAT is S1G_DUP_1M	In TXVECTOR, indicates the channel width of the transmitted S1G 1 MHz Duplicate PPDU. In RXVECTOR, indicates the estimated channel width of the received S1G 1 MHz Duplicate PPDU. Enumerated type: CBW2 for 2 MHz CBW4 for 4 MHz CBW8 for 8 MHz CBW16 for 16 MHz	Y	Y
LENGTH	AGGREGATION is AGGREGATED	Indicates the packet duration in number of symbols in the PSDU	Y	Y
	AGGREGATION is NOT_AGGREGATED	Indicates the packet duration in number of octets in the PSDU	Y	Y
APEP_LENGTH	FORMAT is S1G and AGGREGATION is AGGREGATED	If equal to 0, indicates an S1G NDP for both RXVECTOR and TXVECTOR. If greater than 0 in the TXVECTOR, indicates the number of octets in the A-MPDU pre-EOF padding (see 10.12.2) carried in the PSDU. This parameter is used to determine the number of OFDM symbols in the Data field that do not appear after a subframe with 1 in the EOF subfield.	M U	O
	(FORMAT is S1G_DUP_2M or SIG_DUP_1M) and AGGREGATION is AGGREGATED	If equal to 0, indicates an S1G NDP for both RXVECTOR and TXVECTOR. If greater than 0 in the TXVECTOR, indicates the number of octets in the A-MPDU pre-EOF padding (see 10.12.2) carried in the PSDU. This parameter is used to determine the number of OFDM symbols in the Data field that do not appear after a subframe with 1 in the EOF subfield.	Y	O
	Otherwise	Not present	N	N

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
PSDU_LENGTH	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Indicates the value in the RXVECTOR obtained from 23.4.3.	N	Y
	Otherwise	If greater than 0 in the TXVECTOR and AGGREGATION is NOT_AGGREGATED, indicates the number of octets in the PSDU. If greater than 0 in the RXVECTOR, this parameter is the value obtained from 23.4.3. A value of 0 indicates an S1G NDP for both RXVECTOR and TXVECTOR.	Y	Y
USER_POSITION	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Index for user in MU transmission. Integer: range 0–3. NOTE—The entries in the USER_POSITION array are in ascending order.	Y	Y
	Otherwise	Not present	N	N
NUM_STS	FORMAT is S1G	Indicates the number of space-time streams. Integer: range 1–4 per user in the TXVECTOR and 0–4 in the RXVECTOR. NUM_STS summed over all users is in the range 1 to 4 for MU-MIMO.	MU	Y
	FORMAT is S1G_DUP_2M or S1G_DUP_1M	Indicates the number of space-time streams. Integer: range 1–4 per user in the TXVECTOR and 0–4 in the RXVECTOR.	Y	Y
GROUP_ID	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Indicates the group ID. Integer: range 1–62 (see Table 23-14 in 23.3.8.2.3.2.5).	Y	Y
	Otherwise	Not present	N	N
PARTIAL_AID	FORMAT is [S1G with (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and (MU_SU is SU)] or S1G_DUP_2M	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.21). Integer: range 0–511 if UPLINK_INDICATION is 1, and range 0–63 if UPLINK_INDICATION is 0.	Y	Y
	Otherwise	Not present	N	N

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
NUM_USERS	FORMAT is S1G and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and MU_SU is MU	Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4.	Y	N
	Otherwise	Set to 1	Y	N
BEAM_CHANGE	FORMAT is S1G and MU_SU is SU and (CH_BANDWIDTH is CBW2 or CBW4 or CBW8 or CBW16) and PREAMBLE_TYPE is S1G_LONG_PREAMBLE and NUM_STS is 1	Set to 1 if the Q matrix is changed from the omnidirectional portion to the beam changeable portion of the long preamble, in at least one of the nonzero subcarrier of the omnidirectional portion as described in 23.3.8.2.3.2.5. Set to 0 if the Q matrix is unchanged in all the nonzero subcarriers of the omnidirectional portion. NOTE—If BEAM_CHANGE is 0 and PREAMBLE_TYPE is S1G_LONG_PREAMBLE, the receiver may do channel smoothing. Otherwise, smoothing is not recommended.	Y	Y
	Otherwise	Not present	N	N
RESPONSE_INDICATION		Set to 0 if No Response. Set to 1 if NDP Response. Set to 2 if Normal Response. Set to 3 if Long Response.	Y	Y
TRAVELING_PILOTS		Set to 1 if traveling pilots are used in the packet. Set to 0 otherwise.	Y	O
TIME_OF_DEPARTURE_REQUESTED		Boolean value: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first PPDU energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET	dot11MgmtOptionTimingMsmtActivated is true	0 to 2^{32}– 1. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna port to the point in time at which this primitive is issued to the MAC.	N	Y
	Otherwise	Not present	N	N

Table 23-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Condition	Value	TXVECTOR	RXVECTOR
UPLINK_INDICATION	NDP_INDICATION is 0 and FORMAT is S1G and CH_BANDWIDTH is not CBW1	Set to 1 if the S1G PPDU is addressed to AP Set to 0 otherwise (See 10.21).	Y	Y
	Otherwise	Not present	N	N
COLOR	UPLINK_INDICATION is 0 and NDP_INDICATION is 0 and (FORMAT is S1G or S1G_DUP_2M) and CH_BANDWIDTH is not CBW1 and MU_SU is SU	Set to a value of its choosing within the range 0 to 7 (See 10.21)	Y	Y
	Otherwise	Not present	N	N
SCRAMBLER_OR_CRC	NDP_INDICATION is 0	Indicates the Scrambler Initialization value in the Service field (as defined in 23.3.9.2) prior to descrambling. Bit sequence of 7 bits in length: [B0:B6] of the SERVICE field value prior to descrambling.	N	Y
	FORMAT is S1G and NDP_INDICATION is 1	Indicates the value of the calculated CRC in the SIG field. Bit sequence of 4 bits in length: Either [B26:B29] of the 1 MHz SIG field or [B38:B41] of the ≥ 2 MHz SIG field.	N	Y
	FORMAT is S1G_DUP_2M and NDP_INDICATION is 1	Indicates the value of the calculated CRC in the SIG field. Bit sequence of 4 bits in length: [B38:B41] of the ≥ 2 MHz SIG field.	N	Y
	FORMAT is S1G_DUP_1M and NDP_INDICATION is 1	Indicates the value of the calculated CRC in the SIG field. Bit sequence of 4 bits in length: [B26:B29] of the 1 MHz SIG field.	N	Y
	Otherwise	Not present	N	N

NOTE—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present.
N = Not present.
O = Optionally present.
MU indicates that the parameter is present once for an S1G SU PPDU and present per user for an S1G MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by *u*, where *u* takes values 0 to NUM_USERS-1.

23.2.3 Effect of CH_BANDWIDTH parameter on PPDU format

Table 23-2 shows the PPDU format as a function of the CH_BANDWIDTH parameter.

Table 23-2—PPDU format as a function of CH_BANDWIDTH parameter

FORMAT	CH_BANDWIDTH	PPDU format
S1G	CBW1	The STA transmits an S1G PPDU of 1 MHz bandwidth. If the operating channel width is wider than 1 MHz, then the transmission shall use the primary 1 MHz channel.
S1G	CBW2	The STA transmits an S1G PPDU of 2 MHz bandwidth. If the operating channel width is wider than 2 MHz, then the transmission shall use the primary 2 MHz channel.
S1G	CBW4	The STA transmits an S1G PPDU of 4 MHz bandwidth. If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel.
S1G	CBW8	The STA transmits an S1G PPDU of 8 MHz bandwidth. If the operating channel width is wider than 8 MHz, then the transmission shall use the primary 8 MHz channel.
S1G	CBW16	The STA transmits an S1G PPDU of 16 MHz bandwidth.
S1G_DUP_2M	CBW4	The STA transmits an S1G 2 MHz Duplicate PPDU using two adjacent 2 MHz channels as defined in 23.3.9.12.2. If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel. Phase rotation pattern for each 2 MHz channel is [1 j] from the lowest frequency as defined in Equation (23-7).
S1G_DUP_2M	CBW8	The STA transmits an S1G 2 MHz Duplicate PPDU using four adjacent 2 MHz channels as defined in 23.3.9.12.2. If the BSS operating channel width is 16 MHz, then the transmission shall use the primary 8 MHz channel. Phase rotation pattern for each 2 MHz channel is [1 -1 -1 -1] from the lowest frequency as defined in Equation (23-8).
S1G_DUP_2M	CBW16	The STA transmits an S1G 2 MHz Duplicate PPDU using eight adjacent 2 MHz channels as defined in 23.3.9.12.2. Phase rotation pattern for each 2 MHz channel is [1 -1 -1 -1 1 -1 -1 -1] from the lowest frequency as defined in Equation (23-9).
S1G_DUP_1M	CBW2	The STA transmits an S1G 1 MHz Duplicate PPDU using two adjacent 1 MHz channels as defined in 23.3.9.12.1. If the operating channel width is wider than 2 MHz, then the transmission shall use the primary 2 MHz channel. Phase rotation pattern for each Equation (23-10).
S1G_DUP_1M	CBW4	The STA transmits an S1G 1 MHz Duplicate PPDU using four adjacent 1 MHz channels as defined in 23.3.9.12.1. If the operating channel width is wider than 4 MHz, then the transmission shall use the primary 4 MHz channel. Phase rotation pattern for each 1 MHz channel is [1 j -j -1] from the lowest frequency as defined in Equation (23-11).

Table 23-2—PPDU format as a function of CH_BANDWIDTH parameter *(continued)*

FORMAT	CH_BANDWIDTH	PPDU format
S1G_DUP_1M	CBW8	The STA transmits an S1G 1 MHz Duplicate PPDU using eight adjacent 1 MHz channels as defined in 23.3.9.12.1. If the BSS operating channel width is 16 MHz, then the transmission shall use the primary 8 MHz channel. Phase rotation pattern for each 1 MHz channel is [1 -1 1 1 1 1 -1 -1] from the lowest frequency as defined in Equation (23-12).
S1G_DUP_1M	CBW16	The STA transmits an S1G 1 MHz Duplicate PPDU using sixteen adjacent 1 MHz channels as defined in 23.3.9.12.1. Phase rotation pattern for each 1 MHz channel is [1 1 1 -1 1 1 1 -1 -1 -1 1 -1 1 1 -1 1] from the lowest frequency as defined in Equation (23-13).

23.3 S1G PHY sublayer

23.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a PSDU (in the SU case) or one or more PSDUs (in the MU case) are processed (e.g., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in the detection, demodulation and delivery of the PSDU.

23.3.2 S1G PPDU format

Three formats are defined for the S1G PHY: S1G_SHORT, S1G_LONG, and S1G_1M.

The general structure for S1G_SHORT is defined as in Figure 23-1. This format is used for SU transmission using 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs.

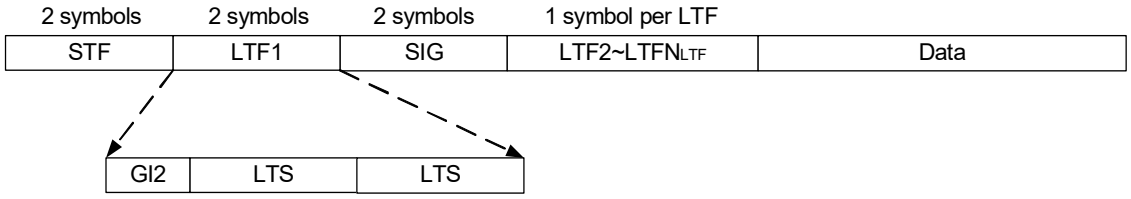

Figure 23-1—S1G_SHORT format

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The general structure for S1G_LONG is defined as in Figure 23-2. This frame format can be used for MU and SU beamformed transmissions using 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs.

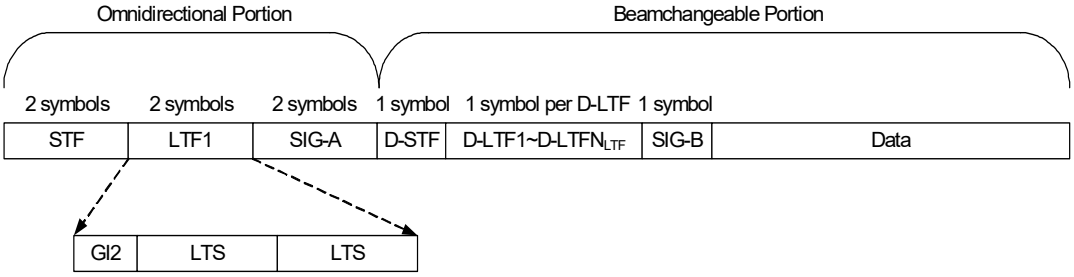

Figure 23-2—S1G_LONG format

The general structure for S1G_1M is defined as in Figure 23-3. This frame format is used for S1G_1M PPDU SU transmission.

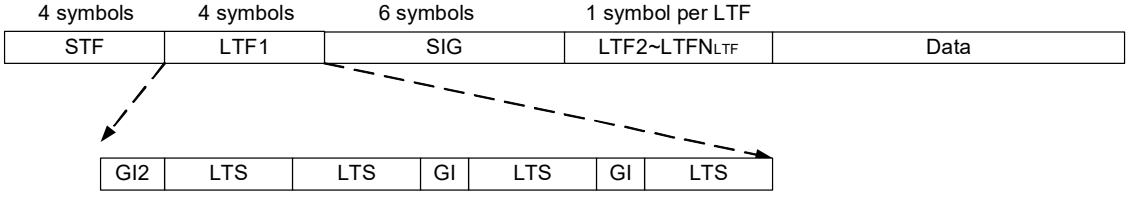

Figure 23-3—S1G_1M format

The fields of the S1G PPDU formats are summarized in Table 23-3.

Table 23-3—Fields of the S1G PPDU

Field	Description
STF	Short Training field
LTF	Long Training field
SIG	SIGNAL field
SIG-A	Signal A field
D-STF	Short Training field for the beam changeable portion
D-LTF	Long Training field for the beam changeable portion
SIG-B	Signal B field
Data	The Data field carries the PSDU(s)
GI	Guard interval
GI2	Double guard interval
LTS	Long training symbol

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The SIG-A, D-STF, D-LTF, and SIG-B fields exist only in S1G_LONG format. In an S1G NDP, the Data field is not present (see 23.3.11. The number of symbols in the LTF field of S1G_1M and S1G_SHORT, or in the D-LTF field of S1G_LONG, N_{VHTLTF}, can be either 1, 2, or 4 and is determined by the total number of space-time streams across all users being transmitted in the S1G PPDU (see Table 23-10 in 23.3.8.2.2).

23.3.3 Transmitter block diagram

Each field in an S1G PPDU can be generated using a subset of the following blocks (only select blocks are listed below):

a) PHY padding
b) Scrambler
c) BCC encoder parser
d) FEC (BCC or LDPC) encoders
e) Stream parser
f) Segment parser (for 16 MHz)
g) BCC Interleaver
h) Replicate the encoded bits (for 1 MHz MCS 10)
i) Constellation mapper
j) Pilot insertion
k) Replicate over multiple 1 MHz or 2 MHz widths
l) Multiply by first column of P_{HTLTF}
m) LDPC tone mapper
n) Segment deparser (for 16 MHz)
o) Space-time block code (STBC) encoder
p) Cyclic shift diversity (CSD) per STS insertion
q) Spatial mapper
r) Inverse discrete Fourier transform (IDFT)
s) Cyclic shift diversity (CSD) per chain insertion
t) Guard interval (GI) insertion
u) Windowing

The general transmission flow for S1G_1M MCS 0–9, and all the MCSs for S1G_SHORT and S1G_LONG formats are the same as the corresponding portions in 21.3.

Specifically, Figure 21-5, with “20 MHz” replaced by “2 MHz”, shows the transmit process for the SIG-A field of an S1G PPDU in S1G_LONG. These transmit blocks are also used to generate the omnidirectional portion of the S1G_LONG PPDU, except that the BCC encoder and interleaver are not used when generating the STF and LTF1 fields.

Figure 21-6 and Figure 21-7, with “20 MHz” replaced by “2 MHz”, show the transmit process for generating the SIG-B field of a 2 MHz, 4 MHz, and 8 MHz long format S1G PPDU for SU PPDU and MU PPDU, respectively. Figure 21-8, with “160 MHz” replaced by “16 MHz”, shows the transmit process for generating the SIG-B field of a 16 MHz long format S1G SU PPDU.

Figure 21-10 shows the transmitter blocks used to generate the BCC encoded Data field of a 2 MHz, 4 MHz, and 8 MHz SU PPDU in short or long format, and of an S1G_1M PPDU except MCS 10. It should be noted that the number of encoders is fixed to one for BCC (i.e., N_{ES}=1), in S1G operation. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right

of, and including, the spatial mapping block, are also used to generate the STF and LTF fields in S1G_1M and S1G_SHORT, or the D-STF and D-LTF fields in S1G_LONG. This is illustrated in Figure 23-6 in 23.3.8.2.2.4 for the mentioned LTF fields. A similar set of transmit blocks is used to generate the mentioned STF fields.

Figure 21-11 shows the transmitter blocks used to generate the LDPC encoded Data field of a 2 MHz, 4 MHz, and 8 MHz SU PPDU in short or long format, and of an S1G_1M PPDU except MCS 10.

Figure 21-12 shows the transmit process for generating the Data field of a 2 MHz, 4 MHz, and 8 MHz MU PPDU in long format with BCC and/or LDPC encoding. The number of encoders is fixed to one (i.e., N_{ES}=1) for BCC in S1G operation.

Figure 21-13 and Figure 21-14 show the transmit process for generating the Data field of a 16 MHz SU PPDU in short or long format, with BCC and LDPC encoding, respectively. The number of encoders is fixed to one (i.e., N_{ES}=1) for BCC in S1G operation.

Figure 23-4 below shows the transmit process for generating the Data field of an S1G_1M PPDU with MCS 10, either BCC or LDPC encoded.

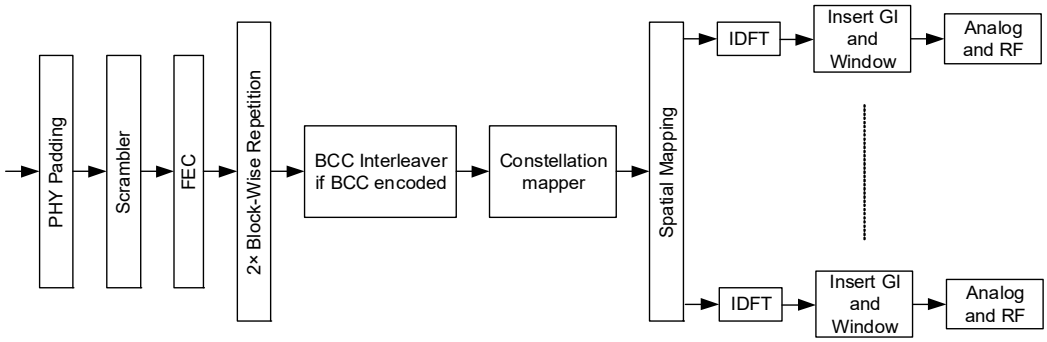

Figure 23-4—Transmitter block diagram for the Data field of an S1G_1M PPDU with BCC or LDPC encoding and MCS 10

23.3.4 Overview of the PPDU encoding process

23.3.4.1 General

This subclause provides an overview of the S1G PPDU encoding process.

23.3.4.2 Construction of the Preamble part in an S1G_LONG PPDU

23.3.4.2.1 Construction of STF

Construct the STF field as defined in 23.3.8.2.2.3 with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.
b) Sequence generation: Generate the STF field sequence over the CH_BANDWIDTH as described in 23.3.8.2.3.2.3.
c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.
d) IDFT: Compute the inverse discrete Fourier transform.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 23.3.8.2.3.2.2.

f) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 23.3.7.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.2 Construction of LTF1

Construct the LTF1 field as defined in 23.3.8.2.2.4 with the following highlights:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the LTF1 field sequence over the CH_BANDWIDTH as described in 23.3.8.2.2.4.

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

d) IDFT: Compute the inverse discrete Fourier transform.

e) CSD: Apply CSD for each transmit chain and frequency segment as described in 23.3.8.2.3.2.2.

f) Insert GI and apply windowing: Prepend a GI of 16 μs in duration and apply windowing as described in 23.3.7.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.3 Construction of SIG-A

The SIG-A field consists of two symbols, SIG-A1 and SIG-A2, as defined in 23.3.8.2.3.2.5 and is constructed as follows:

a) Obtain the CH_BANDWIDTH, STBC, MU_SU, GROUP_ID (MU only), PARTIAL_AID (SU only), NUM_STS, GI_TYPE, FEC_CODING, MCS (SU only), NUM_USERS, LENGTH, AGGREGATION (SU only), RESPONSE_INDICATION, BEAM_CHANGE (SU only for single space-time stream), SMOOTHING and TRAVELING_PILOTS from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the N_{tail} tail bits as shown in 23.3.8.2.3.2.5. This operation gives as a result 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6.

c) BCC interleaver: Interleave as described in 17.3.5.7.

d) Constellation mapper: QBPSK modulate the first 48 interleaved bits by rotating by 90° counter-clockwise relative to the original BPSK as described in 23.3.8.2.3.2.5 to form the first symbol of SIG-A field. BPSK modulate the second 48 interleaved bits to form the second symbol of SIG-A field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10.

f) Duplication and phase rotation: Duplicate SIG-A1 and SIG-A2 over each 2 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

g) IDFT: Compute the inverse discrete Fourier transform.

h) CSD: Apply CSD for each transmit chain as described in 23.3.8.2.3.2.2.

i) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.4 Construction of D-STF

The D-STF field is defined in 23.3.8.2.3.3.3 and constructed as follows:

a) Sequence generation: Generate the D-STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.3.3.3.
b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.
c) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2.
d) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.
e) IDFT: Compute the inverse discrete Fourier transform.
f) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.
g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.5 Construction of D-LTF

The D-LTF field is defined in 23.3.8.2.3.3.4 and constructed as follows:

a) Sequence generation: Generate the D-LTF field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.3.3.4.
b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.
c) A_{LTF} matrix mapping: Apply the P_{HTLTF} matrix to the D-LTF field sequence (the pilot tones are processed differently) as described in 23.3.8.2.3.3.4.
d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2.
e) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.
f) IDFT: Compute the inverse discrete Fourier transform.
g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.
h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.2.6 Construction of SIG-B

The SIG-B field is constructed per user as follows:

a) Obtain the MCS (for MU only) from the TXVECTOR.
b) SIG-B bits: Set the MCS (for MU only) as described in 23.3.8.2.3.3.5. Add the reserved bits and N_{tail} bits of tail.
c) SIG-B field Bit Repetition: Repeat the SIG-B field bits as a function of CH_BANDWIDTH as defined in 23.3.8.2.3.3.5.
d) BCC encoder: Encode the SIG-B field using BCC at rate R=1/2 as described in 17.3.5.6.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

e) Segment parser (if needed): For a 16 MHz transmission, divide the output bits of the BCC encoder into two frequency subblocks as described in 23.3.9.7. This block is bypassed for 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

f) BCC interleaver: Interleave as described in 23.3.9.8.

g) Constellation mapper: Map to a BPSK constellation as defined in 17.3.5.8.

h) Segment deparser (if needed): For a 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3. This block is bypassed for 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

i) Pilot insertion: Insert pilots following the steps described in 21.3.10.10.

j) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the data subcarriers as described in 23.3.8.2.3.3.5. The total number of data and pilot subcarriers is the same as in the Data field.

k) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.3.2.2.

l) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

m) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

n) IDFT: Compute the inverse discrete Fourier transform.

o) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

p) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.3 Construction of the Preamble part in an S1G_SHORT PPDU

23.3.4.3.1 Construction of STF

The STF field is defined in 23.3.8.2.2.3 and constructed as follows:

a) Determine the CH_BANDWIDTH from the TXVECTOR.

b) Sequence generation: Generate the STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.3.

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

d) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the STF field sequence as described in 23.3.8.2.2.4.

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2.

f) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.3.2 Construction of LTF1

The LTF1 field is defined in 23.3.8.2.2.4 and constructed as follows:

a) Determine FORMAT from TXVECTOR.

b) Sequence generation: If FORMAT is S1G, generate the LTF1 field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.4. If format is S1G_DUP_2M, generate the LTF1 field sequence in the frequency domain over a 2 MHz bandwidth.

c) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

d) A_{LTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the LTF1 field sequence (the pilot tones are processed differently) as described in 23.3.8.2.2.4.

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2.

f) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 16 μs in duration and apply windowing as described in 17.3.2.5.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.3.3 Construction of SIG

The SIG field is constructed per-user as follows:

a) Obtain the CH_BANDWIDTH, STBC, PARTIAL_AID, NUM_STS, GI_TYPE, FEC_CODING, MCS, SMOOTHING, NUM_USERS, LENGTH, AGGREGATION, RESPONSE_INDICATION, NDP_INDICATION, TRAVELING_PILOTS, UPLINK_INDICATION, and COLOR, from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the N_{tail} tail bits as shown in 23.3.8.2.2.5. This operation gives as a result 48 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6.

c) BCC interleaver: Interleave as described in 17.3.5.7.

d) Constellation mapper: QBPSK modulate the first 48 interleaved bits as described in 17.3.5.8 to form the first symbol of SIG field. QBPSK modulate the second 48 interleaved bits to form the second symbol of SIG field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10.

f) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the data subcarriers as described in 23.3.8.2.2.5.

g) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2.

h) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

i) Duplication and phase rotation: Duplicate two symbols of SIG field over each 2 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.3.4 Construction of LTF2-LTFNLTF

The LTF2-LTFNLTF field is defined in 23.3.8.2.2.4 and constructed as follows:

a) Sequence generation: Generate the LTF2-LTFNLTF field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.2.2.4.

b) Phase rotation: Apply appropriate phase rotation for each 2 MHz subchannel as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

c) A_{LTF} matrix mapping: Apply the mapping of the P_{HTLTF} matrix (from the second column to the last column) to the LTF2-LTFNLTF field sequence (the pilot tones are processed differently) as described in 23.3.8.2.2.4.

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2.

e) Spatial mapping: Apply the Q matrix as described in 23.3.10 and 23.3.9.11.

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.4 Construction of the Preamble part in an S1G_1M PPDU

23.3.4.4.1 Construction of 1 MHz STF

The 1 MHz STF field is defined in 23.3.8.3.3 and constructed as follows:

a) Determine the CH_BANDWIDTH from the TXVECTOR if S1G 1 MHz Duplicate PPDU.

b) Sequence generation: Generate the 1 MHz STF field in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.3. Apply the 3 dB power boosting if the MCS from the TXVECTOR equals MCS 10 as described in 23.3.8.3.3.

c) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 and 23.3.7.

d) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the 1 MHz STF field sequence as described in 23.3.8.3.4.

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2.

f) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

23.3.4.4.2 Construction of 1 MHz LTF1

The 1 MHz LTF1 field is defined in 23.3.8.3.4 and constructed as follows:

a) Determine FORMAT from TXVECTOR.

b) Sequence generation: If FORMAT is S1G, generate the 1 MHz LTF1 field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.4. If FORMAT is S1G_DUP_1M, generate the LTF1 field sequence in the frequency domain over a 1 MHz bandwidth.

c) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 and 23.3.7.

d) A_{LTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the 1 MHz LTF1 field sequence (the pilot tones are processed differently) as described in 23.3.8.3.4.

e) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2.

f) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

g) IDFT: Compute the inverse discrete Fourier transform.

h) Insert GI and apply windowing: Prepend a GI of 16 μs in duration for the first two symbols and insert a GI of 8 μs in duration per each subsequent symbol. Apply windowing as described in 17.3.2.5.

i) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.4.3 Construction of 1 MHz SIG

The SIG field is constructed per-user as follows:

a) Obtain the STBC, NUM_STS, GI_TYPE, FEC_CODING, MCS, SMOOTHING, LENGTH, AGGREGATION, RESPONSE_INDICATION, NDP_INDICATION and TRAVELING_PILOTS from the TXVECTOR. Add the reserved bits, append the calculated 4-bit CRC, then append the N_{tail} tail bits as shown in 23.3.8.3.5. This operation gives as a result 36 uncoded bits.

b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6 and apply the block-wise 2 times repetition on a per-OFDM symbol basis.

c) BCC interleaver: Interleave as described in 23.3.9.8.

d) Constellation mapper: BPSK modulate the interleaved bits as described in 17.3.5.8 to form the 6 symbols of SIG field.

e) Pilot insertion: Insert pilots as described in 17.3.5.10.

f) P_{HTLTF} matrix mapping: Apply the mapping of the first column of the P_{HTLTF} matrix to the data subcarriers as described in 23.3.8.3.5.

g) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2.

h) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

i) Duplication and phase rotation: Duplicate 6 symbols of SIG field over each 1 MHz of the CH_BANDWIDTH if S1G 1 MHz Duplicate PPDU. Apply the appropriate phase rotation for each 1 MHz subchannel as described in 23.3.9.12 and 23.3.7.

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

23.3.4.4.4 Construction of 1 MHz LTF2-LTFNLTF

The 1 MHz LTF2-LTFNLTF field is defined in 23.3.8.3.4 and constructed as follows:

a) Sequence generation: Generate the 1 MHz LTF2-LTFNLTF field sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 23.3.8.3.4.

b) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel as described in 23.3.9.12 and 23.3.7 if S1G 1 MHz Duplicate PPDU.

c) A_{LTF} matrix mapping: Apply the mapping of the P_{HTLTF} matrix (from the second column to the last column) to the 1 MHz LTF2-LTFNLTF field sequence (the pilot tones are processed differently) as described in 23.3.8.3.4.

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.3.2.

e) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI of 8 μs in duration and apply windowing as described in 17.3.2.5.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.5 Construction of Preambles for S1G_DUP_2M and S1G_DUP_1M

For S1G_DUP_2M and S1G_DUP_1M, the preambles are initially constructed according to 23.3.4.3 and 23.3.4.4, respectively.

In the case of S1G_DUP_2M, the initial 2 MHz preamble is duplicated in frequency with phase rotation as defined in 23.3.4.3 to fill the final transmission bandwidth (i.e., 4 MHz, 8 MHz, or 16 MHz) indicated by the TXVECTOR parameter CH_BANDWIDTH.

In the case of S1G_DUP_1M, the initial 1 MHz preamble is duplicated in frequency with phase rotation as defined in 23.3.4.4 to fill the final transmission bandwidth (i.e., 2 MHz, 4 MHz, 8 MHz, or 16 MHz) indicated by the TXVECTOR parameter CH_BANDWIDTH.

23.3.4.6 Construction of Data field in S1G SU PPDUs for all cases except 1 MHz MCS 10

23.3.4.6.1 Using BCC

The construction of the Data field in an S1G SU PPDU with BCC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.3.2.

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3.

d) BCC encoder: Divide the scrambled bits between the encoders by sending bits to different encoders in a round robin manner. The number of encoders is determined by rate-dependent parameters described in 23.5. BCC encode as described in 23.3.9.4.2 and 23.3.9.4.3.

e) Stream parser: Rearrange the output of the BCC encoders into blocks as described in 23.3.9.6.

f) Segment parser (if needed): For a contiguous 16 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 23.3.9.7. This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

g) BCC interleaver: Interleave as described in 23.3.9.8.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

h) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, or 256-QAM constellation points as described in 23.3.9.9.

i) Segment deparser (if needed): For a contiguous 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3. This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

j) STBC: Apply STBC as described in 23.3.9.9.4.

k) Pilot insertion: Insert pilots following the steps described in 23.3.9.10.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 if S1G_SHORT preamble is used, 23.3.8.2.3.3.2 if S1G_LONG preamble is used and 23.3.8.3.2 if S1G_1M preamble is used.

m) Spatial mapping: Apply the Q matrix as described in 23.3.10 and in 23.3.9.11.

n) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel if 2 MHz preamble is used or for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

o) IDFT: Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.6.2 Using LDPC

The construction of the Data field in an S1G SU PPDU with LDPC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.4.2.

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3.

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the LENGTH from the TXVECTOR as described in 23.3.9.4.4.

e) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 23.3.9.6.

f) Segment parser (if needed): For a contiguous 16 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 23.3.9.7. This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

g) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, or 256-QAM constellation points as described in 23.3.9.9.

h) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 23.3.9.9.2. LDPC tone mapper is bypassed for 1 MHz transmission.

i) Segment deparser (if needed): For a contiguous 16 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 23.3.9.9.3. This block is bypassed for 1 MHz, 2 MHz, 4 MHz, and 8 MHz S1G PPDU transmissions.

j) STBC: Apply STBC as described in 23.3.9.9.4.

k) Pilot insertion: Insert pilots following the steps described in 23.3.9.10.

l) CSD: Apply CSD for each space-time stream and frequency segment as described in 23.3.8.2.2.2 if S1G_SHORT preamble is used, 23.3.8.2.3.3.2 if S1G_LONG preamble is used and 23.3.8.3.2 if S1G_1M preamble is used.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

m) Spatial mapping: Apply the *Q* matrix as described in 23.3.10 and in 23.3.9.11.

n) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel if 2 MHz preamble is used or for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.11, 23.3.9.12, and 23.3.7.

o) IDFT: Compute the inverse discrete Fourier transform.

p) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.7 Construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode)

23.3.4.7.1 Using BCC

The construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode) with BCC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.3.2.

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3.

d) BCC encoder: BCC encode as described in 23.3.9.4.2 and 23.3.9.4.3.

e) Block repetition: Apply the block-wise 2 times repetition on a per-OFDM symbol basis as described in 23.3.9.5.

f) BCC interleaver: Interleave as described in 23.3.9.8.

g) Constellation mapper: Map to BPSK constellation points as described in 23.3.9.9.

h) Pilot insertion: Insert pilots following the steps described in 23.3.9.10.

i) Spatial mapping: Apply the *Q* matrix as described in 23.3.9.11.

j) Phase rotation: Apply appropriate phase rotation for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 and 23.3.7.

k) IDFT: Compute the inverse discrete Fourier transform.

l) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

m) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.7.2 Using LDPC

The construction of the Data field in an S1G SU PPDU (1 MHz MCS 10 mode) with LDPC encoding proceeds as follows:

a) SERVICE field: Generate the SERVICE field as described in 23.3.9.2 and append the PSDU to the SERVICE field.

b) PHY padding: Append the PHY pad bits to the PSDU as described in 23.3.9.4.4.2.

c) Scrambler: Scramble the PHY padded data as described in 23.3.9.3.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the LENGTH from the TXVECTOR as described in 23.3.9.4.4.

e) Block repetition: Apply the block-wise 2 times repetition on a per-OFDM symbol basis as described in 23.3.9.5.

f) Constellation mapper: Map to BPSK constellation points as described in 23.3.9.9.

g) Pilot insertion: Insert pilots following the steps described in 23.3.9.10.

h) Spatial mapping: Apply the Q matrix as described in 23.3.9.11.

i) Phase rotation: Apply appropriate phase rotations for each 1 MHz subchannel if S1G 1 MHz Duplicate PPDU as described in 23.3.9.12 and 23.3.7.

j) IDFT: Compute the inverse discrete Fourier transform.

k) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

l) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.4.8 Construction of the Data field in an S1G MU PPDU

23.3.4.8.1 General

For an MU transmission, the PPDU encoding process is performed on a per-user basis up to the input of the spatial mapping block except that the CSD is applied across users as described in 23.3.8.2.3.3.2 if an S1G_LONG preamble is used. All user data is combined and mapped to the transmit chains in the spatial mapping block. An S1G_1M PPDU, or an S1G_SHORT PPDU, or an 2 MHz S1G duplicate PPDU in S1G_LONG format shall not be used for an MU transmission.

23.3.4.8.2 Using BCC

A Data field with BCC encoding is constructed using the process described in 23.3.4.6.1 and 23.3.4.7.1 before the spatial mapping block and repeated for each user that uses BCC encoding.

23.3.4.8.3 Using LDPC

A Data field with LDPC encoding is constructed using the process described in 23.3.4.6.2 and 23.3.4.7.2 before the spatial mapping block and repeated for each user that uses LDPC encoding.

23.3.4.8.4 Combining to form an S1G MU PPDU

The per-user data is combined as follows:

a) Spatial Mapping: Apply the Q matrix as described in 23.3.10. The combining of all user data is done in this block.

b) Phase rotation: Apply the appropriate phase rotations for each 2 MHz subchannel as described in 23.3.9.11 and 23.3.7.

c) IDFT: Compute the inverse discrete Fourier transform.

d) Insert GI and apply windowing: Prepend a GI and apply windowing as described in 17.3.2.5. If the TXVECTOR parameter GI_TYPE equals LONG_GI, the GI duration shall be 8 μs. If the GI_TYPE parameter is SHORT_GI, the GI duration shall be 8 μs for the first OFDM symbol of the Data field, and 4 μs for all subsequent OFDM symbols.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the requested channel and transmit. Refer to 23.3.7 and 23.3.8 for details.

23.3.5 Modulation and coding scheme

The S1G-MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the SIG field or SIG-A field for S1G SU PPDUs and in the SIG-B field for S1G MU PPDUs using S1G_LONG. Rate-dependent parameters for the full set of S1G-MCSs are shown in Table 23-41 to Table 23-60 (in 23.5).

Table 23-41 to Table 23-60 give rate-dependent parameters for S1G-MCSs with indices 0 to 9 (and index 10 solely for 1 MHz, N_{SS} = 1), with number of spatial streams from 1 to 4 and bandwidth options of 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz. Equal modulation is applied to all streams for a particular user.

23.3.6 Timing-related parameters

Table 23-4 defines the timing-related parameters for all S1G PPDU formats, except the SIG field in S1G_SHORT, and the SIG-A field in S1G_LONG. Note that the timing-related parameters for the SIG field in S1G_1M PPDU and the SIG-B field in S1G_LONG are the same as those defined for the Data field as shown in Table 23-4.

Table 23-4—Timing-related constants

Parameter	CBW1	CBW2	CBW4	CBW8	CBW16	Description
N_{SD}	24	52	108	234	468	Number of data subcarriers per OFDM symbol
N_{SP}	2	4	6	8	16	Number of pilot subcarrier per OFDM symbol
N_{ST}	26	56	114	242	484	Total number of useful subcarriers per OFDM symbol
N_{SR}	13	28	58	122	250	Highest data subcarrier index per OFDM symbol
Δ_F	31.25 kHz					Subcarrier frequency spacing
T_{DFT}	32 μs = $1/\Delta_F$					IDFT/DFT period
T_{GI}	8 μs = $T_{DFT}/4$					Guard interval duration
T_{GI2}	16 μs					Double guard interval
T_{GIS}	4 μs = $T_{DFT}/8$					Short guard interval duration
T_{SYML}	40 μs = $T_{DFT} + T_{GI} = 1.25 \times T_{DFT}$					Duration of OFDM symbol with normal guard interval

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 23-4—Timing-related constants *(continued)*

Parameter	CBW1	CBW2	CBW4	CBW8	CBW16	Description
T_{SYMS}	36 μs = T_{DFT} + T_{GIS} = 1.125 × T_{DFT}					Duration of OFDM symbol with short guard interval
T_{SYM}	T_{SYML} or T_{SYMS} depending on the GI used					OFDM symbol duration
T_{STF}	160 μs = 4 × T_{SYML}	80 μs = 2 × T_{SYML}				STF field duration
T_{DSTF}	N/A	40 μs = T_{SYML}				S1G_LONG preamble D-STF field duration
T_{LTF1}	160 μs = 4 × T_{DFT} + 2 × T_{GI} + T_{GI2}	80 μs = 2 × T_{DFT} + T_{GI2}				First LTF field duration
T_{LTF}	40 μs = T_{SYML}					Second and subsequent LTF field duration
T_{DLTF}	N/A	40 μs = T_{SYML}				S1G_LONG preamble D-LTF field duration
T_{SIG}	240 μs = 6 × T_{SYML}	80 μs = 2 × T_{SYML}				SIG field duration
T_{SIG-A}	N/A	80 μs = 2 × T_{SYML}				S1G_LONG preamble SIG-A field duration
T_{SIG-B}	N/A	40 μs = T_{SYML}				S1G_LONG preamble SIG-B field duration
Nservice	8					Number of bits in the SERVICE field
N_{tail}	6					Number of tail bits per BCC encoder

NOTE— $N_{ST} = N_{SD} + N_{SP}$.

Table 23-5 defines the timing-related parameters for the SIG field in S1G_SHORT, or the SIG-A field in S1G_LONG. Note that short/double guard interval is not used for SIG/SIG-A field in ≥ 2 MHz PPDUs.

Table 23-5—Timing-related constants for SIG/SIG-A field in ≥ 2 MHz PPDUs

Parameter	CBW1	CBW2	CBW4	CBW8	CBW16	Description
N_{SD}	N/A	48	48	48	48	Number of data subcarriers per OFDM symbol per 2 MHz subchannel
N_{SP}	N/A	4	4	4	4	Number of pilot subcarrier per OFDM symbol per 2 MHz subchannel
N_{ST}	N/A	52	52	52	52	Total number of useful subcarriers per OFDM symbol per 2 MHz subchannel
N_{SR}	N/A	26	56	120	248	Highest data subcarrier index per OFDM symbol
Δ_F	N/A	31.25 kHz				Subcarrier frequency spacing
T_{DFT}	N/A	32 μs = $1/\Delta_F$				IDFT/DFT period
T_{GI}	N/A	8 μs = $T_{DFT}/4$				Guard interval duration
T_{SYM}	N/A	40 μs = $T_{DFT} + T_{GI} = 1.25 \times T_{DFT}$				OFDM symbol duration
T_{SIG}	N/A	80 μs = $2 \times T_{SYM}$				SIG field duration
$T_{SIG\text{-}A}$	N/A	80 μs = $2 \times T_{SYM}$				S1G_LONG preamble SIG-A field duration

Table 23-6 defines parameters used frequently in Clause 23.

Table 23-6—Frequently used parameters

Symbol	Explanation
N_{CBPS}, $N_{CBPS,u}$	Number of coded bits per symbol for user u, $u = 0, ..., N_u–1$. For an S1G SU PPDU, $N_{CBPS} = N_{CBPS,0}$. For an S1G MU PPDU, N_{CBPS} is undefined.
N_{CBPSS}, $N_{CBPSS,u}$	Number of coded bits per symbol per spatial stream. For the SIG-B field in S1G_LONG, $N_{CBPSS} = N_{SD}$ for all users. For the Data field, $N_{CBPSS,u}$ equals the number of coded bits per symbol per spatial stream for user u, $u = 0, ..., N_u–1$. For the Data field of an S1G SU PPDU, $N_{CBPSS} = N_{CBPSS,0}$. For the Data field of an S1G MU PPDU, N_{CBPSS} is undefined.
N_{CBPSSI}, $N_{CBPSSI,u}$	Number of coded bits per symbol per spatial stream per BCC interleaver block. For an S1G SU PPDU, $N_{CBPSSI} = \begin{cases} N_{CBPSS}, \text{ for 1 MHz, 2 MHz, 4 MHz, or 8 MHz} \\ \frac{N_{CBPSS}}{2}, \text{ for a 16 MHz PPDU} \end{cases}$ For an S1G MU PPDU for user u, $u = 0, ..., N_u–1$ $N_{CBPSSI,u} = \begin{cases} N_{CBPSS,u}, \text{ for 1 MHz, 2 MHz, 4 MHz, or 8 MHz} \\ \frac{N_{CBPSS,u}}{2}, \text{ for a 16 MHz PPDU} \end{cases}$
N_{DBPS}, $N_{DBPS,u}$	Number of data bits per symbol for user u, $u = 0, ..., N_u–1$. For an S1G SU PPDU, $N_{DBPS} = N_{DBPS,0}$. For an S1G MU PPDU, N_{DBPS} is undefined.
N_{BPSCS}, $N_{BPSCS,u}$	Number of coded bits per subcarrier per spatial stream for user u, $u = 0, ..., N_u–1$. For an S1G SU PPDU, $N_{BPSCS} = N_{BPSCS,0}$. For an S1G MU PPDU, N_{BPSCS} is undefined.
N_{RX}	Number of receive chains.
N_u	For S1G_LONG, the omnidirectional portion always has N_u=1, and in the beam changeable portion, N_u represents the number of users in the transmission (equal to the TXVECTOR parameter NUM_USERS). For S1G_1M and S1G_SHORT, N_u=1.
N_{STS}, $N_{STS,u}$	Number of space-time streams. For S1G_LONG, the omnidirectional portion always has $N_{STS,u}$=1 (see NOTE); and for the beam changeable portion $N_{STS,u}$ is the number of space-time streams for user u, $u = 0,…, N_u–1$. For S1G_1M and S1G_SHORT,$N_{STS} = N_{STS,0}$. For an S1G SU PPDU, $N_{STS} = N_{STS,0}$; for an S1G MU PPDU, N_{STS} is undefined.

Table 23-6—Frequently used parameters *(continued)*

Symbol	Explanation
$N_{STS,total}$	For S1G_1M, S1G_SHORT, and the beam changeable portion of S1G_LONG, $N_{STS,total}$ is the total number of space-time streams in a PPDU. $N_{STS,total} = \sum_{u=0}^{N_u-1} N_{STS,u}$ For the omnidirectional portion of S1G_LONG, $N_{STS,total}$ is undefined. Note that $N_{STS,total} = N_{STS}$ for an S1G SU PPDU.
N_{SS}, $N_{SS,u}$	Number of spatial streams. For S1G_LONG, the omnidirectional portion always has $N_{SS,u}=1$ (see NOTE); and for the beam changeable portion $N_{SS,u}$ is the number of spatial streams for user u, $u = 0,\ldots, N_u-1$. For S1G_1M and S1G_SHORT, $N_{SS} = N_{SS,0}$. For an S1G SU PPDU, $N_{SS} = N_{SS,0}$; for an S1G MU PPDU, N_{SS} is undefined.
N_{TX}	Number of transmit chains.
N_{ES}, $N_{ES,u}$	The number of BCC encoders. For the SIG-B field of S1G_LONG, $N_{ES}=1$ for each user. For the beam changeable portion of S1G_LONG, $N_{ES,u}$ is the number of BCC encoders for the Data field for user u, $u = 0, \ldots N_u-1$. For the Data field of an S1G SU PPDU, $N_{ES} = N_{ES,0}$. For the Data field of an S1G MU PPDU, N_{ES} is undefined. For the Data field encoded using LDPC, $N_{ES}=1$ for an S1G SU PPDU and $N_{ES,u}=1$ for an S1G MU PPDU for user u, $u = 0, \ldots N_u-1$.
N_{LTF}	Number of long training fields in S1G_1M or S1G_SHORT; or the number of data long training fields in S1G_LONG (see 23.3.8.2.2.4, 23.3.8.2.3.3.3, and 23.3.8.3.4)
R, R_u	R_u is the coding rate for user u, $u = 0, \ldots, N_u-1$. For an S1G SU PPDU, $R = R_0$ For an S1G MU PPDU, R is undefined
M_u	For the omnidirectional portion of S1G_LONG, $M_u = 0$. Otherwise, $M_u = \sum_{u'=0}^{u-1} N_{STS,u'}$ with $M_0 = 0$.
NOTE—For the omnidirectional portion of S1G_LONG, u is 0 only since $N_u=1$.	

23.3.7 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5.

For a 1 MHz S1G PPDU transmission, the 1 MHz is divided into 32 subcarriers. The signal is transmitted on subcarriers –13 to –1 and 1 to 13, with 0 being the center (DC) subcarrier.

For a 2 MHz S1G PPDU transmission, the 2 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers –28 to –1 and 1 to 28, with 0 being the center (DC) subcarrier.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For a 4 MHz S1G PPDU transmission, the 4 MHz is divided into 128 subcarriers. The signal is transmitted on subcarriers –58 to –2 and 2 to 58.

For an 8 MHz S1G PPDU transmission, the 8 MHz is divided into 256 subcarriers. The signal is transmitted on subcarriers –122 to –2 and 2 to 122.

For a 16 MHz S1G PPDU transmission, the 16 MHz is divided into 512 subcarriers. The signal is transmitted on subcarriers –250 to –130, –126 to –6, 6 to 126, and 130 to 250.

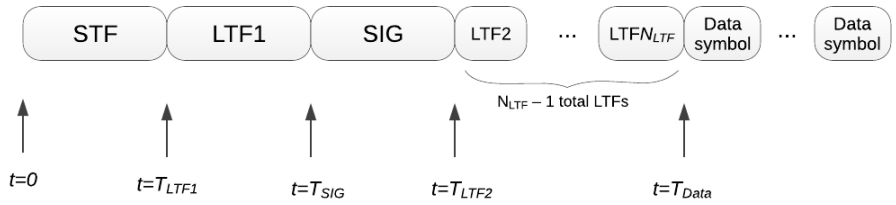
The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (23-1).

$$r_{RF}(t) = \mathrm{Re}\{r(t)\exp(j2\pi f_c t)\} \tag{23-1}$$

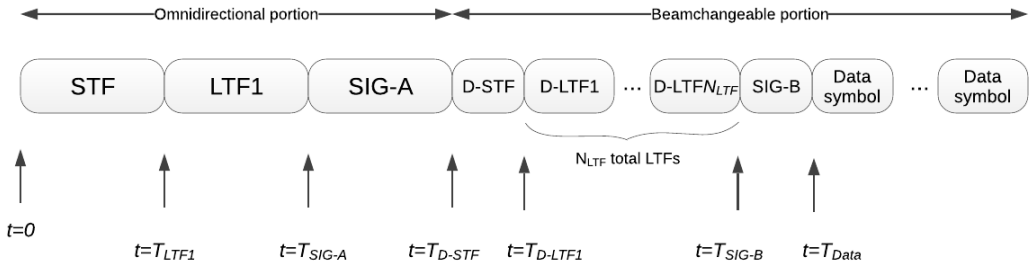
where

f_c represents the center frequency of the carrier

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields of the different frame formats are shown in Figure 23-5, where N_{LTF} is the number of LTF or D-LTF field symbols and is defined in Table 23-10 (in 23.3.8.2.2.4), for up to $N_{STS,Total} = 4$.



a. 1 MHz frame format and ≥ 2 MHz Short frame format



b. ≥ 2 MHz Long frame format

Figure 23-5—Timing boundaries for S1G PPDU fields

The time offset, t_{Field}, determines the starting time of the corresponding field.

For the S1G_1M PPDU frame format and the S1G_SHORT PPDU frame format, the signal transmitted on transmitted on transmit chain i_{TX} shall be as shown in Equation (23-2).

$$r_{PPDU}^{i_{TX}}(t) = r_{STF}^{i_{TX}}(t) + r_{LTF1}^{i_{TX}}(t - t_{LTF1}) + r_{SIG}^{i_{TX}}(t - t_{SIG}) + \sum_{i_{LTF}=2}^{N_{LTF}} r_{LTF}^{(i_{TX}, i_{LTF})}(t - t_{LTF2} - (i_{LTF} - 2)T_{LTF}) + r_{Data}^{i_{TX}}(t - t_{Data}) \quad (23\text{-}2)$$

where

$$t_{LTF} = T_{STF}$$
$$t_{SIG} = t_{LTF1} + T_{LTF1}$$
$$t_{LTF2} = t_{SIG} + T_{SIG}$$
$$t_{Data} = t_{LTF2} + (N_{LTF} - 1)T_{LTF}$$

For the S1G_LONG PPDU format, the signal transmitted on transmit chain *iTX* shall be as shown in Equation (23-3).

$$r_{\text{PPDU}}^{(i_{\text{TX}})}(t) = r_{\text{STF}}^{(i_{\text{TX}})}(t) + r_{\text{LTF1}}^{(i_{\text{TX}})}(t - t_{\text{LTF1}}) + r_{\text{SIG-A}}^{(i_{\text{TX}})}(t - t_{\text{SIG}}) + r_{\text{D-STF}}^{(i_{\text{TX}})}(t - t_{D-STF}) + \sum_{i_{\text{LTF}}=1}^{N_{\text{LTF}}} r_{\text{D-LTF}}^{(i_{\text{TX}}, i_{\text{LTF}})}(t - t_{\text{D-LTF1}} - (i_{\text{LTF}} - 1)T_{\text{LTF}}) + r_{\text{SIG-B}}^{(i_{\text{TX}})}(t - t_{\text{SIG-B}}) + r_{\text{Data}}^{(i_{\text{TX}})}(t - t_{\text{Data}}) \quad (23\text{-}3)$$

where

$$t_{\text{LTF1}} = T_{\text{STF}}$$
$$t_{\text{SIG-A}} = t_{\text{LTF1}} + T_{\text{LTF1}}$$
$$t_{\text{D-STF}} = t_{\text{SIG-A}} + T_{\text{SIG-A}}$$
$$t_{\text{D-LTF1}} = t_{\text{D-STF}} + T_{\text{D-STF}}$$
$$t_{\text{SIG-B}} = t_{\text{D-LTF1}} + N_{\text{LTF1}} \cdot T_{\text{LTF}}$$
$$t_{\text{Data}} = t_{\text{SIG-B}} + T_{\text{SIG-B}}$$

Each field, $r_{Field}^{(i_{\text{TX}})}(t)$, is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (23-4).

$$r_{\text{Field}}^{(i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} N_{\text{Norm}}}} w_{T_{\text{Field}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u - 1} \sum_{m=1}^{N_{STS,u}} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} X_{k,u}^{(m)} \exp\left(j2\pi k \Delta_F (t - T_{GI,Field} - T_{CS}(M_u + m))\right) \quad (23\text{-}4)$$

This general representation holds for all subfields. When the bandwidth is greater than or equal to 2 MHz and the S1G_LONG format is used, the total power of the time domain beam changeable portion field signals summed over all transmit chains should not exceed the total power of the time domain omnidirectional portion signals summed over all transmit chains. For notational simplicity, the parameter BW is omitted from some bandwidth dependent terms.

Table 23-7 summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment.

Table 23-7—Tone scaling factor and guard interval duration values for PHY fields

Field	$N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment					Guard interval duration
	1 MHz	2 MHz	4 MHz	8 MHz	16 MHz	
STF	6	12	24	48	96	N/A (See NOTE 2)
LTF1	26	56	114	242	484	For bandwidths ≥ 2 MHz, duration is T_{GI2}. For 1 MHz bandwidth, duration is T_{GI2} for first and second symbols, and T_{GI} for third and fourth symbols.
SIG	26	52	104	208	416	T_{GI}
SIG-A for long format	N/A	52	104	208	416	T_{GI}
D-STF for long format	N/A	12	24	48	96	N/A
LTF2~LTFN_{LTF}	26	56	114	242	484	T_{GI}
D-LTF for long format	N/A	56	114	242	484	T_{GI}
SIG-B for long format	N/A	56	114	242	484	T_{GI}
First Data Symbol	26	56	114	242	484	T_{GI} (see NOTE 3)
From second to the last Data Symbols	26	56	114	242	484	T_{GI} or T_{GIS} (see NOTE 3)
S1G_DUP_1M-Data (see NOTE 1)	N/A	52	104	208	416	T_{GI} or T_{GIS} (see NOTE 3)
S1G_DUP_2M-Data (see NOTE 1)	N/A	N/A	112	224	448	T_{GI} or T_{GIS} (see NOTE 3)

NOTE 1—For notational convenience, S1G_DUP_1M-Data and S1G_DUP_2M-Data is used as a label for the Data field of a duplicate PPDU with format type S1G_DUP_1M or S1G_DUP-2M, respectively.

NOTE 2—The OFDM symbols of the STF field do not have a guard interval, therefore its duration is not applicable.

NOTE 3—T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI. Regardless of the GI_TYPE value in TXVECTOR, the first Data OFDM symbol always uses T_{GI} as its guard interval duration.

N_{Norm} for the omnidirectional portion of the S1G_LONG, $N_{\text{Norm}} = N_{\text{TX}}$, for all other cases, $N_{\text{Norm}} = N_{STS,total}$, where $N_{STS,total}$ is given in Table 23-6.

$w_{\text{T}_{\text{Field}}}(t)$ is a windowing function. An example function, $w_{\text{T}_{\text{Field}}}(t)$, is given in 17.3.2.5.

T_{Subfield} is the duration of the subfield being referenced, and its usage is as follows:

- T_{STF} for the STF field, $T_{D\text{-}STF}$ for the D-STF field
- T_{LTF1} for the LTF1 field
- T_{SIG} for the SIG field, $T_{SIG\text{-}A}$ for the SIG-A field
- T_{LTF} for the LTF2~LTF$_{\text{NLTF}}$ fields for the S1G_1M, the S1G_SHORT format, and for the D-LTFs fields in the S1G_LONG format
- $T_{SIG\text{-}B}$ field for the SIG-B

N_u is defined in Table 23-6.

N_{SR} is the highest data subcarrier index per frequency segment and has values listed in Table 23-4 and in Table 23-5.

$N_{STS,u}$ is defined in Table 23-6.

M_u is defined in Table 23-6.

$[X]_{a,\,b}$ indicates the element in row a and column b of the matrix X, where $1 \le a \le N_{\text{row}}$, and $1 \le b \le N_{\text{col}}$. N_{row} and N_{col} are the number of rows and columns, respectively, of the matrix X.

Q_k is the spatial mapping matrix for the subcarrier k. For the omnidirectional portion of S1G_LONG, Q_k is a column vector, denoted as $Q_k^{(omni)}$, with N_{TX} elements with element i_{TX} being $\exp(-j2\pi k\Delta_F T_{CS}^{i_{TX}})$, where $T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} whose values are given in Table 23-12 (in 23.3.8.2.3.2.2). For other cases, Q_k is a matrix with N_{TX} rows and $N_{STS,total}$ columns.

Δ_F is the subcarrier frequency spacing given in Table 23-4.

$X_{k,\,u}^{(m)}$ is the frequency domain symbol in subcarrier k of user u for of space-time stream m. Some of the $X_{k,\,u}^{(m)}$ within $-N_{\text{SR}} \le k \le N_{\text{SR}}$ have a value of zero. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, as well as the unmodulated tones of STF and D-STF fields.

$T_{GI,Field}$ is the guard interval duration used for each OFDM symbol in the field. The value for each field is defined in Table 23-7. T_{GI}, T_{GI2} and T_{GIS} are defined in Table 23-4.

$T_{CS}(l)$ for the omnidirectional portion of S1G_LONG, $T_{CS}(l) = 0$. For the other cases, $T_{CS}(l)$ represents the cyclic shift per space-time stream, whose value is defined in Table 23-9 (in 23.3.8.2.2.2) for ≥ 2 MHz, and Table 23-17 (in 23.3.8.3.2).

The function $\Upsilon_{k,\mathrm{BW}}$ is used to represent a rotation of the tones. BW in $\Upsilon_{k,\mathrm{BW}}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 23-8.

Table 23-8—CH_BANDWIDTH and Gamma sub$_{\mathrm{k,\,BW}}$

CH_BANDWIDTH	$\Upsilon_{k,\mathrm{BW}}$
CBW1	$\Upsilon_{k,1}$
CBW2	$\Upsilon_{k,2}$
CBW4	$\Upsilon_{k,4}$
CBW8	$\Upsilon_{k,8}$
CBW16	$\Upsilon_{k,16}$

For a 1 MHz PPDU transmission,

$$\Upsilon_{k,1} = 1 \tag{23-5}$$

For a 2 MHz PPDU transmission,

$$\Upsilon_{k,2} = 1 \tag{23-6}$$

For a 4 MHz PPDU transmissions of S1G or S1G_DUP_2M frames,

$$\Upsilon_{k,4} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \tag{23-7}$$

For 8 MHz PPDU transmission of S1G or S1G_DUP_2M frames,

$$\Upsilon_{k,8} = \begin{cases} 1, k < -64 \\ -1, k \geq -64 \end{cases} \tag{23-8}$$

For 16 MHz PPDU transmissions of S1G or S1G_DUP_2M frames,

$$\Upsilon_{k,16} = \begin{cases} 1, & k < -192 \\ -1, & -192 \leq k < 0 \\ 1, & 0 \leq k < 64 \\ -1, & 64 \leq k \end{cases} \tag{23-9}$$

For 2 MHz PPDU transmissions of S1G_DUP_1M frames,

$$\Upsilon_{k,2} = \begin{cases} 1, k < 0 \\ -1, k \geq 0 \end{cases} \tag{23-10}$$

Copyright © 2021 IEEE. All rights reserved.

For 4 MHz PPDU transmissions of S1G_DUP_1M frames,

$$\Upsilon_{k,4} = \begin{cases} 1, k < -32 \\ j, -32 \le k < 0 \\ -j, 0 \le k < 32 \\ -1, 32 \le k \end{cases} \quad (23\text{-}11)$$

For 8 MHz PPDU transmissions of S1G_DUP_1M frames,

$$\Upsilon_{k,8} = \begin{cases} 1, k < -96 \\ -1, -96 \le k < -64 \\ 1, -64 \le k < 64 \\ -1, 64 \le k \end{cases} \quad (23\text{-}12)$$

For 16 MHz PPDU transmissions of S1G_DUP_1M frames,

$$\Upsilon_{k,16} = \begin{cases} 1, k < -160 \\ -1, -160 \le k < -128 \\ 1, -128 \le k < -32 \\ -1, -32 \le k < 64 \\ 1, 64 \le k < 96 \\ -1, 96 \le k < 128 \\ 1, 128 \le k < 192 \\ -1, 192 \le k < 224 \\ 1, 224 \le k \end{cases} \quad (23\text{-}13)$$

23.3.8 S1G preamble

23.3.8.1 Introduction

Three preamble formats are defined that correspond to the three non-duplicate S1G PPDU formats: the S1G_1M preamble, the S1G_SHORT preamble, and the S1G_LONG preamble. The first two preamble formats are defined solely for single user, and the third preamble format may be used in either single user or multi-user PPDUs. The duplicate mode PPDU formats S1G_DUP_2M and S1G_DUP_1M use the S1G_SHORT and S1G_1M preambles, respectively.

All numeric fields are transmitted in unsigned format, LSB first.

23.3.8.2 Formats for greater than or equal to 2 MHz

23.3.8.2.1 Introduction

This subclause describes the preamble formats used for non-duplicate S1G PPDUs of 2 MHz and greater and duplicate S1G_DUP_2M PPDUs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

23.3.8.2.2 S1G_SHORT preamble

23.3.8.2.2.1 General

The S1G_SHORT preamble is used for the S1G_SHORT and S1G_DUP_2M PPDU formats and is only used for SU transmissions. The S1G_SHORT preamble is structured similarly to the Greenfield format as defined in Clause 19.

23.3.8.2.2.2 Cyclic shift for S1G modulated fields

The cyclic shift values defined in this subclause apply to the STF, LTF, SIG and Data fields of the S1G_SHORT preamble PPDU, for ≥ 2 MHz transmit bandwidths. Throughout the S1G_SHORT preamble, cyclic shifts are applied to prevent beamforming when similar signals are transmitted in different space-time streams. The STF, LTF, and SIG fields start as single stream during generation but are replicated up to $N_{STS,total}$ streams. For the LTF, these replicated streams undergo P-matrix mapping prior to CSD application as shown in Figure 23-6 (in 23.3.8.2.2.4). For the STF and SIG the CSDs are applied per stream immediately after replication. The same cyclic shift is applied to the $N_{STS,total}$ streams during the transmission of the Data field of the S1G_SHORT preamble PPDU. The cyclic shift value $T_{CS}(n)$ for space-time stream n out of $N_{STS,total}$ total space-time streams is shown in Table 23-9.

Table 23-9—Cyclic shift values for the S1G_SHORT preamble PPDU

$T_{CS}(n)$ for ≥ 2 MHz, S1G_SHORT Preamble PPDU				
Total number of space-time streams ($N_{STS,total}$)	**Cyclic shift for space-time stream *n* (μs)**			
	1	**2**	**3**	**4**
1	0	—	—	—
2	0	−4	—	—
3	0	−4	−2	—
4	0	−4	−2	−6

23.3.8.2.2.3 STF definition

The STF field for a 2 MHz or 4 MHz transmission is defined by Equation (19-8) and Equation (19-9), respectively, in 19.3.9.3.3. For a 8 MHz or 16 MHz transmission, the STF field is defined by Equation (21-18) and Equation (21-19), respectively, in 21.3.8.2.2. Note that these equations do not include the phase rotation per 2 MHz subchannel.

The time domain representation of the STF field signal at transmit chain i_{TX} shall be as specified in Equation (23-14).

$$r_{\mathrm{STF}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{STF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left[Q_k \right]_{i_{TX},m} \left[P_{HTLTF} \right]_{m,1} \Upsilon_{k,\mathrm{BW}} S_k \exp\left(j2\pi k \Delta_F (t - T_{CS}(m)) \right) \quad (23\text{-}14)$$

where

N_{SR} is 26 for a 2 MHz transmission or defined in Table 23-4 for a 4 MHz, 8 MHz, or 16 MHz transmission

S_k	is defined in Equation (19-8), Equation (19-9), Equation (21-8), or Equation (21-9) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively.
$T_{CS}(m)$	represents the cyclic shift for space-time stream m with a value given in Table 23-9
$\Upsilon_{k,BW}$	is defined by Equation (23-6) to Equation (23-9)
Δ_F	is defined in Table 23-4
N_{STS}	is defined in Table 23-6
P_{HTLTF}	is defined in 19.3.9.4.6
N_{STF}^{Tone}	has the value given in Table 23-7
Q_k	is defined in 23.3.7

23.3.8.2.2.4 LTF definition

The LTF field provides means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for N_{STS} space-time streams (spatial mapper inputs) used for the transmission of the PSDU. For each tone, the MIMO channel that can be estimated is an $N_{RX} \times N_{STS}$ matrix. All S1G transmissions have a preamble that contains LTF symbols, where the data tones of each LTF symbol are multiplied by entries belonging to a matrix P_{HTLTF}, to enable channel estimation at the receiver.

The pilot tones of each LTF symbol are multiplied by the first column of the P_{HTLTF} matrix. The multiplication of the pilot tones in the LTF symbols by the first column of the P_{HTLTF} matrix instead of the whole P_{HTLTF} matrix is to allow receivers to track phase and frequency offset during MIMO channel estimation using the LTF. The number of LTF symbols, N_{LTF}, is a function of the total number of space-time streams N_{STS} as shown in Table 23-10. As a result, the LTF field consists of one, two, or four symbols that are necessary for the demodulation of the Data field in the PPDU or for channel estimation in an NDP.

Table 23-10—Number of LTFs required for different numbers of space-time streams

N_{STS}	N_{LTF}
1	1
2	2
3	4
4	4

The LTF field for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission is defined by Equation (21-36) Equation (21-37), Equation (21-38), and Equation (21-39), respectively, in 21.3.8.3.5. Note that these equations do not include the phase rotation per 2 MHz subchannel.

The generation of the time domain LTF symbols is shown in Figure 23-6 where A^k_{LTF} is given in Equation (23-15).

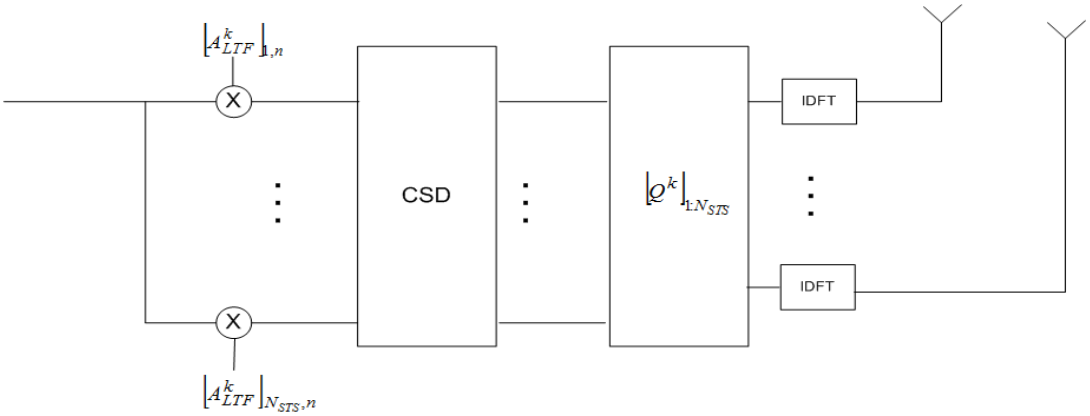

Figure 23-6—Generation of LTF symbols

$$A^k_{LTF} = \begin{cases} \left[P_{HTLTF}\right]_{*,1} \times \left[1\ 1\ 1\ 1\right], if\ k \in K_{Pilot_Fix} \\ P_{HTLTF}, \text{ otherwise} \end{cases} \tag{23-15}$$

where

K_{Pilot_Fix} is the subcarrier indices for the fixed pilot tones:

For a 2 MHz transmission, $K_{Pilot_Fix} = \{\pm 7, \pm 21\}$

For a 4 MHz transmission, $K_{Pilot_Fix} = \{\pm 11, \pm 25, \pm 53\}$

For an 8 MHz transmission, $K_{Pilot_Fix} = \{\pm 11, \pm 39, \pm 75, \pm 103\}$

For a 16 MHz transmission,

$K_{Pilot_Fix} = \{\pm 25, \pm 53, \pm 89, \pm 117, \pm 139, \pm 167, \pm 203, \pm 231\}$

$[P_{HTLTF}]_{*,1}$ is the first column of the P_{HTLTF} matrix

The time domain representation of the LTF1 field, and LTF2~LTF$_{\text{NLTF}}$ fields signals at transmit chain i_{TX} shall be as specified in Equation (23-16) and Equation (23-17), respectively.

$$r^{(i_{\text{TX}})}_{\text{LTF1}}(t) = \frac{1}{\sqrt{N^{\text{Tone}}_{\text{LTF}} N_{\text{STS}}}} w_{T_{\text{LTF1}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_k\right]_{i_{TX},m} \Upsilon_{k,\text{BW}} \left[A^k_{LTF}\right]_{m,1} LTF_k \\ \cdot \exp\left(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}(m))\right) \end{array} \right) \tag{23-16}$$

$$\begin{aligned} r^{(i_{\text{TX}})}_{\text{LTF2~LTF}_{\text{N}_{\text{LTF}}}}(t) = & \frac{1}{\sqrt{N^{\text{Tone}}_{\text{LTF}} N_{\text{STS}}}} \sum_{n=1}^{N_{LTF}-1} w_{T_{\text{LTF}}}(t - (n-1)T_{LTF}) \\ & \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_k\right]_{i_{TX},m} \Upsilon_{k,\text{BW}} \left[A^k_{LTF}\right]_{m,(n+1)} LTF_k \\ \cdot \exp\left(j2\pi k \Delta_F (t - (n-1)T_{LTF} - T_{GI} - T_{CS}(m))\right) \end{array} \right) \end{aligned} \tag{23-17}$$

where

LTF_k is defined in Equation (21-36), Equation (21-37), Equation (21-38), or Equation (21-39) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively

Copyright © 2021 IEEE. All rights reserved.

N_{SR} and T_{LTF}	are defined in Table 23-4
$T_{CS}(m)$	represents the cyclic shift for space-time stream *m* with a value given in Table 23-9
$\Upsilon_{k,BW}$	is defined by Equation (23-6) to Equation (23-9)
Δ_F	is defined in Table 23-4
N_{STS}	is defined in Table 23-6
A_{LTF}^{k}	is defined in Equation (23-15)
N_{LTF}^{Tone}	has the value given in Table 23-7
Q_k	is defined in 23.3.7

The first LTF (LTF1) field consists of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. The placement of the first and subsequent LTF fields in an S1G_SHORT PPDU is shown in Figure 23-1.

23.3.8.2.2.5 SIG definition

The SIG field carries information required to interpret S1G format PPDUs sent with a short preamble. The structure of the SIG field for the first symbol (SIG-1) is shown in Figure 23-7 and for the second symbol (SIG-2) is shown in Figure 23-8. The SIG field format of NDP CMAC PPDUs is described in Figure 23-21 (in 23.3.11).

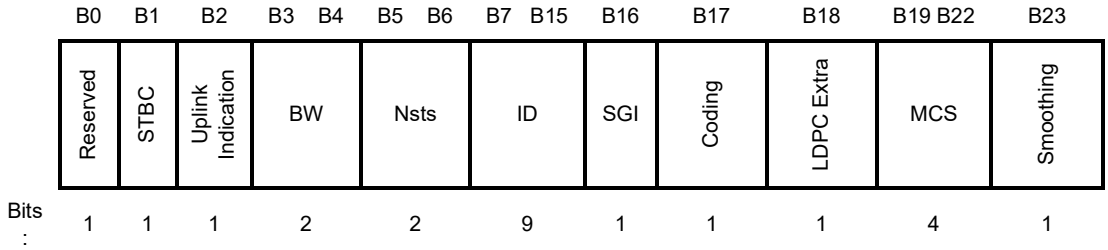

Figure 23-7—SIG-1 structure

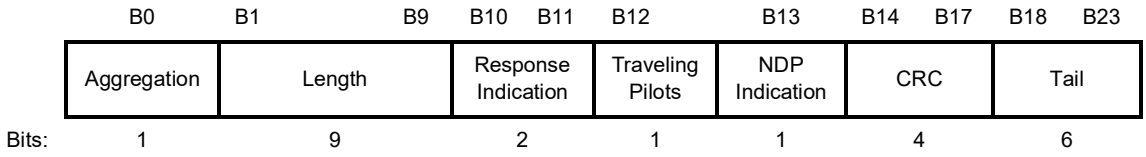

Figure 23-8—SIG-2 structure

The SIG field of S1G format PPDUs sent with a short preamble contains the fields listed in Table 23-11.

The SIG field is composed of two OFDM symbols, SIG-1 and SIG-2, each providing 24 data bits, as shown in Table 23-11. SIG-1 is transmitted before SIG-2. The SIG field symbols shall be BCC encoded at rate, R = 1/2, interleaved, mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9, respectively.

Table 23-11—Fields in the SIG field of short preamble

Symbol	Bit	Field	Description
SIG-1	B0	Reserved	Reserved. Set to 1.
	B1	STBC	Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding.
	B2	Uplink Indication	Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. (See TXVECTOR parameter UPLINK_INDICATION.)
	B3–B4	BW	If FORMAT is S1G in TXVECTOR, set to 0 when CH_BANDWIDTH is CBW2 1 when CH_BANDWIDTH is CBW4 2 when CH_BANDWIDTH is CBW8 3 when CH_BANDWIDTH is CBW16 If FORMAT is S1G_DUP_2M in TXVECTOR, set to 0.
	B5–B6	Nsts	Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams
	B7–B15	ID	If Uplink Indication field is not present or set to 1, B7–B15 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.21). If Uplink Indication field is set to 0, B7–B9 are an identifier of the BSS and B10–B15 are the partial AID. (See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.)
	B16	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B17	Coding	Set to 0 for BCC and 1 for LDPC
	B18	LDPC Extra	If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4, otherwise set to 0. If Coding field is 0, this field is set to 1.
	B19–B22	MCS	MCS Index
	B23	Smoothing	A value of 1 indicates that channel smoothing is recommended. A value of 0 indicates that channel smoothing is not recommended.

Table 23-11—Fields in the SIG field of short preamble *(continued)*

Symbol	Bit	Field	Description
SIG-2	B0	Aggregation	Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise. NOTE— S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5.
	B1–B9	Length	When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to N_{SYM_i} given in 23.4.3. (See TXVECTOR parameter PSDU_LENGTH.)
	B10–B11	Response Indication	Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of frame that is expected to follow SIFS after the current frame transmission (see 10.3.2.5).
	B12	Traveling Pilots	Set to 1 to indicate traveling pilots usage in packet. Otherwise 0 to indicate regular pilot tone locations.
	B13	NDP Indication	Differentiate the PPDU from an NDP CMAC PPDU: Set to 0 to indicate that the PPDU is not an NDP CMAC PPDU.
	B14–B17	CRC	CRC calculated as in 23.3.8.2.2.6.
	B18–B23	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.

The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}$, $k = 0, \ldots, 47$, where $n = 0, 1$, respectively. All the 96 complex numbers are rotated by 90° counter-clockwise relative to their original BPSK constellation points in order to accommodate differentiation of the S1G_SHORT PPDU from an S1G_1M PPDU, or from an S1G_LONG PPDU. The first rotated 48 complex numbers form the first symbol of SIG field; and the second rotated 48 complex numbers form the second symbol of SIG field, which follow the constellation diagram shown in Figure 23-9.

Figure 23-9—Data constellation in SIG field of S1G_SHORT

The time domain waveform for the SIG field in an S1G_SHORT PPDU at transmit chain i_{TX} shall be as specified in Equation (23-18).

$$r_{\mathrm{SIG}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{SIG}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=0}^{1} w_{T_{\mathrm{SYML}}}(t - nT_{SYML}) \sum_{i_{BW}=0}^{N_{2MHz}-1} \left(\sum_{k=-26}^{26} \sum_{m=1}^{N_{STS}} \Upsilon_{(k-K_{shift}(i_{BW})),\mathrm{BW}} \left[Q_k\right]_{i_{TX},m} \left[P_{HTLTF}\right]_{m,1} \left(j.D_{k,n,2} + p_n P_k\right) \cdot \exp\left(j2\pi(k - K_{Shift}(i_{BW}))\Delta_F(t - nT_{SYML} - T_{GI} - T_{CS}(m))\right) \right) \quad (23\text{-}18)$$

where

N_{2MHz} is the number of 2 MHz subchannels that are contained within the whole bandwidth of the current PPDU (e.g., $N_{2MHz} = 2$ for a 4 MHz PPDU)

$$K_{Shift}(i) = (N_{2MHz} - 1 - 2i).32 \quad (23\text{-}19)$$

$$D_{k,n,2} = \begin{cases} 0, & k = 0, \pm 7, \pm 21 \\ d_{M_2'(k),n}, & \text{otherwise} \end{cases} \quad (23\text{-}20)$$

where $M'_2(k)$ is defined in Equation (23-21)

$$M_2'(k) = \begin{cases} k + 26, & -26 \le k \le -22 \\ k + 25, & -20 \le k \le -8 \\ k + 24, & -6 \le k \le -1 \\ k + 23, & 1 \le k \le 6 \\ k + 22, & 8 \le k \le 20 \\ k + 21, & 22 \le k \le 26 \end{cases} \quad (23\text{-}21)$$

p_n and P_k are defined in 17.3.5.10
$T_{CS}(m)$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-9
T_{SYML} is defined in Table 23-4
$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)
Δ_F is defined in Table 23-4
N_{STS} is defined in Table 23-6
P_{HTLTF} is defined in 19.3.9.4.6
N_{SIG}^{Tone} has the value given in Table 23-7
Q_k is defined in 23.3.7

NOTE—This definition results in a QBPSK modulation on the two symbols of SIG field, where the constellation of the data tones is rotated by 90º counter-clockwise relative to the third and fourth repetitions of LTF1 field in S1G_1M preamble, and relative to the second symbol of SIG-A field of the S1G_LONG preamble, respectively, as shown in Figure 23-1 to Figure 23-3, to facilitate the differentiation among the three preamble formats at the receiver.

23.3.8.2.2.6 CRC calculation for S1G SIG-A fields

The CRC protects bits 0–25 of the 1 MHz SIG field and bits 0–37 of the ≥ 2 MHz SIG-A field. The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^4 \bmod G(D) \quad (23\text{-}22)$$

where

$M(D) = m_0D^N + m_1D^{N-1} + \ldots + m_ND^0$ is the SIG field or SIG-A represented as a polynomial

where

N is 25 for the 1 MHz SIG field and 37 for the ≥ 2 MHz SIG-A field

m_i is the ith bit of the corresponding SIG/SIG-A field

$I(D) = \sum_{i=N-3}^{N} D^i$ are initialization values that are added modulo 2 to the first 4 bits of SIG/SIG-A field

$G(D) = D^4 + D^1 + 1$ is the CRC generating polynomial

$crc(D) = c_3D^3 + c_2D^2 + c_1D^1 + c_0D^0$

The CRC field is transmitted with c_3 first.

Figure 23-10 shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, C3 first, through an inverter.

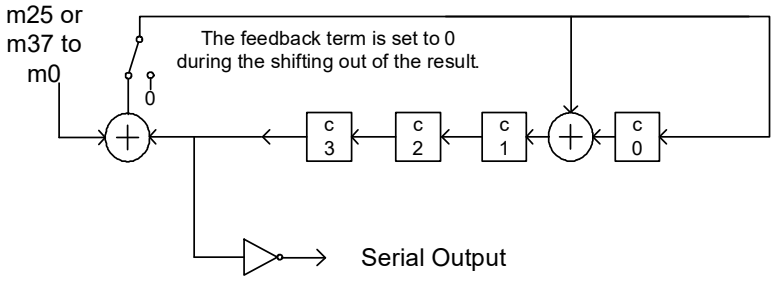

Figure 23-10—4-bit CRC calculation

As an example, if bits $\{m_0 \ldots m_{25}\}$ are given by {11 0110 0111 0110 1001 1110 1111}, the output bits $\{b_3 \ldots b_0\}$, where b_3 is output first, are {0101}.

23.3.8.2.3 S1G_LONG preamble

23.3.8.2.3.1 General

The S1G_LONG preamble is used for the S1G_LONG PPDU format. In contrast to the S1G_1M and S1G_SHORT preambles, the S1G_LONG preamble can be used for MU transmissions, in addition to SU transmissions. The S1G_LONG preamble is structured similarly to the Mixed mode format as defined in Clause 19 and Clause 21.

23.3.8.2.3.2 Omnidirectional portion

23.3.8.2.3.2.1 General

The omnidirectional portion of the S1G_LONG preamble is single user and single-space-time stream modulated. By definition, to be omnidirectional, no spatial mapping (Q-matrix multiplication) is applied.

23.3.8.2.3.2.2 Cyclic shift for S1G modulated fields

This subclause describes the set of cyclic shift values (defined per-antenna) to be applied to the omnidirectional portion of the S1G_LONG preamble, namely the STF, LTF, and SIG-A fields. The STF, LTF, and SIG-A fields start as single-stream during generation but are replicated up to N_{TX} streams. These fields are mapped to the transmit antennas, at which point the cyclic shifts are applied. The cyclic shift values are defined in Table 23-12, which specifies the per-antenna cyclic shift value $T_{CS}^{i_{TX}}$ for antenna i_{TX} of the N_{TX} total transmit antennas.

Table 23-12—Per antenna cyclic shift values of S1G_LONG preamble PPDU

$T_{CS}^{i_{TX}}$ for ≥ 2 MHz, omnidirectional portion of S1G_LONG Preamble PPDU				
Total number of Tx antennas	Cyclic shift (for Tx Antenna i_{TX}) (μs)			
	1	2	3	4
1	0	N/A	N/A	N/A
2	0	–4	N/A	N/A
3	0	–4	–2	N/A
4	0	–4	–2	–6
NOTE—N/A = not applicable.				

23.3.8.2.3.2.3 STF definition

The STF field for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the STF field in short preamble as specified in 23.3.8.2.2.3.

The time domain representation of the STF field signal at transmit chain i_{TX} shall be as specified in Equation (23-23).

$$r_{STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{STF}^{Tone} N_{TX}}} w_{T_{STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} [Q_k^{(\text{omni})}]_{i_{TX},1} \Upsilon_{k,\text{BW}} S_k \exp(j2\pi k \Delta_F t) \quad (23\text{-}23)$$

where

N_{SR} is 26 for a 2 MHz transmission or defined in Table 23-4 for a 4 MHz, 8 MHz or 16 MHz transmission.

S_k is defined in Equation (19-8), Equation (19-9), Equation (21-8), or Equation (21-9) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-4

N_{STF}^{Tone} has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

$Q_k^{(omni)}$ is defined in 23.3.7

23.3.8.2.3.2.4 LTF1 definition

The LTF1 field values for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the LTF field in short preamble as specified in 23.3.8.2.2.4.

The time domain representation of the LTF1 field signal at transmit chain i_{TX} shall be as specified in Equation (23-24).

$$r_{\mathrm{LTF1}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{LTF}^{Tone} N_{TX}}} w_{\mathrm{T}_{LTF1}}(t) \sum_{k=-N_{SR}}^{N_{SR}} [Q_k^{(\mathrm{omni})}]_{i_{TX},1} \Upsilon_{k,\mathrm{BW}} LTF_k \exp(j2\pi k\Delta_F(t - T_{GI2})) \quad (23\text{-}24)$$

where

LTF_k is defined in Equation (21-36), Equation (21-37), Equation (21-38), or Equation (21-39) for a 2 MHz, 4 MHz, 8 MHz, or 16 MHz transmission, respectively

N_{SR} is defined in Table 23-4

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-4

N_{STF}^{Tone} has the value given in Table 23-7

$Q_k^{(omni)}$ is defined in 23.3.7.

The LTF1 field consists of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. The placement of the first and subsequent LTF fields in an S1G_SHORT PPDU is shown in Figure 23-1.

23.3.8.2.3.2.5 SIG-A definition

The SIG-A field of the long preamble carries information required to interpret S1G format PPDUs sent using the long preamble. The structure of the SIG-A field is different for SU PPDUs and MU PPDUs. The structure of the SIG-A field for SU PPDUs for the first symbol (SIG-A1) is shown in Figure 23-11 and for the second symbol (SIG-A2) is shown in Figure 23-12. The structure of the SIG-A field for MU PPDUs for the first symbol (SIG-A1) is shown in Figure 23-13 and for the second symbol (SIG-A2) is shown in Figure 23-14.

The SIG-A field of S1G format PPDUs sent with an S1G_LONG preamble for SU contains the fields listed in Table 23-13 and for MU, the fields listed in Table 23-14.

Table 23-13—Fields in the SIG-A field of S1G_LONG preamble SU PPDU

Symbol	Bit	Field	Description
SIG-A1	B0	MU/SU	Set to 0 for SU PPDUs.
	B1	STBC	Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding.
	B2	Uplink Indication	Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. (See TXVECTOR parameter UPLINK_INDICATION.)
	B3–B4	BW	Set to 0 for 2 MHz, 1 for 4 MHz, 2 for 8 MHz, 3 for 16 MHz
	B5–B6	Nsts	Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams
	B7–B15	ID	If Uplink Indication field is not present or set to 1, B7–B15 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.21). If Uplink Indication field is set to 0, B7-B9 are an identifier of the BSS and B10–B15 are the partial AID. (See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.)
	B16	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B17	Coding	Set to 0 for BCC and 1 for LDPC
	B18	LDPC Extra	If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4, otherwise set to 0. If Coding field is 0, this field is set to 1.
	B19–B22	MCS	MCS Index
	B23	Beam Change/ Smoothing Indication	If Nsts subfield indicates 1 space-time stream, this field is a Beam Change Indication field: — A value of 1 indicates that the Q matrix is changed from the omnidirectional portion to the beam changeable portion of the preamble, in at least one of the nonzero subcarriers of the omnidirectional portion. — A value of 0 indicates that the Q matrix is unchanged in all the nonzero subcarriers of the omnidirectional portion. If Nsts subfield indicates more than 1 space-time stream, this field is a Smoothing Indication field: — A value of 1 indicates that channel smoothing is recommended, — A value of 0 indicates that channel smoothing is not recommended. See NOTE 1. See NOTE 2.

Table 23-13—Fields in the SIG-A field of S1G_LONG preamble SU PPDU *(continued)*

Symbol	Bit	Field	Description
SIG-A2	B0	Aggregation	Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise. NOTE—S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5.
	B1–B9	Length	When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to N_{SYM_i}, given in 23.4.3. (See TXVECTOR parameter PSDU_LENGTH.)
	B10–B11	Response Indication	Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of frame that is expected to follow SIFS after the current frame transmission (see 10.3.2.5).
	B12	Reserved	Reserved. Bit set to 1.
	B13	Traveling Pilots	Set to 1 to indicate traveling pilots usage in packet. Otherwise 0 to indicate regular pilot tone locations.
	B14–B17	CRC	CRC calculated as in 23.3.8.2.2.6.
	B18–B23	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.

NOTE 1—When the Nsts subfield indicates 1 space-time stream, if Beam Change/Smoothing Indication field is set to 0, the receiver may do channel smoothing. Otherwise, smoothing is not recommended.
NOTE 2—The Q matrix for omnidirectional portion is $Q_k^{(\mathrm{omni})}$ as defined in 23.3.7.

Table 23-14—Fields in the SIG-A field of S1G_LONG preamble MU PPDU

Symbol	Bit	Field	Description
SIG-A1	B0	MU/SU	Set to 1 for MU PPDUs
	B1	STBC	Set to 0 in MU PPDUs.
	B2	Reserved	Reserved. Set to 1.
	B3–B10	NSTS	NSTS is divided into 4 user positions of 2 bits each, denoted by 4 subfields MU[0] Nsts …MU[3] Nsts. User position *p*, where $0 \le p \le 3$, uses bits $B(3 + 2p) - B(4 + 2p)$. The space-time streams of user u are indicated at user position $p = \text{USER_POSITION}[u]$ where $u = 0, 1, \ldots \text{NUM_USERS} - 1$ and the notation A[*b*] denotes the value of array A at index *b*. Zero space-time streams are indicated at positions not listed in the USER_POSITION array. Set to 0 for 0 space-time streams Set to 1 for 1 space-time stream Set to 2 for 2 space-time streams Set to 3 for 3 space-time streams
	B11–B12	BW	Set to 0 for 2 MHz, 1 for 4 MHz, 2 for 8 MHz, 3 for 16 MHz
	B13–B18	GID	In an MU PPDU the Group ID is set as defined in 23.3.10.4
	B19	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B20–B23	Coding-I	If the MU[0] NSTS field is nonzero, then B20 indicates coding for user 0: set to 0 for BCC, 1 for LDPC. If the MU[0] NSTS field is 0, then B20 is reserved and set to 1. If the MU[1] NSTS field is nonzero, then B21 indicates coding for user 1: set to 0 for BCC, 1 for LDPC. If the MU[1] NSTS field is 0, then B21 is reserved and set to 1. If the MU[2] NSTS field is nonzero, then B22 indicates coding for user 2: set to 0 for BCC, 1 for LDPC. If the MU[2] NSTS field is 0, then B22 is reserved and set to 1. If the MU[3] NSTS field is nonzero, then B23 indicates coding for user 3: set to 0 for BCC, 1 for LDPC. If the MU[3] NSTS field is 0, then B23 is reserved and set to 1.
SIG-A2	B0	Coding-II	Set to 1 if at least one LDPC user's PPDU encoding process results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 and 21.3.10.5.5. Set to 0 otherwise.
	B1	Reserved	Reserved. Set to 1.
	B2–B10	Length	Set to the N_{sym}, given in 23.4.3. NOTE— A-MPDU is always used for MU PPDUs.
	B11–B12	Response Indication	Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of frame that is expected to follow SIFS after the current frame transmission (see 10.3.2.5).
	B13	Traveling Pilots	Set to 1 to indicate traveling pilots usage in packet. Otherwise 0 to indicate regular pilot tone locations.
	B14–B17	CRC	CRC calculated as in 23.3.8.2.2.6.
	B18–B23	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.

The SIG-A field is composed of two OFDM symbols, SIG-A1 and SIG-A2, each containing 24 data bits, as shown in Table 23-13. SIG-A1 is transmitted before SIG-A2. The SIG-A field symbols shall be BCC encoded at rate, R = 1/2, interleaved, mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9, respectively. The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}$, $k = 0, \ldots, 47$, where $n = 0, 1$, respectively. The first group of the 48 complex numbers are rotated by 90° counter-clockwise relative to their original BPSK constellation points in order to accommodate differentiation of the S1G_LONG PPDU from an S1G_1M PPDU. The second group of the 48 complex numbers without rotations may be used to accommodate differentiation of the S1G_LONG PPDU from an S1G_SHORT PPDU. The first rotated 48 complex numbers form the first symbol of SIG-A; and the second unrotated 48 complex numbers form the second symbol of SIG-A, which follow the constellation diagram shown in Figure 23-15.

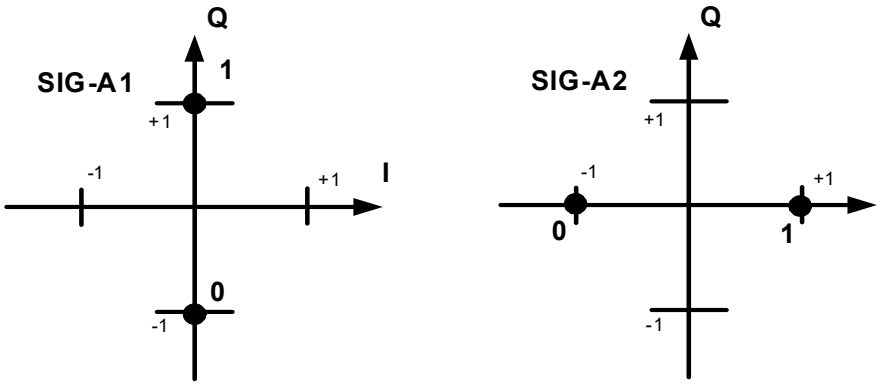

Figure 23-15—Data constellation in SIG-A field of S1G_LONG

The time domain waveform for the SIG-A field in an S1G_LONG PPDU at transmit chain i_{TX} shall be as specified in Equation (23-25).

$$r_{SIG-A}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{SIG-A}^{Tone} N_{TX}}} \sum_{n=0}^{N_{2MHz}-1} w_{T_{SYML}}(t - nT_{SYML}) \sum_{i_{BW}=0}^{1} \left(\sum_{k=-26}^{26} [Q_k^{(\text{omni})}]_{i_{TX},1} \Upsilon_{(k-K_{Shift}(i_{BW})),BW} ((-1)^n j^{n+1} D_{k,n,2} + p_n P_k) \exp(j2\pi(k - K_{Shift}(i_{BW}))\Delta_F(t - nT_{SYML} - T_{GI})) \right) \quad (23\text{-}25)$$

where

N_{2MHz}, $K_{Shift}(i)$, and $D_{k,n,2}$ are the same as those defined in 23.3.8.2.2.5

p_n and P_k are defined in 17.3.5.10

T_{SYML} is defined in Table 23-4

$\Upsilon_{k,BW}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-4

$N_{SIG\text{-}A}^{Tone}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

$Q_k^{(omni)}$ is defined in 23.3.7

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

NOTE—As shown in Figure 23-1 to Figure 23-3, this definition results in a QBPSK modulation on the first symbol of SIG-A field, where the constellation of the data tones is rotated by 90º counter-clockwise relative to the third repetition of LTF1 field in S1G_1M preamble, facilitating its differentiation from S1G_1M; and the second symbol of SIG-A field is BPSK modulated, facilitating its differentiation from S1G_SHORT.

23.3.8.2.3.3 Beamchangeable portion

23.3.8.2.3.3.1 General

The beamchangeable portion of the S1G_LONG preamble can be either single-user or multi-user modulated with single or multiple space-time streams. Beamforming can be applied through spatial mapping (Q-matrix multiplication) starting with the beamchangeable portion of the preamble and continuing into the Data field.

Beamchangeable portion of the long preamble could be either single user or multi-user modulated.

23.3.8.2.3.3.2 Cyclic shift for S1G modulated fields

This subclause describes the set of cyclic shift values (defined per space-time stream) to be applied to the beamchangeable portion of the S1G_LONG preamble, namely the D-STF, D-LTF, and SIG-B fields. In a transmission, these fields start as single stream and are replicated up to $N_{STS,total}$ streams at which point the cyclic shifts are applied. The cyclic shift values are defined in Table 23-15, which specifies the per-stream cyclic shift value $T_{CS}(n)$ for space-time stream *n* out of $N_{STS,total}$ total space-time streams.

When the S1G_LONG preamble PPDU is used for an MU transmission, the cyclic shifts of the beamchangeable portion are applied sequentially, first per user and then per space-time stream up to the total number of users and space-time streams $N_{STS,total}$ as follows: the cyclic shift of the space-time stream number m for user *u* is given by $T_{CS}(M_u + m)$, of the row corresponding to $N_{STS,total}$ in Table 23-15. In this case, the index *n* takes into account the cyclic shifts already applied to space-time streams of prior users (M_u), and the space-time stream index (m) of the current user *u* in the sequence.

M_u is given by Table 23-6.

Table 23-15—Per space-time stream cyclic shift values of S1G_LONG preamble PPDU

$T^{long}_{CS,S1G}(n)$ for ≥2 MHz, beam changeable portion of S1G_LONG preamble PPDU				
Total number of space-time streams ($N_{STS,total}$)	**Cyclic for space-time stream n (μs)**			
	1	**2**	**3**	**4**
1	0	N/A	N/A	N/A
2	0	–4	N/A	N/A
3	0	–4	–2	N/A
4	0	–4	–2	–6
NOTE—N/A = not applicable.

23.3.8.2.3.3.3 D-STF definition

The main purpose of the D-STF field is to improve automatic gain control estimation in an SU or MU MIMO transmission. The duration of the D-STF field is 40 μs. The frequency domain sequence $\{S_k\}$ used to construct the D-STF field is the same as the STF field in short or long preamble as indicated in 23.3.8.2.2.3.

The time domain representation of the D-STF field signals at transmit chain i_{TX} shall be as specified in Equation (23-26).

$$r_{\text{D-STF}}^{(i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{D-STF}}^{\text{Tone}} N_{\text{STS,total}}}} w_{T_{\text{D-STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} \left(\begin{array}{l} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} \cdot S_k \\ \cdot \exp\left(j2\pi k \Delta_F (t - T_{CS}(M_u+m))\right) \end{array} \right) \quad (23\text{-}26)$$

where

N_{SR} is defined in Table 23-4

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-15

$\Upsilon_{k,\text{BW}}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-4

$N_{STS,total}$, $N_{STS,u}$, N_u, and M_u are defined in Table 23-6.

$N_{\text{D-STF}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

Q_k is defined in 23.3.7

The duration of the D-STF field is $T_{\text{D-STF}}$ regardless of the Short GI field setting in SIG-A.

23.3.8.2.3.3.4 D-LTF definition

The D-LTF field values for 2 MHz, 4 MHz, 8 MHz, and 16 MHz are the same as the LTF field in short preamble as specified in 23.3.8.2.2.4.

The generation of the time domain D-LTF field symbols per frequency segment is shown in Figure 23-6.

The time domain representation of the D-LTF field signals at transmit chain i_{TX} shall be as specified in Equation (23-27).

$$\begin{aligned} r_{\text{D-LTF}}^{(i_{\text{TX}})}(t) = & \frac{1}{\sqrt{N_{\text{D-LTF}}^{\text{Tone}} N_{\text{STS,total}}}} \sum_{n=0}^{N_{LTF}-1} w_{T_{\text{D-LTF}}}(t - nT_{D-LTF}) \\ & \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_u-1} \sum_{m=1}^{N_{STS,u}} \left(\begin{array}{l} \left[Q_k\right]_{i_{TX},(M_u+m)} \Upsilon_{k,\text{BW}} \cdot \left[A_{LTF}^k\right]_{(M_u+m),(n+1)} LTF_k \\ \cdot \exp\left(j2\pi k \Delta_F (t - nT_{D-LTF} - T_{GI} - T_{CS}(M_u+m))\right) \end{array} \right) \end{aligned} \quad (23\text{-}27)$$

where

N_{SR} is defined in Table 23-4

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-15

$\Upsilon_{k,\text{BW}}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-4

$N_{STS,total}$, $N_{STS,u}$, N_u, and M_u are defined in Table 23-6

A_{LTF}^{k} is defined in Equation (23-15)

$N_{\text{D-STF}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

Q_k is defined in 23.3.7

As indicated by Equation (23-27), the duration of each symbol of the D-LTF field is $T_{\text{D-LTF}}$ regardless of the Short GI field setting in SIG-A.

The generation of the time domain D-LTF field symbols is the same as Figure 23-6, with N_{STS} replaced by $N_{STS,total}$.

23.3.8.2.3.3.5 SIG-B definition

If the SU/MU Indication subfield in SIG-A field is set to 0 (SU), then SIG-B field is one symbol that is identical to the first D-LTF field (D-LTF1). In this case, the time domain representation of the SIG-B field at transmit chain i_{TX} shall be as specified in Equation (23-27) with n=0.

If the SU/MU Indication subfield in SIG-A field is set to 1 (MU), then SIG-B field is one symbol and contains 26 bits in a 2 MHz PPDU, 27 bits in a 4 MHz PPDU and 29 bits in 8 MHz and 16 MHz PPDUs for each user. The fields in the SIG-B field are listed in Table 23-16.

Table 23-16—Fields in the SIG-B field for MU PPDU

Field	Bit Allocation				Description
	2 MHz	4 MHz	8 MHz	16 MHz	
MCS	B0–B3	B0–B3	B0–B3	B0–B3	Per-user MCS in MU-MIMO
Reserved	B4–B11	B4–B12	B4–B14	B4–B14	All 1s
CRC	B12–B19	B13–B20	B15–B22	B15–B22	
Tail	B20–B25	B21–B26	B23–B28	B23–B28	All 0s

The 8-bit CRC is calculated according to the procedure described in 23.3.8.2.3.3.6.

In this case, the repetition, encoding, interleaving and modulation flow for the data subcarriers of SIG-B field in 2 MHz, 4 MHz, 8 MHz, and 16 MHz are identical to those specified for 20 MHz, 40 MHz, 80 MHz, and 160 MHz, respectively, as shown in 21.3.8.3.6. Different from the VHT-SIG-B field defined in Clause 21, the pilot subcarriers of SIG-B field are mapped by the first column of P_{HTLTF} matrix to N_{STS}, total space-time streams, and the pilot polarity of the SIG-B symbol is p_2 instead of p_3. The time domain representation for SIG-B field signal at transmit chain i_{TX} shall be as specified in Equation (23-28).

$$r_{\mathrm{SIG\text{-}B}}^{(i_{\mathrm{TX}})}(t)=\frac{1}{\sqrt{N_{\mathrm{SIG\text{-}B}}^{\mathrm{Tone}}N_{\mathrm{STS,total}}}}w_{T_{\mathrm{SIG\text{-}B}}}(t)\sum_{k=-N_{SR}}^{N_{SR}}\sum_{u=0}^{N_u-1}\sum_{m=1}^{N_{STS,u}}\left(\begin{array}{l}\left[Q_k\right]_{i_{TX},(M_u+m)}\Upsilon_{k,\mathrm{BW}}\cdot\left[P_{HTLTF}\right]_{(M_u+m),1}\left(D_{k,BW}^{(u)}+p_2P_0^k\right)\\ \cdot\exp\left(j2\pi k\Delta_F(t-T_{GI}-T_{CS}(M_u+m))\right)\end{array}\right) \tag{23-28}$$

where

N_{SR} is defined in Table 23-4

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-15

$\Upsilon_{k,\mathrm{BW}}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-4

$N_{STS,total}$, $N_{STS,u}$, N_u , and M_u are defined in Table 23-6

P_{HTLTF} is defined in Equation (19-27) in 19.3.9.4.6

p_n is defined in 17.3.5.10

P_n^k is defined in 21.3.10.10

$N_{\mathrm{SIG\text{-}B}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

Q_k is defined in 23.3.7

For a 2 MHz transmission,

$$D_{k,2}^{(u)}=\begin{cases}0,k=0,\pm7,\pm21\\ d_{M_2'(k)}^{(u)},\text{otherwise}\end{cases} \tag{23-29}$$

$$M_2'(k)=\begin{cases}k+28,\ -28\le k\le-22\\ k+27,\ -20\le k\le-8\\ k+26,\ -6\le k\le-1\\ k+25,\ 1\le k\le6\\ k+24,\ 8\le k\le20\\ k+23,\ 22\le k\le28\end{cases} \tag{23-30}$$

23.3.8.2.3.3.6 CRC calculation for SIG SIG-B field

The CRC protects the MCS and Reserved field bits of the SIG-B field. The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \quad (23\text{-}36)$$

where

$M(D) = m_0 D^N + m_1 D^{N-1} + \ldots + m_N D^0$ is the MCS and Reserved field appended (bits 0–N of SIG B) and represented as a polynomial

where

N is 11, 12, 14, and 14 for 2 MHz, 4 MHz, 8 MHz, and 16 MHz SIG-B fields, respectively

m_i is the ith bit of the corresponding SIG-B field

$I(D) = \sum_{i=N-7}^{N} D^i$ are the initialization values that are added to the first 8 bits of the SIG-B field

$G(D) = D^8 + D^2 + D^1 + 1$ is the CRC generating polynomial

$crc(D) = c_0 D^7 + c_1 D^6 + \ldots + c_6 D^1 + c_7$

The CRC field is transmitted with c_7 first.

Figure 19-8 in 19.3.9.4.4 shows the operation of the CRC using the same generator polynomial. For SIG-B CRC operation specifically, the bits will be input serially from m_N to m_0.

23.3.8.3 Format for 1 MHz

23.3.8.3.1 Introduction

This subclause describes the preamble format used for non-duplicate S1G PPDUs of 1 MHz and duplicate S1G_DUP_1M PPDUs.

23.3.8.3.2 Cyclic shift for S1G modulated fields

The cyclic shift values defined in this subclause apply to the STF, LTF, SIG and Data fields of the S1G_1M PPDU. Throughout the S1G_1M preamble, cyclic shifts are applied to prevent beamforming when similar signals are transmitted in different space-time streams. The STF, LTF, and SIG fields start as single stream during generation but are replicated up to $N_{STS,total}$ streams. For the LTF, these replicated streams undergo P-matrix mapping prior to CSD application as shown in Figure 23-6. For the STF and SIG the CSDs are applied per stream immediately after replication. The same cyclic shift is applied to the $N_{STS,total}$ streams during the transmission of the Data field of the S1G_1M PPDU. The cyclic shift value $T_{CS}(n)$ for space-time stream n out of $N_{STS,total}$ total space-time streams is shown in Table 23-17.

Table 23-17—Cyclic shift values of S1G_1M PPDU

$T_{CS}(n)$ values for S1G_1M PPDU				
Total number of space-time streams ($N_{STS,total}$)	**Cyclic shift for space-time stream n (μs)**			
	1	**2**	**3**	**4**
1	0	—	—	—
2	0	–4	—	—
3	0	–4	–1	—
4	0	–4	–1	–5

23.3.8.3.3 STF definition

The STF field in S1G_1M preamble is repeated with 4 OFDM symbols, i.e., twice the duration of the STF fields in S1G_SHORT preamble and S1G_LONG preamble.

The time domain representation of the STF field signal at transmit chain i_{TX} shall be as specified in Equation (23-37).

$$r_{\mathrm{STF}}^{(i_{TX})}(t) = \frac{\alpha(\mathrm{MCS})}{\sqrt{N_{\mathrm{STF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{STF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left[Q_k\right]_{i_{TX},m} \left[P_{HTLTF}\right]_{m,1} \cdot S_k \exp\left(j2\pi k \Delta_F (t - T_{CS}(m))\right) \quad (23\text{-}37)$$

where

N_{SR} is defined in Table 23-4

$T_{CS}(m)$ represents the cyclic shift for space-time stream m with a value given in Table 23-17

Δ_F is defined in Table 23-4

N_{STS} is defined in Table 23-6

Copyright © 2021 IEEE. All rights reserved.

P_{HTLTF} is defined in Equation (19-27) in 19.3.9.4.6

$N_{\mathrm{STF}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

S_k has nonzero values $[0.5, -1, 1, -1, -1, -0.5] \times (1+j) \times \sqrt{2/3}$ on tones $k = [-12,-8,-4,4,8,12]$, respectively

$\alpha(MCS)$ is an MCS dependent scaling factor, with the following value $\alpha(MCS) = \begin{cases} \sqrt{2}, & \text{MCS=10} \\ 1, & \text{otherwise} \end{cases}$

Q_k is defined in 23.3.7

23.3.8.3.4 LTF definition

The duration of the first LTF (LTF1) field in S1G_1M preamble is of 4 OFDM symbols with repetitions, i.e., twice the duration of the LTF1 fields in S1G_LONG preamble and S1G_SHORT preamble. The first two repetitions have the same structure as the LTF1 field in S1G_LONG preamble and S1G_SHORT preamble, i.e., they consist of two periods of the long training symbol, preceded by a double length (16 μs) cyclic prefix. Each of the last two repetitions of LTF1 field consists one period of the long training symbol preceded by a normal length (8 μs) cyclic prefix. The duration of the each of the remaining LTFs in S1G_1M preamble is of one OFDM symbol.

The placement of the first and subsequent LTFs in an S1G_1M PPDU is shown in Figure 23-3.

The generation of the time domain LTF symbols is the same as Table 23-6.

The time domain representation of the first two repetitions of the LTF1 field, and the last two repetitions of the LTF1 field shall be as specified in Equation (23-38) and Equation (23-39), respectively

$$r_{\mathrm{LTF1_1,2}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{LTF1}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[A_{LTF}^{k} \right]_{m,1} LTF_k \\ \quad \cdot \exp\left(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}(m)) \right) \end{array} \right) \tag{23-38}$$

$$r_{\mathrm{LTF1_3,4}}^{(i_{\mathrm{TX}})}(t) = \frac{1}{\sqrt{N_{\mathrm{LTF}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} w_{T_{\mathrm{LTF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} \left[Q_k \right]_{i_{TX},m} \Upsilon_{k,\mathrm{BW}} \left[A_{LTF}^{k} \right]_{m,1} LTF_k \\ \quad \cdot \exp\left(j2\pi k \Delta_F (t - T_{GI} - T_{CS}(m)) \right) \end{array} \right) \tag{23-39}$$

where

N_{SR}, T_{LTF1}, and T_{LTF} are defined in Table 23-4

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-17

$\Upsilon_{k,\mathrm{BW}}$ is defined by Equation (23-6) to Equation (23-9)

Δ_F is defined in Table 23-4

N_{STS} is defined in Table 23-6

$N_{\mathrm{LTF}}^{\mathrm{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

A_{LTF}^{k} is defined in Equation (23-40)

Q_k is defined in 23.3.7

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$A_{LTF}^{k} = \begin{cases} [P_{HTLTF}]_{*,1} \times [1 \quad 1 \quad 1 \quad 1], \text{ if } k \in K_{\text{Pilot_Fix}} \\ P_{HTLTF}, \text{ otherwise} \end{cases} \tag{23-40}$$

where

$K_{\text{Pilot_Fix}}$ is the subcarrier indices for the fixed pilot tones. For a 1 MHz transmission, $K_{\text{Pilot_Fix}} = \{\pm 7\}$.

$[P_{HTLTF}]_{*,1}$ is the first column of the P_{HTLTF} matrix.

$LTF_{-16:15} = \{0, 0, 0, 1, -1, 1, -1, -1, 1, -1, 1, 1, -1, 1, 1, 1, 0, -1, -1, -1, 1, -1, -1, -1, 1, -1, 1, 1, 1, -1, 0, 0\}$

NOTE 1—This LTF sequence is chosen to be orthogonal to both halves of the 2 MHz LTF sequence in order to facilitate the differentiation of S1G_1M preambles from S1G_SHORT and S1G_LONG preambles. The orthogonality metric used to select the sequences satisfied the criteria

$$\sum_{k} A(k)B(k)A(k+1)^{*}B(k+1)^{*} = 0$$

where {A} and {B} are the 1 MHz sequence and either of the halves of the 2 MHz sequence, and where k=1,2,3,...,16,18,19,...,31 skipping the 1 MHz DC location on k=17.

NOTE 2—This definition results in a BPSK modulation on the last two symbols of LTF1 field, to facilitate the differentiation of S1G_1M preambles from S1G_SHORT and S1G_LONG preamble.

The time domain representation of the LTF2~LTF$_{\text{NLTF}}$ field signals at transmit chain i_{TX} shall be as specified in Equation (23-41).

$$r_{\text{LTF2}\sim\text{LTF}_{N_{\text{LTF}}}}^{(i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{LTF}}^{\text{Tone}} N_{\text{STS}}}} \sum_{n=1}^{N_{LTF}-1} w_{T_{\text{LTF}}}(t-(n-1)T_{LTF}) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} \left(\begin{array}{l} [Q_k]_{i_{TX},m} \cdot [A_{LTF}^{k}]_{m,(n+1)} \, LTF_k \\ \quad \cdot \exp\left(j2\pi k \Delta_F (t-(n-1)T_{LTF} - T_{GI} - T_{CS}(m))\right) \end{array} \right) \tag{23-41}$$

where

N_{SR} and T_{LTF} are defined in Table 23-4

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-15

Δ_F is defined in Table 23-4

N_{STS} is defined in Table 23-6

A_{LTF}^{k} is defined in Equation (23-40)

$N_{\text{LTF}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

Q_k is defined in 23.3.7

23.3.8.3.5 SIG definition

The SIG field carries information required to interpret S1G_1M PPDUs. The structure of the 6 symbol SIG field (which carries 6 information bits per symbol) is shown in Figure 23-16. Note that unlike other SIG field structures the indexing of the bits incorporates all the SIG field symbols, i.e., B0–B5 denote the first symbol, B6–B11 the second, and so on. The SIG field format of NDP CMAC PPDUs is described in Figure 23-20 and Figure 23-21 (in 23.3.11).

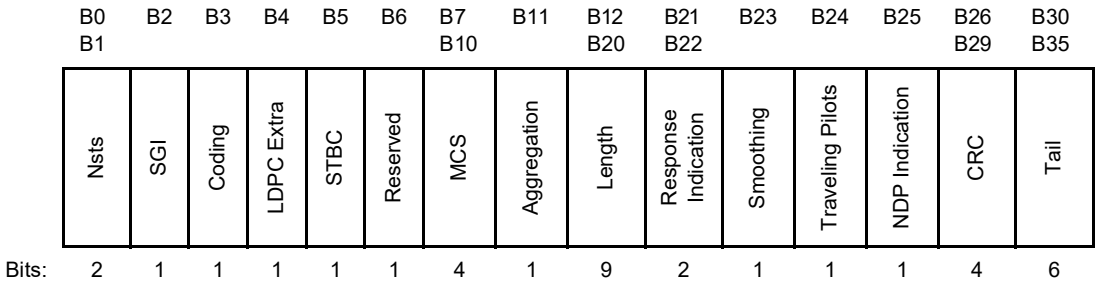

Figure 23-16—Structure of the 6 symbol SIG field of S1G_1M PPDU

The SIG field of S1G_1M PPDU contains the fields listed in Table 23-18.

Table 23-18—Fields in the SIG field of S1G_1M PPDU

Symbol	Bit	Field	Description
SIG-1	B0–B1	NSTS	Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams
	B2	Short GI	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
	B3	Coding	Set to 0 for BCC and 1 for LDPC
	B4	LDPC Extra	If Coding field is 1, set to 1 if the LDPC PPDU encoding process (of an SU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4, otherwise set to 0. If Coding field is 0, this field is set to 1.
	B5	STBC	Set to 1 if all spatial streams have space-time block coding and set to 0 if no spatial streams has space-time block coding.
SIG-2	B6	Reserved	Reserved. Set to 1.
	B7–B10	MCS	MCS Index
	B11	Aggregation	Set to 1 when aggregation is ON (as indicated by AGGREGATION parameter of TXVECTOR), and 0 otherwise. NOTE— S1G PPDUs are transmitted with aggregation ON when PSDU to be carried is greater than 511 octets, as defined in 10.12.5.

Table 23-18—Fields in the SIG field of S1G_1M PPDU *(continued)*

Symbol	Bit	Field	Description
SIG-3 and SIG-4	B12–B20	Length	When the Aggregation subfield is equal to 0, set to the number of octets in the PSDU. When the Aggregation subfield is equal to 1, set to N_{SYM_i}, given in 23.4.3. (See TXVECTOR parameter PSDU_LENGTH.)
	B21–B22	Response Indication	Set to the value obtained from the TXVECTOR parameter RESPONSE_INDICATION. The Response Indication field indicates the presence and type of frame that is expected to follow SIFS after the current frame transmission (see 10.3.2.5).
	B23	Smoothing	A value of 1 indicates that channel smoothing is recommended. A value of 0 indicates that channel smoothing is not recommended.
SIG-5	B24	Traveling Pilots	Set to 1 to indicate traveling pilots usage in packet. Otherwise 0 to indicate regular pilot tone locations.
	B25	NDP Indication	Differentiate the PPDU from an NDP CMAC PPDU: Set to 0 to indicate that the PPDU is not an NDP CMAC PPDU.
	B26–B29	CRC	CRC calculated as in 23.3.8.2.2.6.
SIG-6	B30–B35	Tail	Used to terminate the trellis of the convolutional decoder. Set to 0.

The SIG field of S1G_1M is composed of six OFDM symbols, SIG-1 ~ SIG-6, each containing 6 data bits, as shown in Table 23-18. SIG-1 is transmitted first and SIG-6 is the last. The SIG field symbols shall be BCC encoded at rate, R = 1/2, and repeated two times for the encoded bits within each OFDM symbol, interleaved, mapped to a BPSK constellation, and have pilots inserted, following the steps for MCS 10 transmission flow described in 23.3.9. The stream of 144 complex numbers generated by these steps (before pilot insertion) is divided into six groups of 24 complex numbers $d_{k,n}$, $k = 0, \ldots, 23$, where $n = 0, 1, \ldots, 5$, respectively. All the 144 complex numbers are BPSK modulated. The first 24 complex numbers form the first symbol of SIG field; and the second 24 complex numbers form the second symbol of SIG field, and so forth.

The time domain waveform for the SIG field in an S1G_1M PPDU at transmit chain i_{TX} shall be as specified in Equation (23-42).

$$r_{\mathrm{SIG}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\mathrm{SIG}}^{\mathrm{Tone}} N_{\mathrm{STS}}}} \sum_{n=0}^{5} w_{T_{\mathrm{SYML}}}(t - nT_{SYML}) \cdot \sum_{k=-13}^{13} \sum_{m=1}^{N_{STS}} \left[Q_k \right]_{i_{TX},m} \left[P_{HTLTF} \right]_{m,1} \left(D_{k,n,1} + p_n P_n^k \right) \cdot \exp\left(j2\pi k \Delta_F (t - nT_{SYML} - T_{GI} - T_{CS}(m)) \right) \quad (23\text{-}42)$$

where

p_n is defined in 17.3.5.10, and P_n^k for S1G_1M is defined in 23.3.9.10

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-17

T_{SYML} is defined in Table 23-4

Δ_F is defined in Table 23-4

N_{STS} is defined in Table 23-6

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

P_{HTLTF} is defined in Equation (19-27) in 19.3.9.4.6

$N_{\text{SIG}}^{\text{Tone}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

Q_k is defined in 23.3.7

$$D_{k,n,1} = \begin{cases} 0, & k = 0, \pm 7 \\ d_{M_1'(k),n}, & \text{otherwise} \end{cases} \tag{23-43}$$

where

$M'_1(k)$ is defined in Equation (23-44)

$$M_1'(k) = \begin{cases} k+13, & -13 \le k \le -8 \\ k+12, & -6 \le k \le -1 \\ k+11, & 1 \le k \le 6 \\ k+10, & 8 \le k \le 13 \end{cases} \tag{23-44}$$

23.3.9 Data field

23.3.9.1 General

The number of OFDM symbols in the Data field is determined by the Length field in SIG field or SIG-A field of the three S1G PPDU formats, the preamble duration and the setting of the Short GI field in SIG field or SIG-A field, (see 23.3.8.2.2.5, 23.3.8.2.3.2.5, and 23.3.8.3.5). When BCC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the PHY pad bits and the tail bits (bits for SU and bits for each user *u* in MU). When LDPC encoding is used, the Data field shall consist of the SERVICE field, the PSDU and the PHY pad bits. No tail bits are present when LDPC encoding is used.

23.3.9.2 SERVICE field

In S1G PPDUs, the SERVICE field has 8 bits, which shall be denoted as bits 0–7. The bit 0 shall be transmitted first in time.

The SERVICE field is as shown in Table 23-19.

Table 23-19—SERVICE field

Bits	Field	Description
B0–B6	Scrambler Initialization	Set to 0
B7	Reserved	Set to 0

23.3.9.3 Scrambler

The SERVICE, PSDU and PHY pad parts of the Data field shall be scrambled by the scrambler defined in 17.3.5.5.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

23.3.9.4 Coding

23.3.9.4.1 General

The Data field shall be encoded using either the binary convolutional code (BCC) defined in 23.3.9.4.2 and 23.3.9.4.3, or the low-density parity check (LDPC) code defined in 23.3.9.4.4. The encoder is selected by the coding bit(s) in SIG field or SIG-A field of the three S1G PPDU formats, as defined in 23.3.8.2.2.5, 23.3.8.2.3.2.5, and 23.3.8.3.5. When BCC FEC encoding is used, the number of encoders is determined by rate-dependent parameters as defined in 23.5. The operation of the BCC FEC is described in 23.3.9.4.2 and 23.3.9.4.3. The operation of the LDPC coder is described in 23.3.9.4.4. Support for the reception of a BCC encoded Data field is mandatory.

23.3.9.4.2 BCC encoder parsing operation

The BCC encoder parsing operation for S1G PPDUs is the same as those specified in 21.3.10.5.2.

23.3.9.4.3 BCC coding and puncturing

23.3.9.4.3.1 General

The BCC coding and puncturing operation for S1G PPDUs is the same as those specified in 21.3.10.5.3.

23.3.9.4.3.2 Padding for BCC

For a BCC encoder, the number of PHY padding bits, $N_{PAD,u}$, is calculated as

$$N_{PAD,u} = N_{SYM} \times N_{DBPS,u} - 8 \times PSDU_LENGTH_u - N_{service} - N_{tail} \times N_{ES,u}$$

where

$PSDU_LENGTH_u$ is the value of the TXVECTOR parameter PSDU_LENGTH for user u

N_{SYM} is the number of symbols in the Data field and is given in 23.4.3 by Equation (23-79) for S1G SU PPDUs and Equation (23-82) for S1G MU PPDUs

For SU, $N_{PAD} = N_{PAD,0}$.

The padding flow for BCC encoded PPDUs is as follows:

For an S1G MU PPDU, or an S1G SU PPDU with the Aggregation subfield equal to 1 in its SIG field or SIG-A field, the MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user u (i.e., append the maximum number of octets that is less than or equal to $N_{PAD,u}$). The PHY determines the number of PHY pad bits, which is $N_{PAD,u}$ modulo 8, and appends them to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length subfield in SIG field or SIG-A field shall set the appropriate value indicating N_{SYM} data symbols.

For an S1G SU PPDU with the Aggregation subfield equal to 0 in its SIG field or SIG-A field, MAC padding is not conducted and the PHY directly appends N_{PAD} padding bits to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length field shall set the appropriate value indicating PSDU_LENGTH in number of octets.

Both the PSDU and the PHY padding bits are scrambled and finally the $6.N_{ES}$ zero tail bits are appended after the scrambled PSDU and PHY padding bits.

23.3.9.4.4 LDPC coding

23.3.9.4.4.1 General

For an S1G SU PPDU using LDPC coding to encode the Data field, the LDPC code and encoding process described in 19.3.11.7 shall be used with the following modifications. First, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits are encoded. Thus, N_{pld} for S1G SU PPDUs shall be computed using Equation (23-45) instead of Equation (19-35).

$$N_{pld} = N_{SYM,init} \times N_{DBPS} \tag{23-45}$$

where

$N_{SYM,init}$ is given by Equation (23-46) if the Aggregation subfield in its SIG field or SIG-A field is set to 1 or Equation (23-47) otherwise.

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \cdot APEP_LENGTH + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \tag{23-46}$$

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \cdot PSDU_LENGTH + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \tag{23-47}$$

where

m_{STBC}	is equal to 2 when STBC is used, and 1 otherwise
$APEP_LENGTH$	is the value of TXVECTOR parameter APEP_LENGTH
$PSDU_LENGTH$	is the value of TXVECTOR parameter PSDU_LENGTH

Following the calculation of N_{pld}, N_{avbits} shall be computed using Equation (23-48) instead of Equation (19-36).

$$N_{avbits} = N_{SYM,init} \times N_{CBPS} \tag{23-48}$$

In addition, if N_{SYM} computed in Equation (19-41) in step d) of 19.3.11.7.5 is greater than $N_{SYM,init}$, then the LDPC Extra field of its SIG field or SIG-A field shall be set to 1. Otherwise, the LDPC Extra field of its SIG field or SIG-A field shall be set to 0.

LDPC codes used in S1G MU PPDUs shall follow the definitions in 19.3.11.7. Refer to 23.3.9.4.5 for a description of the LDPC encoding process for S1G MU PPDUs.

23.3.9.4.4.2 Padding for LDPC

For LDPC encoding, the number of PHY padding bits for user u, $N_{PAD,u}$ is calculated as

$$N_{PAD,u} = N_{SYM,init} \times N_{DBPS,u} - 8 \times PSDU_LENGTH_u - N_{service}$$

where

$PSDU_LENGTH_u$ is the value of the TXVECTOR parameter PSDU_LENGTH for user u

$N_{SYM,init}$ is the initial number of symbols for the Data field when using LDPC given in 23.4.3 by Equation (23-82) for S1G SU PPDUs and Equation (23-83) for S1G MU PPDUs.

For SU, there is only one user, hence $N_{PAD} = N_{PAD,0}$.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The padding flow for LDPC encoded PPDUs is as follows:

The initial parameter computation $N_{SYM,init}$, N_{pld} and N_{avbits} are identical to those defined in 21.3.10.5.4.

For an S1G MU PPDU, or an S1G SU PPDU with the Aggregation subfield equal to 1 in its SIG field or SIG-A field, the MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user *u* (i.e., append the maximum number of octets that is less than or equal to N_{PAD} or $N_{PAD,u}$). The PHY determines the number of pad bits, which is N_{PAD} mod 8 or $N_{PAD,u}$ mod 8, and appends them to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length subfield in SIG field or SIG-A field shall set the appropriate value indicating N_{SYM} data symbols.

For an S1G SU PPDU with the Aggregation subfield equal to 0 in its SIG field or SIG-A field, MAC padding is not conducted and the PHY directly appends N_{PAD} padding bits to the PSDU, each of the PHY padding bits could be either 0 or 1. In this case, the Length field shall set the appropriate value indicating PSDU_LENGTH in number of octets

Both the PSDU and the PHY padding bits are scrambled, and then finally the scrambled PSDU and PHY padding bits are LDPC encoded according to 21.3.10.5.4.

In both cases, if $N_{SYM} > N_{SYM,\ init}$, the LDPC Extra subfield of SIG field or SIG-A field shall be set to 1 (see 23.3.8.2.2.5, 23.3.8.2.3.2.5, and 23.3.8.3.5).

23.3.9.4.5 Encoding process for S1G MU PPDUs

The encoding process for S1G MU PPDUs using S1G_LONG is the same as those specified in 21.3.10.5.5.

23.3.9.5 Repetition for 1 MHz MCS 10

In an 1 MHz PPDU that is modulated by MCS 10, the 6 information bits of each OFDM symbol are encoded with R=1/2, then the 12 encoded bits in each OFDM symbol is block-wise repeated by the following steps.

Assume that the sequence $[C_1 \ldots C_{12}]$ represents the 12 encoded bits in each OFDM symbol, the output bit stream after the repetition is:

$$C_{out}=[[C_1 \ldots C_{12}], [C_1 \ldots C_{12}] \text{ XOR } s], \quad (23\text{-}49)$$

where
s = [1 0 0 0 0 1 0 1 0 1 1 1]

The 24 output bits of the repetition are then sent to BCC interleaver (if BCC encoded) or the constellation mapper (if LDPC encoded).

23.3.9.6 Stream parser

The stream parser for S1G PPDUs is the same as those specified in 21.3.10.6 with up to 4 spatial streams.

For S1G_1M PPDU modulated using MCS 10, more than one spatial stream shall not be applied.

23.3.9.7 Segment parser

The segment parser for S1G 16 MHz PPDUs is the same as those specified for 160 MHz PPDUs in 21.3.10.7.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

23.3.9.8 BCC interleaver

The BCC interleavers for S1G 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs are the same as those defined for 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDUs, respectively, as specified in 21.3.10.8.

For S1G_1M PPDU, the interleaver parameters are defined by Table 23-20.

Table 23-20—Number of rows and columns in the interleaver for 1 MHz

Parameter	1 MHz
N_{COL}	8
N_{ROW}	$3 \times N_{BPSCS}$
$N_{ROT}\,(N_{SS} \leq 4)$	2

The interleaver parameters for 1 MHz MCS 10 is identical to the parameters used for 1 MHz MCS 0.

23.3.9.9 Constellation mapping

23.3.9.9.1 General

The constellation mappings for S1G PPDUs modulated using MCS 0 to MCS 9 are the same as those specified in 21.3.10.9.1 with the same MCS indices.

The constellation mapping for 1 MHz MCS 10 is identical to the BPSK constellation mapping that is applied in MCS 0.

23.3.9.9.2 LDPC tone mapping

The LDPC tone mappings for S1G 2 MHz, 4 MHz, 8 MHz, and 16 MHz PPDUs are the same as those defined for 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDUs, respectively, as specified in 21.3.10.9.2.

For LDPC encoded S1G_1M PPDU, LDPC tone mapping is not applied.

23.3.9.9.3 Segment deparser

The segment deparser for S1G 16 MHz PPDUs is the same as those specified for 160 MHz PPDUs in 21.3.10.9.3.

23.3.9.9.4 Space-time block coding

The STBC for S1G PPDUs is the same as those specified in 21.3.10.9.4.

For S1G_1M PPDU modulated using MCS 10, STBC shall not be applied.

23.3.9.10 Pilot subcarriers

For an S1G_1M SIG field and Data field, two pilot tones shall be inserted in subcarriers. For fixed pilots, the pilot mapping for subcarrier k for symbol n shall be as specified in Equation (23-50).

$$P_n^{\{-7,7\}} = \{\psi_{(n \bmod 2)+2}, \psi_{((n+1) \bmod 2)+2}\} \quad (23\text{-}50)$$

$$P_n^{k \notin \{-7,7\}} = 0$$

where

ψ_m is given in Table 21-21 in 21.3.10.10

For S1G_SHORT PPDU and S1G_LONG PPDU, with fixed pilots, P_n^k with same FFT sizes is identical to what is defined in 21.3.10.10.

For traveling pilots, at symbol n, P_n^k is defined as follows:

$$P_n^k = \begin{cases} 1.5 \times P_{n,\text{fix}}^{k_{\text{Pilot_Fix}}^{(l)}}, k \in K_{\text{Pilot_Travel}}(n) \text{ and } k = K_{\text{Pilot_Travel}}^{(l)}(n) \\ 0, \text{otherwise} \end{cases} \quad (23\text{-}51)$$

where

$K_{\text{Pilot_Travel}}(n)$ is the set of traveling pilot subcarrier positions corresponding to data symbol n ($n = 0,1,2,\ldots N_{SYM}-1$)

$K_{\text{Pilot_Travel}}^{(l)}(n)$ is the pilot tone position in the pilot subcarrier set $K_{\text{Pilot_Travel}}(n)$ corresponding to pilot index l, as shown in Table 23-21 to Table 23-28

$P_{n,\text{fix}}^k$ is identical to P_n^k for fixed pilots

$k_{\text{Pilot_Fix}}^{(l)}$ is the pilot tone position corresponding to pilot index l in the case of fixed pilots, specifically:

For 1 MHz, $\{k_{\text{Pilot_Fix}}^{(0)}, k_{\text{Pilot_Fix}}^{(1)}\} = \{-7, 7\}$

For 2 MHz, $\{k_{\text{Pilot_Fix}}^{(0)}, \ldots, k_{\text{Pilot_Fix}}^{(3)}\} = \{-21, -7, 7, 21\}$

For 4 MHz, $\{k_{\text{Pilot_Fix}}^{(0)}, \ldots, k_{\text{Pilot_Fix}}^{(5)}\} = \{-53, -25, -11, 11, 25, 53\}$

For 8 MHz, $\{k_{\text{Pilot_Fix}}^{(0)}, \ldots, k_{\text{Pilot_Fix}}^{(7)}\} = \{-103, -75, -39, -11, 11, 39, 75, 103\}$

For 16 MHz,

$\{k_{\text{Pilot_Fix}}^{(0)}, \ldots, k_{\text{Pilot_Fix}}^{(15)}\} = \{-231, -203, -167, -139, -117, -89, -53, -25, 25, 53, 89, 117, 139, 167, 203, 231\}$

The traveling pilot positions for symbol n, $K_{\text{Pilot_Travel}}(n)$, are derived by the following paragraphs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For an S1G SU PPDU where in its SIG field or SIG-A field the NSTS subfield indicates one space-time stream and the Traveling Pilots subfield is set to 1, the traveling pilots positions $K_{\text{Pilot_Travel}}(n)$ varies from symbol to symbol according to Table 23-21 to Table 23-24 for bandwidth 1 MHz, 2 MHz, 4 MHz, and 8 MHz. In this case, for data symbol n (n = 0,1,2,….N_{SYM}-1), the pilot positions $K_{\text{Pilot_Travel}}(n)$ equal to those in the column corresponding to the pattern index.:

$$m(n) = n \bmod N_{TP,BW} \tag{23-52}$$

where

$N_{TP,BW}$ is the traveling pilot pattern period with the following values:

$N_{TP,1\text{MHz}} = 13$

$N_{TP,2\text{MHz}} = 14$

$N_{TP,4\text{MHz}} = 19$

$N_{TP,8\text{MHz}} = 32$

$N_{TP,16\text{MHz}} = 32$

For an S1G SU PPDU where in its SIG field or SIG-A field the NSTS subfield indicates two space-time streams, STBC subfield is set to 1 and the Traveling Pilots subfield is set to 1, the traveling pilots positions $K_{\text{Pilot_Travel}}(n)$ varies every other symbol according to Table 23-25 to Table 23-28 for bandwidth 1 MHz, 2 MHz, 4 MHz, and 8 MHz. In this case, for data symbol n (n = 0,1,2,….N_{SYM}–1), the pilot positions $K_{\text{Pilot_Travel}}(n)$ equal to those in the column corresponding to the pattern index.

$$m(n) = \left\lfloor \frac{n}{2} \right\rfloor \bmod N_{TP,BW} \tag{23-53}$$

where

$N_{TP,BW}$ is the traveling pilot pattern period with the following values:

$N_{TP,1\text{MHz}} = 7$

$N_{TP,2\text{MHz}} = 7$

$N_{TP,4\text{MHz}} = 10$

$N_{TP,8\text{MHz}} = 16$

$N_{TP,16\text{MHz}} = 16$

For a 16 MHz S1G PPDU with traveling pilots, in the data symbol n (n = 0,1,2,….N_{SYM}–1), there are a total of 16 pilot subcarriers, whose positions $K_{\text{Pilot_Travel}}(n)$ are expressed as

$$K_{\text{Pilot_Travel}}(n) = \begin{cases} K_{\text{Pilot_Travel,8MHz}}(n) - 128, \text{ for pilot indices } 0 \le l \le 7 \\ K_{\text{Pilot_Travel,8MHz}}(n) + 128, \text{ for pilot indices } 8 \le l \le 15 \end{cases} \quad (23\text{-}54)$$

where $K_{\text{Pilot_Travel,8MHz}}(n)$ is the traveling pilot positions of the 8 pilot subcarriers for symbol index n and 8 MHz, calculated based on Table 23-24 for a single space-time stream, or based on Table 23-28 for STBC with two space-time streams.

For S1G MU PPDUs, or S1G SU PPDUs with more than two space-time streams, or S1G SU PPDUs with two space-time streams without STBC, traveling pilots are not defined.

where

T_{SYML} and T_{SYM} are defined in Table 23-4

Q_k is a spatial mapping/steering matrix with N_{TX} rows and N_{STS} or $N_{STS,total}$ columns for subcarrier *k*. Q_k may be frequency dependent. Refer to the examples of listed in 19.3.11.11.2 for examples of that could be used for S1G SU PPDUs. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 and the number of transmit chains N_{TX} could be up to 4. For SU PPDUs to which beamforming is applied, Q_k is a beamforming steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. For S1G MU PPDUs, Q_k is the DL-MU-MIMO steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. The beamforming steering matrices and DL-MU-MIMO steering matrices are implementation specific.

The autodetection between 1 MHz and 2 MHz preambles assumes channel smoothness. It is recommended that the spatial mapping matrix Q_k applied to LTF1 field is chosen such that it preserves the smoothness of the physical channel. This can, for example, be achieved by minimizing the amplitude and phase variation of each element of Q_k in successive tones.

Examples:

a) The following may be used Q_k: Q_k as defined for cyclic shift diversity using the values specified in the corresponding tables.

b) The following Q_k should not be used:
   — Antenna hopping as described in 19.3.11.11.2 c) 2)
   — The values of Q_k on successive tones flip between 1 and 0

23.3.9.12 S1G 1 MHz and 2 MHz duplicate transmission

23.3.9.12.1 S1G 1 MHz duplicate transmission

An S1G 1 MHz duplicate transmission is used to transmit to S1G STAs that may be present in a part of a 2 MHz, 4 MHz, 8 MHz, or 16 MHz channel.

In an S1G 1 MHz duplicate PPDU, both the S1G_1M preamble and Data field are duplicated in each 1 MHz subchannel of the 2 MHz, 4 MHz, 8 MHz, or 16 MHz channel. Both an 1 MHz data PPDU and an 1 MHz NDP may be duplicated.

For S1G 1 MHz duplicate transmission, the Data field signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-62).

$$r_{Data}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{1MHz_DUP_Data}}^{\text{Tone}} N_{STS}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{i_{BW}=0}^{N_{1MHz}-1} \Bigg(\sum_{k=-13}^{13} \sum_{m=1}^{N_{STS}} ([Q_k]_{i_{TX},m} \gamma_{1MHz,\, k-(K_{Shift,\,1MHz}(i_{BW})),\, BW} (\tilde{D}_{k,m,n,1MHz} + [P_{HTLTF}]_{m,\, g(n)} \cdot p_{n+6} P_n^k) \exp(j2\pi(k - K_{Shift,\,1MHz}(i_{BW}))\Delta_F \cdot (t - T_{Accum}(n) - T_{GI,\,Data}(n) - T_{CS}(m)))) \Bigg) \quad (23\text{-}62)$$

where

p_n is defined in 17.3.5.10

P_n^k is defined in 23.3.9.10

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-17

$\Upsilon_{1MHz,k,\mathrm{BW}}$ is defined by Equation (23-10) to Equation (23-13)

Δ_F is defined in Table 23-4

N_{STS} is defined in Table 23-6

P_{HTLTF} is defined in Equation (19-27) in 19.3.9.4.6

$N^{\mathrm{Tone}}_{\mathrm{1MHz_DUP_Data}}$ has the value given in tone scaling factor and guard interval duration values for PHY fields in Table 23-7

$T_{GI,Data}(n)$ is defined in Equation (23-58)

$\tilde{D}_{k,n,n,BW}$ is defined in Equation (23-59)

$T_{Accum}(n)$ is defined in Equation (23-61)

N_{1MHz} is the number of 1 MHz subchannels that are contained within the whole bandwidth of the current PPDU (e.g., $N_{1MHz} = 4$ for a 4 MHz PPDU)

$$g(n)=\begin{cases}(n \bmod 2)+1, & \text{if the STBC bit and Traveling Pilots bit in SIG-A field are both set to 1}\\ 1, & \text{otherwise}\end{cases}$$

$$K_{Shift,1MHz}(i)=(N_{1MHz}-1-2i).16 \tag{23-63}$$

23.3.9.12.2 S1G 2 MHz duplicate transmission

An S1G 2 MHz duplicate transmission is used to transmit to S1G STAs that may be present in a part of a 4 MHz, 8 MHz, or 16 MHz channel.

In an S1G 2 MHz duplicate PPDU, the S1G_SHORT preamble and Data field are duplicated in each 2 MHz subchannel of the 4 MHz, 8 MHz, or 16 MHz channel.

A 2 MHz NDP sounding shall not be duplicated. Instead, a 4 MHz, 8 MHz, or 16 MHz NDP shall be transmitted whenever needed. NDP CMAC PPDUs transmitted over a 4 MHz, 8 MHz, or 16 MHz channel shall be carried in an S1G 2 MHz duplicate frame.

For an S1G 2 MHz duplicate PPDU, the Data field signal from transmit chain i_{TX}, $1 \le i_{TX} \le N_{TX}$, shall be as specified in Equation (23-64).

$$r^{(i_{TX})}_{Data}(t) = \frac{1}{\sqrt{N^{\mathrm{Tone}}_{\mathrm{2MHz_DUP_Data}} N_{STS}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - T_{Accum}(n)) \sum_{i_{BW}=0}^{N_{2MHz}-1} \Bigg(\sum_{k=-28}^{28} \sum_{m=1}^{N_{STS}} ([Q_k]_{i_{TX},m} \gamma_{(k-K_{Shift}(i_{BW})),BW} (\tilde{D}_{k,m,n,2MHz} + [P_{HTLTF}]_{m,g(n)} \cdot p_{n+2} P^k_n) \exp(j2\pi(k-K_{Shift}(i_{BW}))\Delta_F \cdot (t - T_{Accum}(n) - T_{GI,Data}(n) - T_{CS}(m)))) \Bigg) \tag{23-64}$$

where

p_n is defined in 17.3.5.10

P^k_n is defined in 23.3.9.10

$T_{CS(m)}$ represents the cyclic shift for space-time stream *m* with a value given in Table 23-9

$K_{Shift}(i)$ is defined in Equation (23-19)

23.3.10 SU-MIMO and DL-MU-MIMO Beamforming

23.3.10.1 General

S1G SU-MIMO and DL-MU-MIMO beamforming are techniques used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. The general description of SU-MIMO and DL-MU-MIMO beamforming is identical to its VHT counterparts as described in 21.3.11.1 with VHT replaced by S1G.

In S1G operation, the SU-MIMO allows beamforming up to 4 space-time streams, and DL-MU-MIMO beamforming allows up to 4 total number of space-time streams for all users each with up to 3 space-time streams.

S1G beamforming exchange is defined only for 2 MHz, 4 MHz, 8 MHz, and 16 MHz.

23.3.10.2 Beamforming Feedback Matrix V

The description of beamforming feedback matrix V in an S1G band is identical to its VHT counterpart as described in 21.3.11.2 with VHT replaced by S1G.

Compressed beamforming feedback using 19.3.12.3.6 is the only beamforming feedback format defined for S1G operation. In certain cases when the ψ angle is not included in the feedback frame (e.g., for SU feedback with $N_c = 1$), the ψ angles not included in the feedback report are given the values below, which will correspond to a single column V matrix having elements with equal magnitude:

If $N_r \times N_c = 4 \times 1$, $\Psi_{21} = 0.25\pi$, $\Psi_{31} = 0.196\pi$, $\Psi_{41} = 0.167\pi$
If $N_r \times N_c = 3 \times 1$, $\Psi_{21} = 0.25\pi$, $\Psi_{31} = 0.196\pi$
If $N_r \times N_c = 2 \times 1$, $\Psi_{21} = 0.25\pi$

23.3.10.3 Maximum Number of Total Spatial Streams in S1G MU PPDUs

An MU capable STA shall support reception of S1G MU PPDUs with the total number of space-time streams across the NUM_USERS users being less than or equal to its Compressed Steering Number of Beamformer Antennas Supported in the S1G Capabilities Information field. The upper limit is 4 spatial streams.

23.3.10.4 Group ID

The description of Group ID in an S1G band is identical to its VHT counterpart as described in 21.3.11.4 with VHT replaced by S1G.

23.3.11 S1G preamble format for NDPs

An NDP may be used for sounding or for NDP CMAC PPDUs. In the case of NDP sounding, the SIG field in an NDP shall indicate multiple space-time streams and more than one LTF fields; NDP CMAC PPDUs only contain single space-time stream with one LTF field.

NDP is the only S1G sounding format.

NDP for sounding is defined only using the S1G_SHORT, and NDP for sounding is not allowed for 1 MHz transmissions. NDP CMAC PPDUs may either use an S1G_SHORT, or an S1G_1M.

The format of an S1G NDP for sounding is shown in Figure 23-17.

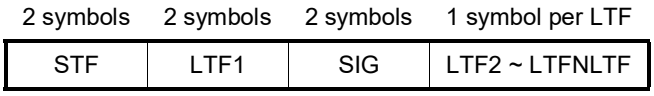

Figure 23-17—S1G NDP for sounding format

NOTE—The number of LTF symbols in the NDP is determined by the NSTS subfield in SIG field.

Transmission of an S1G NDP for sounding shall comply with the following rules:

- Shall use the S1G PPDU format but without the Data field.
- Shall use the S1G_SHORT.
- Shall use the following settings in SIG field:
  - MCS field is set to 0.
  - Length field is set to 0.
  - Bandwidth field is set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding VHT NDP Announcement frame carried in an S1G PPDU.
  - NSTS field indicates two or more space-time streams.
  - Partial AID field is set as described in 10.21.
  - The NDP indication bit is set to 0.
  - Response Indication field is set to Long Response (see TXVECTOR parameter RESPONSE_INDICATION).

The format of an NDP CMAC PPDU in 2 MHz, 4 MHz, 8 MHz, or 16 MHz is shown in Figure 23-18. The > 2 MHz NDP CMAC PPDUs are 2 MHz NDP CMAC PPDUs duplicated up to the transmission bandwidth according to CH_BANDWIDTH in TXVECTOR.

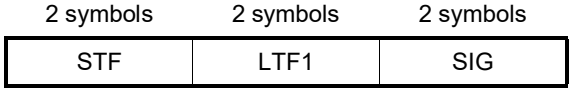

Figure 23-18—NDP CMAC PPDU for ≥ 2 MHz

The format of an S1G NDP CMAC PPDU in 1 MHz is shown in Figure 23-19. S1G NDP CMAC PPDUs for 1 MHz are duplicated up to their transmission bandwidth according to CH_BANDWIDTH in TXVECTOR.

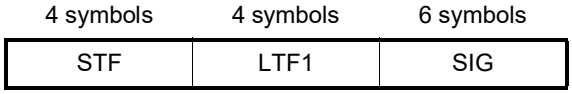

Figure 23-19—NDP CMAC PPDU for 1 MHz

Transmission of an NDP CMAC PPDU shall comply with the following rules:

- Shall use the S1G PPDU format but without the Data field.
- Shall use either the S1G_SHORT or the S1G_1M.
- Shall use the following settings in SIG field:
  - The NDP indication bit is set to 1.
- Shall contain only one LTF field.

The SIG field formats of NDP CMAC PPDUs are shown in Figure 23-20 and Figure 23-21.

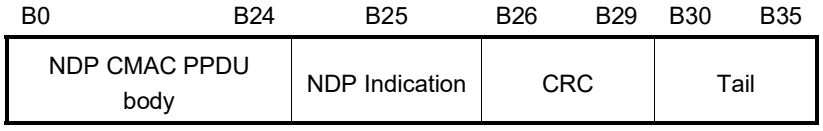

Figure 23-20—SIG field format for 1 MHz NDP CMAC PPDU

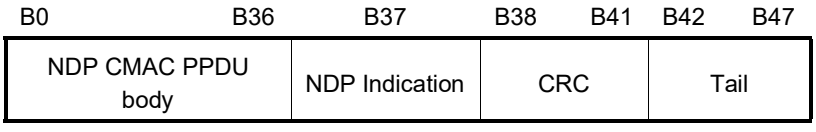

Figure 23-21—SIG field format for ≥ 2 MHz NDP CMAC PPDU

The NDP CMAC PPDU body field is described in 23.3.12.

The NDP Indication field is set to 1.

The CRC field is described in 23.3.8.2.2.6. Tail field is set to 0.

23.3.12 NDP CMAC PPDUs

23.3.12.1 General

The format of NDP CMAC PPDUs that use the S1G_1M format is shown in Figure 23-19. Figure 23-20 shows the SIG field format that contains the NDP CMAC PPDU body field. B25 of the SIG field (the second bit of the fifth symbol) is set to 1 to indicate an NDP CMAC PPDU. The NDP CMAC PPDU body field is 25 bits for NDP CMAC PPDUs that are transmitted using the S1G_1M format (NDP_1M).

The format of NDP CMAC PPDUs that use the S1G_SHORT format is shown in Figure 23-18. Figure 23-21 shows the SIG field format that contains the NDP CMAC PPDU body field. B37 of the SIG field (the fourteenth bit of the second symbol) is set to 1 to indicate an NDP CMAC PPDU. The NDP CMAC PPDU body field is 37 bits for NDP CMAC PPDUs that are transmitted using the S1G_SHORT format (NDP_2M).

An NDP CMAC PPDU is indicated by setting the TXVECTOR parameter NDP_INDICATION to 1. The TXVECTOR parameter NDP_CMAC_PPDU_BODY is set to the concatenated bits of the NDP CMAC PPDU body field.

An RXVECTOR parameter NDP_INDICATION equal to 1 indicates reception of an NDP CMAC PPDU, and the NDP CMAC PPDU body field of the frame is obtained from the RXVECTOR parameter NDP_CMAC_PPDU_BODY.

The PHY preamble format for transmission of NDP CMAC PPDUs is defined in 23.3.11.

This subclause describes the NDP CMAC PPDU body field content for each of the NDP CMAC PPDU types. The type of the NDP CMAC PPDU is indicated in the NDP CMAC PPDU Type field and its values are defined in Table 23-29.

NDP CMAC frames are not MPDUs but NDPs, but they obey the rules for equivalent MPDUs, as shown in Table 23-29.

Table 23-29—NDP CMAC PPDU Type field values

Value	Meaning	Equivalent MPDU	See subclause
0	NDP CTS or NDP CF-End	CTS or CF-End	23.3.12.2.1, 23.3.12.2.2
1	NDP PS-Poll	PS-Poll	23.3.12.2.3
2	NDP Ack	Ack	23.3.12.2.4
3	NDP PS-Poll-Ack	Ack to PS-Poll	23.3.12.2.5
4	NDP BlockAck	BlockAck	23.3.12.2.6
5	NDP Beamforming Report Poll	Beamforming Report Poll	23.3.12.2.7
6	NDP Paging	Action	23.3.12.2.8
7	NDP Probe Request	Probe Request	23.3.12.2.9

23.3.12.2 NDP CMAC PPDU details

23.3.12.2.1 NDP CTS

23.3.12.2.1.1 NDP_1M CTS

The format of the NDP CMAC PPDU body field of the NDP_1M CTS frame is shown in Figure 23-22.

	B0 B2	B3	B4	B5 B13	B14 B23	B24
	NDP CMAC PPDU Type	CTS/CF-End Indicator	Address Indicator	RA/Partial BSSID	Duration	Early Sector Indicator
Bits:	3	1	1	9	10	1

Figure 23-22—NDP CMAC PPDU body field of the NDP_1M CTS frame

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 0.

The Address Indicator field is set to 0 to indicate that the RA/Partial BSSID field contains the partial identifier of the receiving STA. It is set to 1 to indicate that the RA/Partial BSSID field contains the partial BSSID of the BSS of the AP transmitting the frame and is interpreted as a broadcast address (see 10.3.2.9 for the receiving STA's behavior). When the NDP CTS frame is used in the sector training it is set to 1.

The RA/Partial BSSID (PBSSID) field indicates:

— RA: the partial AID of the receiving non-AP STA or the partial BSSID of the receiving AP's BSS as described in 10.21

— Partial BSSID: the partial BSSID of the BSS of the transmitting AP as described in 10.21

The Duration field is expressed in units of OFDM symbol duration (40 μs) (Table 23-4) and follows the definitions in 9.3.1.3.

The Early Sector Indicator field is set to 1 to indicate that the NDP CTS frame is followed by the sectorized beam frame exchange. It is set to 0 to indicate that the NDP CTS frame is not followed by the sectorized beam frame exchange.

23.3.12.2.1.2 NDP_2M CTS

The format of the NDP CMAC PPDU body field of the NDP_2M CTS frame is shown in Figure 23-23.

	B0 B2	B3	B4	B5 B13	B14 B28	B29	B30 B32	B33 B36
	NDP CMAC PPDU Type	CTS/ CF-End Indicator	Address Indicator	RA/ Partial BSSID	Duration	Early Sector Indicator	Bandwidth Indication	Reserved
Bits:	3	1	1	9	15	1	3	4

Figure 23-23—NDP CMAC PPDU body field of the NDP_2M CTS frame

The NDP CMAC PPDU Type field is set to 0.

Copyright © 2021 IEEE. All rights reserved.

The CTS/CF-End Indicator field is set to 0.

The Address Indicator field is set to 0 to indicate that the RA/Partial BSSID field contains the partial identifier of the receiving STA. It is set to 1 to indicate that the RA/Partial BSSID field contains the partial BSSID of the BSS of the AP transmitting the frame and is interpreted as a broadcast address (see 10.3.2.9 for the receiving STA's behavior). When the NDP CTS frame is used in the sector training it is set to 1.

The RA/Partial BSSID (PBSSID) field indicates

— RA: the partial AID of the receiving non-AP STA or the partial BSSID of the receiving AP's BSS as described in 10.21

— Partial BSSID: the partial BSSID of the BSS of the transmitting AP as described in 10.21

The Duration field is expressed in units of microseconds and follows the definitions in 9.3.1.3.

The Early Sector Indicator field is set to 1 to indicate that the NDP CTS frame is followed by the sectorized beam frame exchange. It is set to 0 to indicate that the NDP CTS frame is not followed by the sectorized beam frame exchange.

The Bandwidth Indication field is described in 9.2.4.1.11.

23.3.12.2.2 NDP CF-End

23.3.12.2.2.1 NDP_1M CF-End

The format of the NDP CMAC PPDU body field of the NDP_1M CF-End frame is shown in Figure 23-24.

	B0 B2	B3	B4 B12	B13 B22	B23 B24
	NDP CMAC PPDU Type	CTS/CF-End Indicator	Partial BSSID (TA)	Duration	Reserved
Bits:	3	1	9	10	2

Figure 23-24—NDP CMAC PPDU body field of the NDP_1M CF-End frame

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 1.

The Partial BSSID field indicates the PARTIAL_AID of the address of the STA contained in the AP.

The Duration field is expressed in units of OFDM symbol time (40 μs) and follows the definitions in 9.3.1.6.

23.3.12.2.2.2 NDP_2M CF-End

The format of the NDP CMAC PPDU body field of the NDP_2M CF-End frame is shown in Figure 23-25.

	B0 B2	B3	B4 B12	B13 B27	B28 B36
	NDP CMAC PPDU Type	CTS/CF-End Indicator	Partial BSSID (TA)	Duration	Reserved
Bits:	3	1	9	15	9

Figure 23-25—NDP CMAC PPDU body field of the NDP_2M CF-End frame

The NDP CMAC PPDU Type field is set to 0.

The CTS/CF-End Indicator field is set to 1.

The Partial BSSID field indicates the PARTIAL_AID of the address of the STA contained in the AP.

The Duration field is expressed in units of microseconds and follows the definitions in 9.3.1.6.

23.3.12.2.3 NDP PS-Poll

23.3.12.2.3.1 NDP_1M PS-Poll

The format of the NDP CMAC PPDU body field of the NDP_1M PS-Poll frame is shown in Figure 23-26.

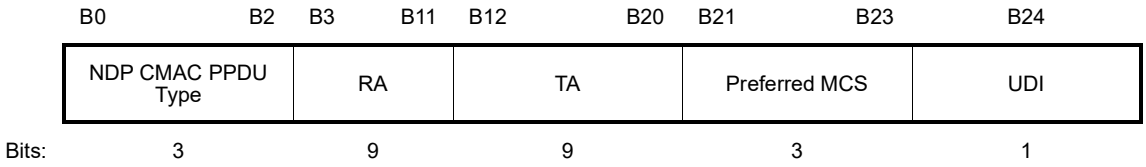

Figure 23-26—NDP CMAC PPDU body field of the NDP_1M PS-Poll frame

The NDP CMAC PPDU Type field is set to 1.

The RA field indicates the partial AID of the STA contained in the AP as described in 10.21.

The TA field indicates the partial AID of the STA transmitting the frame as described in 10.21.

The Preferred MCS field indicates the preferred MCS level for an 1 MHz channel width of the STA for downlink transmission. Mapping between Preferred MCS value and corresponding MCS index is shown in Table 23-30.

Table 23-30—Preferred MCS subfield values for NDP_1M PS-Poll frame

Preferred MCS value	MCS Index	Description
0	0	BPSK 1/2
1	1 or 2	QPSK 1/2 or QPSK 3/4
2	3 or 4	16-QAM 1/2 or 16-QAM 3/4
3	5 or 6	64-QAM 2/3 or 64-QAM 3/4
4	7 or 8	64-QAM 5/6 or 256-QAM 3/4
5	9	64-QAM 5/6
6	10	BPSK 1/4
7	No Preference	

The Uplink Data Indicator (UDI) subfield indicates if the STA has uplink data to transmit:

— Set to 0 to indicate that there is no uplink data present
— Set to 1 to indicate that there is uplink data present

23.3.12.2.3.2 NDP_2M PS-Poll

The format of the NDP CMAC PPDU body field of the NDP_2M PS-Poll frame is shown in Figure 23-27.

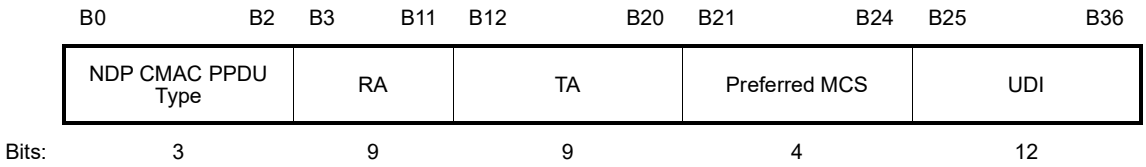

Figure 23-27—NDP CMAC PPDU body field of the NDP_2M PS-Poll frame

The NDP CMAC PPDU Type field is set to 1.

The RA field indicates the partial AID of the address of the STA contained in the AP as described in 10.21.

The TA field indicates the partial AID of the address of the STA transmitting the frame as described in 10.21.

The Preferred MCS field indicates the preferred MCS level for a 2 MHz channel width of the STA for downlink transmission. Mapping between Preferred MCS value and corresponding MCS index is shown in Table 23-31.

Table 23-31—Preferred MCS subfield values for NDP_2M PS-Poll frame

Preferred MCS value	MCS Index	Description
0–9	0–9	The value represents MCS index for the STA's preferred MCS level.
10	No Preference	
11–15	Reserved	

The Uplink Data Indicator (UDI) subfield indicates if the STA has uplink data to transmit and is used by an SST STA to indicate its selected SST channel:

— Set to 0 to indicate that there is no uplink data present

— Set to 1 to indicate that there is uplink data present but the estimated time for the transmission of the uplink Data frames that are present at the STA is not determined.

— Set to a value between 2 and 9 to indicate the relative position of the selected SST channel with respect to the lowest numbered channel in the SST Enabled Channel Bitmap field of a received SST Operation element. For example, setting the UDI to 2 indicates that the selected SST channel is the first channel in the SST Enabled Channel Bitmap field, while setting the UDI to 3 indicates that the selected SST channel is the second channel in the SST Enabled Channel Bitmap field, etc.

— Set to a value greater than 9 to indicate the estimated time, in units of 40 μs, required for the transmission of the uplink Data frames that are present at the STA, excluding the duration of their response and applicable IFS durations.

23.3.12.2.4 NDP Ack

23.3.12.2.4.1 General

The NDP Ack frame, used to respond to an S1G frame, other than an NDP PS-Poll frame, is described in this subclause.

23.3.12.2.4.2 NDP_1M Ack

The format of the NDP CMAC PPDU body field of the NDP_1M Ack frame is shown in Figure 23-28.

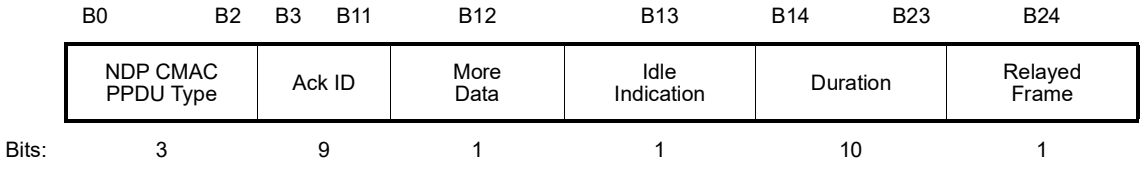

Figure 23-28—NDP CMAC PPDU body field of the NDP_1M Ack frame

The NDP CMAC PPDU Type field is set to 2.

The Ack ID field is set to the bit sequence Scrambler Initialization [0:6] || FCS[30:31] obtained from the scrambler initialization value in the Service field (as defined in 23.3.9.2) prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8.

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 9.2.5.7. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 9.2.5.7 where the value is expressed in units of 40 μs. If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP Ack frame response.

The Relayed Frame field is set as described in 10.54.5 and 10.61.

23.3.12.2.4.3 NDP_2M Ack

The format of the NDP CMAC PPDU body field of the NDP_2M Ack frame is shown in Figure 23-29.

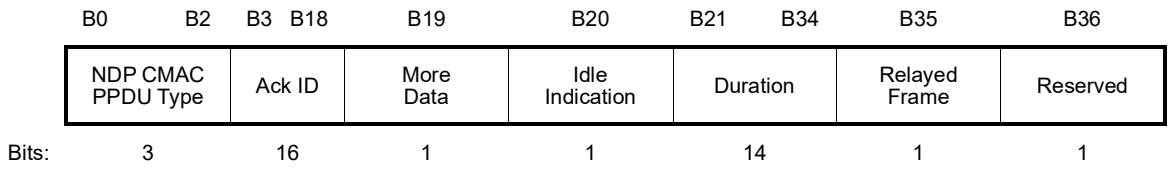

Figure 23-29—NDP CMAC PPDU body field of the NDP_2M Ack frame

The NDP CMAC PPDU Type field is set to 2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Ack ID field is set to the bit sequence Scrambler Initialization [0:6] || FCS[23:31] obtained from the scrambler initialization value in the Service field (as defined in 23.3.9.2) prior to descrambling, and the FCS field of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8.

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 9.2.5.7. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 9.2.5.7 where the value is expressed in units of 1 microsecond. If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP Ack frame response.

The Relayed Frame field is set as described in 10.54.5 and 10.61.

23.3.12.2.5 NDP PS-Poll-Ack

23.3.12.2.5.1 General

The NDP PS-Poll-Ack frame, used to respond to an NDP PS-Poll frame, is described in this subclause.

23.3.12.2.5.2 NDP_1M PS-Poll-Ack

The format of the NDP CMAC PPDU body field of the NDP_1M PS-Poll-Ack frame is shown in Figure 23-30.

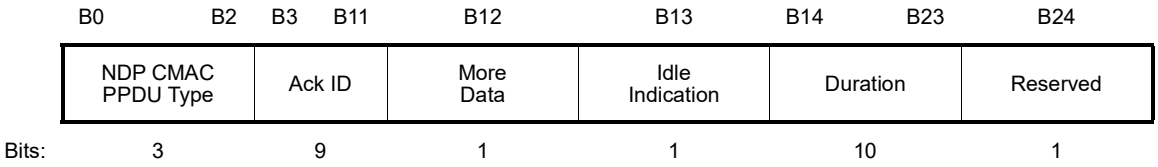

Figure 23-30—NDP CMAC PPDU body field of the NDP_1M PS-Poll-Ack frame

The NDP CMAC PPDU Type field is set to 3.

The Ack ID field is set to the bit sequence CRC[0:3] || TA[4:8] obtained from the CRC and TA field of the NDP PS-Poll frame that elicited the response. The CRC value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8.

The Idle Indication field is set to 0 if the value of the Duration field is an extension of the Ack ID. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set to the bit sequence TA[3] || RA[0:8] obtained from the RA and TA fields of the NDP PS-Poll frame that elicited the response. If the Idle Indication is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP PS-Poll-Ack frame response.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

23.3.12.2.5.3 NDP_2M PS-Poll-Ack

The format of the NDP CMAC PPDU body field of the NDP_2M PS-Poll-Ack frame is shown in Figure 23-31.

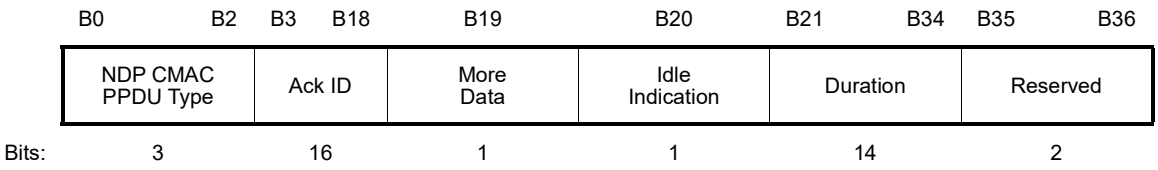

Figure 23-31—NDP CMAC PPDU body field of the NDP_2M PS-Poll-Ack frame

The NDP CMAC PPDU Type field is set to 3.

The Ack ID field is set to the bit sequence CRC[0:3] || TA[0:8] || RA[6:8]] obtained from the CRC, TA, and RA field of the NDP PS-Poll frame that elicited the response. The CRC value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The More Data field is described in 9.2.4.1.8.

The Idle Indication field is set to 0 if the value of the Duration field sets the NAV as described in 10.3.2.15. Otherwise, it is set to 1 if the value of the Duration field indicates an idle period.

If the Idle Indication field is 0, the Duration field is set as described in 10.3.2.15, where the value is expressed in units of 1 microsecond.

If the Idle Indication field is 1, the Duration field is set to the duration of time, in milliseconds, during which an idle period (during which there is no frame transmission) is expected from the STA that elicited the response, starting from the end of the NDP PS-Poll-Ack frame response.

23.3.12.2.6 NDP BlockAck

23.3.12.2.6.1 NDP_1M BlockAck

The format of the NDP CMAC PPDU body field of the NDP_1M BlockAck frame is shown in Figure 23-32.

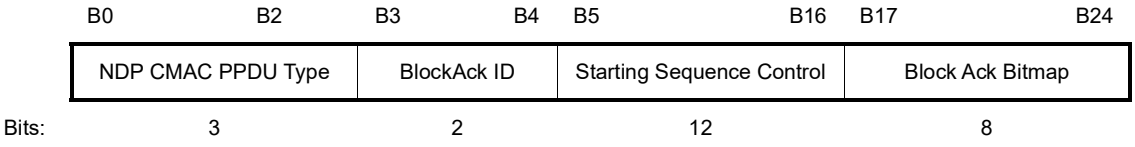

Figure 23-32—NDP CMAC PPDU body field of the NDP_1M BlockAck frame

The NDP CMAC PPDU Type field is set to 4.

The BlockAck ID field contains the identifier of the NDP BlockAck frame. It is set to the 2 LSBs of the bit sequence of the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2), prior to descrambling, of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Starting Sequence Control field contains the sequence number of the first MSDU or A-MSDU for which the NDP BlockAck frame is sent. This field is defined in 10.25.6.5 when the NDP BlockAck is used during a block ack agreement and is defined in 10.3.2.12 when it is used in a fragment BA procedure.

The Block Ack Bitmap field of the NDP BlockAck frame is used to indicate the received status of:

— Up to 8 MSDUs and A-MSDUs when the NDP BlockAck is used during a block ack agreement. Each bit that is equal to 1 in the NDP BlockAck bitmap acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the NDP BlockAck bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Control field.

— Up to 8 fragments of an MSDU when the NDP BlockAck is used in a fragment BA procedure (see 10.3.2.12). Each bit that is equal to 1 in the BlockAck Bitmap acknowledges the reception of a single fragment of an MSDU, in the order of the fragment number, with the first bit of the BlockAck Bitmap corresponding to the MPDU with fragment number equal to 0 or 8.

The transmitting (receiving) STA encodes (decodes) the BlockAck ID field and the Starting Sequence Control field of the NDP BlockAck frames applying the protection mechanism described in 10.57.

23.3.12.2.6.2 NDP_2M BlockAck

The format of the NDP CMAC PPDU body field of the NDP_2M BlockAck frame is shown in Figure 23-33.

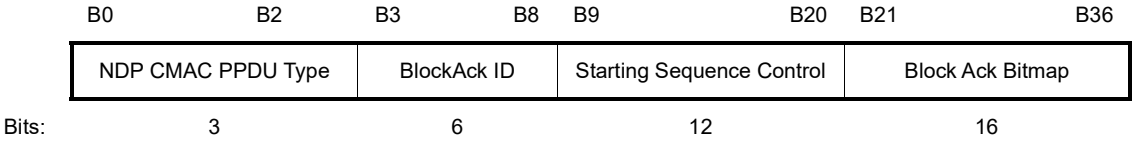

Figure 23-33—NDP CMAC PPDU body field of the NDP_2M BlockAck frame

The NDP CMAC PPDU Type field is set to 4.

The BlockAck ID field contains the identifier of the NDP BlockAck frame. It is set to the 6 LSBs of the bit sequence of the scrambler initialization value in the SERVICE field (as defined in 23.3.9.2), prior to descrambling, of the PSDU that carries the soliciting frame. The scrambler initialization value is obtained from the RXVECTOR parameter SCRAMBLER_OR_CRC.

The Starting Sequence Control field contains the sequence number of the first MSDU or A-MSDU for which the NDP BlockAck frame is sent. This field is defined in when the NDP BlockAck is used during a block ack agreement and is defined in 10.3.2.12 when it is used in a fragment BA procedure.

The Block Ack Bitmap field of the NDP BlockAck frame is used to indicate the received status of:

— Up to 16 MSDUs and A-MSDUs when the NDP BlockAck is used during a block ack agreement. Each bit that is equal to 1 in the NDP BlockAck bitmap acknowledges the reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the NDP BlockAck bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Control field.

— Up to 16 fragments of an MSDU when the NDP BlockAck is used in a fragment BA procedure (see 10.3.2.12). Each bit that is equal to 1 in the BlockAck Bitmap acknowledges the reception of a single fragment of an MSDU, in the order of the fragment number, with the first bit of the BlockAck Bitmap corresponding to the MPDU with fragment number equal to 0.

The transmitting (receiving) STA encodes (decodes) the BlockAck ID field and the Starting Sequence Control field of the NDP BlockAck frames applying the protection mechanism described in 10.57.

23.3.12.2.7 NDP Beamforming Report Poll

23.3.12.2.7.1 NDP_2M Beamforming Report Poll

The format of the NDP CMAC PPDU body field of the NDP_2M Beamforming Report Poll frame is shown in Figure 23-34.

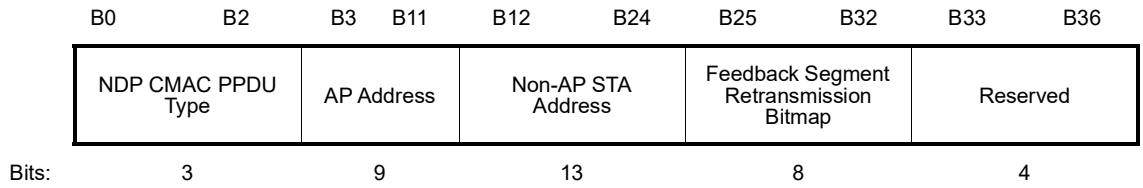

Figure 23-34—NDP CMAC PPDU body field of the NDP_2M Beamforming Report Poll frame

The NDP CMAC PPDU Type field is set to 5.

The AP Address field indicates the partial BSSID of the AP's BSS as described in 10.21.

The Non-AP STA Address field indicates the AID of the non-AP STA.

The Feedback Segment Retransmission Bitmap field indicates the feedback segments to be polled in a VHT Compressed Beamforming report, which is contained in one or more VHT Compressed Beamforming frames.

23.3.12.2.8 NDP Paging

23.3.12.2.8.1 NDP_1M Paging

The format of the NDP CMAC PPDU body field of the NDP_1M Paging frame is shown in Figure 23-35.

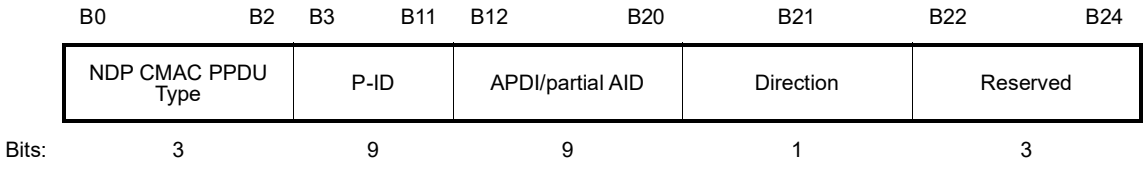

Figure 23-35—NDP CMAC PPDU body field of the NDP_1M Paging frame

The NDP CMAC PPDU Type field is set to 6.

The P-ID field is the identifier of the NDP paging requester, as described in 10.47.6.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

If the Direction field is 1 the APDI/partial AID field indicates the AP direction information (APDI), where

- The 8 MSBs of the APDI, depending on the value of the Action subfield of the NDP Paging Response, contain
  - The PTSF subfield if the Action subfield is not equal to 4. The PTSF subfield is set to the value of the partial TSF of the transmitting STA as defined in 10.47.6.
  - The ASD subfield if the Action subfield is equal to 4. The ASD subfield is the additional sleep duration and is set to the time, in units of SIFS, after which the receiver STA is in awake state as described in 10.47.6.
- The LSB of the APDI is the Check Beacon Flag subfield and is an indicator of critical changes in the Beacon frame as described in 10.47.6.

If the Direction field is 0, the APDI/partial AID field indicates the partial AID of the NDP paging responder STA.

The Direction field is set to 1, if the NDP paging responder is an AP, otherwise it is set to 0.

23.3.12.2.8.2 NDP_2M Paging

The format of the NDP CMAC PPDU body field of the NDP_2M Paging frame is shown in Figure 23-36.

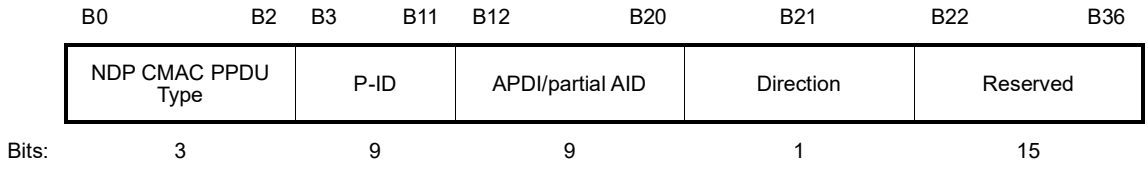

Figure 23-36—NDP CMAC PPDU body field of the NDP_2M Paging frame

The NDP CMAC PPDU Type field is set to 6.

The P-ID field is the identifier of the NDP paging requester, as described in 10.47.6.

If the Direction field is 1, the APDI/partial AID field indicates the APDI (AP Direction Information) where:

- The 8 MSBs of the APDI, depending on the value of the Action subfield of the NDP Paging Response, contain
  - The PTSF subfield if the Action subfield is not equal to 4. The PTSF subfield is set to the value of the partial TSF of the transmitting STA as defined in 10.47.6.
  - The ASD subfield if the Action subfield is equal to 4. The ASD subfield is the additional sleep duration and is set to the time, in units of SIFS, after which the receiver STA is in awake state as described in 10.47.6.
- The LSB of the APDI is the Check Beacon Flag subfield and is an indicator of critical changes in the Beacon frame as described in 10.47.6.

If the Direction field is 0, the APDI/partial AID field indicates the partial AID of the NDP paging responder STA.

The Direction field is set to 1, if the NDP paging responder is an AP, otherwise it is set to 0.

23.3.12.2.9 NDP Probe Request

23.3.12.2.9.1 General

NDP Probe Request frames are used in the procedures described in 11.1.4.3.6.

23.3.12.2.9.2 NDP_1M Probe Request

The format of the NDP CMAC PPDU body field of the NDP_1M Probe Request frame is shown in Figure 23-37.

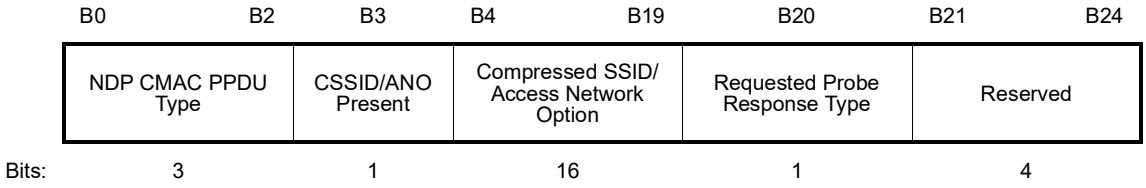

Figure 23-37—NDP CMAC PPDU body field of the NDP_1M Probe Request frame

The NDP CMAC PPDU Type field is set to 7.

The CSSID/ANO Present field indicates if the NDP Probe Request frame contains a Compressed SSID field or an Access Network Option field:

— Set to 0 if the NDP Probe Request frame contains the Compressed SSID field.
— Set to 1 if the NDP Probe Request frame contains the Access Network Option field.

When the CSSID/ANO Present field is 0, the Compressed SSID/Access Network Option field bits [0:15] are set to Compressed SSID, which is the 2 least significant octets of a 32-bit CRC calculated as defined 9.2.4.8, wherein the calculated fields is the Full SSID.

When the CSSID/ANO Present field is 1, the Compressed SSID/Access Network Option field bits [0:7] are set to Access Network Option, which is defined in 9.4.2.91 (see Figure 9-483). The Compressed SSID/Access Network Option field bits [8:15] are reserved.

The Requested Probe Response Type field indicates the Probe Response type:

— Set to 0 if the STA requests a PV1 Probe Response frame.
— Set to 1 if the STA requests a Probe Response frame.

23.3.12.2.9.3 NDP_2M Probe Request

The format of the NDP CMAC PPDU body field of the NDP_2M Probe Request frame is shown in Figure 23-38.

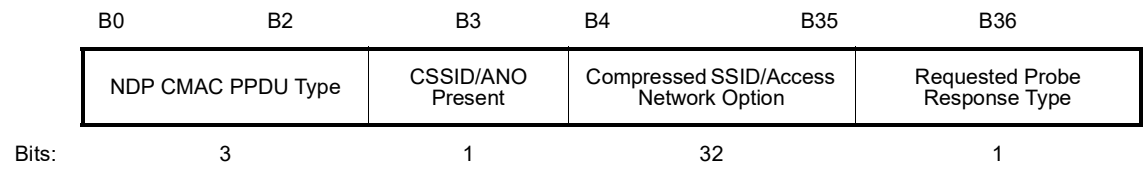

Figure 23-38—NDP CMAC PPDU body field of the NDP_2M Probe Request frame

The NDP CMAC PPDU Type field is set to 7.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The CSSID/ANO Present field indicates if the NDP Probe Request frame contains a Compressed SSID field or an Access Network Option field:

— Set to 0 if the NDP Probe Request contains the Compressed SSID field.
— Set to 1 if the NDP Probe Request contains the Access Network Option field.

When the CSSID/ANO Present field is 0, the Compressed SSID/Access Network Option field bits [0:31] are set to Compressed SSID, which is a 32-bit CRC calculated as defined in 9.2.4.8, wherein the calculated fields is the Full SSID.

When the CSSID/ANO Present field is 1, the Compressed SSID/Access Network Option field bits [0:7] are set to Access Network Option, which is defined in 9.4.2.91 (see Figure 9-483). The Compressed SSID/ Access Network Option field bits [8:31] are reserved.

The Requested Probe Response Type field indicates the Probe Response type:

— Set to 0 if the STA requests a PV1 Probe Response frame.
— Set to 1 if the STA requests a Probe Response frame.

23.3.13 Regulatory requirements

WLANs implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision, or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

23.3.14 Channelization

STAs compliant with the physical layer defined in Clause 23 operate in the channels (700 MHz – 1 GHz) defined in Annex E.

The channel center frequency, f_c, is defined as

$$f_c\,[\text{MHz}] = \mathit{ChannelStartingFrequency} + f_{\text{separation}} \times \mathit{ChannelCenterFrequencyIndex}$$

where

$f_{\text{separation}}$ is the frequency separation between channels, and has the value of 0.5 MHz

ChannelStartingFrequency and *ChannelCenterFrequencyIndex* are region and operating class specific and given in Annex E. The Channel spacing column in Annex E denotes the corresponding bandwidth for S1G operation.

The center frequency of the primary 1 MHz or primary 2 MHz channel, $f_{c,\,\text{primary}}$, is defined as:

$$f_{c,\,\text{primary}}\,[\text{MHz}] = \mathit{ChannelStartingFrequency} + f_{\text{separation}} \times \mathit{PrimaryChannelNumber}$$

where

$f_{\text{separation}}$ is the frequency separation between channels, and has the value of 0.5 MHz

PrimaryChannelNumber is the subchannel index of the primary 1 or 2 MHz channel within the overall bandwidth for S1G operation

23.3.15 Slot time

The slot time for the S1G PHY shall be 52 μs.

23.3.16 Transmit and receive port impedance

Transmit and receive antenna port impedance for each transmit and receive antenna is defined in 17.3.8.7.

23.3.17 S1G transmit specification

23.3.17.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels see 23.3.17.4.2. Transmit modulation accuracy specifications are described in 23.3.17.4.2 and 23.3.17.4.3. The test method is described in 23.3.17.4.4. The spectral mask requirements in this subclause do not apply to the RF LO leakage.

For a 1 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 0.9 MHz, –20 dBr at 0.6 MHz frequency offset, –28 dBr at 1 MHz frequency offset and –40 dBr at 1.5 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 0.45 and 0.6 MHz, 0.6 and 1 MHz, and 1 and 1.5 MHz shall be linearly interpolated in dB domain from the requirements for 0.45, 0.6, 1 and 1.5 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –40 dBm/MHz at any frequency offset. Figure 23-39 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –40 dBm/MHz.

Measurements shall be made using a 10 kHz resolution bandwidth and a 100 Hz video bandwidth.

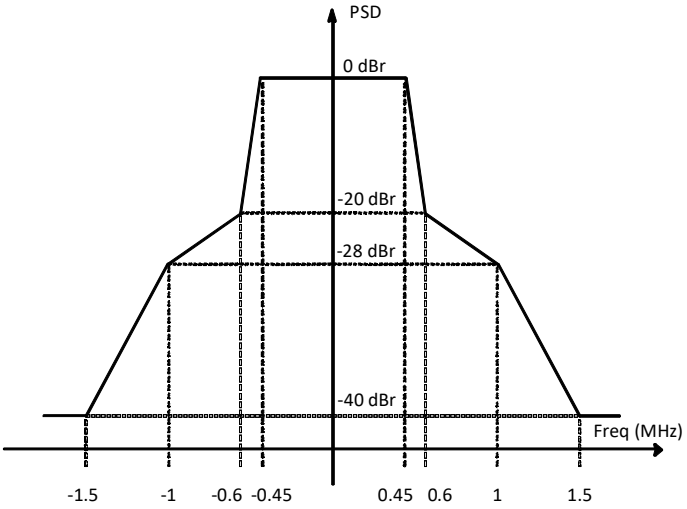

Figure 23-39—Transmit spectral mask for 1 MHz channel

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For a 2 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 1.8 MHz, –20 dBr at 1.1 MHz frequency offset, –28 dBr at 2 MHz frequency offset and –40 dBr at 3 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 0.9 and 1.1 MHz, 1.1 and 2 MHz, and 2 and 3 MHz shall be linearly interpolated in dB domain from the requirements for 0.9, 1.1, 2 and 3 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –43 dBm/MHz at any frequency offset. Figure 23-40 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –43 dBm/MHz.

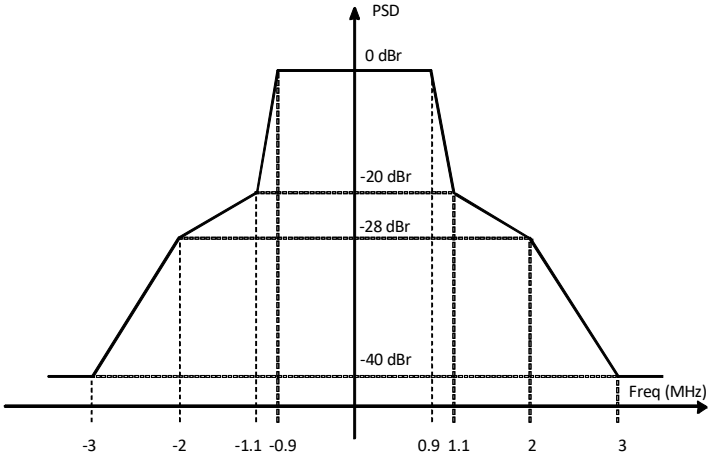

Figure 23-40—Transmit spectral mask for 2 MHz channel

For a 4 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 3.8 MHz, –20 dBr at 2.1 MHz frequency offset, –28 dBr at 4 MHz frequency offset and –40 dBr at 6 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 1.9 and 2.1 MHz, 2.1 and 4 MHz, and 4 and 6 MHz shall be linearly interpolated in dB domain from the requirements for 1.9, 2.1, 4 and 6 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –46 dBm/MHz at any frequency offset. Figure 23-41 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –46 dBm/MHz.

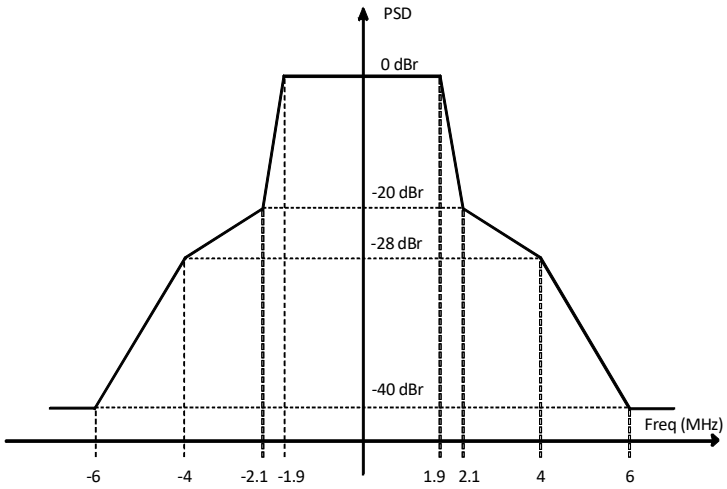

Figure 23-41—Transmit spectral mask for 4 MHz channel

For a 8 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 7.8 MHz, –20 dBr at 4.1 MHz frequency offset, –28 dBr at 8 MHz frequency offset and –40 dBr at 12 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 3.9 and 4.1 MHz, 4.1 and 8 MHz, and 8 and 12 MHz shall be linearly interpolated in dB domain from the requirements for 3.9, 4.1, 8 and 12 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –49 dBm/MHz at any frequency offset. Figure 23-42 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –49 dBm/MHz.

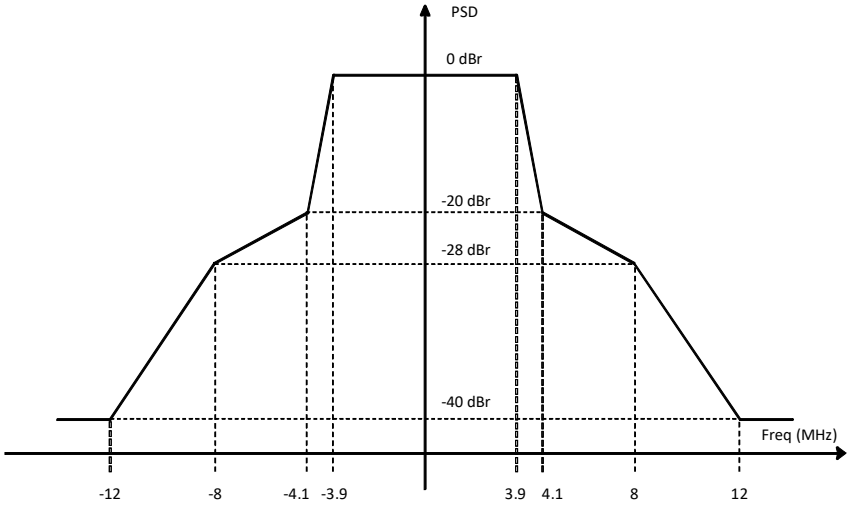

Figure 23-42—Transmit spectral mask for 8 MHz channel

For a 16 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 15.8 MHz, –20 dBr at 8.1 MHz frequency offset, –28 dBr at 16 MHz frequency offset and –40 dBr at 24 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 7.9 and 8.1 MHz, 8.1 and 16 MHz, and 16 and 24 MHz shall be linearly interpolated in dB domain from the requirements for 7.9, 8.1, 16 and 24 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and –49 dBm/MHz at any frequency offset. Figure 23-43 shows an example of the resulting overall spectral mask when the –40 dBr spectrum level is above –49 dBm/MHz.

23.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs.

Let $E_{i,avg}$ denote the average constellation energy of a BPSK modulated subcarrier *i* in an S1G data symbol.

In a normal mode S1G transmission or contiguous S1G 1 MHz or 2 MHz Duplicate mode transmission having a bandwidth listed in Table 23-32, $E_{i,avg}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 23-32 from the average of $E_{i,avg}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,avg}$ is done in the linear domain.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz normal mode transmissions and transmissions based on 1 and 2 MHz duplicated segments.

Table 23-32—Maximum spectral flatness deviations

Format	BW of transmission (MHz)	Averaging subcarrier indices	Tested subcarrier indices	Maximum deviation (dB)
Normal Mode S1G	1	–8 to –1 and +1 to +8	–8 to –1 and +1 to +8	± 4
			–13 to –9 and +9 to +13	+4/–6
	2	–16 to –1 and +1 to +16	–16 to –1 and +1 to +16	± 4
			–28 to –17 and +17 to +28	+4/–6
	4	–42 to –2 and +2 to +42	–42 to –2 and +2 to +42	± 4
			–58 to –43 and +43 to +58	+4/–6
	8	–84 to –2 and +2 to +84	–84 to –2 and +2 to +84	± 4
			–122 to –85 and +85 to +122	+4/–6

			–250 to –225, –223 to –198, –186 to –173, –43 to –33, –31 to –6, +6 to +31, +33 to +43, +173 to +186, +198 to 223, and +225 to +250	+4/–6

23.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ± 20 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator.

23.3.17.4 Modulation accuracy

23.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 23.3.17.4.2 and 23.3.17.4.3. The test method is described in 23.3.17.4.4.

23.3.17.4.2 Transmitter center frequency leakage

TX LO leakage is a consequence of the RF local oscillator (LO) and is the DC power emitted at its tuned center frequency. This TX LO leakage shall meet the following requirements for all formats and bandwidths:

— When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 31.25 kHz shall not exceed the average power per-subcarrier of the transmitted PPDU, or equivalently,($P - 10\log_{10}(N_{ST})$), where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 23-4.

— When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 31.25 kHz shall fall within that resolution BW of a 2 MHz channelization boundary and shall not exceed the maximum of –27 dB relative to the total transmit power and –15 dBm, or equivalently max(P–27,–15), where P is the transmit power per

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

antenna in dBm. If 2 MHz channelization is not allowed in the regulatory region of operation, the TX LO leakage shall fall within the resolution BW of a 1 MHz channelization boundary and shall not exceed the maximum of –27 dB relative to the total transmit power and –15 dBm, or equivalently max(P–27,–15), where P is the transmit power per antenna in dBm.

The transmit center frequency leakage is specified per antenna.

23.3.17.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, OFDM PPDUs and spatial streams [see Equation (19-89)] shall not exceed a data-rate dependent value according to Table 23-33. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, N_{SS}=N_{STS} (no STBC) shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz transmissions.

Table 23-33—Allowed relative constellation error versus constellation size and coding rate

Modulation	Coding rate	Relative constellation error (dB)
BPSK	1/2 with 2× repetition	–4
BPSK	1/2	–5
QPSK	1/2	–10
QPSK	3/4	–13
16-QAM	1/2	–16
16-QAM	3/4	–19
64-QAM	2/3	–22
64-QAM	3/4	–25
64-QAM	5/6	–27
256-QAM	3/4	–30
256-QAM	5/6	–32

23.3.17.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the bandwidth of the signal being transmitted; except that for duplicate transmissions, each 1 MHz or 2 MHz subchannel may be tested independently while all subchannels are being transmitted.

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

a) Start of PPDU shall be detected.
b) Transition from STF field to LTF1 field shall be detected and fine timing shall be established.
c) Coarse and fine frequency offsets shall be estimated.
d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
e) For each LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams.
g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase, group the results from all the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.
h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.
i) Compute the average across PPDUs of the RMS of all errors per PPDU as given by Equation (19-89).

The test shall be performed over at least 20 PPDUs [as defined in Equation (19-89)]. The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

23.3.17.5 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex T with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is

$1 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{1\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW1

$2 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{2\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW2

$4 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{4\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW4

$8 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{8\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW8

$16 \times 10^6\left(1 + \left\lceil \frac{f_H - f_L}{16\ \text{MHz}} \right\rceil\right)$ sample/s, for a CH_BANDWIDTH parameter equal to CBW16

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted.

— FIRST_TRANSITION_FIELD is the STF field.
— SECOND_TRANSITION_FIELD is the LTF1 field.
— TRAINING_FIELD is the LTF1 field windowed in a manner that should approximate the windowing described in 17.3.2.5 with TTR = 1000 ns.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns for a CH_BANDWIDTH parameter equal to CBW16, and unspecified otherwise.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

23.3.18 S1G receiver specification

23.3.18.1 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 256 octets with the rate-dependent input levels listed in Table 23-34. The test in this subclause and the minimum sensitivity levels specified in Table 23-34 apply only to non-STBC modes, 8 μs GI, BCC, and S1G PPDU.

Table 23-34—Receiver minimum input level sensitivity

Modulation	Rate (R)	Minimum sensitivity (1 MHz PPDU) (dBm)	Minimum sensitivity (2 MHz PPDU) (dBm)	Minimum sensitivity (4 MHz PPDU) (dBm)	Minimum sensitivity (8 MHz PPDU) (dBm)	Minimum sensitivity (16 MHz PPDU) (dBm)
BPSK	1/2 with 2× repetition	–98	N/A	N/A	N/A	N/A
BPSK	1/2	–95	–92	–89	–86	–83
QPSK	1/2	–92	–89	–86	–83	–80
QPSK	3/4	–90	–87	–84	–81	–78
16-QAM	1/2	–87	–84	–81	–78	–75
16-QAM	3/4	–83	–80	–77	–74	–71
64-QAM	2/3	–79	–76	–73	–70	–67
64-QAM	3/4	–78	–75	–72	–69	–66
64-QAM	5/6	–77	–74	–71	–68	–65
256-QAM	3/4	–72	–69	–66	–63	–60
256-QAM	5/6	–70	–67	–64	–61	–58

23.3.18.2 Adjacent channel rejection

Adjacent channel rejection for *W* MHz channels (where *W* is 1, 2, 4, 8, or 16) shall be measured by setting the requested signal's strength 3 dB above the rate dependent sensitivity specified in 23.3.18.1 and raising the power of the interfering signal of *W* MHz bandwidth until 10% PER is caused for a PSDU length of 256 octets. The power difference between the interfering and requested channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed *W* MHz away from the center frequency of the requested signal.

The interfering signal in the adjacent channel shall be a conformant S1G signal, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. For a conforming S1G PHY, the corresponding rejection shall be no less than specified in Table 23-35.

The test in this subclause and the adjacent sensitivity levels specified in Table 23-35 only apply to non-STBC modes with 8 μs GI and BCC.

The measurement of adjacent channel rejection for 2/4/8/16 MHz operation in a regulatory domain is only required if such a frequency band plan is permitted in that regulatory domain.

Table 23-35—Minimum required adjacent and nonadjacent channel rejection levels

Modulation	Rate, R	Adjacent Channel Rejection (dB)		Nonadjacent Channel Rejection (dB)	
		1 MHz Channel	2/4/8/16 MHz Channel	1 MHz Channel	2/4/8/16 MHz Channel
BPSK	1/2 with 2× repetition	19	N/A	35	N/A
BPSK	1/2	16	16	32	32
QPSK	1/2	13	13	29	29
QPSK	3/4	11	11	27	27
16-QAM	1/2	8	8	24	24
16-QAM	3/4	4	4	20	20
64-QAM	2/3	0	0	16	16
64-QAM	3/4	–1	–1	15	15
64-QAM	5/6	–2	–2	14	14
256-QAM	3/4	–7	–7	9	9
256-QAM	5/6	–9	–9	7	7

23.3.18.3 Nonadjacent channel rejection

Nonadjacent channel rejection for *W* MHz channels (where *W* is 1, 2, 4, 8, or 16) shall be measured by setting the requested signal's strength 3 dB above the rate-dependent sensitivity specified in Table 23-35, and raising the power of the interfering signal of W MHz bandwidth until a 10% PER occurs for a PSDU length of 256 octets. The power difference between the interfering and requested channel is the corresponding nonadjacent channel rejection. The center frequency of the nonadjacent channel shall be placed 2×*W* MHz or more away from the center frequency of the requested signal.

The interfering signal in the nonadjacent channel shall be a conformant S1G signal, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. For a conforming OFDM PHY, the corresponding rejection shall be no less than specified in Table 23-35.

The test in this subclause and the nonadjacent sensitivity levels specified in Table 23-35 only apply to non-STBC modes with 8 μs GI and BCC.

The measurement of nonadjacent channel rejection for 2/4/8/16 MHz operation in a regulatory domain is only required if such a frequency band plan is permitted in that regulatory domain.

23.3.18.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 256 octets, for a maximum input level of –30 dBm, measured at each antenna for any baseband S1G modulation.

23.3.18.5 CCA sensitivity

23.3.18.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

23.3.18.5.2 Type 1 and type 2 channelization for CCA levels

In S1G operation, the CCA sensitivity levels are defined such that they are dependent and specific to country channelization and channel location within the frequency band. For S1G channelizations in all regions of the world, there are to be two available classifications for channels and CCA levels, defined as type 1 and type 2.

For BSSs set up on channels classified as using type 1, STAs are to use what are referred to in this subclause as type 1 CCA levels when performing their CCA procedures. Likewise, if the BSS is set up on channels classified as type 2, STAs are required to use type 2 specific CCA levels. For SST BSS setups (see 10.52) where the SST BSS can include both type 1 and type 2 channels, the device in the SST BSS shall use the CCA level (type 1 or type 2) that corresponds to the current channel that is being accessed when performing their CCA procedures. The type 1 and type 2 channel classification for different operating classes in different regions of the world are denoted by "CCA Level Classification" in Table E-4 to Table E-5 in Annex E.

In general, type 1 channels have CCA levels set to favor protection of ongoing transmissions and range of devices, relative to type 2 channels. Type 2 channels have CCA levels set to favor higher bandwidth and data rate transmissions, and to allow for higher reuse within the total network across different BSSs (relative to type 1 channels). To achieve this, type 2 channel CCA levels (i.e., thresholds) are defined to be higher than type 1 channel CCA levels.

CCA levels will impact system behavior and performance increasingly with loading, therefore it is generally advantageous for BSSs primarily serving devices requiring more channel and transmission protection to set up on type 1 channels, and for BSSs expected to service devices with higher bandwidth and data rate transmissions to set up on type 2 channels if the region/country has both type 1 and type 2 channels available.

An S1G STA configures its active CCA conditions by generating a PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive with the CCA_SENSITIVITY_TYPE parameter. For operating in type 1 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_1. For operating in type 2 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_2. For operating the 8/16 MHz intended channel width in type 2 channels, the MAC sublayer generates a PHY-CONFIG.request primitive with a PHYCONFIG_VECTOR parameter CCA_SENSITIVITY_TYPE set to CCA_SENSITIVITY_TYPE_2_WIDEBAND.

23.3.18.5.3 CCA sensitivity for operating classes requiring CCA-ED

For the operating classes requiring CCA-Energy Detect (CCA-ED), CCA shall also detect a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table E-1 to Table E-4. The operating classes requiring the corresponding CCA-ED behavior class are given in Annex E. A STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

There is no distinction between type 1 and type 2 channel CCA levels for CCA-Energy Detect threshold levels, and all channels will use the same set of values: CCA-ED shall indicate a channel busy condition when the received signal strength exceeds the CCA-ED threshold of –75 dBm for the primary 1 MHz, –72 dBm for the primary 2 MHz channel and the secondary 2 MHz channels, –69 dBm for the secondary 4 MHz channel, and –66 dBm for the secondary 8 MHz channel.

23.3.18.5.4 CCA sensitivity for signals occupying the primary 2 MHz and/or primary 1 MHz channel

23.3.18.5.4.1 General

In S1G operation, the CCA sensitivity levels a device shall use when detecting the start of S1G PPDUs are based on whether the occupied primary channel in question is classified as type 1 or type 2.

For devices operating in type 1 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –98 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4).

— Any S1G PPDU detected at or above –89 dBm within the primary 1 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

For devices operating in type 2 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –89 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4).

— Any S1G PPDU detected at or above –86 dBm within the primary 1 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

The device shall not issue a PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the packet or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary1}) if any received signal in the primary 1 MHz channel exceeds the CCA-ED threshold of –75 dBm within a period aCCATime.

For devices operating in type 1 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 2 MHz, 4 MHz, 8 MHz, or 16 MHz operating channel width:

— An S1G_1M PPDU detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –89 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— A ≥ 2 MHz S1G PPDU at or above –89 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— Any of the applicable conditions listed in Table 23-36. An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-36 with > 90% probability within a period of aCCATime (see 23.4.4).

Table 23-36—Additional conditions for CCA BUSY on the primary 2 MHz in type 1 channelization

Operating Channel Width	Conditions
2 MHz, 4 MHz, 8 MHz, 16 MHz	The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –92 dBm in the primary 2 MHz channel.
4 MHz, 8 MHz, 16 MHz	The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –89 dBm in the primary 4 MHz channel.
8 MHz, 16 MHz	The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 8 MHz channel.
16 MHz	The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm.

For devices operating in type 2 channels, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 2 MHz, 4 MHz, 8 MHz, or 16 MHz operating channel width:

— An S1G_1M PPDU is detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –86 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— A ≥ 2 MHz S1G PPDU at or above –86 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— Any of the applicable conditions listed in Table 23-37. An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-37 with > 90% probability within a period of aCCATime (see 23.4.4).

Table 23-37—Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization

Operating Channel Width	Conditions
2 MHz, 4 MHz, 8 MHz, 16 MHz	The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –89 dBm in the primary 2 MHz channel.
4 MHz, 8 MHz, 16 MHz	The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 4 MHz channel.
8 MHz, 16 MHz	The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm in the primary 8 MHz channel.
16 MHz	The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –80 dBm.

The device shall not issue a PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the

packet or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary2}) if any received signal in the primary 2 MHz channel exceeds the CCA-ED threshold of –72 dBm within a period aCCATime.

Additionally, when a STA detects an S1G_SHORT or S1G_LONG PPDU with a Partial AID field of its SIG field indicating a partial AID or COLOR value that matches its own partial AID or BSSID, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) for the remaining duration of the PPDU as indicated in its preamble.

23.3.18.5.4.2 CCA sensitivity for devices in type 2 channels implementing intended 8 or 16 MHz transmit channel width channel access procedure

For devices operating in type 2 channels, if the device intends to transmit an 8 or 16 MHz channel width PPDU and the device implements the procedure and rules for high intended BW transmission channel access described in 10.23.2.6, the PHY shall issue a PHY-CCA.indication(BUSY, {primary1}) if one of the following conditions is present in an otherwise idle primary 1 MHz channel:

— The start of an S1G_1M PPDU or duplicate S1G_1M PPDU detected in the primary 1 MHz channel at or above –86 dBm within the primary 1 MHz channel with > 90% probability within a period aCCATime (see 23.4.4).

— Any S1G PPDU detected at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).

The device shall not issue a PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the packet or until all conditions above are no longer satisfied. Additionally, the device shall issue a PHY-CCA.indication(BUSY, {primary1}) if any received signal in the primary 1 MHz channel exceeds the CCA-ED threshold of –75 dBm within a period aCCATime.

The PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary1}) are not present and one of the following conditions is met in an otherwise idle 8 MHz or 16 MHz operating channel width:

— An S1G_1M PPDU is detected in the nonprimary 1 MHz portion of the primary 2 MHz channel at or above –86 dBm within the nonprimary 1 MHz with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— A ≥ 2 MHz S1G PPDU at or above –86 dBm within the primary 2 MHz channel with > 90% probability within a period of aCCAMidTime (see 23.4.4).

— Any of the applicable conditions listed in Table 23-38. An applicable condition shall be met (i.e., triggered) if the PHY detects the start of the described PPDU(s) in Table 23-38 with > 90% probability within a period of aCCATime (see 23.4.4).

The device shall not issue a PHY-CCA.indication(BUSY, {secondary2}), PHY-CCA.indication(BUSY, {secondary4}), or PHY-CCA.indication(BUSY, {secondary8}) until the end of the duration indicated by the packet or until all conditions above are no longer satisfied. Additionally, for both type 1 and type 2 channels, the device shall issue a PHY-CCA.indication(BUSY, {primary2}) if any received signal in the primary 2 MHz channel exceeds the CCA-ED threshold of –72 dBm within a period of aCCATime.

Additionally, when a STA detects an S1G_SHORT or S1G_LONG PPDU with a Partial AID field of its SIG field indicating a partial AID or COLOR value that matches its own partial AID or BSSID, the PHY shall issue a PHY-CCA.indication(BUSY, {primary2}) for the remaining duration of the PPDU as indicated in its preamble.

Table 23-38—Additional conditions for CCA BUSY on the primary 2 MHz in type 2 channelization for 8/16 MHz intended channel width

Operating Channel Width	Conditions
8 MHz, 16 MHz	The start of a 2 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –86 dBm in the primary 2 MHz channel.
8 MHz, 16 MHz	The start of a 4 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –83 dBm in the primary 4 MHz channel.
8 MHz, 16 MHz	The start of an 8 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –80 dBm in the primary 8 MHz channel.
16 MHz	The start of a 16 MHz S1G_SHORT or S1G_LONG PPDU, or of a duplicate S1G_SHORT or S1G_LONG PPDU at or above –77 dBm.

23.3.18.5.5 CCA sensitivity for signals not occupying the primary 2 MHz channel

In S1G operation, the CCA sensitivity levels for detecting signals in the secondary channels may be classified separately for type 1 or type 2 channels.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary2}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary2}) are not present and one of the following conditions are present in an otherwise idle 4 MHz, 8 MHz, 16 MHz operating channel width:

- For both type 1 and type 2 channels, any signal within the secondary 2 MHz channel at or above a threshold of –72 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondary4}), PHY-CCA.indication(BUSY,{secondary8}) or PHY-CCA.indication(IDLE) while the threshold continues to be exceeded.
- For type 1 channels, a 2 MHz S1G PPDU detected in the secondary 2 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).
- For type 2 channels, a 2 MHz S1G PPDU detected in the secondary 2 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary4}) if the conditions for issuing PHY-CCA.indication(BUSY, {primary2}) and PHY-CCA.indication(BUSY, {secondary2}) are not present and one of the following conditions are present in an otherwise idle 8 MHz, 16 MHz operating channel width:

- For both type 1 and type 2 channels, any signal within the secondary 4 MHz channel at or above a threshold of –69 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY, {secondary8}) or PHY-CCA.indication(IDLE) while the threshold continues to be exceeded.
- For type 1 channels:
  - A 4 MHz S1G PPDU detected in the secondary 4 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).
  - A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 4 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.

— For type 2 channels:
  — A 4 MHz S1G PPDU detected in the secondary 4 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).
  — A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 4 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary8}) if the conditions for PHY-CCA.indication(BUSY, {primary2}), PHY-CCA.indication(BUSY, {secondary2}) and PHY-CCA.indication(BUSY,{secondary4}) are not present and one of the following conditions are present in an otherwise idle 16 MHz operating channel width:

— For both type 1 and type 2 channels, any signal within the secondary 8 MHz channel at or above –66 dBm.
— For type 1 channels:
  — An 8 MHz S1G PPDU detected in the secondary 8 MHz channel at or above –83 dBm with > 90% probability within a period of aCCAMidTime (see 23.4.4).
  — A 4 MHz S1G PPDU detected in any 4 MHz subchannel of the secondary 8 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.
  — A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 8 MHz channel at or above –86 dBm with > 90% probability within a period of aCCAMidTime.
— For type 2 channels:
  — An 8 MHz S1G PPDU detected in the secondary 8 MHz channel at or above –79 dBm with > 90% probability within a period aCCAMidTime (see 23.4.4).
  — A 4 MHz S1G PPDU detected in any 4 MHz subchannel of the secondary 8 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.
  — A 2 MHz S1G PPDU detected in any 2 MHz subchannel of the secondary 8 MHz channel at or above –82 dBm with > 90% probability within a period of aCCAMidTime.

23.3.18.6 RSSI

The RSSI parameter returned in the RXVECTOR shall be calculated during the reception of the (D-)LTFs and shall be a monotonically increasing function of the received power.

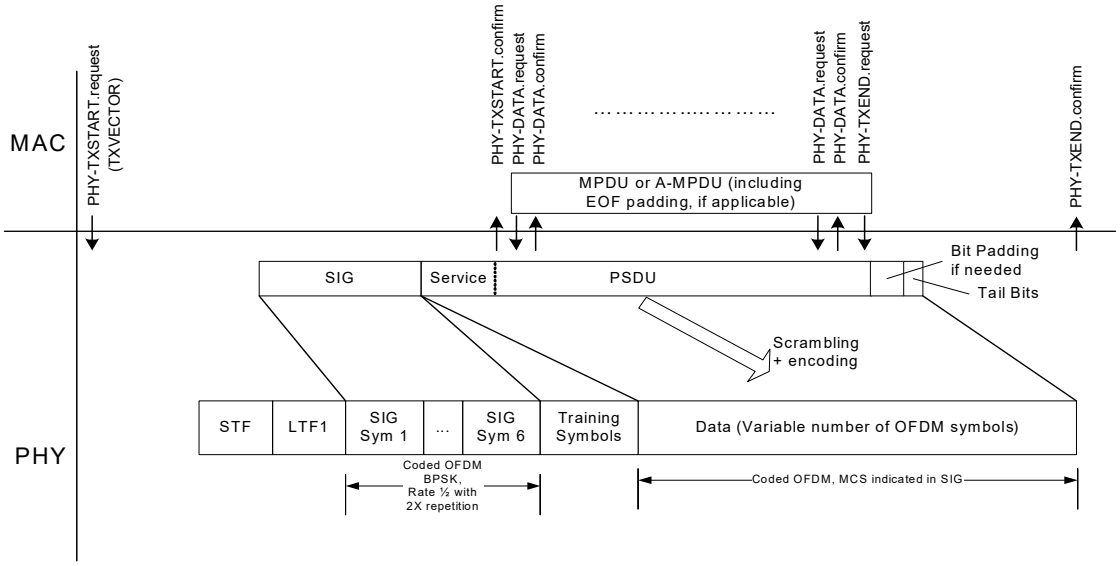
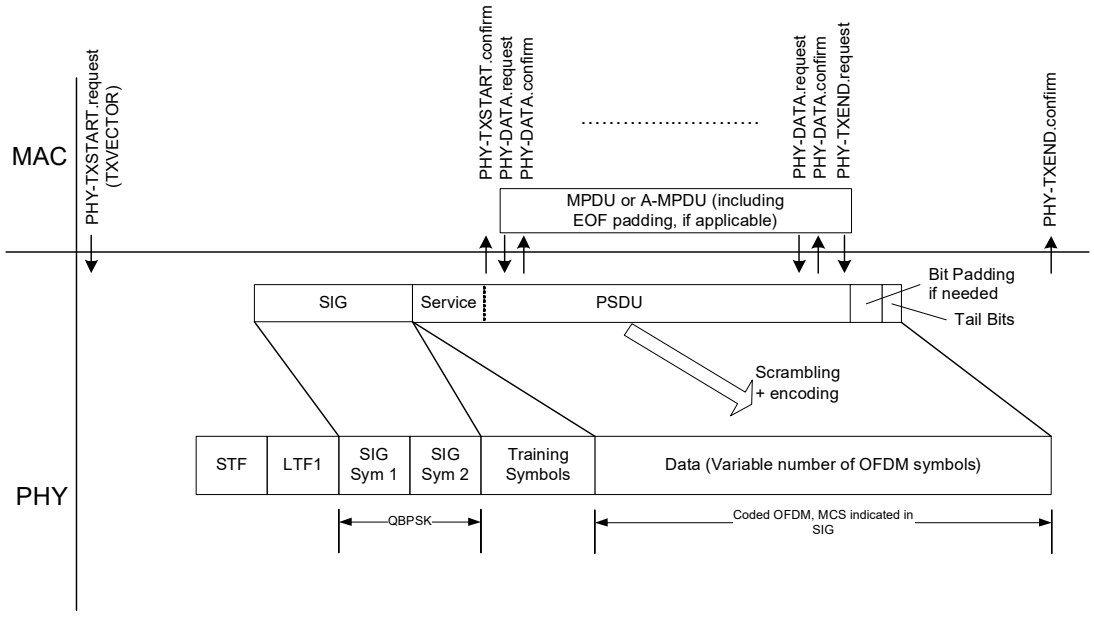
23.3.19 PHY transmit procedure

The typical transmit procedure is shown in Figure 23-44, Figure 23-45, and Figure 23-46. For this transmit procedure, the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is S1G. These transmit procedures do not describe the operation of optional features, such as LDPC, STBC, or MU.



NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 23-44—PHY transmit procedure for an SU transmission using S1G_1M procedure



NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 23-45—PHY transmit procedure for an SU transmission using S1G_SHORT procedure

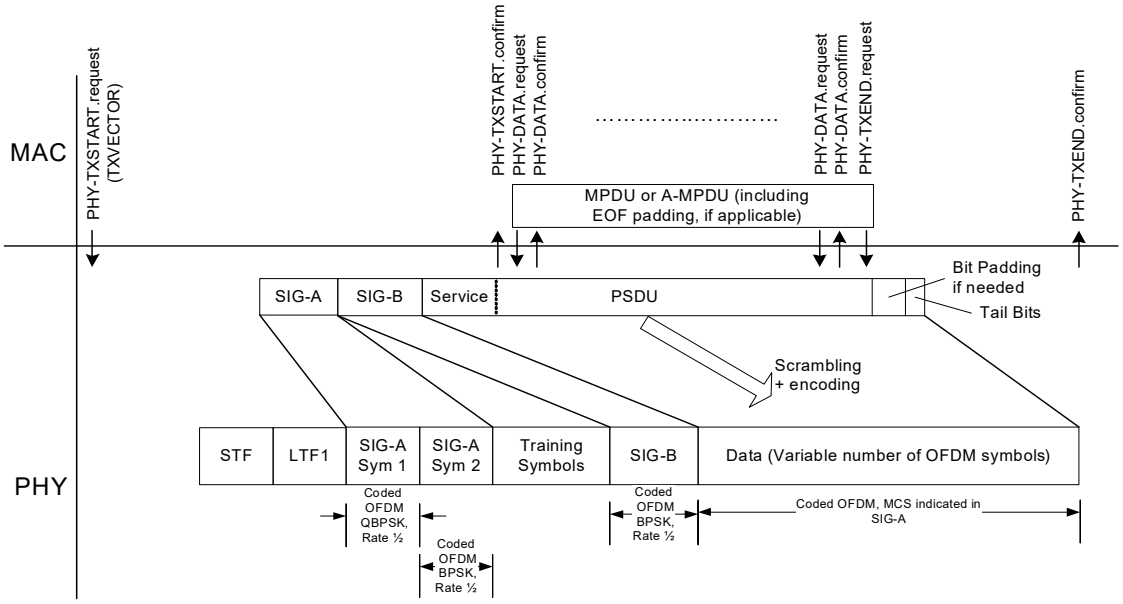
NOTE—For an MU PPDU the A-MPDU is per user in the MAC sublayer and the S1G training symbols, SIG-B, and Data are per user in the PHY layer in Figure 23-46, with the number S1G training symbols depending on the total number of space-time streams across all users.

In order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 23.4.



NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 23-46—PHY transmit procedure for an SU transmission using S1G_LONG procedure

Other transmit parameters, such as S1G-MCS coding types and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 23.2.2.

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 23.3.18.5 and 8.3.5.12). Note that under some circumstances, the MAC uses the value of the PHY-CCA.indication primitive before (and if) issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 23-1.

Transmission of the PHY preamble shall start immediately, using the parameters passed in the PHY-TXSTART.request primitive and the PHY shall issue a PHY-TXSTART.confirm primitive to the MAC.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the FEC_CODING, CH_BANDWIDTH, NUM_STS, STBC, MCS, and NUM_USERS parameter of the TXVECTOR, as described in 23.3.2.

The SERVICE field and PSDU are encoded as described in 23.3.3. The data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. Zero to seven PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integer multiple of the number of coded bits per OFDM symbol.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Transmission can be prematurely terminated by the MAC through the primitive PHY-TXEND.request primitive. PSDU transmission is terminated by receiving a PHY-TXEND.request primitive. Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. In an SU transmission, normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by NSYM (see 23.4.3).

In the PHY, the GI or short GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

A NDP CMAC transmit procedure is shown in Figure 23-47 and Figure 23-48.

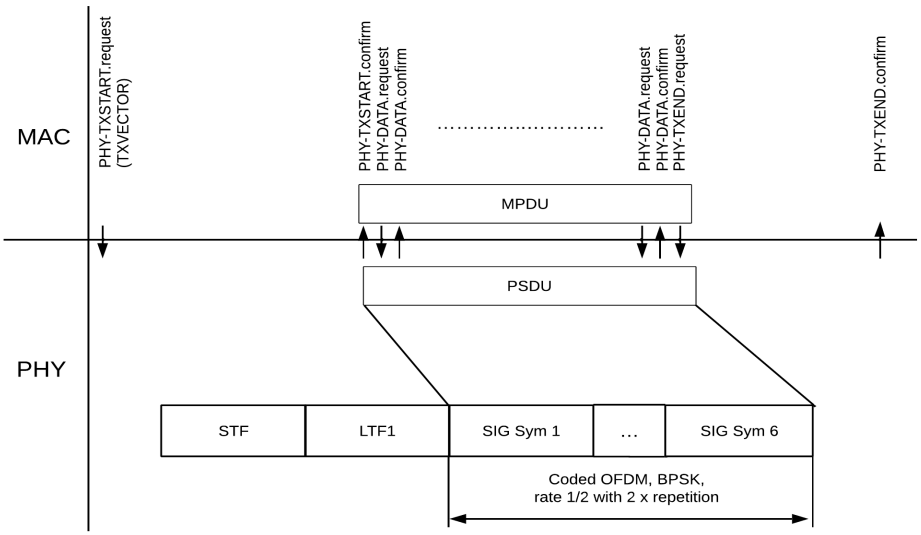


Figure 23-47—PHY transmit procedure for an NDP CMAC PPDU transmission using S1G_1M format

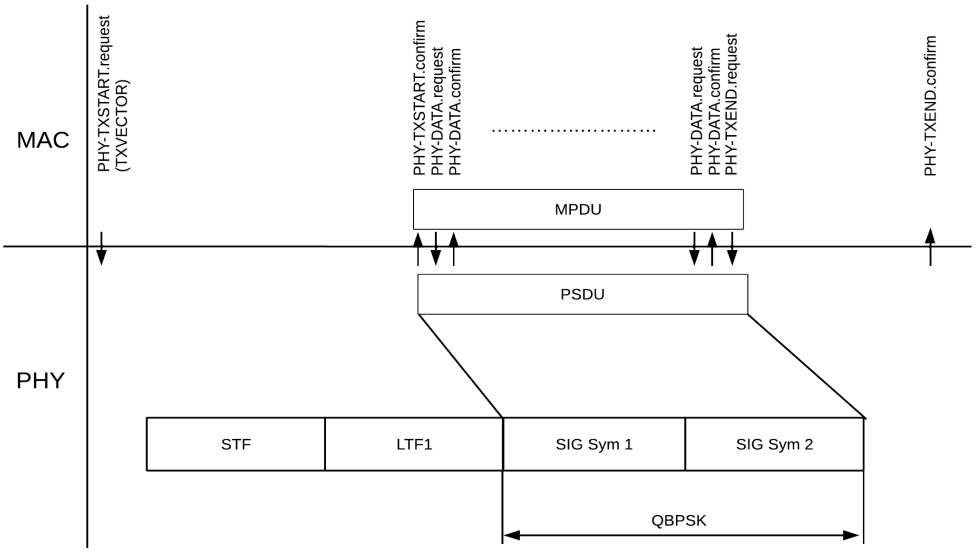

Figure 23-48—PHY transmit procedure for an NDP CMAC PPDU transmission using S1G_SHORT format

In case of transmission of the NDP CMAC PPDU, the PHY performs the same procedure like the typical transmit procedure as described in this subclause except as follows

— No service field appended
— No PHY padding bits appended to the PSDU
— No scrambling applied to PSDU
— PSDU is mapping to the SIG field

When the PPDU transmission is completed the PHY entity enters the receive state.

A typical state machine implementation of the transmit PHY for an S1G PPDU transmission is provided in Figure 23-49. Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as multi-user, LDPC, or STBC.

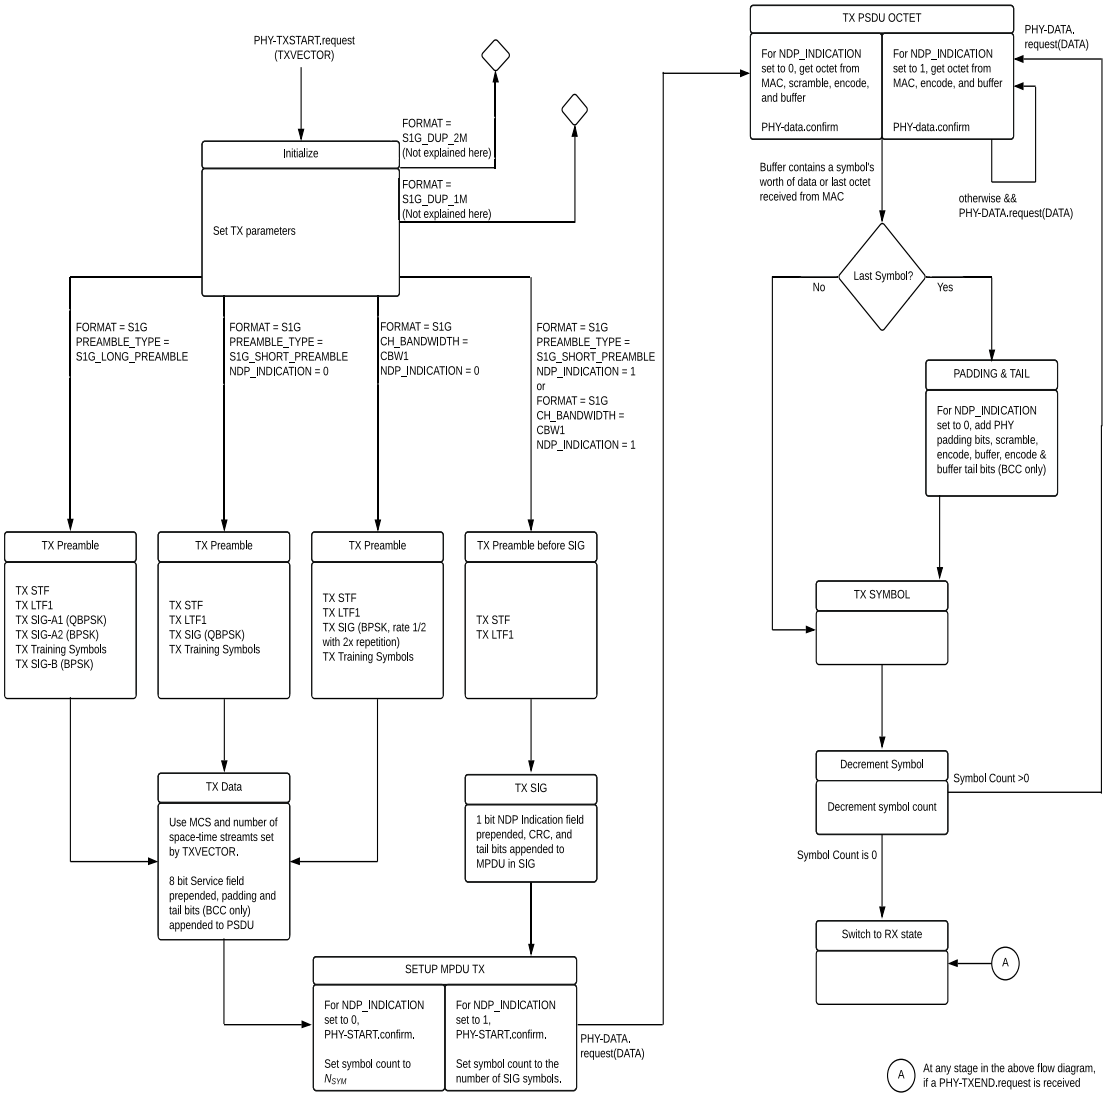

Figure 23-49—PHY transmit state machine for an S1G PPDU transmission

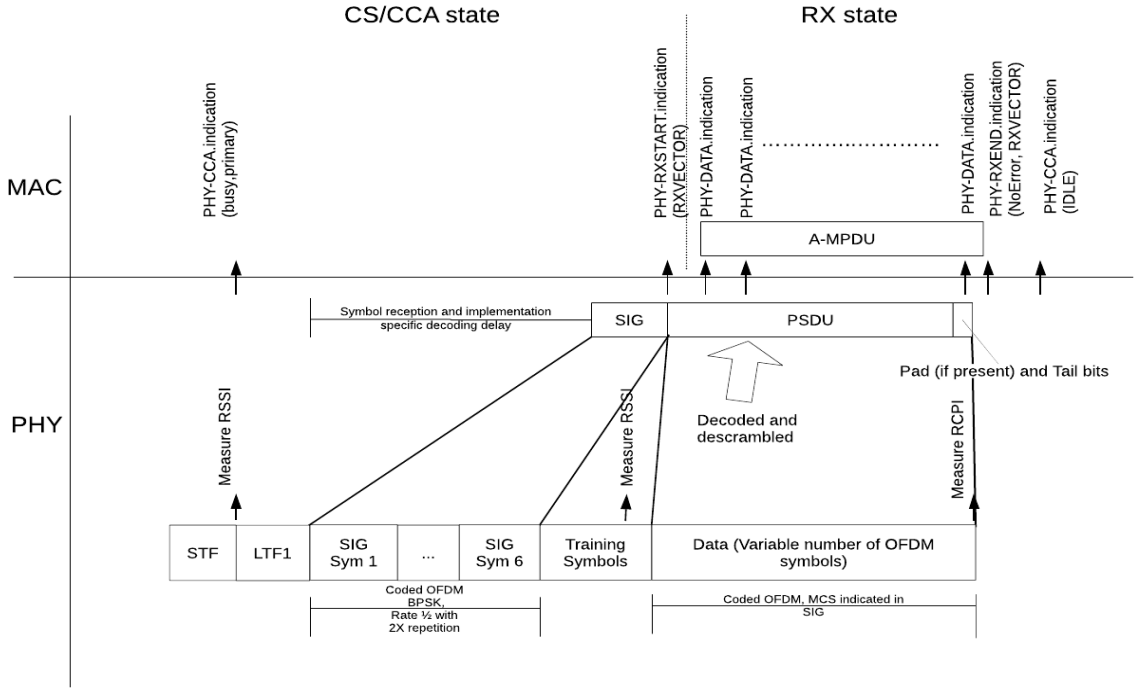
23.3.20 PHY receive procedure

Typical PHY receive procedures are shown in Figure 23-50, Figure 23-51, and Figure 23-52, corresponding to S1G_1M preamble format, S1G_SHORT preamble format, and S1G_LONG preamble format, respectively. A typical state machine implementation of the receive PHY is given in Figure 23-53. This receive procedure and state machine do not describe the operation of optional features, such as LDPC or STBC. Through station management (via the PLME) the PHY is set to the appropriate frequency, as specified in 23.4. The PHY has also been configured with group information (i.e., group membership and position in group) so that it can receive data intended for the STA. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.



NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

Figure 23-50—PHY receive procedure for an SU transmission, S1G_1M procedure

Upon receiving the transmitted PHY preamble overlapping the primary 2 MHz channel in a greater than or equal to 2 MHz BSS, or primary 1 MHz channel in a 1 MHz BSS, the PHY measures a receive signal strength. This activity is indicated by the PHY to the MAC via a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 23.3.18.5. The CH_BANDWIDTH parameter indicates one of the 1 MHz, 2 MHz, 4 MHz, 8 MHz and 16 MHz channel widths.

The PHY shall not issue a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary channel.

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

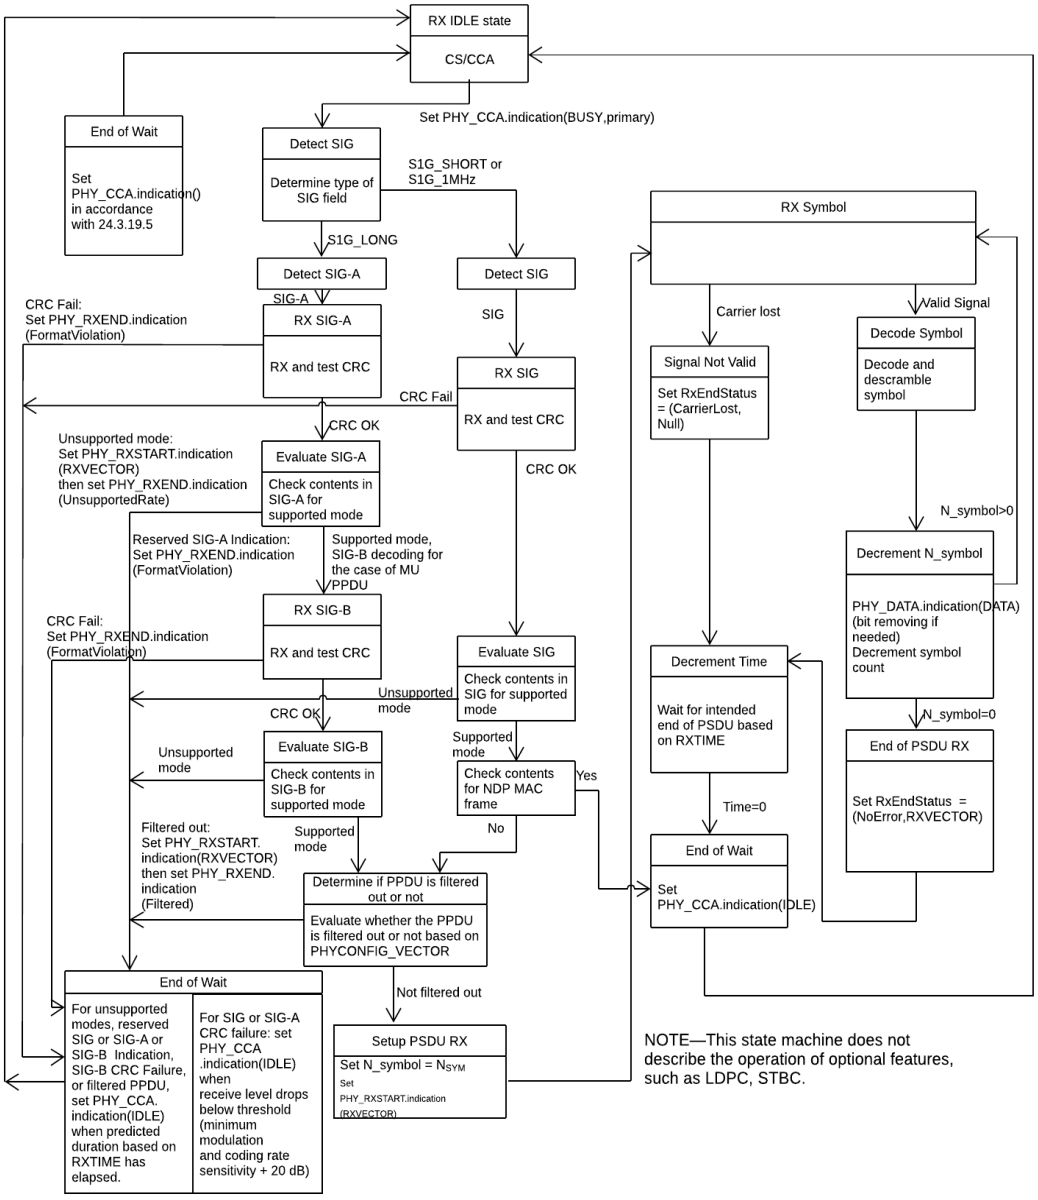

Figure 23-53—PHY receive state machine

After the PHY-CCA.indication(BUSY, channel-list) is issued, the PHY entity shall begin receiving the training symbols and searching for SIG or SIG-A in order to set the maximum duration of the data stream and get other PHY parameters such as the demodulation type, code type, and the decoding rate. If the check of the SIG or SIG-A CRC is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive, and set PHY_CCA.indication(IDLE) when receive level drops below threshold (minimum modulation and coding rate sensitivity + 20 dB). If a valid SIG or SIG-A CRC is indicated, and the Uplink Indication bit is 1 and the ID field value matches the PBSSID of the BSS of which the STA is a member or the Uplink Indication bit is 0 and the COLOR field value matches the COLOR indicated by the AP to which the STA is associated, then the S1G PHY shall maintain PHY-CCA.indication(BUSY, channel-list) for the predicted duration of

the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG or SIG-A Indication. If a valid SIG or SIG-A CRC is indicated, and the Uplink Indication bit is 1 and the ID field value does not match the PBSSID of the BSS of which the STA is a member or the Uplink Indication bit is 0 and the COLOR field value does not match the COLOR indicated by the AP to which the STA is associated, then the S1G PHY shall maintain PHY-CCA.indication(BUSY, channel-list) for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG-A Indication if the reception meets the minimum CCA sensitivity level specified in 23.3.18.5.4. Reserved SIG or SIG-A Indication is defined as an SIG or SIG-A with Reserved bits equal to 0 or a combination not valid as defined in 23.3.8.2.2.5, 23.3.8.2.3.2.5, or 23.3.8.3.5, or a combination of S1G-MCS and NSTS not included in 23.5 or any other SIG or SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 23.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication (RXVECTOR) shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 23.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.55 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

If the SIG or SIG-A indicates an unsupported mode, the PHY shall issue PHY-RXEND.indication(UnsupportedRate). If the SIG or SIG-A indicates an invalid CRC or Reserved SIG or SIG-A Indication, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation).

If the PHY preamble reception is successful and a valid SIG or SIG-A CRC is indicated:

— Upon reception of an S1G_LONG format preamble, after receiving a valid SIG-A indicating a supported mode, the PHY entity shall begin receiving the rest of S1G training symbols and SIG-B. If the received MU/SU subfield in SIG-A has a value indicating SU PPDU (see 23.3.8.2.3.2.5), the PHY entity does not need to decode SIG-B since in this case SIG-B does not carry any information bit (see 23.3.8.2.3.3.5). If the SIG-B is not decoded, subsequent to an indication of a valid SIG-A, a PHY-RXSTART.indication (RXVECTOR) primitive shall be issued.

  If the received MU/SU subfield in SIG-A has a value indicating MU PPDU (see 23.3.8.2.3.2.5), SIG-B shall be decoded. If the check of the SIG-B CRC is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive, and the S1G PHY shall maintain PHYCCA.indication(BUSY, channel-list) for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (23-69) or Equation (23-70), for all supported modes, unsupported modes, and Reserved SIG-B Indication. Reserved SIG-B Indication is defined as a SIG-B with the bits of the Reserved field not all 1s or MCS not included in 23.5. If the SIG-B indicates an unsupported mode, the PHY shall issue the error condition PHY-RXEND.indication(UnsupportedRate) primitive, and a PHY-RXSTART.indication primitive shall not be issued. If the check of the SIG-B CRC is valid and it indicates a supported mode, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 23-1.

— Upon reception of an S1G_SHORT or S1G_1M format preamble, after receiving a valid SIG indicating a supported mode, the PHY entity shall begin receiving the rest of S1G training symbols, and then a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 23-1.

  In this case, if the NDP Indication subfield in SIG field has a value indicating an NDP CMAC PPDU, the PHY shall generate a PHYCCA.indication(IDLE) primitive and return to RX IDLE state, and it shall not issue the PHY-RXSTART.indication(RXVECTOR) primitive.

The PHY optionally filters out the PPDU based on the GID, MU[0-3] NSTS, UPLINK_INDICATION and ID fields of SIG or SIG-A and the contents of the PHYCONFIG_VECTOR as follows:

- The PHY shall not filter out the PPDU if one of the following is true:
  - ($g = 0$) and (l_{00} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID00)
  - ($g = 63$) and (l_{63} is true) and (*partialaid* is included in PARTIAL_AID_LIST_GID63)
  - ($1 \leq g \leq 62$) and (MembershipStatusInGroupID[g] = 1) and (n_{STS}[UserPositionInGroupID[g]] > 0)
- where
  - l_{NN} is the one of the LISTEN_TO_GID*NN* parameters of the PHYCONFIG_VECTOR
  - MembershipStatusInGroupID[g] is the Membership Status Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
  - g is defined to be
    - The value of the GroupID field of the SIG-A for an S1G MU PPDU
    - 0 for an S1G SU PPDU when UPLINK_INDICATION is equal to 1
    - 63, in all other cases
  - $n_{STS}[u]$ is the value of the MU[u] NSTS field of SIG or SIG-A
  - UserPositionInGroupID[g] is the User Position Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
  - *partialaid* is the value of the ID field of SIG or SIG-A
- Otherwise, the PHY may filter out the PPDU.

If the PPDU is filtered out, the PHY shall issue a PHY-RXEND.indication(Filtered) primitive.

The Data field follows the training and signal fields. When the Coding subfield in SIG or SIG-A field indicates BCC, the number of symbols in the Data field is determined by Equation (23-65).

$$N_{SYM} = \begin{cases} \text{LENGTH}, & \text{if Aggregation} = 1 \\ m_{STBC} \times \left\lceil \dfrac{8 \times LENGTH + N_{service} + N_{tail} \times N_{ES}}{m_{STBC} \times N_{DBPS}} \right\rceil, & \text{if Aggregation} = 0 \end{cases} \quad (23\text{-}65)$$

where

N_{ES} and N_{DBPS}	are defined in Table 23-6
$N_{service}$ and N_{tail}	are defined in Table 23-4
m_{STBC}	is equal to 2 when STBC is used, and 1 otherwise
LENGTH and Aggregation	are the values indicated by the LENGTH and Aggregation subfields of SIG or SIG-A field, respectively

Copyright © 2021 IEEE. All rights reserved.

When the Coding subfield in SIG or SIG-A indicates LDPC and Aggregation subfield in SIG or SIG-A field is 1, the number of symbols in the Data field is determined by Equation (23-66).

$$N_{SYM} = LENGTH \tag{23-66}$$

where

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

When the Coding subfield in SIG or SIG-A indicates LDPC and Aggregation subfield in SIG or SIG-A field is 0, the parameter $N_{SYM, init}$ is determined by Equation (23-67).

$$N_{SYM,init} = m_{STBC} \times \left\lceil \frac{8 \times LENGTH + N_{service}}{m_{STBC} \times N_{DBPS}} \right\rceil \tag{23-67}$$

where

N_{DBPS} is defined in Table 23-6

$N_{service}$ is defined in Table 23-4

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

In this case, the number of symbols in the Data field N_{SYM} is determined by Equation (23-68).

$$N_{SYM} = \begin{cases} N_{SYM,init}, & \text{if LDPC Extra OFDM Symbol = 0} \\ N_{SYM,init} + 1, & \text{if LDPC Extra OFDM Symbol = 1 and STBC = 0} \\ N_{SYM,init} + 2, & \text{if LDPC Extra OFDM Symbol = 1 and STBC = 1} \end{cases} \tag{23-68}$$

where

LENGTH is the value indicated by the LENGTH subfield of SIG or SIG-A field

LDPC Extra OFDM Symbol is the value indicated by LDPC Extra subfield in SIG or SIG-A field

STBC is the value indicated by the STBC subfield in SIG or SIG-A field

The PHY parameter RXTIME for the case of S1G_SHORT or S1G_1M format is determined by Equation (23-69).

$$RXTIME(\mu s) = \begin{cases} T_{DSTF} + T_{LTF}(N_{LTF} - 1) + N_{SYM} T_{SYML}, & \text{if Short GI = 0} \\ T_{DSTF} + T_{LTF}(N_{LTF} - 1) + T_{SYML} + (N_{SYM} - 1).T_{SYMS}, & \text{if Short GI = 1} \end{cases} \tag{23-69}$$

where

T_{LTF} , T_{SYML} and T_{SYMS} are defined in Table 23-4

N_{LTF} is defined in Table 23-10

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The PHY parameter RXTIME for the case of S1G_LONG format is determined by Equation (23-70).

$$RXTIME(\mu s) = \begin{cases} T_{DSTF} + N_{LTF}T_{DLTF} + T_{SIG-B} + N_{SYM}T_{SYML}, & \text{if Short GI = 0} \\ T_{DSTF} + N_{LTF}T_{DLTF} + T_{SIG-B} + T_{SYML} + (N_{SYM} - 1).T_{SYMS}, & \text{if Short GI = 1} \end{cases} \quad (23\text{-}70)$$

where

T_{DLTF} , T_{SIG-B} , T_{SYML} and T_{SYMS} are defined in Table 23-4

N_{LTF} is defined in Table 23-10

When the Aggregation subfield in the SIG or SIG-A field is equal to 0, the value of the PSDU_LENGTH parameter returned in the RXVECTOR using is set to the LENGTH field of the SIG/SIG-A.

When the Aggregation subfield in the SIG or SIG-A field is equal to 1, the value of the PSDU_LENGTH parameter returned in the RXVECTOR using BCC encoding is calculated using Equation (23-71).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM}N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (23\text{-}71)$$

where

N_{ES} is defined in Table 23-6

N_{DBPS} is defined in Table 23-6

$N_{service}$ and N_{tail} are defined in Table 23-4

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using LDPC encoding is calculated using Equation (23-72).

$$PSDU_LENGTH = \left\lfloor \frac{N_{SYM}.N_{DBPS} - N_{service}}{8} \right\rfloor \quad (23\text{-}72)$$

where

N_{DBPS} is defined in Table 23-6

$N_{service}$ is defined in Table 23-4

When the Aggregation subfield in the SIG or SIG-A field is equal to 1, the value of the PSDU_LENGTH parameter returned in the RXVECTOR for an NDP sounding or an NDP CMAC PPDU is 0.

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition PHY-RXEND.indication(CarrierLost) shall be reported to the MAC. After waiting for the end of the PSDU as determined by Equation (23-69) or Equation (23-70), the PHY shall set the PHY-CCA.indication(IDLE) primitive and return to the RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the receiver shall be returned to the RX IDLE state, as shown in Figure 23-53.

23.4.2 PHY MIB

S1G PHY MIB attributes are defined in Annex C with specific values defined in Table 23-39. The "Operational semantics" column in Table 23-39 contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

23.4.3 TXTIME and PSDU_LENGTH calculation

For S1G_SHORT preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-73) for short GI and Equation (23-74) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1), \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} + T_{SYMS} \cdot (N_{SYM} - 1), \text{ if} N_{SYM} > 0 \end{cases} \quad (23\text{-}73)$$

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} \cdot N_{SYM} \quad (23\text{-}74)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

T_{STF}, T_{LTF1}, T_{LTF}, T_{SYML} and T_{SYMS} are defined in Table 23-4

T_{SIG} is defined in Table 23-5

N_{LTF} is defined in Table 23-10

For S1G_LONG preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-75) for short GI and Equation (23-76) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG-A} + T_{D_PREAMBLE} + T_{SIG-B}, \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG-A} + T_{D_PREAMBLE} + T_{SIG-B} + T_{SYML} + T_{SYMS} \cdot (N_{SYM} - 1), \text{ if } N_{SYM} > 0 \end{cases} \quad (23\text{-}75)$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG-A} + T_{D_PREAMBLE} + T_{SIG-B} + T_{SYML} N_{SYM} \quad (23\text{-}76)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

$T_{D_PREAMBLE} = T_{DSTF} + T_{DLTF} \cdot N_{LTF}$

T_{STF}, T_{LTF1}, T_{DSTF}, T_{DLTF}, T_{SIG-B}, T_{SYML} and T_{SYMS} are defined in Table 23-4

T_{SIG-A} is defined in Table 23-5.

N_{LTF} is defined in Table 23-10.

For S1G_1M preamble, the value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for an S1G PPDU using Equation (23-77) for short GI and Equation (23-78) for long GI.

$$\text{TXTIME} = \begin{cases} T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1), \text{ if } N_{SYM} = 0 \\ T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} + T_{SYMS}(N_{SYM} - 1), \text{ if } N_{SYM} > 0 \end{cases} \quad (23\text{-}77)$$

$$\text{TXTIME} = T_{PREAMBLE} + T_{SIG} + T_{LTF} \cdot (N_{LTF} - 1) + T_{SYML} N_{SYM} \quad (23\text{-}78)$$

where

$T_{PREAMBLE} = T_{STF} + T_{LTF1}$

T_{STF}, T_{LTF1}, T_{LTF}, T_{SIG}, T_{SYML} and T_{SYMS} are defined in Table 23-4

N_{LTF} is defined in Table 23-10

For an NDP, there is no Data field and $N_{SYM} = 0$.

For an S1G SU PPDU using BCC encoding, the total number of data symbols in the Data field, $N_{SYM,}$ is given by Equation (23-79) if the Aggregation subfield in its SIG field or SIG-A field is set to 1 or Equation (23-80) otherwise.

$$N_{SYM} = m_{STBC} \times \left\lceil \frac{8 \cdot APEP_LENGTH + N_{service} + N_{tail} \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (23\text{-}79)$$

$$N_{SYM} = m_{STBC} \times \left\lceil \frac{8 \cdot PSDU_LENGTH + N_{service} + N_{tail} \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (23\text{-}80)$$

where

m_{STBC}	is equal to 2 when STBC is used, and 1 otherwise
N_{ES} and N_{DBPS}	are defined in Table 23-6
$N_{service}$ and N_{tail}	are defined in Table 23-4
PSDU_LENGTH	is the value of TXVECTOR parameter PSDU_LENGTH

For an S1G SU PPDU using LDPC encoding, the total number of data symbols in the Data field, N_{SYM}, is given in 23.3.9.4.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For an S1G MU PPDU, the total number of data symbols in the Data field, N_{SYM}, is given by

$$N_{SYM} = \max\{N_{SYM,u}\}_{u=0}^{N_{user}-1}$$

where

$N_{SYM,u}$ is defined in Equation (23-79) replacing N_{SYM}, $APEP_LENGTH$, N_{ES}, and N_{DBPS} with $N_{SYM,u}$, $APEP_LENGTH_u$, $N_{ES,u}$, and $N_{DBPS,u}$ for BCC and in 23.3.9.4.4 for LDPC

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an S1G SU PPDU using BCC encoding is calculated using Equation (23-81)

$$PSDU_LENGTH = \left\lfloor \frac{N_{SYM} \cdot N_{DBPS} - N_{service} - N_{tail} N_{ES}}{8} \right\rfloor \quad (23\text{-}81)$$

where

N_{SYM} is given by Equation (23-79) or Equation (23-80)

N_{ES} and N_{DBPS} are defined in Table 23-6

$N_{service}$ and N_{tail} are defined in Table 23-4

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an S1G SU PPDU using LDPC encoding is calculated using Equation (23-82)

$$PSDU_LENGTH = \left\lfloor \frac{N_{SYM,init} \cdot N_{DBPS} - N_{service}}{8} \right\rfloor \quad (23\text{-}82)$$

where

$N_{SYM,init}$ is given by Equation (23-46) or Equation (23-47)

N_{DBPS} is defined in Table 23-6

$N_{service}$ is defined in Table 23-4

The value of the PSDU_LENGTH parameter for user u returned in the PLME-TXTIME.confirm primitive and in the RXVECTOR for an S1G MU PPDU is calculated using Equation (23-83)

$$PSDU_LENGTH_u = \begin{cases} \left\lfloor \frac{N_{SYM} \cdot N_{DBPS,u} - N_{service} - N_{tail} N_{ES,u}}{8} \right\rfloor & \text{when BCC is used for user } u \\ \left\lfloor \frac{N_{SYM_max_init} \cdot N_{DBPS,u} - N_{service}}{8} \right\rfloor & \text{when LDPC is used for user } u \end{cases} \quad (23\text{-}83)$$

where

$N_{SYM_max_init}$ is given by Equation (21-65)

$N_{ES,u}$ is N_{ES} for user u, where N_{ES} is defined in Table 23-6

$N_{DBPS,u}$ is N_{DBPS} for user u, where N_{DBPS} is defined in Table 23-6

$N_{service}$ and N_{tail} are defined in Table 23-4

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NDP is 0.

23.4.4 PHY characteristics

The static S1G PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 23-40. The definitions for these characteristics are given in 6.5.4.

Table 23-40—S1G PHY characteristics

Characteristics	Value
aSlotTime	52 μs
aSIFSTime	160 μs
aCCATime	< 40 μs
aRxPHYStartDelay	600 μs for S1G_1M preamble; 280 μs for S1G_SHORT preamble and S1G_LONG preamble.
aRxTxTurnaroundTime	Implementation dependent, see 10.3.7.
aTxPHYDelay	Implementation dependent, see 10.3.7.
aRxPHYDelay	Implementation dependent, see 10.3.7.
aRxTxSwitchTime	Implementation dependent, see 10.3.7.
aTxRampOnTime	Implementation dependent, see 10.3.7.
aAirPropagationTime	6 μs
aMACProcessingDelay	Implementation dependent, see 10.3.7.
aDTT2UTTTime	320 μs
aCCAMidTime	212 μs
aPPDUMaxTime	27 920 μs (see NOTE 1)
aPSDUMaxLengthWithNoAggregation	511 octets (see NOTE 2)
aPSDUMaxLength	797 159 octets (see NOTE 3)

NOTE 1—This is the maximum PPDU duration in μs for an S1G_1M PPDU with a bandwidth of 1 MHz, S1G-MCS 10 and 1 spatial stream, limited by PSDU length of 511 octets.

NOTE 2—This is the maximum PSDU length in octets for an S1G PPDU supported by the Length field in the S1G SIG field when the Aggregation field is 0.

NOTE 3—This is the maximum length in octets for an S1G SU PPDU with a bandwidth of 16 MHz, S1G-MCS 9 and 4 spatial streams, limited by 511 data symbols supported by the Length field in the S1G SIG field, excluding the SERVICE field and tail bits.

23.5 Parameters for S1G-MCSs

The rate-dependent parameters for 1 MHz, 2 MHz, 4 MHz, 8 MHz, and 16 MHz, N_{ss} = 1,...,4 are given in Table 23-41 to Table 23-60. Support for 4 μs GI is optional in all cases. Support for MCS 8 and 9 (when valid) is optional in all cases. An S1G AP-STA shall support single spatial stream MCSs within the range MCS 0 to MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Data Rate subfield values in the VHT Supported MCS Set field. An S1G non-AP STA shall support single spatial stream MCSs within the range MCS 0 to MCS 2 for 1 and 2 MHz channel widths.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When more than one spatial stream is supported, the Tx or Rx Highest Supported Data Rate subfield values in the VHT Supported MCS Set field may result in a reduced MCS range (cut-off) for greater than one spatial stream. Support for 1 MHz and 2 MHz with N_{SS} = 1 is mandatory. Support for 1 and 2 MHz with N_{SS} = 2,3,4 is optional. Support for 4 MHz, 8 MHz, and 16 MHz with N_{SS} = 1,...,4 is optional.

NOTE—When LDPC is used with MCS 10, the resulting N_{CBPS} is 12 because the 2× repetition is applied after the LDPC encoding procedure.

24. China directional multi-gigabit (CDMG) PHY specification

24.1 CDMG PHY introduction

24.1.1 Scope

The CDMG PHY supports a 1.08 GHz channel width in comparison with the DMG PHY in Clause 20, which supports a 2.16 GHz channel width. As many aspects of CDMG PHY are the same as DMG PHY, this clause mainly lists the new features corresponding to Clause 20.

The CDMG PHY supports two modulation methods:

— A control modulation using MCS 0 of the CDMG Control mode defined in 24.4

— A single carrier (SC) modulation using MCS 1 to MCS 16 of the CDMG SC mode defined in 24.5 and MCS 17 to MCS 23 of the CDMG low-power SC mode defined in 24.6

All CDMG modulation methods share a similar preamble (see 24.3.6).

The services provided to the MAC by the CDMG PHY consist of the following protocol functions, defined as follows:

a) A function that defines a method of mapping the PHY service data units (PSDU) into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the MCSs, these STAs support a mixture of CDMG SC mode, CDMG low-power SC mode, and CDMG control mode.

24.1.2 CDMG PHY functions

24.1.2.1 General

The CDMG PHY contains two functional entities: the PHY and the layer management function (PLME). Each of these functions is described in detail in 24.3 to 24.9. The CDMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 8.

24.1.2.2 PHY management entity

The PLME performs management of the local PHY functions in conjunction with the MLME.

24.1.2.3 Service specification method

The description for service specification method is the same as that contained in 20.1.2.2.

24.2 CDMG PHY service interface

24.2.1 Introduction

The introduction for CDMG PHY service interface is the same as that contained in 20.2.1.

24.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 24-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 24-1—TXVECTOR and RXVECTOR parameters

Parameter	Value	TXVECTOR	RXVECTOR
MCS	The MCS parameter is an enumerated type that indicates the modulation and coding scheme used in the transmission of the packet. Values are integers in the range 0–23. — A MCS value of 0 indicates the use of CDMG control mode or CDMG robust PHY mode. — MCS values of 1 to 16 indicate use of Single Carrier modulations. The value is an index to Table 24-4. — MCS values of 17–23 indicate use of CDMG low-power SC mode. The value is an index toTable 24-6. The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	Y	Y
LENGTH	Indicates the number of octets in the PSDU in the range 1–262 143.	Y	Y
ADD_PPDU	Enumerated type: — ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — NO-ADD-PPDU indicates no additional PPDU follows this PPDU.	Y	Y
PPDU_TYPE	Enumerated type: — TRN-R indicates either a PPDU whose Data field is followed by one or more TRN subfields, or a PPDU that is requesting TRN subfields to be appended to a future response PPDU. — TRN-T indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV configuration at the beginning of each TRN subfield. This parameter is reserved if TRN_LEN is 0.	Y	Y
TRN_LEN	TRN_LEN indicates the length of the training field. Values are in the range 0–16 (see 24.9.2.2.3).	Y	Y
AGGREGATION	Indicates whether the PSDU contains an A-MPDU. Enumerated type: — AGGREGATED indicates this is a PSDU with A-MPDU aggregation. — NOT_AGGREGATED indicates this is a PSDU without A-MPDU aggregation.	Y	Y
RSSI	The allowed values for the RSSI parameter are in the range from 0 to 255. This parameter is a measure by the PHY of the power observed at the input of the antennas plus the antenna gain, or equivalent antenna gain for a phase-array antenna, used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.	N	Y
SNR	This parameter indicates the SNR measured during the reception of a CDMG control mode packet. Values are –10 dB to 53.75 dB in 0.25 dB steps.	N	Y

Table 24-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
ANT_CONFIG	Indicates which antenna configuration(s) is to be used throughout the transmission of the packet and when to switch between configurations. Values are implementation dependent.	Y	N
CHAN_MEASUREMENT	Channel as measured during the reception of the TRN subfields. Each measurement includes 63 complex numbers.	N	Y
TIME_OF_DEPARTURE_REQUESTED	Enumerated type: — true indicates that the MAC entity requests that the PHY entity measure and report time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. — false indicates that the MAC entity requests that the PHY entity neither measure nor report time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 10 nanosecond units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC.	N	See NOTE
BEAM_TRACKING_REQUEST	This parameter indicates whether beam tracking is requested. Enumerated type: — BEAM-TRACKING-REQUESTED or BEAM-TRACKING-NOT-REQUESTED.	Y	Y
LAST_RSSI	In the TXVECTOR, LAST_RSSI indicates the received power level of the last packet with a valid PHY header that was received a SIFS before transmission of the current packet; otherwise, it is 0 (10.3.2.3.3). In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the PCLP header of the received packet.Valid values are integers in the range 0 to 15: — Values of 2 to 14 represent power levels (–74+value×2) dBm. — A value of 15 represents power greater than or equal to –45 dBm. — A value of 1 represents power less than or equal to –71 dBm. — A value of 0 indicates that the previous packet was not received a SIFS before the current transmission.	Y	Y
Turnaround	Set to 1 or 0 as specified in 10.3.2.3.3.	Y	Y
ENHANCED_BEAM_TRACKING_REQUEST	This parameter indicates whether enhanced beam tracking is requested. Enumerated type: — ENHANCED-BEAM-TRACKING-REQUESTED or ENHANCED-BEAM-TRACKING-NOT-REQUESTED.	Y	Y
ROBUST_MODE	This parameter incorporating with the MCS parameter is an enumerated type that indicates CDMG control mode or CDMG robust PHY mode used in the transmission of the packet. It is present if MCS index is 0. Values are integers in the range 0–2. — A CDMG ROBUST_MODE value of 0 indicates the use of CDMG control mode. — A CDMG ROBUST_MODE value of 1 indicates the use of CDMG robust PHY mode 0. — A CDMG ROBUST_MODE value of 2 indicates the use of CDMG robust PHY mode 1. This parameter is not present if MCS index is not 0.	Y	Y
NOTE—“Y” if dot11TimingMsmtActivated is true; otherwise, “N”.

24.2.3 TXSTATUS parameters

The parameters listed in Table 24-2 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm primitive.

Table 24-2—TXSTATUS parameters

Parameter	Value
TIME_OF_DEPARTURE	When the first frame energy is sent by the transmitting port, in units equal to 1/TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TIME_OF_DEPARTURE_ClockRate	0 to 2^{16}–1. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request.
TX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 10 nanosecond units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC.

24.3 Common parameters

24.3.1 Channelization

The CDMG PHY operates in the channels defined in Annex E and shall support at least channel numbers 2, 35, and 36.

The channel center frequency is defined as:

Channel center frequency = Channel starting frequency + Channel spacing × (Channel number mod 32)

where the channel starting frequency is equal to 56.16 GHz, and the channel spacing is defined in Table E-6 in Annex E.

24.3.2 Transmit mask

The transmitted spectrum shall adhere to the transmit spectrum mask shown in Figure 24-1. The transmit spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 0.94 GHz, –17 dBr at a 0.6 GHz offset, –22 dBr at a 1.35 GHz offset, and –30 dBr at a 1.53 GHz offset and above, inside the channels allowed for the regulatory domain in which the STA is transmitting. The measurement shall be made using a 1 MHz resolution bandwidth and a 300 kHz video bandwidth.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The transmitted spectrum shall be measured on data packets longer than 10 μs without the training fields.

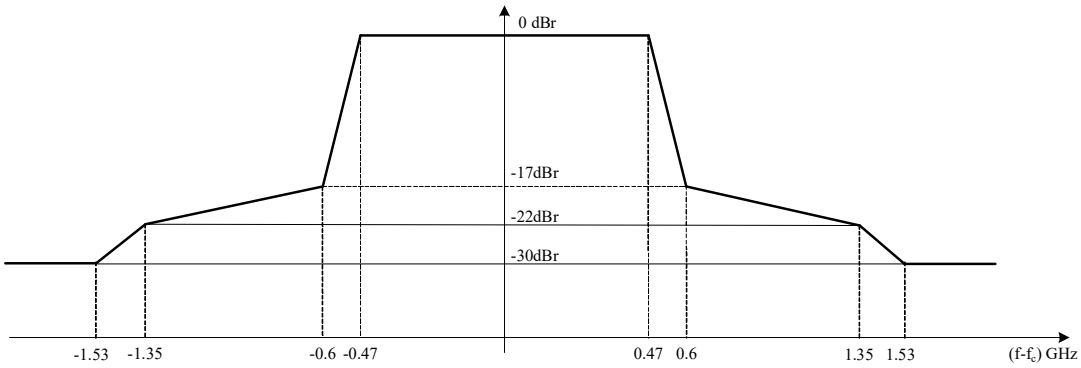

Figure 24-1—Transmit mask

24.3.3 Common requirements

24.3.3.1 Introduction

This subclause describes the common requirement from all three CDMG modes: control, SC, and low-power SC.

In all of the modes, all defined fields are transmitted bit 0 first in time.

24.3.3.2 Center frequency tolerance

24.3.3.2.1 General

The transmitter center frequency tolerance shall be ± 20 ppm.

24.3.3.2.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 0.9 μs from the start of the packet.

24.3.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

24.3.3.4 Transmit center frequency leakage

The transmitter center frequency leakage shall not exceed –23 dB relative to the overall transmitted power.

24.3.3.5 Transmit rampup and rampdown

The description for transmit rampup and rampdown for CDMG PHY is the same as that contained in 20.3.3.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

24.3.3.6 Antenna setting

Antenna setting shall remain constant for the transmission of the entire packet except for the case of transmission of BRP-TX PPDU (see 24.9.2.2). During the transmission of BRP-TX PPDUs it shall remain constant for the transmission of the STF, CE field, and Data field.

24.3.3.7 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver for which the error rate criterion (defined in 24.3.3.8) is met. A receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 $\mu W/cm^2$ for each of the modulation formats that the receiver supports.

24.3.3.8 Receiver minimum input sensitivity

For MCS 0, the PER shall be less than 5% for a PSDU length of 256 octets with the MCS dependent input levels listed in Table 24-3 defined at the antenna connector. For the other MCSs, the PER shall be less than 1% for a PSDU length of 4096 octets with the MCS dependent input levels listed in Table 24-3 defined at the antenna connector.

NOTE—For RF power measurements performed over the air, the input level is corrected to compensate for the antenna gain in the implementation. The gain of the antenna is the maximum estimated gain by the manufacturer. In the case of the phased-array antenna, the gain of the phased-array antenna is the maximum sum of estimated element gain minus 3 dB implementation loss.

Table 24-3 assumes 5 dB implementation loss and 10 dB noise factor (noise figure).

24.3.4 Timing-related parameters

Table 24-4 defines timing-related parameters.

Table 24-4—Timing-related parameters

Parameter	Value
N_{GI}	64
N_{SPB}	448
F_c: chip rate	880 MHz
T_c: chip time	$1 / F_c$ (~1.14 ns)
T_{seq}	$128 \times T_c$ (~146 ns)
T_{STF}: Detection sequence duration	$18 \times T_{seq}$ (~2618.2 ns)
T_{CE}: Channel estimation sequence duration	$9 \times T_{seq}$ (~1309.1 ns)
T_{HEADER}: header duration	$3 \times 512 \times T_c$ (~1.75 μs)
$T_{STF\text{-}CP}$: Control mode short training field duration	$50 \times T_{seq}$ (~7.2727 μs)
$T_{CE\text{-}CP}$: Control mode channel estimation field duration	T_{CE} (~1309.1 ns)
T_{Data}	(N_{BLKS} × aSCBlockSize + aSCGILength) × T_c NOTE—N_{BLKS} is defined in 20.5.3.2.3.3 and aSCBlockSize and aSCGILength are defined in Table 20-30.

24.3.5 Mathematical conventions in the signal description

The description for CDMG PHY packet structure and related equations is the same as that contained in 20.3.5.1.

24.3.6 Common preamble

24.3.6.1 General

The preamble is the part of the PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, I/Q imbalance estimation, indication of modulation (SC), and channel estimation. The SFS field in the preamble enables the receiver to perform estimation and compensation for the packet in a time domain and frequency domain according to the STF. The format of the preamble consists of a Short Training field followed by a Channel Estimation field. Figure 24-2 illustrates the SC packet preamble.

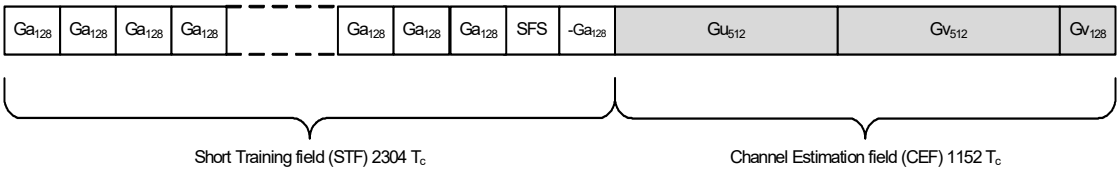

Figure 24-2—CDMG SC mode preamble

All numeric fields are transmitted in unsigned format, LSB first.

24.3.6.2 Short training field

The Short Training field is composed of 16 repetitions of sequences $Ga_{128}(n)$ of length 128 defined in 20.10, a single frequency sequence (SFS) of length 256 that used for I/Q imbalance estimation, followed by a single sequence $-Ga_{128}(n)$. The SFS is defined as

$$SFS(n) = \exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots$$

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} (Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 16 \times 128 - 1 \\ \exp\left(j\pi\frac{n}{2}\right), n = 16 \times 128, \ldots, 17 \times 128 - 1 \\ (-Ga_{128}(n \bmod 128))\exp\left(j\pi\frac{n}{2}\right), n = 17 \times 128, \ldots, 18 \times 128 - 1 \end{cases}$$

24.3.6.3 Channel estimation field

The Channel Estimation field is used for channel estimation, as well as indication of which modulation is going to be used for the packet, and enables the receiver to suppress nonlinear impact generated in a power amplification process according to the CE field. The Channel Estimation field is composed of a concatenation of two sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ where the last 128 samples of $Gu_{512}(n)$ are equal to the last 128 samples used in the Short Training field. They are followed by a 128 samples sequence $Gv_{128}(n)$ equal to the first 128 samples of both $Gu_{512}(n)$ and $Gv_{512}(n)$.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The Gu_{512} and Gv_{512} sequences are defined as

$$Gu_{512} = \left[-Gb_{128}\ -Ga_{128}\ Gb_{128}\ -Ga_{128}\right]$$

$$Gv_{512} = \left[-Gb_{128}\ Ga_{128}\ -Gb_{128}\ -Ga_{128}\right]$$

When the data field of the packet is modulated using single carrier, the Gu_{512} and Gv_{512} fields are concatenated in the order illustrated in Figure 24-3.

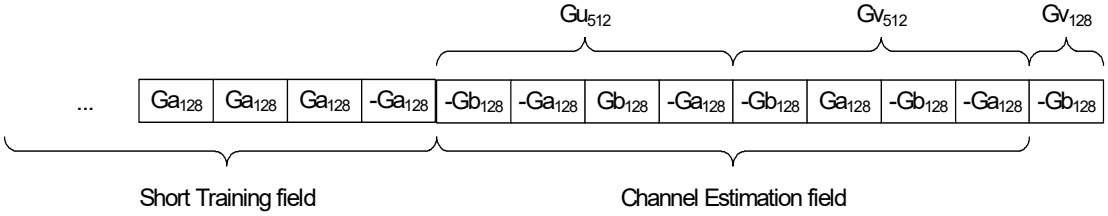

Figure 24-3—Channel Estimation field for SC packets

The waveform for the channel estimation sequence is

$$r_{CE_{SC}}(nT_c) = (Gu_{512}(n) + Gv_{512}(n-512) + Gv_{128}(n-1024))\exp\left(j\pi\frac{n}{2}\right),\ n = 0, 1, \ldots, 1151$$

Note that sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ are defined for $0 \le n \le 511$. For other values of n, $Gu_{512}(n)$ and $Gv_{512}(n)$ are set to 0.

24.3.7 HCS calculation for headers of CDMG control mode and CDMG SC mode

The description for HCS calculation for headers of CDMG control mode and CDMG SC mode is the same as that contained in 20.3.7.

24.3.8 Common LDPC parity matrices

The description for common LDPC parity matrices for CDMG PHY is the same as that contained in 20.3.8.

24.3.9 Scrambler

The description for CDMG PHY scrambler is the same as that contained in 20.3.9.

24.3.10 Received channel power indicator (RCPI) measurement

The description for received channel power indicator (RCPI) measurement for CDMG PHY is the same as that contained in 20.3.10.

24.4 CDMG control mode

24.4.1 Introduction

Transmission and reception of control mode PPDUs are mandatory. CDMG control mode uses the same chip rate as the CDMG SC mode. CDMG control mode is transmitted when the TXVECTOR indicates MCS 0.

The modulation and coding scheme for the CDMG control mode is shown in Table 24-5.

Table 24-5—CDMG control mode modulation and coding scheme

MCS index	Modulation	Code rate	Data rate
0	DBPSK	1/2[a]	13.75 Mb/s[a]

[a] Code rate and data rate might be lower due to codeword shortening.

24.4.2 PPDU format

The CDMG control mode PPDU is composed of the Preamble, Header, Data field, and possibly AGC and TRN subfields. This is shown in Figure 24-4.

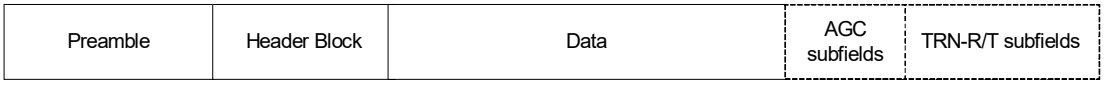

Figure 24-4—CDMG control mode PPDU format

24.4.3 Transmission

24.4.3.1 Preamble

24.4.3.1.1 General

The preamble is the part of the CDMG control mode PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, indication of frame type, and channel estimation.

The preamble is composed of two parts as shown in Figure 24-5: the Short Training field and the Channel Estimation field.

Figure 24-5—CDMG control mode preamble

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

24.4.3.1.2 Short Training field

The Short Training field is composed of 48 repetitions of sequences $Gb_{128}(n)$ of length 128, followed by a single $-Gb_{128}(n)$ sequence (for synchronization) and then a single $-Ga_{128}(n)$ sequence. The sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined in 20.10.

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 0, 1, \ldots, 48 \times 128 - 1 \\ -Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 48 \times 128, \ldots, 49 \times 128 - 1 \\ -Ga_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right), & n = 49 \times 128, \ldots, 50 \times 128 - 1 \end{cases}$$

Note that sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined for $0 \le n \le 127$. For other values of n, they are set to 0.

24.4.3.1.3 Channel Estimation field

The Channel Estimation field is the same as the Channel Estimation field of the CDMG SC mode, as defined in Figure 24-3 of 24.3.6.3.

24.4.3.2 Header

24.4.3.2.1 General

In the CDMG control mode, the preamble is followed by the header block. The header consists of several fields that define the details of the PPDU to be transmitted.

The header fields are described in Table 24-1.

Table 24-1—CDMG control mode header fields

Field name	Bit	Description
Differential Encoder Initialization	B0	Used to initialize the differential encoding *c(0)* in 20.4.3.3.4. May be set to any value.
Scrambler Initialization	B1–B4	Bits X1–X4 of the initial scrambler state (see 20.4.3.3.2).
Length	B5–B14	Number of data octets in the PSDU. Range 14–1023.
PPDU Type	B15	As defined in Table 24-3.
Training Length	B16–B20	Length of the training field. The use of this field is defined in 24.9.2.2.3.
Turnaround	B21	Contains a copy of the parameter TURNAROUND from the TXVECTOR.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 24-1—CDMG control mode header fields *(continued)*

Field name	Bit	Description
Robust PHY Mode Indication/Reserved bits	B22–B23	— Set to 00: control mode. — Set to 01: robust PHY mode 0. — Set to 10: robust PHY mode 1. — Set to 11: reserved.
HCS	B24–B39	Header check sequence. Calculation of the header check sequence is defined in 24.3.7.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

24.4.3.2.2 Generation of HCS bits

The header check sequence (HCS) is calculated over bits 0–23 and uses CRC 16-CCITT as described in 24.3.7.

24.4.3.2.3 Header encoding and modulation

The header bits followed by the HCS bits are prepended to the data field bits and passed into the data field encoder per 24.4.3.3. The minimal payload length is 14 octets

24.4.3.3 Data field

The description for Data field for CDMG control mode is the same as that contained in 20.4.3.3.

24.4.4 Performance requirements

24.4.4.1 Transmit requirements

24.4.4.1.1 Introduction

Transmitter performance requirements of the CDMG control mode are defined in 24.4.4.1.2.

24.4.4.1.2 Transmit EVM

The description for transmit EVM for CDMG control mode is the same as that contained in 20.4.4.1.2.

24.4.4.2 Receive requirements

24.4.4.2.1 Introduction

This subclause describes the performance requirement from the CDMG control mode receiver.

24.4.4.2.2 CCA

The start of a CDMG control mode transmission at a receive level greater than –71 dBm shall cause CCA to indicate busy with a probability > 90% within 3 μs.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

24.5 CDMG SC mode

24.5.1 Introduction

Transmission and reception of CDMG SC mode PPDUs are mandatory for selected MCSs.

24.5.2 PPDU format

A SC frame is composed of the Short Training field (STF), the Channel Estimation (CE) field, the Header, SC blocks and optional training fields, as shown in Figure 24-6.

Figure 24-6—SC frame format

The robust PHY modes use the CDMG control mode with short spreading sequences for the data. (See Table 24-2.) The following Golay complementary sequences Ga(8) and Ga(4) are used as spreading sequences for robust PHY mode 0 and 1, respectively.

Ga(8)=(+1, +1, +1, −1, +1, +1, −1, +1)

Ga(4)=(+1, +1, +1, −1)

Table 24-2—CDMG robust PHY modes

CDMG-Robust mode	Modulation	Code rate	Spreading sequence	Data rate (Mb/s)
0	DBPSK	1/2	Ga(8)	55
1	DBPSK	1/2	Ga(4)	110

24.5.3 Transmission

24.5.3.1 Header

24.5.3.1.1 General

In the CDMG SC mode, the preamble is followed by the header. The header consists of several fields that define the details of the PPDU to be transmitted. The encoding and modulation of the header are described in 24.5.3.1.4.

The header fields are described in Table 24-3.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 24-3—CDMG SC mode header fields

Field name	Number of bits	Start bit	Description
Scrambler Initialization	7	0	Bits X1–X7 of the initial scrambler state (see 20.3.9).
MCS	6	7	Modulation and coding scheme (see Table 24-4).
Length	18	13	Number of data octets in the PSDU. Range 1–262 143.
Additional PPDU	1	31	Contains a copy of the parameter ADD_PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU.
PPDU Type	1	32	Corresponds to the TXVECTOR parameter PPDU_TYPE. — PPDU Type = 0 (BRP-RX PPDU, see 20.9.2.2.3), indicates either a packet whose Data field is followed by one or more TRN subfields (when the Beam Tracking Request field is 0 or in CDMG control mode), or a PPDU that contains TRN subfields to be appended to a future response PPDU (when the Beam Tracking Request field is 1). — PPDU Type = 1 (BRP-RX PPDU, see 20.9.2.2.3), indicates a PPDU whose Data field is followed by one or more TRN subfields. The transmitter may change AWV at the beginning of each TRN subfield. The field is reserved when the Training Length field is 0.
Training Length	5	33	Corresponds to the TXVECTOR parameter TRN_LEN. If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 24.9.2.2.3. A value of 0 indicates that no training field is present in this PPDU. If the Beam Tracking Request field is 1 and the PPDU Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the PPDU Type field is 0, the Training Length field indicates the length of the training field requested for receive training.
Aggregation	1	38	Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0.
Beam Tracking Request	1	39	Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.42.7); otherwise, set to 0. The Beam Tracking Request field is reserved when the Training Length field is 0.
Last RSSI	4	40	Contains a copy of the parameter LAST_RSSI from the TXVECTOR. The value is an unsigned integer: Values of 2 to 14 represent power levels (–74+value×2) dBm. A value of 15 represents a power greater than or equal to –45 dBm. A value of 1 represents a power less than or equal to –71 dBm. A value of 0 indicates that the previous packet was not received a SIFS period before the current transmission.
Turnaround	1	44	As defined in Table 24-1.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 24-3—CDMG SC mode header fields *(continued)*

Field name	Number of bits	Start bit	Description
Enhanced Beam Tracking Request	1	45	Corresponds to the TXVECTOR parameter ENHANCED_BEAM_TRACKING_REQUEST. Set to 1 to indicate that one STF and CE field are appended to the Data and TRN fields. Otherwise, set to 0.
Reserved	2	46	
HCS	16	48	Header check sequence. Definition of this field calculation is in 24.5.3.1.3.

24.5.3.1.2 Modulation and coding scheme

The modulation and coding scheme (MCS) field specifies the modulation and code rate that is used in the PPDU. The modulation and coding schemes for the SC mode are defined in Table 24-4.

Table 24-4—CDMG SC mode modulation and coding schemes

MCS index	Modulation	N_{CBPS}	Repetition	Code rate	Data rate (Mb/s)
1	π/2-BPSK	1	2	1/2	192.5
2	π/2-BPSK	1	1	1/2	385
3	π/2-BPSK	1	1	5/8	481.25
4	π/2-BPSK	1	1	3/4	577.5
5	π/2-BPSK	1	1	13/16	625.625
6	π/2-QPSK	2	1	1/2	770
7	π/2-QPSK	2	1	5/8	962.5
8	π/2-QPSK	2	1	3/4	1155
9	π/2-QPSK	2	1	13/16	1251.25
10	π/2-16-QAM	4	1	1/2	1540
11	π/2-16-QAM	4	1	5/8	1925
12	π/2-16-QAM	4	1	3/4	2310
13	π/2-16-QAM	4	1	13/16	2502.5
14	π/2-64-QAM	6	1	5/8	2887.5
15	π/2-64-QAM	6	1	3/4	3465
16	π/2-64-QAM	6	1	13/16	3453.75

Transmit and receive support for MCS 9 and below is mandatory. Other MCSs are optional.

24.5.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 24.3.7.

24.5.3.1.4 Header encoding and modulation

The description for header encoding and modulation for CDMG SC mode is the same as that contained in 20.5.3.1.4.

24.5.3.2 The Data field

24.5.3.2.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded, and modulated as described in the following subclauses. The amount of padding is defined in 24.5.3.2.3.

24.5.3.2.2 Scrambler

The description for CDMG SC mode scrambler is the same as that contained in 20.5.3.2.2.

24.5.3.2.3 Encoding

The description for CDMG SC mode encoding is the same as that contained in 20.5.3.2.3.

24.5.3.2.4 Modulation mapping

24.5.3.2.4.1 General

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

24.5.3.2.4.2 π/2-BPSK modulation

The description for CDMG SC mode π/2-BPSK modulation is the same as that contained in 20.5.3.2.4.2.

24.5.3.2.4.3 π/2-QPSK modulation

The description for CDMG SC mode π/2-QPSK modulation is the same as that contained in 20.5.3.2.4.3.

24.5.3.2.4.4 π/2-16-QAM modulation

The description for CDMG SC mode π/2-16-QAM modulation is the same as that contained in 20.5.3.2.4.5.

24.5.3.2.4.5 π/2-64-QAM modulation

In π/2-64-QAM modulation, the input bit stream is grouped into sets of 6 bits and mapped according to the following equation:

$$\tilde{s}(k) = \frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1)) + j\frac{1}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6+4}-1)(2c_{6k+5}-1))$$

Copyright © 2021 IEEE. All rights reserved.

where k is the output symbol index, k = 0, 1, …. Each output symbol is then rotated according to the following equation:

$$s_k = s_k \cdot e^{j \cdot \pi \cdot k/2}$$

The constellation bit encoding for 64-QAM is shown in Figure 24-7.

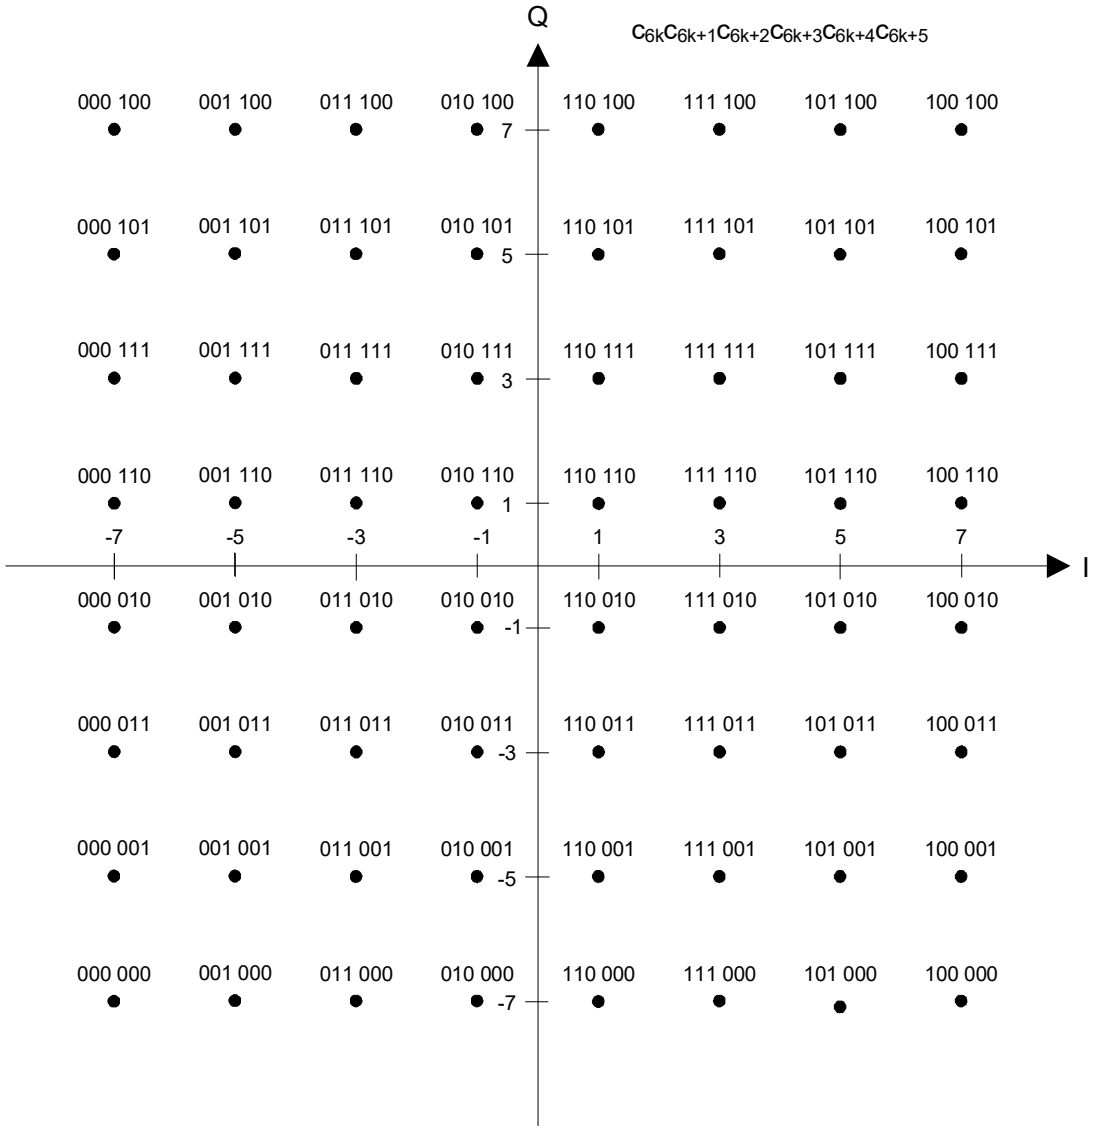

Figure 24-7—64-QAM constellation bit encoding

24.5.3.2.5 Symbol blocking and guard insertion

The description for CDMG SC mode symbol blocking and guard insertion is the same as that contained in 20.5.3.2.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

24.5.4 Performance requirements

24.5.4.1 Transmit requirements

24.5.4.1.1 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The equalizer shall be trained using information in the SC preamble (STF and/or CE field). For the CDMG SC mode EVM, measuring N_s samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given packet (ramp up/down). The EVM is calculated according to the formula below:

$$EVM = 20\log_{10}\left(\sqrt{\left(\frac{1}{N_s P_{avg}}\sum_{i=1}^{N_S}[(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]\right)}\right)$$

where

N_s is the number of samples to be measured and N_s should be 1000

P_{avg} is the average power of the constellation

(I_i, Q_i) is the complex coordinates of the measured symbol i

(I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i

(I_0, Q_0) is the complex DC term chosen to reduce EVM

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed a MCS dependent value according to Table 24-5.

Table 24-5—CDMG SC mode EVM requirements

MCS index	Modulation	Coding rate	EVM value (dB)
1	π/2-BPSK	1/2 with repetition	–6
2	π/2-BPSK	1/2	–7
3	π/2-BPSK	5/8	–9
4	π/2-BPSK	3/4	–10
5	π/2-BPSK	13/16	–12
6	π/2-QPSK	1/2	–11
7	π/2-QPSK	5/8	–12

Table 24-5—CDMG SC mode EVM requirements *(continued)*

MCS index	Modulation	Coding rate	EVM value (dB)
8	π/2-QPSK	3/4	–13
9	π/2-QPSK	13/16	–15
10	π/2-16-QAM	1/2	–19
11	π/2-16-QAM	5/8	–20
12	π/2-16-QAM	3/4	–21
13	π/2-16-QAM	13/16	–23
14	π/2-64-QAM	5/8	–25
15	π/2-64-QAM	3/4	–26
16	π/2-64-QAM	13/16	–28

24.5.4.1.2 Time of departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is 880×10^6 sample/s.
— FIRST_TRANSITION_FIELD is Short Training field.
— SECOND_TRANSITION_FIELD is Channel Estimation field.
— TRAINING_FIELD is Channel Estimation field.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

24.5.4.2 Receive requirements

24.5.4.2.1 Introduction

This subclause describes the receiver requirements of the CDMG SC mode.

24.5.4.2.2 CCA sensitivity

The start of a CDMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (–71 dBm) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 1.

24.6 CDMG low-power SC mode

24.6.1 Introduction

The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.

The CDMG low-power SC mode is an optional SC mode. This mode can provide lower processing power requirements for CDMG transceivers.

24.6.2 Transmission

24.6.2.1 Preamble

The CDMG low-power SC mode uses the same preamble as the CDMG SC mode.

24.6.2.2 Header

24.6.2.2.1 General

The CDMG low-power SC mode header fields are the same fields as in the CDMG SC mode (see Table 24-3 in 24.5.3.1).

The CDMG low-power SC mode modulation and coding schemes are listed in Table 24-6.

Table 24-6—CDMG low-power SC mode modulation and coding schemes

MCS	Modulation	Effective code rate	Coding scheme	N_{CPB}	Rate (Mb/s)
17	π/2-BPSK	13/28	RS(224,208)+Block-Code(16,8)	392	313
18	π/2-BPSK	13/21	RS(224,208)+Block-Code(12,8)	392	417
19	π/2-BPSK	52/63	RS(224,208)+SPC(9,8)	392	556
20	π/2-QPSK	13/28	RS(224,208)+Block-Code(16,8)	392	625.5
21	π/2-QPSK	13/21	RS(224,208)+Block-Code(12,8)	392	834
22	π/2-QPSK	52/63	RS(224,208)+SPC(9,8)	392	1112
23	π/2-QPSK	13/14	RS(224,208)+Block-Code(8,8)	392	1251.5

24.6.2.2.2 Header encoding and modulation

The description for header encoding and modulation for CDMG low-power SC mode is the same as that contained in 20.6.2.2.2.

24.6.2.3 Data field

The description for CDMG SC mode Data field is the same as that contained in 20.6.2.3.

Copyright © 2021 IEEE. All rights reserved.

24.7 PHY transmit procedure

The PHY transmit procedure is shown in Figure 24-8. In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 24.10. Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 24.2.2.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false and shall start immediately if TIME_OFDEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

The preamble format (control or SC mode) depends on the MCS in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the packet according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the encoding and transmission of the header according to the parameters of the PHY-TXSTART.request(TXVECTOR) primitive. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 20.4.3.3.3, 20.5.3.2.3, and 20.6.2.3.3. The encoded data are then modulated as described in 24.4, 24.5, and 24.6, depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN units are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND primitive after the transmission of the last bits. If TRN units are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of the AGC subfields and TRN units. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN unit. The packet transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

24.8 PHY receive procedure

A CDMG STA shall follow the DMG receive procedure defined in 20.8 when a DMG PPDU is detected on a 2.16 GHz channel.

The CDMG PHY receive procedure follows similar rules as descrived in 20.8.

24.9 Beamforming

24.9.1 Beamforming concept

The beamforming concept is the same as that contained in 20.9.1.

24.9.2 Beamforming frame format

24.9.2.1 Sector-level sweep

PPDUs transmitted during transmit sector sweep are CDMG control mode PPDUs. PPDUs transmitted during receive sector sweep are CDMG control mode or CDMG SC mode PPDUs.

24.9.2.2 Beam refinement

24.9.2.2.1 General

See 20.9.2.2.1 for the general description of beam refinement.

In addition to DMG beam refinement features, enhanced beam tracking is a process that the CDMG STAs can use to improve their antenna configurations (or antenna weight vectors) both for transmission and reception and measure the backup channel performance of an alternative link via beam tracking. Once the current link has poor quality due to blockage or antenna rotation, the CDMG STAs can switch to an alternative link. Only if the alternative link has been set and enhanced beam tracking is enabled, can CDMG STAs perform enhanced beam tracking. The procedure of enhanced beam tracking is described in 10.42.9.

In addition to TRN training sequences appended, CDMG enhanced beam tracking uses BRP-RX or BRP-TX PPDUs that have an STF and a CE field appended to them.

— BRP-RX PPDUs are PPDUs that have e-TRN-R/TRN-R training sequences following the Data field. These PPDUs with TRN-R sequences enable receiver antenna weight vector training, and these PPDUs with e-TRN-R sequences enable receiver antenna weight vector training and measuring one alternative link.

— BRP-TX PPDUs are PPDUs that have e-TRN-T/TRN-T training sequences following the Data field. The transmitting STA may change antenna configuration at the beginning of each sequence. The receiving STA performs measurements on these sequences and sends feedback to the STA that transmits the BRP-TX PPDU, including the measurement results of alternative link.

24.9.2.2.2 BRP PPDU structure

If the Enhanced Beam Tracking Request field in the PHY header is 0, each beam refinement packet is composed of an STF, a CE field, and a Data field followed by a training field containing an AGC field and a receiver training field, as shown in Figure 20-20.

If the Enhanced Beam Tracking Request field in the PHY header is equal to 1, each BRP PPDU is composed of an STF, a CE field, and a data field followed by a training field containing an AGC field, a receiver training field (TRN-R/T), an STF, and a CE field. The STF and CE fields at the end of the BRP PPDU have

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

the same structure as those at the beginning of the PPDU as defined in 24.3.6. The collection of the AGC field, TRN field, STF, and CE field at the end of BRP PPDU is termed an *e-TRN field*. The AGC fields and TRN fields are used to train the current link and the adjacent links of the current link during beam tracking process. The alternative link is a beam link with different propagation characteristic that cannot be measured accurately by the AGC field and the training field (TRN-R/T) that are used for measuring the adjacent beam links. The STF and the CE field at the end of BRP PPDU are used for measuring and training the alternative link of CDMG STAs during enhanced beam tracking (see 10.42.9). The BRP PPDU structure for CDMG STAs that perform enhanced beam tracking is shown in Figure 24-9.

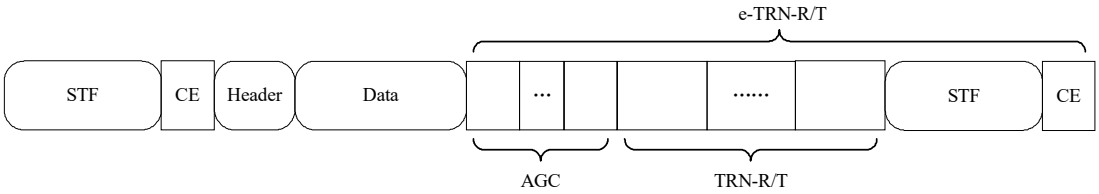

Figure 24-9—BRP PPDU structure (CDMA STAs)

24.9.2.2.3 BRP PPDU header fields

The description for BRP PPDU header fields is the same as that contained in 20.9.2.2.3.

24.9.2.2.4 BRP PPDU duration

The minimum duration of the data field of a BRP PPDU when sent in an SC mode is aBRPminSCblocks SC blocks (see 24.5.3.2.5), and, if needed, the data field of the packet shall be extended by extra 0 padding to generate the required number of SC blocks. Table 24-7 contains the values of N_{CWmin} for MCSs 1 to 9 necessary to compute the padding described in 20.5.3.2.3.3.

Table 24-7—Zero filling for SC BRP PPDUs with MCSs 1 to 9

MCS index	Modulation	N_{CBPS}	Repetition	Code rate	Data rate (Mb/s)	N_{CWmin}
1	π/2-BPSK	1	2	1/2	192.5	12
2	π/2-BPSK	1	1	1/2	385	12
3	π/2-BPSK	1	1	5/8	481.25	12
4	π/2-BPSK	1	1	3/4	577.5	12
5	π/2-BPSK	1	1	13/16	625.625	12
6	π/2-QPSK	2	1	1/2	770	23
7	π/2-QPSK	2	1	5/8	962.5	23
8	π/2-QPSK	2	1	3/4	1155	23
9	π/2-QPSK	2	1	13/16	1251.25	23

The minimum duration of the data field of a BRP PPDU when sent with the low-power SC mode is N_{BLK_MIN} low-power SC blocks (see 20.6.2.3.3).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

24.9.2.2.5 AGC field

The beam refinement AGC fields are composed of 4*N* repetitions of the sequence [Ga_{64} Ga_{64} Ga_{64} Ga_{64} Ga_{64}] when the packet is transmitted using the SC mode and [Gb_{64} Gb_{64} Gb_{64} Gb_{64} Gb_{64}] when the packet is transmitted using the control mode. The sequences Ga64 and Gb64 are defined in 20.10. The sequences are transmitted using rotated π/2-BPSK modulation.

In a BRP-TX PPDU, the transmitter may change the TX AWV configuration at the beginning of each AGC field. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Ga64 or Gb64 subsequence. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T fields. In a BRP-RX PPDU, the transmitter shall use the same TX AWV as in the preamble and data fields of the packet.

24.9.2.2.6 TRN field

The description for TRN field is the same as that contained in 20.9.2.2.6.

24.9.2.2.7 Channel measurement

The description for channel measurement is the same as that contained in 20.9.2.2.7.

24.10 CDMG PLME

24.10.1 PLME SAP sublayer management primitives

Table 24-1 lists the MIB attributes that may be accessed by the PHY entities and the intra-layer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

24.10.2 CDMG PHY MIB

All CDMG PHY MIB attributes are defined in Annex C, with specific values defined in Table 24-1. The column titled “Operational semantics” in Table 24-1 contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

Table 24-1—CDMG PHY MIB attribute default values

Managed object	Default value/range	Operational semantics
dot11PHYOperationTable		
dot11PHYType	cdmg(12)	Static
dot11PHYCDMGTable		
dot11LowPowerSCPHYImplemented	Boolean	Static
dot11LowPowerSCPHYActivated	Boolean	Dynamic

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

24.10.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equations.

For the CDMG SC PHY (N_{TRN} is Training Length field defined in the header; see, for example, Table 24-3):

$$TXTIME = \begin{cases} T_{STF} + T_{CE} + T_{header} + T_{Data} & N_{TRN} = 0 \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, (\alpha \times \beta + \gamma) \times T_C\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and SC} \end{cases}$$

where

α = aBRPminSCblocks
β = aSCBlockSize
γ = aSCGILength
$T_{TRN-Unit}$ = aBRPTRNBlock $\times$ T_C

For the CDMG control PHY:

$$TXTIME = T_{STF-CP} + T_{CE-CP} + (11 \times 8 + (Length - 6) \times 8 + N_{CW} \times 168) \times T_C \times 32 + N_{TRN} \times T_{TRN-Unit}$$

where N_{CW} calculation is defined in 20.4.3.3.3.

24.10.4 PHY characteristics

The static CDMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 24-1. The definitions for these characteristics are given in 6.5.4.

Table 24-1—CDMG PHY characteristics

PHY parameter	Value
aPPDUMaxTime	4 ms
aPSDUMaxLength	262 143 octets

25. China millimeter-wave multi-gigabit (CMMG) PHY specification

25.1 Introduction

25.1.1 Introduction to CMMG PHY

Clause 25 specifies the PHY entities for China millimeter-wave multi-gigabit (CMMG) single carrier (SC) and orthogonal frequency division multiplexing (OFDM) systems.

The maximum number of space-time streams supported in CMMG SC and OFDM system is four.

The CMMG PHY provides support for 540 MHz and 1080 MHz channel widths.

The CMMG PHY data are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), and 64-QAM. Forward error correction (FEC) coding (LDPC coding) is used with coding rates of 1/2, 3/4, 5/8, and 13/16.

A CMMG STA shall support the following features:

- 540 MHz channel width
- Control mode and SC mode (directional transmit and receive)
- Single spatial stream MCS 0 (control mode transmit and receive) in all supported channel widths
- Single spatial stream MCSs 1 to 3 (SC mode transmit and receive) in all supported channel widths
- LDPC coding with length 672
- Normal guard interval as defined in Table 25-3

A CMMG STA may support the following features:

- Support for 1080 MHz channel width
- CMMG-MCSs 4 to 8 (SC mode transmit and receive)
- CMMG-MCSs 9 to 16 (OFDM mode transmit and receive)
- Two or more spatial streams (transmit and receive)
- Short guard interval (transmit and receive)
- LDPC coding with length 2016
- Support MIMO transmission (SC mode and OFDM mode with omnidirectional antenna pattern or quasi-omni antenna pattern transceiver)
- STBC (transmit and receive)
- Transmit beamforming sounding (by sending a CMMG NDP)
- Responding to transmit beamforming sounding

NOTE—MIMO transmission only applies in the case where the antenna pattern is the omnidirectional antenna pattern or quasi-omni antenna pattern.

25.1.2 Scope of CMMG PHY services

The CMMG PHY supports three modulation methods:

- A control modulation using MCS 0 (the CMMG control mode; see 25.4)
- A single carrier (SC) modulation using MCS 1 to MCS 8 (the CMMG SC mode; see 25.5)
- An OFDM modulation using MCS 9 to MCS 16 (the CMMG OFDM mode; see 25.6)

All these modulation methods share a common preamble (see 25.3.5).

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The services provided to the MAC by the CMMG PHY consist of the following protocol functions:

a) A function that defines a method of mapping the PSDUs into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.

b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of CMMG Control mode, CMMG SC mode, and CMMG OFDM mode.

25.1.3 CMMG PHY functions

25.1.3.1 General

The CMMG PHY contains two functional entities: the PHY function and the physical layer management function (PLME). Each of these functions is described in detail in 25.4 (for CMMG control mode), 25.5 (for CMMG SC mode), 25.6 (for CMMG OFDM mode), and 25.14 (for CMMG PLME). The CMMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 6.

25.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

25.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation; the actual method of implementation is left to the discretion of the CMMG PHY compliant developer. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

25.1.3.4 PPDU formats

The structure of the PPDU transmitted by a CMMG STA is determined by the TXVECTOR parameters as defined in Table 25-1.

A CMMG PPDU can be further categorized as a CMMG control mode PPDU, a CMMG SC mode PPDU, or a CMMG OFDM mode PPDU.

25.2 CMMG PHY service interface

25.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

The TXVECTOR supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

25.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 25-1 are defined as part of the TXVECTOR parameter list in the PHYTX-START.request primitive and/or as part of the RXVECTOR parameter list in the PHYRXSTART.indication primitive.

Table 25-1—TXVECTOR and RXVECTOR parameters

Parameter	Value	TXVECTOR	RXVECTOR
MCS	The MCS field indicates the modulation and coding scheme used in the transmission of the packet. Values are integers in the range from 0 to 31. — An MCS value of 0 indicates the use of control mode. — MCS values of 1 to 8 indicate use of single carrier modulations. The value is an index to Table 25-38 to Table 25-45. — MCS values of 9 to 16 indicates use of OFDM modulations. The value is an index to Table 25-46 to Table 25-53.	Y	Y
LENGTH	Indicates the number of octets in the PSDU in the range from 0 to 262 143. A value of zero indicates a packet in which no Data field follows the SIG.	Y	Y
N_TX	Indicates the number of transmit chains.	Y	N
NSS	Indicates the number of spatial streams.	Y	N
EXPANSION_MAT	If PPDU transmission mode is OFDM mode, contains a set of compressed beamforming feedback matrices as defined in 25.6.8.13.2. The number of elements depends on the number of spatial streams and the number of transmit chains. Otherwise, not present.	Y	N
CHAN_MAT	If PSDU LENGTH equals 0, contains a set of compressed beamforming feedback matrices as defined in 25.6.8.13.2 based on the channel measured during the training symbols of the received PPDU. The number of elements depends on the number of spatial streams and the number of transmit chains. Otherwise, not present.	N	Y
ADD_PPDU	Enumerated type: — ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — NO-ADD-PPDU indicates no additional PPDU follows this PPDU.	Y	Y
AGGREGATION	Indicates whether the PSDU contains an A-MPDU. Enumerated type: — AGGREGATED indicates this is a packet with A-MPDU aggregation. — NOT_AGGREGATED indicates this is a packet without A-MPDU aggregation.	Y	Y
RSSI	The allowed values for the RSSI parameter are in the range from 0 to 255. This parameter is a measure by the PHY of the power observed at the antennas used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power.	N	Y
REC_MCS	Indicates the MCS that the STA's receiver recommends.	N	O

Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
SNR	Contains an array of received SNR measurements for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.49.	N	Y
STBC	Indicates whether STBC is used. 0 indicates no STBC (NSTS=NSS in the Data field). 1 indicates STBC is used (NSTS=2NSS in the Data field). This parameter is 0 for a CMMG OFDM MU PPDU.	Y	Y
RCPI	Is a measure of the received RF power measured over the preamble of a received frame. Refer to 20.3.10 for the definition of RCPI.	N	Y
TXOP_PS_NOT_ALLOWED	Indicates whether a CMMG AP allows non-AP CMMG STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the CMMG AP allows non-AP CMMG STAs to enter doze state during a TXOP. 1 indicates that the CMMG AP does not allow non-AP CMMG STAs to enter doze state during a TXOP.	Y	Y
PARTIAL_AID	Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19). Integer: range from 0 to 511 if UPLINK_INDICATION is 1, and range from 0 to 63 if UPLINK_INDICATION is 0.	Y	Y
UPLINK_INDICATION	Set to 1 if the CMMG PPDU is addressed to AP. Set to 0 otherwise (see 10.19).	Y	Y
COLOR	If UPLINK_INDICATION is 0, set to a value of its choosing within the range from 0 to 7 and shall maintain that value for the duration of the existence of the BSS. Otherwise, not present (see 10.19).	Y	Y
CH_BANDWIDTH	Indicates the channel width of the transmitted PPDU: Enumerated type: — CBW540 for 540 MHz — CBW1080 for 1080 MHz	Y	Y
DUPLICATE_MODULATION	In TXVECTOR, indicates the PPDU transmitted with CMMG duplicate format. In RXVECTOR, indicates the estimated PPDU transmitted with CMMG duplicate format; — Present if CH_BANDWIDTH equals CBW1080 and the PPDU is transmitted with duplicate format. — Otherwise not present.	O	O

Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
DYN_BANDWIDTH	In TXVECTOR, if present, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. In RXVECTOR, if valid, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. Enumerated type: — Static if the transmitter is capable of Static bandwidth operation. — Dynamic if the transmitter is capable of Dynamic bandwidth operation. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU.	O	Y
BEAMFORMED	Set to 1 if a beamforming steering matrix is applied to the waveform in a CMMG OFDM mode transmission as described in 19.3.11.11.2. Set to 0 otherwise. NOTE—When BEAMFORMED is equal to 1, smoothing is not recommended.	Y	O
TIME_OF_DEPARTURE_REQUESTED	Enumerated type: — true indicates that the MAC entity requests that the PHY entity measure and report time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. — false indicates that the MAC entity requests that the PHY entity neither measure nor report time of departure parameters.	O	N
RX_START_OF_FRAME_OFFSET	0 to 2^{32}–1. An estimate of the offset (in 100 picosecond units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna port to the point in time at which this primitive is issued to the MAC.	N	Y
PPDU_TYPE	Enumerated type: — TRN-R indicates either a PPDU whose Data field is followed by one or more TRN-R subfields, or a PPDU that is requesting TRN-R subfields to be appended to a future response PPDU. — TRN-T indicates a PPDU whose Data field is followed by one or more TRN-T subfields. This field is reserved if TRN_LEN is 0.	Y	Y
BEAM_TRACKING_REQUEST	This parameter indicates whether beam tracking is requested. Enumerated type: — BEAM-TRACKING-REQUESTED or BEAM-TRACKING-NOT-REQUESTED.	Y	Y

Table 25-1—TXVECTOR and RXVECTOR parameters *(continued)*

Parameter	Value	TXVECTOR	RXVECTOR
LAST_RSSI	In the TXVECTOR, LAST_RSSI indicates the received power level of the last packet with a valid PHY SIG that was received an SIFS period before transmission of the current packet; otherwise, it is 0 (see 10.3.2.3.3). In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the PCLP header of the received packet. Valid values are integers in the range from 0 to 15: — Values of 2 to 14 represent power levels (–71+value×2) dBm. — A value of 15 represents power greater than or equal to –42 dBm. — A value of 1 represents power less than or equal to –68 dBm. — A value of 0 indicates that the previous packet was not received an SIFS period before the current transmission.	Y	Y
SPREADING_FACTOR	Indicates the spreading factor used in the Control mode: — 0 indicates that the spread factor is 13. — 1 indicates that the spread factor is 7. — 2 indicates that the spread factor is 4. — 3 indicates no spreading.		
Turnaround	Set to 1 or 0 as specified in 10.3.2.3.3.	Y	Y

NOTE—In the TXVECTOR and RXVECTOR columns, the following apply:
Y = Present
N = Not present
O = Optional

25.3 Common parameters

25.3.1 Introduction

This subclause introduces some common parameters.

25.3.2 Common requirements

25.3.2.1 Introduction

This subclause describes the common requirements from all 3 modes: control, SC, and OFDM.

25.3.2.2 Transmit RF delay

The transmit RF delay is defined in 17.3.8.6, and its value is implementation dependent.

25.3.2.3 Center frequency tolerance

25.3.2.3.1 General

The transmitter center frequency tolerance shall be ± 20 ppm.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.3.2.3.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 2.5 μs from the start of the packet.

25.3.2.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

25.3.2.3.4 Transmit rampup and rampdown

The transmit power-on ramp is defined as the time it takes for a transmitter to rise from less than 10% to greater than 90% of the average power to be transmitted in the frame.

The transmit power-on ramp shall be less than 30 ns.

The transmit power-down ramp is defined as the time it takes the transmitter to fall from greater than 90% to less than 10% of the maximum power to be transmitted in the frame.

The transmit power-down ramp shall be less than 30 ns.

25.3.2.3.5 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver antenna for which the error rate criterion (defined in 25.3.2.3.6) is met. A compliant receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 $\mu W/cm^2$ for each of the modulation formats that the receiver supports.

25.3.2.3.6 Receive sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 25-2.

Table 25-2—Receiver sensitivity

MCS Index	CBW540 MHz	CBW1080 MHz
0	–81	–78(see NOTE)

15	–55	–52
16	–53	–50
NOTE—The sensitivity is for the largest spreading factor for MCS 0.		

25.3.3 Time-related parameters

Table 25-3 defines the timing-related parameters for CMMG format.

Table 25-3—Time-related parameters

Parameter	CBW540 MHz	CBW1080 MHz	Description
N_{SD}	168	336	Number of complex data numbers per OFDM symbol
N_{SP}	8	16	Number of pilot subcarriers per OFDM symbol
N_{DC}	3	3	Number of DC subcarriers per OFDM symbol
N_{ST}	179	355	Total number of subcarriers per OFDM symbol
N_{SR}	89	177	Highest data subcarrier index per OFDM symbol
F_S	660 MHz	1320 MHz	OFDM sample rate
T_S	$1/F_S$ (~1.515 ns)	$1/F_S$ (~0.758 ns)	OFDM sample time
F_C	440 MHz = 2/3 F_S	880 MHz = 2/3 F_S	SC chip rate
T_C	$1/F_C$ (~2.273 ns)	$1/F_C$ (~1.136 ns)	SC chip time
N_{DFT}	256	512	DFT length
Δ_F	F_S / N_{DFT} = 2.578125 MHz		Subcarrier frequency spacing
T_{DFT}	$N_{DFT} \times T_S$ (~387.879 ns)		IDFT/DFT period
T_{GI}	$T_{DFT}/4$ (~96.97 ns)		Guard interval duration
T_{GIS}	$T_{DFT}/8$ (~48.485 ns)		Short guard interval duration

Table 25-3—Time-related parameters *(continued)*

Parameter	CBW540 MHz	CBW1080 MHz	Description
T_{SYML}	$T_{DFT} + T_{GI} = 1.25T_{DFT}$ (~484.8 ns)		Long GI symbol interval
T_{SYMS}	$T_{DFT} + T_{GIS} = 1.125T_{DFT}$ (~436.4 ns)		Short GI symbol interval
T_{SYM}	T_{SYML} or T_{SYMS} depending on the GI used		Symbol interval
T_{seq}	256 T_C (~581.8 ns)		ZCZ block duration
T_{CSTF}	14 T_{seq} (~8145.5 ns)		Short training field duration for control mode
T_{STF}	14 T_{seq} (~8145.5 ns)		Short training field duration *n* for SC/OFDM mode
T_{CEF}	4 T_{seq} (~2327.3 ns)		Channel estimation field duration
T_{SIG}	4 T_{seq} (~2327.3 ns)		SIGNAL field duration
T_{OSTF}	T_{SYML} (~484.8 ns)		Duration of each OSTF
T_{OCEF}	T_{SYML} (~484.8 ns)		Duration of each OCEF

Table 25-4 defines parameters used frequently in Clause 25.

Table 25-4—Frequently used parameters

Symbol	Explanation
N_{BL}	Number of the data blocks for SC transmission.
N_{CBPB}	Number of coded bits per block.
N_{CBPS}	For OFDM transmission: Number of coded bits per OFDM symbol. For SC transmission: Number of coded bits per constellation symbol.
N_{CBPSS}	Number of coded bits per symbol per spatial stream.
N_{DBPS}	Number of data bits per symbol.
N_{DSPB}	Number of data constellation symbols per block for SC transmission.
N_{UWPB}	Length of the UW in each block for SC transmission.
$N_{BLS} = N_{DSPB} + N_{UWPB}$	Number of the symbols in each block for SC transmission.
N_{BPSCS}	Number of coded bits per subcarrier per spatial stream.
N_{RX}	Number of receive chains.
N_{STS}	For pre-CMMG modulated fields, $N_{STS} = 1$(see NOTE). For CMMG modulated fields, N_{STS} is the number of space-time streams.
N_{OCEF}	Number of OCEF symbols 25.6.7.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Table 25-4—Frequently used parameters *(continued)*

Symbol	Explanation
N_{SS}	Number of spatial streams.
N_{TX}	Number of transmit chains.
R	R is the coding rate.
NOTE—Pre-CMMG modulated fields refer to the STF, CEF, and CMMG SIG field, while CMMG modulated fields refer to the OCEF and Data field (see Figure 25-1, Figure 25-2, and Figure 25-3).	

25.3.4 Mathematical conventions in the signal description

25.3.4.1 Notation

$[\mathbf{Q}]_{m,n}$ indicates the element in row m and column n of matrix $\mathbf{Q}$.

25.3.4.2 Subcarrier indices in use

For a 540 MHz OFDM mode PPDU transmission, the 540 MHz is divided into 256 subcarriers. The signal is transmitted on subcarrier –89 to –2 and 2 to 89, with –1, 0, and 1 being the center (DC) subcarriers.

For a 1080 MHz OFDM mode PPDU transmission, the 1080 MHz is divided into 512 subcarriers. The signal is transmitted on subcarrier –177 to –2 and 2 to 177, with –1, 0, and 1 being the center (DC) subcarriers.

25.3.4.3 Transmitted signal

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is defined by the complex baseband signal in Equation (25-1).

$$r_{RF}^{i_{TX}} = \mathrm{Re}\left\{ r_{PPDU}^{i_{TX}}(t) \exp(j2\pi f_c t) \right\} \tag{25-1}$$

where

r_{PPDU} represents the complex baseband signal in transmit chain i_{TX}
f_c represents the center frequency of the portion of the transmitted PPDU

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The fields and timing boundaries for various fields are shown in Figure 25-1 to Figure 25-3.

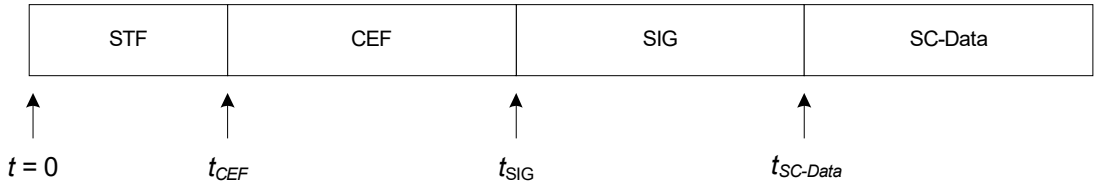

Figure 25-1—Packet structure for the SC mode PPDU with CBW540 MHz

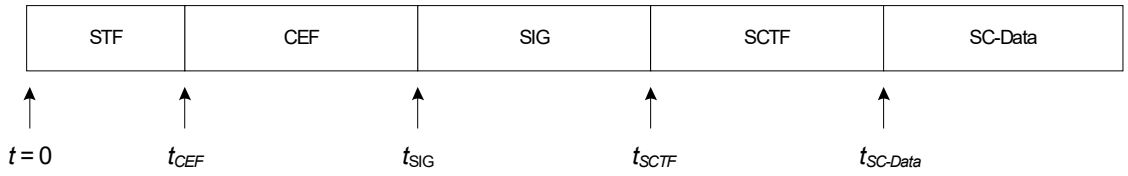

Figure 25-2—Packet structure for the SC mode PPDU with CBW1080 MHz

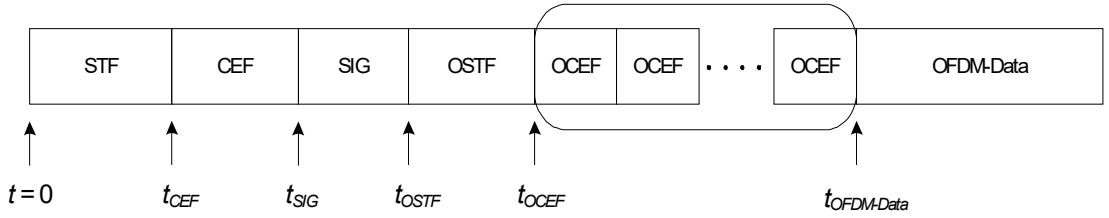

Figure 25-3—Packet structure for the OFDM mode PPDU

The time offset, t_{Field}, determines the starting time of the corresponding field.

For the SC mode transmission with 540 MHz,

$$r^{i_{TX}}_{PPDU}(t) = r^{i_{TX}}_{STF}(t) + r^{i_{TX}}_{CEF}(t - t_{CEF}) + r^{i_{TX}}_{SIG}(t - t_{SIG}) + r^{i_{TX}}_{SC-Data}(t - t_{SC-Data}) \quad (25\text{-}2)$$

For the SC mode transmission with 1080 MHz,

$$r^{i_{TX}}_{PPDU}(t) = r^{i_{TX}}_{STF}(t) + r^{i_{TX}}_{CEF}(t - t_{CEF}) + r^{i_{TX}}_{SIG}(t - t_{SIG}) + r^{i_{TX}}_{SCTF}(t - t_{SCTF}) + r^{i_{TX}}_{SC-Data}(t - t_{SC-Data}) \quad (25\text{-}3)$$

For the OFDM mode transmission,

$$r^{i_{TX}}_{PPDU}(t) = r^{i_{TX}}_{STF}(t) + r^{i_{TX}}_{CEF}(t - t_{CEF}) + r^{i_{TX}}_{SIG}(t - t_{SIG}) + r^{i_{TX}}_{MCTF}(t - t_{MCTF}) + r^{i_{TX}}_{OFDM-Data}(t - t_{OFDM-Data}) \quad (25\text{-}4)$$

where

$$t_{CEF} = T_{STF}$$

$$t_{SIG} = t_{CEF} + T_{CEF}$$

$$t_{SCEF} = t_{SIG} + T_{SIG}$$

$$T_{OSTF} = t_{SIG} + T_{SIG}$$

$$t_{OCEF} = t_{OSTF} + T_{OSTF}$$

$$t_{SC-Data} = t_{SCTF} + T_{SCTF}$$

$$t_{OFDM-Data} = t_{OCTF} + N_{OCEF} T_{OCEF}$$

Each OFDM mode baseband waveform $r_{subfield}(nT_s)$, for the fields above, is defined via the inverse discrete Fourier transform (IDFT) as,

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

$$r_{subfield}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{Tone}N_{STS}}} w_{T_{subfield}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=0}^{N_{STS}-1} [Q_k]_{i_{TX},m} \gamma_{k,CBW} X_{k,m} \exp((j2\pi k\Delta_F(t - T_{GI} - T_{CS}(m)))) \quad (25\text{-}5)$$

In Equation (25-5) the following notions are used:

n_{Tone}	is, for 540 MHz transmission, 176 and, for 1080 MHz transmission, 352
N_{STS}	is the number of the space-time streams
T_{GI}	is the guard interval duration used for each OFDM symbol
Q_k	is the spatial mapping matrix with N_{Tx} rows and N_{STS} for the subcarrier k
$w_{Tsubfield}$	is a windowing function. An example function, $w_{Tsubfield}$, is given in 25.3.4.5
$\gamma_{k,CBW}$	is defined in 25.3.4.4
Δ_F	is the subcarrier frequency spacing given in Table 25-3
$T_{CS}(m)$	represents the cyclic shift per space-time stream, whose value is defined in Table 25-27
$X_{k,m}$	is the frequency-domain symbol in subcarrier k of space-time stream m. Some of the $X_{k,m}$ within $-N_{SR} \le k \le N_{SR}$ have a value of 0, such as the DC tones

The base band waveform for fields defined by time domain sequence or for single carrier transmission is

$$r_{Field}(nT_C) = x(n) \quad (25\text{-}6)$$

where $x(n)$ is the constellation point n.

Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

25.3.4.4 Definition of tone rotation for OFDM mode transmission

The function $\Upsilon_{k,CBW}$ is used to represent a rotation of the tones. $\Upsilon_{k,CBW}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 25-5.

Table 25-5—CH_BANDWIDTH and $\Upsilon_{k,CBW}$

CH_BANDWIDTH	$\Upsilon_{k,CBW}$
CBW540	$\Upsilon_{k,540}$
CBW1080	$\Upsilon_{k,1080}$

For a 540 MHz OFDM mode PPDU transmission,

$$\Upsilon_{k,540} = 1 \quad (25\text{-}7)$$

For a 1080 MHz OFDM mode PPDU transmission,

$$\Upsilon_{k,1080} = \begin{cases} 1, k < 0 \\ j, k \ge 0 \end{cases} \quad (25\text{-}8)$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.3.4.5 The windowing function

The windowing function $w_{TField}(nT_S)$ is used to smooth the transition between adjacent fields in the packet where OFDM mode modulation is employed. No windowing is applied to preamble fields or to SC modulated fields. The windowing function is different from being equivalent to "1" only in the transition region.

An example of a windowing function is given by

$$w_T(t) = \begin{cases} \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2}+\frac{t}{T_R}\right)\right), & \frac{-T_R}{2} < t \le \frac{T_R}{2} \\ 1, & \frac{T_R}{2} < t \le T - \frac{T_R}{2} \\ \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2}-\frac{t}{T_R}\right)\right), & T - \frac{T_R}{2} < t \le T + \frac{T_R}{2} \end{cases} \quad (25\text{-}9)$$

The transition region creates an overlap (with length T_R) between adjacent fields. The field wave form is extended cyclically to fill the part of the transition region in which it is undefined. If the transition region vanishes (i.e., T_R=0), the windowing function degenerates to a rectangular window. The choice of windowing function is implementation dependent, as long as transmit EVM and transmit mask requirements are met.

25.3.5 CMMG PHY preamble

25.3.5.1 General

The CMMG PHY preamble is the part of the PHY PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, indication of transmission mode (Control mode, SC mode, or OFDM mode), indication of transmission bandwidth (540 MHz or 1080 MHz), and channel estimation. The format of the preamble is common to both SC packets and OFDM packets and consists of a Short Training field followed by a Channel Estimation field. The content of the Short Training field is the same between SC and OFDM packets (see 25.3.5.2), but the content of the Channel Estimation field is not the same between such packets (see 25.3.5.3).

NOTE 1—For SC and OFDM MIMO transmission, different transmit antenna transmit a different preamble that is composed of one of the four ZCZ sequences with the order of $Z_{256}^1, Z_{256}^2, Z_{256}^3, Z_{256}^4$, such as for the case of one transmit antenna, the preamble sequence is composed of Z_{256}^1, for the case of two transmit antennas, the preamble sequences are composed of Z_{256}^1, Z_{256}^2, respectively.

NOTE 2—For CMMG Control mode and CMMG SC mode preambles, all fields are transmitted with SC mode transmission. For CMMG OFDM mode preamble, the STFs, the CEFs, and the SIG fields are transmitted with SC mode transmission. For 1080 MHz SC transmission, the STFs, the CEFs, and the SIG fields are transmitted in duplicate format as defined in 25.3.10.

25.3.5.2 CMMG Short Training field

25.3.5.2.1 STF of control mode

The Short Training field is composed of 50 repetitions of the sequence $Z(n)$ of length 32. The sequences $Z(n)$ is defined in 25.8.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The waveform for the STF is

$$r_{STF}(nT_C) = Z(n \bmod 32)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 50 \times 32 - 1 \quad (25\text{-}10)$$

where T_C is SC mode chip time of CBW540 MHz.

25.3.5.2.2 STF of SC and OFDM mode

The Short Training fields of SC and OFDM modes share the same definition. The common Short Training field is composed of 17 repetitions of the sequence $Z(n)$ of length 32. The sequences $Z(n)$ is defined in 25.8.

The waveform for the Short Training field is

$$r_{STF}(nT_C) = Z(n \bmod 32)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 17 \times 32 - 1 \quad (25\text{-}11)$$

where T_C is SC mode chip time of CBW540 MHz.

25.3.5.3 CMMG Channel Estimation field

25.3.5.3.1 CEF of control mode

The CEF of CMMG control mode is composed of four concatenated $Z(n)$ sequences where each sequence is multiplied by an individual sign assignment. As shown in Figure 25-4, the CEF of control mode is defined as $-Z(n)$, $Z(n)$, $-Z(n)$, $-Z(n)$, where the sequence is defined in 25.8.

The waveform for the CEF is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256 - 1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256 \times 2 - 1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256 \times 2, \ldots, 256 \times 3 - 1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256 \times 3, \ldots, 256 \times 4 - 1 \end{cases} \quad (25\text{-}12)$$

where T_C is SC mode chip time of CBW540 MHz. The control mode preamble is defined in Figure 25-4.

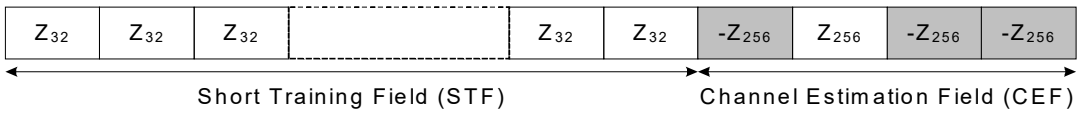

Figure 25-4—Control mode preamble

25.3.5.3.2 CEF of SC mode

The CEF of SC mode is also composed of four concatenated *Z(n)* sequences but is with different sign assignment patterns. As shown in Figure 25-5 and Figure 25-6, the CEF of SC 540 MHz PHY is defined as [$-Z(n)$, $Z(n)$, $Z(n)$, $-Z(n)$], and the CEF of SC 1080 MHz PHY is defined as [$-Z(n)$, $-Z(n)$, $Z(n)$, $Z(n)$], where the sequence *Z(n)* is defined in 25.8.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The waveform for the CEF of SC 540 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}13)$$

and the waveform for the CEF of SC 1080 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}14)$$

where T_C is SC mode chip time of CBW540 MHz.

The SC mode preambles are defined in Figure 25-5 and Figure 25-6.

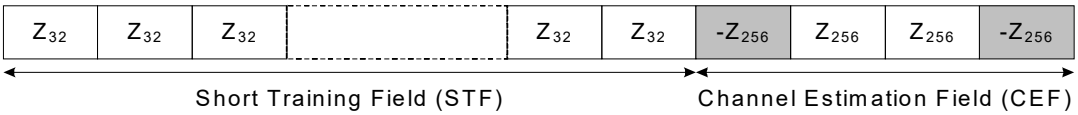

Figure 25-5—CMMG SC mode preamble for CBW540 MHz

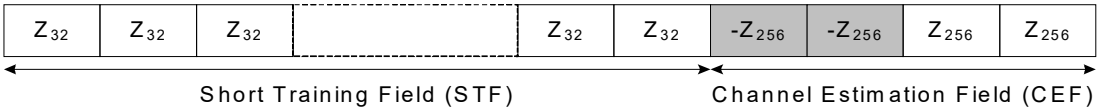

Figure 25-6—CMMG SC mode preamble for CBW1080 MHz

25.3.5.3.3 CEF of OFDM mode

The CEF of OFDM mode is also composed of four concatenated $Z(n)$ sequences but is with different sign assignment patterns. As shown in Figure 25-7 and Figure 25-8, the CEF of OFDM 540 MHz PHY is defined as [$-Z(n)$, $Z(n)$, $Z(n)$, $Z(n)$], and the CEF of OFDM 1080 MHz PHY is defined as [$-Z(n)$, $-Z(n)$, $-Z(n)$, $Z(n)$], where the sequence $Z(n)$ is defined in 25.8.

The waveform for the CEF of OFDM 540 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}15)$$

and the waveform for the CEF of OFDM 1080 MHz mode is

$$r_{CEF}(nT_C) = \begin{cases} -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 0, 1, \ldots, 256-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256, \ldots, 256\times 2-1 \\ -Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 2, \ldots, 256\times 3-1 \\ Z(n \bmod 256)\exp\left(j\pi\frac{n}{2}\right), n = 256\times 3, \ldots, 256\times 4-1 \end{cases} \quad (25\text{-}16)$$

where T_C is SC chip time of CBW540 MHz.

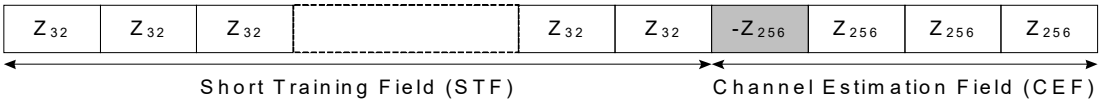

Figure 25-7—CMMG OFDM mode preamble for CBW540 MHz

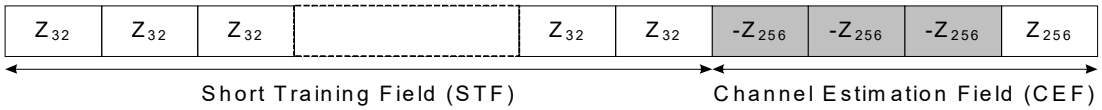

Figure 25-8—CMMG OFDM mode preamble for CBW1080 MHz

25.3.6 CRC calculation

The value of cyclic redundancy check (CRC) field is the 1s complement of Equation (25-17).

$$CRC(D) = (M(D) \oplus I(D))D^K \bmod G(D) \quad (25\text{-}17)$$

where

$m(D) = m_0 D^{N-1} + m_1 D^{N-2} + \ldots + m_{N-1}$

N is the number of bits over which the CRC is generated

m_i is bit i of the input bit sequence

$I(D) = \sum_{i=N-K}^{N-1} D^i$ are initialized values that are added modulo 2 to the first K bits of the input bit sequence

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

K is the length of CRC sequence: $K = 16$ for CRC of the CMMG SIG, and $K = 8$ for the data field
$G(D) = D^{16} + D^{12} + D^5 + 1$ is the CRC generating polynomial of 8 bits
$crc(D) = x_0 D^{15} + x_1 D^{14} + \ldots + x_{14} D + x_{15}$

Figure 25-9 shows the operation of the CRC of 16 bits. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, x_{15} first, through an inverter.

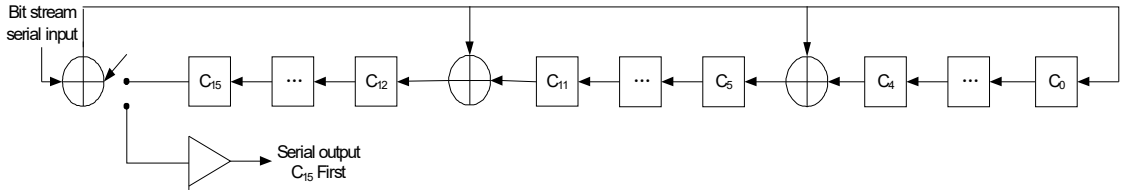

Figure 25-9—16-bit CRC calculation

$G(D) = D^8 + D^7 + D^4 + D^3 + D + 1$ is the CRC generating polynomial of 8 bits.

$crc(D) = x_0 D^7 + x_1 D^6 + \ldots + x_6 D + x_7$

Figure 25-10 shows the operation of the CRC of 8 bits.

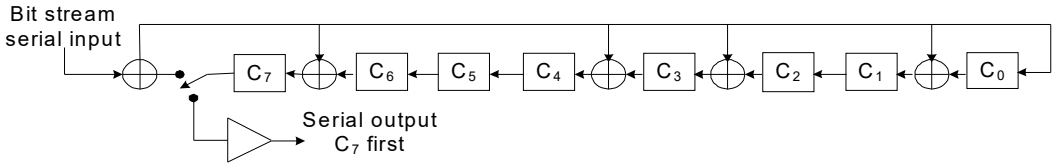

Figure 25-10—8-bit CRC calculation

25.3.7 Scrambler

The CMMG control mode SIG, CMMG SC/OFDM mode SIG, and the data fields following the scrambler initialization field (including data padding bits) shall be scrambled by XORing each bit in turn with a length 127 periodic sequence generated by the polynomial $S(x) = x^7 + x^4 + 1$. The octets of the PSDU and the pad bits shall be placed into a bit stream with bit 0 (LSB) of each octet first and bit 7 of each octet (MSB) last. The generation of the sequence and the XOR operation are defined in Figure 25-11.

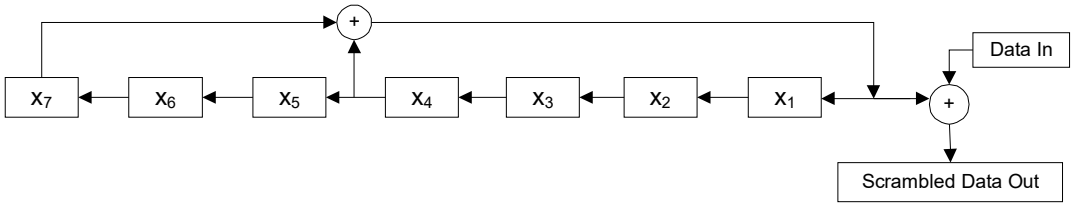

Figure 25-11—Scrambler

For each PPDU, the transmitter shall select a nonzero seed value for the scrambler (bits x_1 to x_7). The seed value should be selected in a pseudo random fashion. The seed value is sent in the Scrambler Initialization field of the PHY header. Each data bit in the data field of the PPDU is then XORed with the scrambler output (x_4 XOR x_7), and the scrambler content shifts once.

25.3.8 Common LDPC parity matrices

25.3.8.1 Introduction

Transmission/reception of LDPC with codeword length of 672 bits (expansion factor $z = 42$) is mandatory, and transmission/reception of LDPC with codeword length 2016 bits (expansion factor $z = 126$) is optional.

25.3.8.2 General

The structured LDPC code is defined by a parity check matrix **H** of size $(m \times z) \times (n \times z)$, which is determined by a base matrix $\overline{\mathbf{H}}$ of size $m \times n$, an expansion factor z, and a base permutation matrix **P** of size $z \times z$. The number of information bits is $k = (n - m) \times z$, the number of codeword bits is nz, then the coding rate is $r = k/(nz)$. If each element $\overline{h}_{ij}$ in the base matrix $\overline{\mathbf{H}}$ is replaced by zero subblock matrix of size $z \times z$ or the subblock matrix $\mathbf{P}^{\overline{h}_{ij}}$, the parity check matrix **H** can be obtained.

The base matrix $\overline{\mathbf{H}}$ is defined as follows:

$$\overline{\mathbf{H}} = \begin{bmatrix} \overline{h}_{00} & \overline{h}_{01} & \cdots & \overline{h}_{0(n-1)} \\ \overline{h}_{10} & \overline{h}_{11} & \cdots & \overline{h}_{1(n-1)} \\ \cdots & \cdots & \cdots & \cdots \\ \overline{h}_{(m-1)0} & \overline{h}_{(m-1)1} & \cdots & \overline{h}_{(m-1)(n-1)} \end{bmatrix} \tag{25-18}$$

The parity check matrix **H** is defined as follows:

$$\mathbf{H} = \begin{bmatrix} \mathbf{P}^{\overline{h}_{00}} & \mathbf{P}^{\overline{h}_{01}} & \cdots & \mathbf{P}^{\overline{h}_{0(n-1)}} \\ \mathbf{P}^{\overline{h}_{10}} & \mathbf{P}^{\overline{h}_{11}} & \cdots & \mathbf{P}^{\overline{h}_{1(n-1)}} \\ \cdots & \cdots & \cdots & \cdots \\ \mathbf{P}^{\overline{h}_{(m-1)0}} & \mathbf{P}^{\overline{h}_{(m-1)1}} & \cdots & \mathbf{P}^{\overline{h}_{(m-1)(n-1)}} \end{bmatrix} \tag{25-19}$$

where, if $\overline{h}_{ij} = -1$, $\mathbf{P}^{\overline{h}_{ij}}$ equals a zero matrix of size $z \times z$; otherwise, $\mathbf{P}^{\overline{h}_{ij}}$ equals the base permutation matrix **P** to h_{ij} power. The base permutation matrix **P** of size $z \times z$ is defined as follows:

$$\mathbf{P} = \begin{bmatrix} 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ 0 & 0 & 0 & \cdots & 1 \\ 1 & 0 & 0 & \cdots & 0 \end{bmatrix} \tag{25-20}$$

25.3.9 CMMG SIG

25.3.9.1 General

The CMMG SIG field carries information required to interpret PPDUs. The preamble and the CMMG SIG fields are all transmitted using modulation. The structure of the CMMG SIG field is shown in Figure 25-12.

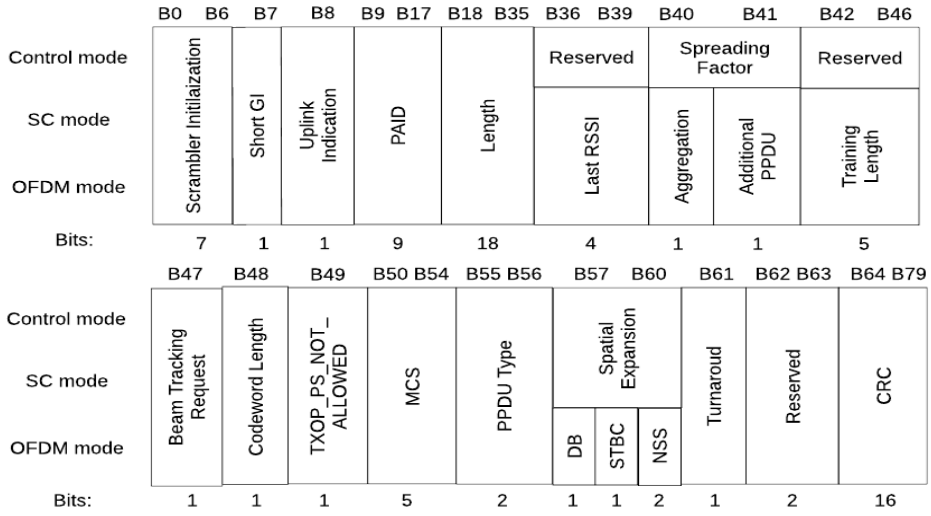

Figure 25-12—CMMG SIG structure

The CMMG SIG field contains the fields listed in Table 25-7. The mapping of the fields is also described in Table 25-7.

Table 25-7—Fields in the CMMG SIG field

Bit	Fields	Number of bits	Description
B0–B6	Scrambler Initialization	7	Bits X1-X7 of the initial scrambler state (see 25.3.7).
B7	Short GI	1	Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field.
B8	Uplink Indication	1	Set to 1 if the PPDU is addressed to an AP. Set to 0 otherwise. (See TXVECTOR parameter UPLINK_INDICATION.)
B9–B17	PAID	9	If Uplink Indication is not present or set to 1, B9–B17 are the partial AID to provide an abbreviated indication of the intended recipient(s) of the PSDU (see 10.19). If Uplink Indication is equal to 0, B9–B11 are an identifier of the BSS and B12–B17 are the partial AID. (See TXVECTOR parameter COLOR and TXVECTOR parameter PARTIAL_AID.)
B18–B35	Length	18	Number of data octets in the PSDU, Range from 0 to 262 143

Table 25-7—Fields in the CMMG SIG field *(continued)*

Bit	Fields	Number of bits	Description
B36–B39	Last RSSI	4	For SC/OFDM mode: Contains a copy of the parameter LAST_RSSI from the TXVECTOR. When set to 0, this field is reserved and ignored by the receiver. The value is an unsigned integer: — Values of 2 to 14 represent power levels (–71+value×2) dBm. — A value of 15 represents a power greater than or equal to –42 dBm. — A value of 1 represents a power less than or equal to –68 dBm. Value of 0 indicates that the previous packet was not received an SIFS period before the current transmission. For control mode: Reserved.
B40–B41	Spreading Factor/ Aggregation/Additional PPDU	2	For control mode: — Set to 0: spreading by 13 — Set to 1: spreading by 7 — Set to 2: spreading by 4 — Set to 3: no spreading For SC/OFDM mode: Aggregation: — Set to 1 indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0. Additional PPDU: — Contains a copy of the parameter ADD_PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — A value of 0 indicates that no additional PPDU follows this PPDU.
B42–B46	Training Length	5	For SC/OFDM mode: Corresponds to the TXVECTOR parameter TRNLEN. If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 25.7.2.3. A value of 0 indicates that no training field is present in this PPDU. If the Beam Tracking Request field is 1 and the PPDU Type field is 10, the Training Length field indicates the length of the training field. If the PPDU Type field is 11, the Training Length field indicates the length of the training field requested for receive training. For control mode: Reserved.
B47	Beam Tracking Request	1	Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.42.7); otherwise, set to 0. The Beam Tracking Request field is reserved when the Training Length field is 0.
B48	Codeword Length	1	Set to 0 indicate that the codeword length is 672. Set to 1 indicate that the codeword length is 2016.

Table 25-7—Fields in the CMMG SIG field *(continued)*

Bit	Fields	Number of bits	Description
B49	TXOP_PS_NOT_ALLOWED	1	Set to 0 by CMMG AP if it allows non-AP CMMG STAs in TXOP power save mode to enter doze state during a TXOP. Set to 1 otherwise. The bit is reserved and set to 1 in CMMG PPDUs transmitted by a non-AP CMMG STA.
B50–B54	MCS	5	MCS index (see 25.15).
B55–B56	PPDU Type	2	When the Training Length field is nonzero, corresponds to the TXVECTOR parameter PPDU_TYPE. — PPDU Type = 11 indicates either a packet whose Data field is followed by one or more TRN-R subfields, or a packet that is requesting TRN-R subfields to be appended to a future response packet. — PPDU Type = 10 indicates a packet whose Data field is followed by one or more TRN-T subfields. When the Training Length field is zero and PPDU Type = 01, indicates that PPDU is a sounding PPDU. This field is reserved when the Training Length field is zero and PPDU Type = 00.
B57–B60	Spatial Expansion	4	For control/SC mode: Index into the corresponding spatial expansion method defined in Table 25-15.
	DB	1	For OFDM mode: If the PPDU is transmitted on 1080 MHz channel: Set DB to 1 for allowing dynamic bandwidth. Set to 0 for not allowing dynamic bandwidth. Otherwise set to 0 (Reserved). For control and SC mode: Reserved.
	STBC	1	For OFDM mode: Set to 1 if space-time block coding is used; otherwise, set to 0.
	NSS	2	For OFDM mode: Set to 0 for 1 spatial stream. Set to 1 for 2 spatial streams. Set to 2 for 3 spatial streams. Set to 3 for 4 spatial streams.
B61	Turnaround	1	As defined in Table 25-1.
B62–B63	Reserved	2	Reserved.
B64–B79	CRC	16	CMMG SIG check sequence. Definition of this field calculation is in 25.3.6.
NOTE—A value of 0 in the CMMG Length field indicates a PPDU that does not include a data field, i.e., NDP. NDP transmissions are used for sounding purposes only (see 10.36.2). The packet ends after the last CMMG OCEF or the CMMG SIG.			

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

All numeric fields are transmitted in unsigned format, LSB first.

25.3.9.2 Encoding of SIG

The scrambled SIG sequence consists of 80 bits, shown as $x = (x_0, x_1, x_2, \ldots, x_{79})$ and encoded with LDPC of rate-1/2 and length 672, as follows:

a) The scrambled SIG sequence is padded with 4 0s bits to create 84 bits. The 84-bit sequence include two contiguous subsequences with length of 42 bits, shown as $[[0, 0, 0, x_0, \ldots, x_{37}], [x_{38}, \ldots, x_{79}]]$, and the two subsequences are repeated once, respectively, to obtain 168 bits, such as $\mathbf{a}' = [[0]_{1\times 4}, x_0, \ldots, x_{37}, [0]_{1\times 4}, x_0, \ldots, x_{37}, x_{38}, \ldots, x_{79}, x_{38}, \ldots, x_{79}]$. Then, the repeated data sequence is padded with 168 zero bits to create 336 bits.

b) Then, using rate-1/2 LDPC base matrix and setting $\overline{h}_{26} = -1$, the 336-bit sequence is added with parity bits $[p_0, \ldots, p_{335}]$ to create LDPC codeword, shown as $\mathbf{c} = [[0]_{1\times 168}, \mathbf{a}', [p_0, \ldots, p_{335}]]$, such that $\mathbf{H} \times \mathbf{c}^{\mathrm{T}} = \mathbf{0}$, where $\mathbf{H}$ is revised LDPC parity check matrix.

The basic code is $\mathbf{c}' = [x_0, x_1, \ldots, x_{79}, p_0, p_1, \ldots, p_{335}]$. Using rate-matching to obtain transmitting sequence of 1024 bits: $S = [\mathbf{c}', \mathbf{c}', \mathbf{c}'(0, \ldots, 191)]$.

25.3.10 CMMG duplication transmission on a 1080 MHz channel

The STFs, the CEFs, and the SIG fields that are transmitted using SC modulation are specified at the SC chip rate F_C equal to 440 MHz. For transmission on the 1080 MHz channel, the signal is resampled with a 2 rate change, applied appreciate phase rotation for each 540 MHz subband, and then summed to form the transmitted signal.

Let $r(nT_C) = r_{STF}(nT_C) + r_{CEF}(nT_C - t_{CEF}) + r_{SIG}(nT_C - t_{SIG})$, where T_C is the SC chip duration for 540 MHz channel bandwidth and r_{CEF} is described in 25.3.5.

Then

$$r^{(1)}\left(n\frac{T_C}{2}\right) = \begin{cases} r\left(n\frac{T_C}{2}\right), n = 0, 2, 4, \ldots \\ 0, otherwise \end{cases} \quad (25\text{-}21)$$

$$r^{(2)}\left(n\frac{T_C}{2}\right) = \sum_{k=0}^{K-1} r^{(1)}\left((n-k)\frac{T_C}{2}\right) h_{Filt}(k), n = 0, 1, 2, \ldots \quad (25\text{-}22)$$

$$\bar{r}\left(n\frac{T_C}{2}\right) = r^{(2)}\left(\left(n + \frac{K-1}{2}\right)\frac{T_C}{2}\right), n = 0, 1, 2, \ldots \quad (25\text{-}23)$$

where K is the length of the filter defined in at chip rate 880 MHz whose definition is out of scope of this standard. The transmitted signal is given as

(25-24)

where B = 540 MHz.

Copyright © 2021 IEEE. All rights reserved.

25.3.11 h_{Filt} definition

The filter h_{Filt} is defined by the following coefficients (from h_0 to h_{70}):

[1,–6,–5,3,8,0,–8,–4,6,8,–4,–13, –2,16,14,–9,–23,–4,23,15, –20,–27,20,57,4,–99, –102,70,247,144,–264, –558,–175,991,2327,2917,2327,991,–175,–558,–264,144,247,70,–102, –99,4,57,20,–27,–20, 15,23,–4, –23,–9,14,16,–2,–13,–4,8,6,–4,–8,0,8,3,–5,–6,1].

Normalized to have a norm of $\sqrt{3}$ so that $h_{Filt}(k) = \frac{\sqrt{3}h_k}{\sqrt{\sum_{l=0}^{70}|h_l|^2}}$.

25.3.12 Encoding of Data field

The scrambled Data field is encoded with LDPC codeword length of n bits, information length of k bits, and expansion factor of z as follows:

a) $L_{DPCW} = k - 8$ is the maximal number of data bits in each LDPC codeword. The number of LDPC codeword is calculated as

$$N_{CW} = \lceil Length \times 8 / L_{DPCW} \rceil .$$

b) The number of data bits in the i^{th} LDPC codeword is

$$L_i = \begin{cases} L_{DPCW1}, i = 0, 1, \ldots, N_{CW1} - 1 \\ L_{DPCW1} - 1, i = N_{CW1}, N_{CW1} + 1, \ldots, N_{CW} - 1 \end{cases}$$

where

$$L_{DPCW1} = \lceil Length \times 8 / N_{CW} \rceil$$

$$N_{CW1} = \mathrm{mod}((Length \times 8), (L_{DPCW1} - 1))$$

c) The data field is broken into N_{CW} blocks of data word $\mathbf{b}_i$, i = 0, 1, …, N_{CW}–1. Each data word is added with 8-bit CRC sequence, see 25.3.6, then padded with $f_i = k – L_i – 8$ zero bits to create k bits, such as $\mathbf{b'}_i = (0, \ldots, 0, \mathbf{b}_i, crc_0^i, \ldots, crc_7^i)$.

d) For each data word, $n–k$ parity bits are added to create the LDPC codeword $\mathbf{d}_i = (\mathbf{b'}_i, p_0^i, p_1^i, \ldots, p_{(n-k-1)}^i)$, such that $\mathbf{H} \times \mathbf{d}_i^T = \mathbf{0}$.

e) Packet encoding: The j^{th} bit set that is composed of all the j^{th} bits of N_{CW} LDPC codeword is encoded with 1-bit parity check to create a parity bit T_j, j = 0, 1, …, n–1. All the parity bits T_j (j = 0, 1, …, n–1) are combined into a parity data word $\mathbf{d}_{N_{CW}}$ with length of n bits. That is, $\mathbf{d}_{N_{CW}} = \mathbf{d}_0 \oplus \mathbf{d}_1 \ldots \oplus \mathbf{d}_{(N_{CW}-1)}$.

f) Bits selection parameter: the punctured-bit index set of i^{th} codeword that are not belong to padding bits are $\mathbf{S}_i$ (i = 0, 1, …, N_{CW}–1), and the punctured-bit index set of parity data word $\mathbf{d}_{N_{CW}}$ is $\overline{\mathbf{S}}_{N_{CW}}$. The intersection of any two different sets of $\overline{\mathbf{S}}_i$ (i = 0, 1, …, N_{CW}) is empty set. The length of $\overline{\mathbf{S}}_i$ is e_i (i = 0,…, N_{CW}), such as: (where $n' = n - f_0$).

1) if N_{CW} = 1: $e_0 = 0$, $e_1 = n'$;

2) if $1 < N_{CW} \le 15$: $e_1 = z$, i = 0, 1, …N_{CW}–1, $e_{N_{CW}} = n' - \sum_{i=0}^{N_{CW}-1} e_i$;

3) if $N_{CW} > 15$:

$$e_i = \begin{cases} a + 1, i = 0, 1, \ldots, g - 1 \\ a, i = g, g + 1, \ldots, N_{CW} \end{cases},$$

where $a = \lfloor n'/(N_{CW} + 1) \rfloor$, $g = n' - a \times (N_{CW} + 1)$.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

g) Bits selection: the first element of $\bar{\mathbf{S}}_i$ is equal to the last element of $\bar{\mathbf{S}}_{(i-1)}$ plus 1, such as,

$$\bar{\mathbf{S}}_i = \left[f_0 + \sum_{j=0}^{i-1} e_j, f_0 + \sum_{j=0}^{i-1} e_j + 1, \ldots, f_0 + \sum_{j=0}^{i} e_j - 1\right],$$

where f_0 is the length of padding bits for the 0th codeword. Remove the zero padding bits and the punctured bits from $\mathbf{d}_i$ to obtain codeword $\mathbf{c}_i$, where $i = 0, 1, \ldots, N_{CW}-1$. The punctured-bit index set of parity data word $\mathbf{d}_{N_{CW}}$is

$$\bar{\mathbf{S}}_{N_{CW}} = \left[f_0 + \sum_{j=0}^{N_{CW}-1} e_j, f_0 + \sum_{j=0}^{N_{CW}-1} e_j + 1, \ldots, f_0 + \sum_{j=0}^{N_{CW}} e_j - 1\right].$$

Remove the padding-bit-generated bits and the punctured bits from $\mathbf{d}_{N_{CW}}$ to obtain $\mathbf{c}_{N_{CW}}$, where the padding-bit-generated bits are totally generated from the zero padding bits.

Example of data field encoding:

The data field contains *Length* = 512 octets. The parameter of LDPC: $n = 672$, $k = 336$, $R = 1/2$, $z = 42$.

a) $L_{DPCW} = k - 8 = 328$, the number of LDPC codeword: $N_{CW} = \lceil Length \times 8 / L_{DPCW} \rceil = 13$;

b) $L_{DPCW1} = \lceil Length \times 8 / N_{CW} \rceil = 316$, $N_{CW1} = \mathrm{mod}((Length \times 8), (L_{DPCW1} - 1)) = 1$,

$$L_i = \begin{cases} 316, i = 0 \\ 315, i = 1, 2, \ldots, 12 \end{cases};$$

that is, the number of data bits in the *0*th LDPC codeword is 316, and the 1st–12th LDPC codeword is 315.

c) The data field is broken into $N_{CW} = 13$ blocks of data word. Each data word is added with 8 bits *CRC* sequence, see 25.3.6. Then padded with zero bits: the *0*th data word is padded with 12 bits and the 1st-12th data word are padded with 13 bits.

d) All the data words are encoded to obtain LDPC codeword $\mathbf{d}_i = (\mathbf{b}'_i, p_0^i, p_1^i, \ldots, p_{(n-k-1)}^i)$, $i = 0, 1, \ldots, 12$.

e) Packet encoding: Encoded with 1-bit parity check to create $\mathbf{d}_{13}$, length of 672 bits.

f) Bits selection parameter: because of $(N_{CW} = 13) \le 15$, $e_i = 42$, $i = 0, 1, \ldots, 12$, and $n' = n - f_0 = 672 - 12 = 660$, $e_{13} = 660 - \sum_{i=0}^{12} e_i = 114$.

Bits selection: Remove the zero padding bits [0, 1, …, 11] and the punctured bits $\bar{\mathbf{S}}_0 = [12, 13, \ldots, 53]$ from $\mathbf{d}_0$ to obtain codeword $\mathbf{c}_0$ with length of 618 bits; Remove the zero padding bits [0, 1, …, 12] and the punctured bits $\bar{\mathbf{S}}_1 = [54, 55, \ldots, 95]$ from $\mathbf{d}_1$ to obtain codeword $\mathbf{c}_1$ with length of 617 bits; the same operating to obtain $\mathbf{c}_2$, …, $\mathbf{c}_{12}$. Remove the padding-bit-generated bits [0, 1, …, 11] and the punctured bits $\bar{\mathbf{S}}_{13} = [558, 559, \ldots, 671]$ from $\mathbf{d}_{13}$ to obtain codeword $\mathbf{c}_{13}$ with length of 546 bits.

25.3.13 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the data portion of the received frame.

The RCPI encoding is defined in 9.4.2.37.

RCPI shall equal the received RF power with an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel width multiplied by 1.1. The relative error between RF power measurements made within a 1 second interval should be less than ± 1 dB.

25.4 CMMG control mode

25.4.1 Introduction

Transmission and reception of the CMMG control mode PPDUs are mandatory. The CMMG control mode uses the same chip rate as the CMMG SC mode. The CMMG control mode is transmitted when the TXVECTOR indicates MCS 0. The modulation and coding scheme for the CMMG control mode is shown in Table 25-8.

Table 25-8—Modulation and coding scheme for the CMMG control mode

MCS index	Modulation	Code rate	Data rate
0	π/2-BPSK	1/2	25.38 Mb/s for SF 13, 47.14 Mb/s for SF 11, 82.5 Mb/s for SF 4, and 330 Mb/s for no spreading

25.4.2 PPDU format

The CMMG control mode frame is composed of CMMG control mode STF, CMMG control mode CEF, CMMG control mode SIG, CMMG control mode Data field, and possibly AGC and TRN-R/T subfields. This is shown in Figure 25-13.

Figure 25-13—CMMG control mode PPDU format

25.4.3 CMMG preamble transmission

In CMMG control mode preamble is transmitted using SC transmission (see 25.3.5).

25.4.4 CMMG control mode SIG transmission

25.4.4.1 General

The CMMG control mode SIG and data are modulated by π/2-BPSK and are spread by Barker sequences.

25.4.4.2 Generation of CRC bits

The CRC sequence is calculated over bits 0–63 and uses CRC 16-CCITT as described in 25.3.6.

25.4.4.3 Scrambler

The operation of the scrambler is defined in 25.3.7. Bits $x_1, x_2, x_3, x_4, x_5, x_6, x_7$ of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the SIG. The SIG is scrambled starting from bit 7.

25.4.4.4 Encoding

See 25.3.9.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.4.4.5 Modulation

The CMMG control mode SIG is modulated with π/2-BPSK modulation, the input bit stream is mapped according to the following equation $\tilde{s}_k = 2 \cdot c_k - 1$. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k e^{(j\pi k)/2}$.

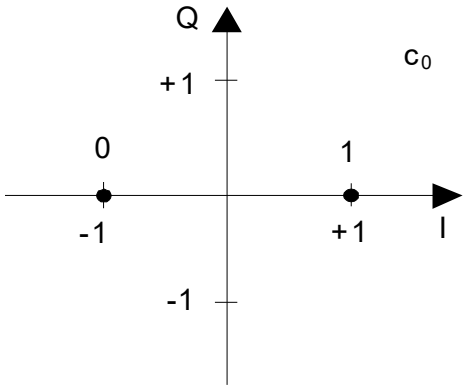

Figure 25-14—Constellation bit encoding for BPSK

25.4.4.6 Spreading

The constellation points are spread using the Barker sequence Barker(*L*) defined as follows in Table 25-9, where *L* is the spreading length.

Table 25-9—The Barker(*L*) sequences

Length *L*	Barker(*L*) sequences
4	+1,+1, –1,+1
7	+1, +1, +1, −1, −1,+1, −1
13	+1, +1, +1, +1, +1, −1, −1, +1, +1, −1, +1, −1, +1

The waveform for the modulated and spread data field is

$$r_{DATA}(nT_C) = \left(\text{Barker}(n \bmod L) d\left(\left\lfloor \frac{n}{L} \right\rfloor\right)\right) \times \exp\left(j\pi\frac{n}{2}\right), n = 0, 1, 2, \ldots \quad (25\text{-}25)$$

where $d(k)$ is the modulated constellation point k and T_C is the SC chip time.

For CMMG control mode SIG, the spreading factor is always Barker(13).

25.4.5 CMMG control mode Data field

25.4.5.1 General

The Data field consists of the payload data of the PSDU. The PSDU is scrambled, encoded, modulated, and spread as described in the following subclauses.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.4.5.2 Scrambler

The operation of the scrambler is defined in 25.3.7. The scrambling of the data field continues the scrambling of the CMMG control mode SIG with no reset.

25.4.5.3 Encoding

Use the LDPC of rate-1/2 and length 672. See 25.3.12.

25.4.5.4 Modulation

See 25.4.4.5.

25.4.5.5 Spreading

Spreading factor of CMMG control mode data field is indicated in CMMG control mode SIG. See 25.4.4.6.

25.4.6 CMMG control mode performance requirements

25.4.6.1 Transmit requirements

25.4.6.1.1 Introduction

Transmitter performance requirements of the control mode are defined in 25.4.6.1.2.

25.4.6.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The instrumentation shall incorporate a rake receiver or equalizer to reduce error resulting from multipath. If used, the equalizer shall be trained using information in the preamble (STF/CEF). For CMMG control mode EVM, the signal is first despread using the spreading Barker sequence, the EVM is then calculated on the resulting symbols according to Equation (25-26).

$$EVM = 20\log_{10}\left(\sqrt{\frac{1}{N_S P_{avg}}\sum_{i=1}^{N_S}[(I_i - I_i^*)^2 + (Q_i - Q_i^*)^2]}\right) \quad (25\text{-}26)$$

where N_S is the number of samples to be measured and N_S shall be 1000, P_{ave} is the average power of the constellation, (I_i, Q_i) is the complex coordinates of the measured symbol i, (I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i.

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 25-10.

Table 25-10—EVM requirement for control mode

MCS index	Description	EVM value (dB)
0	Control mode modulation	–6

25.4.6.2 Receive requirements

25.4.6.2.1 Introduction

Subclause 25.4.6.2.2 describes the performance requirement from the CMMG control mode receiver.

25.4.6.2.2 CCA

The start of a CMMG control mode transmission at a receive level greater than the minimum sensitivity for CMMG control mode (–78 dBm) shall cause CCA to indicate busy with a probability > 90% within 3 μs.

25.5 CMMG SC mode

25.5.1 Introduction

Transmission and reception of CMMG SC mode PPDUs in MCSs 1 to 3 is mandatory. Transmission and reception of CMMG SC mode PPDUs with MIMO may be supported.

25.5.2 Transmitter block diagram

Figure 25-15 shows the transmit process for the CMMG SC mode SIG transmission. The actual structure of the transmitter is implementation dependent.

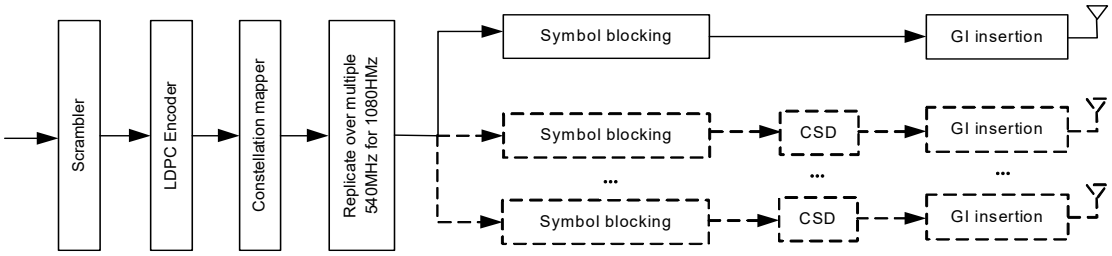

Figure 25-15—Transmitter block diagram for CMMG SC mode SIG field

Figure 25-16 shows the transmit block used to generate the data fields of 540 MHz and 1080 MHz using SC mode transmission.

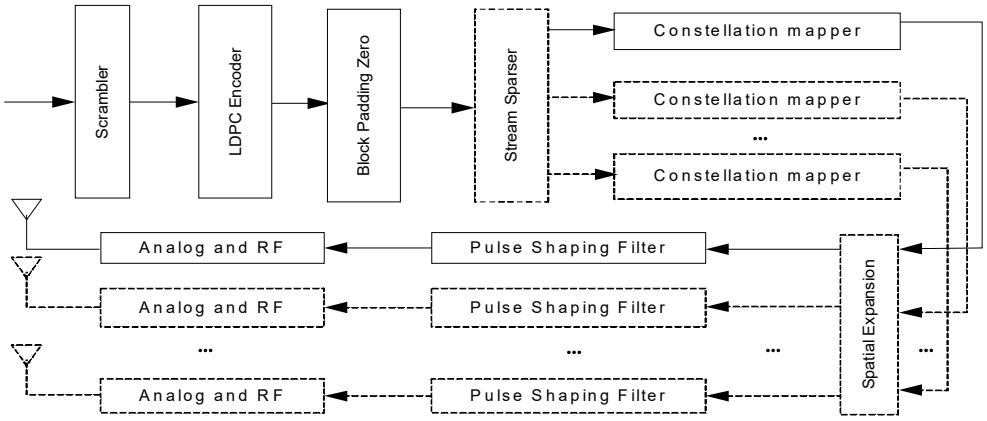

Figure 25-16—Transmitter block diagram for data fields of CMMG SC mode PPDUs

NOTE—The operations denoted by the dotted line arrows and dotted line boxes in the above two figures are optional and are applied for SC MIMO transmission.

25.5.3 Overview of the PPDU encoding process

25.5.3.1 General

This subclause provides an overview of the CMMG SC mode PPDU encoding process.

25.5.3.2 Construction of CMMG SC mode SIG

The construction of the CMMG SC mode SIG field proceeds as follows:

a) Obtain the parameters from TXVECTOR. Add the reserved bits, append the calculated CRC. The calculation of the CRC of the CMMG SC mode SIG is described in 25.3.6.

b) Scrambler: Scramble the CMMG SC mode SIG bits. The scrambler is described in 25.3.7.

c) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.5.5.4.2.

d) Constellation mapper: BPSK modulate the coded bits as described in 25.5.5.4.3 to form the transmitted symbol blocks of CMMG SC mode SIG.

e) Duplication and phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as 25.5.5.4.4.

f) Symbol blocking: Divide the encoded SIG field into symbol block of length 256.

g) CSD: Apply CSD for each transmit chain as described in 25.5.5.4.5. This only applies to the CMMG SC mode MIMO mechanism.

h) GI insertion: Prepend a GI for each symbol block of length 256.

i) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

NOTE—Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.5.3.3 Construction of CMMG SC mode PPDUs

The construction of the data field in a CMMG SC mode PPDU LDPC encoding proceeds as follows:

a) Scrambler: Scramble the PHY padded data.
b) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.3.12.
c) Blocking Padding Zero: Append the PHY pad bits to the PSDU as described in 25.5.6.4.
d) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 25.5.6.5.
e) Constellation mapper: Map to π/2-BPSK, π/2-QPSK, π/2-16-QAM, or π/2-64-QAM constellation points as described in 25.5.6.6.
f) Spatial Expansion: Apply the spatial expansion mechanism according to the combination of the number of the spatial streams and the number of the transmit antennas as described in 25.5.6.7.
g) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

25.5.4 CMMG SC mode PPDU format

A CMMG SC mode PPDU frame is composed of the CMMG SC mode STF, the CMMG SC mode CEF, the CMMG SC mode SIG field, the optional CMMG SC mode SCTF, the SC data block, and the optional training fields, which is defined in Figure 25-17 where the SCTF fields is transmitted for 1080 MHz channel bandwidth.

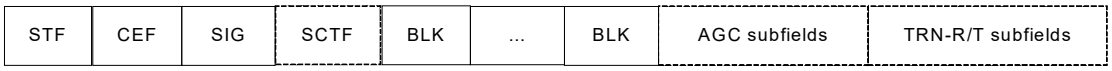

Figure 25-17—Format of CMMG SC mode PPDU

NOTE—The SCTF is only transmitted for 1080 MHz channel bandwidth and is composed of a ZCZ sequence of length 512. For MIMO transmission, different transmit antenna transmit a different preamble that is composed of one the four ZCZ sequences with the order of $Z_{512}^{1}, Z_{512}^{2}, Z_{512}^{3}, Z_{512}^{4}$, such as for the case of one transmit antenna, the preamble sequence is composed of Z_{512}^{1} , for the case of two transmit antennas, the preamble sequences are composed of Z_{512}^{1}, Z_{512}^{2} , respectively.

25.5.5 CMMG SC mode SIG transmission

25.5.5.1 SIG field

The CMMG SC mode SIG field carries information required to interpret PPDUs. The preamble and the CMMG SC mode SIG fields all are transmitted with SC mode modulation.

25.5.5.2 Generation of the CRC bits of SIG

The calculation of the CRC of the CMMG SC mode SIG is described in 25.3.6.

25.5.5.3 Scrambler

The operation of the scrambler is defined in 25.3.7. Bits $x_1, x_2, x_3, x_4, x_5, x_6, x_7$ of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the SIG. The CMMG SC mode SIG is scrambled starting from bit 7.

25.5.5.4 Encoding and modulations

25.5.5.4.1 General

The modulation and coding scheme defines the modulation and code rate that is used in the PPDU. The modulation and coding schemes are defined in 25.5.6.6.

25.5.5.4.2 Encoding

See 25.3.9.2.

25.5.5.4.3 Modulation

See 25.4.4.5.

25.5.5.4.4 Duplication

If the channel bandwidth is 1080 MHz, the modulated SIG symbols are transmitted in duplicate format as defined in 25.3.10.

25.5.5.4.5 Symbol blocking, CSD, and GI insertion

The modulated CMMG SC mode SIG symbols are divided into four symbols blocks of length 256. For each block, the cyclic shift values for the CMMG SC mode SIG field of the PPDU for transmit chain i_{TX} out of a total of N_{TX} are defined in Table 25-11.

Table 25-11—Cyclic shift values for the CMMG SIG field

$T_{CS}^{i_{TX}}$ values for the CMMG-SIG field				
Total number of transmit chains (N_{TX})	Cyclic shift for transmit chain i_{TX} (in units of ns)			
	1	2	3	4
1	0	—	—	—
2	0	$-128T_C$	—	—
3	0	$-85T_C$	$-170T_C$	—
4	0	$-64T_C$	$-128T_C$	$-192T_C$

After the CSD operations, each group of 256 symbols is prepended by the last 64 symbols that form the cyclic prefix.

25.5.6 Data field transmission

25.5.6.1 General

The subclause describes the transmission of the SC data field.

25.5.6.2 Scrambler

The operation of the scrambler is defined in 25.3.7. The scrambling of the Data field continues the scrambling of the CMMG SC mode SIG with no reset for CMMG SC mode transmission.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.5.6.3 Encoding

See 25.3.12.

25.5.6.4 Symbol block padding zeros

The number of symbol blocks, N_{BL}, is calculated as follows:

$$N_{BL} = m_{SE}\left\lceil \frac{Length \times 8 + (8 + L_{CHECK}) \times N_{CW}}{m_{SE} N_{CBPB}} \right\rceil \quad (25\text{-}27)$$

where L_{CHECK} is the number of LDPC parity bits, m_{SE} values are listed in Table 25-12, and N_{CBPB} values are shown in Table 25-13.

Table 25-12—Values of m_{SE}

N_{SS}	N_{TX}	m_{SE}
1	1	1
	2	2
	3	3
	4	4
2	2	2
	3	4
	4	4
3	3	3
	4	6
4	4	4

Table 25-13—Values of N_{CBPB}

Symbol mapping	N_{CBPB} (540 MHz)		N_{CBPB} (1080 MHz)	
	Long GI	Short GI	Long GI	Short GI
π/2-BPSK	192	224	384	448
π/2-QPSK	384	448	768	896
π/2-16-QAM	768	896	1536	1792
π/2-64-QAM	1152	1344	2304	2688

The number of padding zeros is given by

$$N_{BPAD} = N_{BL} N_{CBPB} - (Length \times 8 + (8 + L_{CHECK}) \times N_{CW}) \quad (25\text{-}28)$$

The PSDU is concatenated with N_{BPAD} 0s. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.5.6.5 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoder are processed in groups of N_{CBPB}. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (25-29).

$$s = \max\left\{1, \frac{N_{CBPS}}{2}\right\} \tag{25-29}$$

Consecutive blocks of s bits are assigned to different spatial streams in a round robin fashion.

Bit i at the output of encoder is assigned to input bit k of spatial stream where

$$i = (i_{SS} - 1) \cdot s + N_{SS} \cdot s \cdot \left\lfloor \frac{k}{s} \right\rfloor + k \bmod s \tag{25-30}$$

where $i_{SS} = 1, 2, \ldots, N_{SS}$, $i = 0, 1, \ldots, N_{CBPB}-1$, $k = 0, 1, \ldots, N_{CBPSS}-1$.

25.5.6.6 Constellation mapping

The modulation and coding scheme (MCS) field specifies the modulation and code rate used in the PPDU.

A CMMG STA shall support all equal modulation (EQM) rates for one spatial stream (MCSs 1 to 3). MCSs 4 to 8 are optional.

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

In π/2-BPSK modulation, the input bit stream is mapped according to the following equation:

$$\tilde{s}_k = 2 \cdot c_k - 1$$

where c_k is the k^{th} input coded (or scrambled pad) bit. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

NOTE—With appropriate choice of transmit filtering, π/2-BPSK is equivalent to a precoded pulse-shaped MSK (e.g., GMSK). The precoder is simply $b_{out,k} = b_{in,k} \oplus b_{in,k-1}$, where $b_{in,k}$ is the scrambled input stream, $b_{in,-1}$ is 0, and $b_{out,k}$ is the input to the (G)MSK modulator.

In π/2-QPSK modulation (see Figure 25-18), the input bit stream is mapped according to the following equation:

$$\tilde{s}(k) = \frac{1}{\sqrt{2}}((2c_{2k} - 1) + j(2c_{2k+1} - 1))\exp\left(-j\frac{\pi}{4}\right)$$

where k is the output symbol index, $k = 0, 1, \ldots$. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

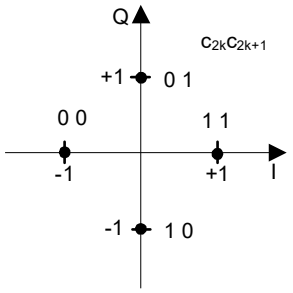

Figure 25-18—QPSK constellation bit encoding

In π/2-16-QAM modulation (see Figure 25-19), the input bit stream is mapped according to the following equation:

$$\tilde{s}_k = \frac{1}{\sqrt{10}}\{(4c_{4k}-2)-(2c_{4k}-1)(2c_{4k+1}-1)+j(4c_{4k+2}-2)-j(2c_{4k+2}-1)(2c_{4k+3}-1)\} \quad (25\text{-}31)$$

where k is the output symbol index, k = 0, 1, …. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

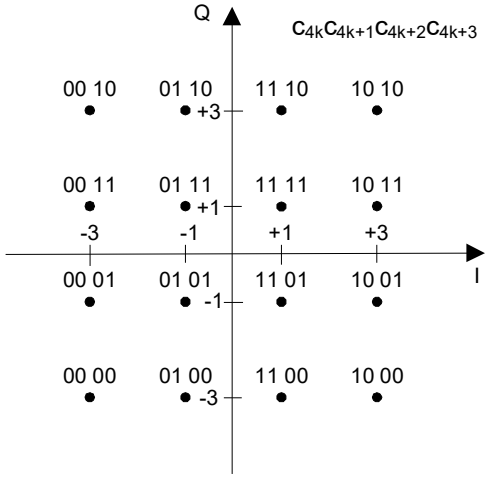

Figure 25-19—16-QAM constellation bit encoding

In π/2-64-QAM modulation (see Figure 25-20), the input bit stream is mapped according to the following equation:

$$\begin{aligned}\tilde{s}_k = {} & \frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1)) \\ & +j\frac{1}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6+4}-1)(2c_{6k+5}-1))\end{aligned} \quad (25\text{-}32)$$

where k is the output symbol index, k = 0, 1, …. Each output symbol is then rotated according to the following equation:

$$s_k = \tilde{s}_k e^{(j\pi k)/2}$$

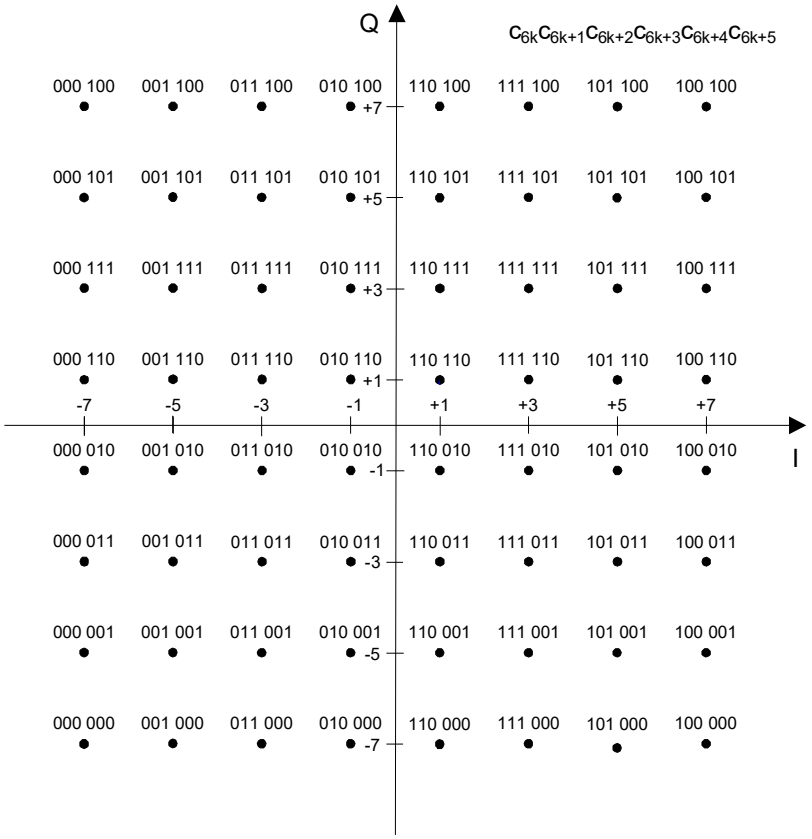

Figure 25-20—64-QAM constellation bit encoding

25.5.6.7 Spatial expansion

Each spatial stream is divided into many subblocks that each subblock includes N_{DSPB} constellation symbols. Values of N_{DSPB} and N_{UWPB} are shown in Table 25-14.

Table 25-14—Values of N_{DSPB} and N_{UWPB}

	N_{CBPB} (CBW540 MHz)		N_{CBPB} (CBW1080 MHz)	
	Long GI	**Short GI**	**Long GI**	**Short GI**
N_{DSPB}	192	224	384	448
N_{UWPB}	64	32	128	64

The spatial stream of complex numbers, $\mathbf{d}_{i,n}$, $i = 1, \ldots, N_{SS}$, $n = 0, 1, \ldots, N_{BL}–1$, is the input to the spatial expansion module, which produces as output the stream of complex numbers $\mathbf{x}_{i_{TXT},n}$, $i_{TXT} = 1, \ldots, N_{TXT}$. The relation between the spatial streams and the output streams is given in Table 25-15 where $\mathbf{x}_{i_{TXT},n} = (\tilde{\mathbf{x}}_{i_{TXT},n})^T$, $\tilde{\mathbf{d}}_{i,n} = [\mathbf{d}_{i,n}, \mathbf{0}_{1 \times N_{UWPB}}]^T$, $\tilde{\mathbf{u}}_{i_{TXT}} = \left[\mathbf{0}_{1 \times N_{DSPB}}, Z_{N_{UWPB}}^{i_{TXT}}\right]^T$, and $\mathbf{Q}_{N_{BLS}}$ is defined as

Copyright © 2021 IEEE. All rights reserved.

$$\mathbf{Q}_{N_{BLS}} = \begin{bmatrix} \mathbf{Q}_1 & \mathbf{Q}_2 \\ \mathbf{Q}_3 & \mathbf{Q}_4 \end{bmatrix} \tag{25-33}$$

where $\mathbf{Q}_2 = \mathbf{0}_{N_{DSPB} \times N_{UWPB}}$, $\mathbf{Q}_3 = \mathbf{0}_{N_{UWPB} \times N_{DSPB}}$, and

$$\mathbf{Q}_1 = \begin{bmatrix} 0 & 0 & 0 & \dots & 0 & 0 & 1 \\ 0 & 0 & 0 & \dots & 0 & 1 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & 1 & 0 & \dots & 0 & 0 & 0 \\ 1 & 0 & 0 & \dots & 0 & 0 & 0 \end{bmatrix}_{N_{DSPB} \times N_{DSPB}}, \mathbf{Q}_4 = \begin{bmatrix} 0 & 0 & 0 & \dots & 0 & 0 & 1 \\ 0 & 0 & 0 & \dots & 0 & 1 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & 1 & 0 & \dots & 0 & 0 & 0 \\ 1 & 0 & 0 & \dots & 0 & 0 & 0 \end{bmatrix}_{N_{UWPB} \times N_{UWPB}} \tag{25-34}$$

The starting index for the first symbol for π/2 rotation is 0. If the Additional PPDU field within the SIG field is equal to 0, the same ZCZ sequence guard interval is prepended to the first block transmitted. If the Additional PPDU field within the SIG field is equal to 1, the same ZCZ sequence guard interval is prepended to the first block transmitted. See Figure 25-21.

NOTE 1—$a = 2$, for $N_{SS} = 1$ and $N_{TXT} = 4$; otherwise, $a = 1$.
NOTE 2—* indicates conjugate operation.

25.5.6.8 Duplication transmission

When the TXVECTOR parameter DUPLICATE_MODULATION is present, the transmitted PPDU is a duplicate. The modulated data symbols are duplicated as described in 25.3.10.

25.5.7 Performance requirements

25.5.7.1 Transmit requirements

25.5.7.1.1 Introduction

Transmitter performance requirements of the SC mode are defined in 25.5.7.1.2.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.5.7.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery, amplitude adjustment, and equalization while making the measurements. The equalizer shall be trained using information in the CMMG SC mode preamble (STF/CEF). For the CMMG SC mode EVM, measuring samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given packet (ramp up/down). The EVM is calculated according to the formula below:

(25-35)

where

N_S is the number of samples to be measured and N_S should be 1000
P_{avg} is the average power of the constellation
(I_i, Q_i) is the complex coordinates of the measured symbol i
(I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i
(I_0, Q_0) is the complex DC term chosen to reduce EVM

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 25-16.

Table 25-16—EVM requirements for SC mode

CMMG-MCS indexes	Modulation	Coding rate	EVM value (dB)
1	π/2-BPSK	1/2	–7
2	π/2-QPSK	1/2	–11
3	π/2-QPSK	3/4	–13
4	π/2-16-QAM	1/2	–19
5	π/2-16-QAM	3/4	–21
6	π/2-64-QAM	5/8	–25
7	π/2-64-QAM	3/4	–26
8	π/2-64-QAM	13/16	–28

25.5.7.1.3 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

— MULTICHANNEL_SAMPLING_RATE is 440×10^6 sample/s for 540 MHz channel and 880×10^6 sample/s for 1080 MHz channel
— FIRST_TRANSITION_FIELD is Short Training field
— SECOND_TRANSITION_FIELD is Channel Estimation field
— TRAINING_FIELD is Channel Estimation field
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

25.5.7.2 Receive requirements

25.5.7.2.1 Introduction

This subclause describes the receiver requirements of the CMMG SC mode.

25.5.7.2.2 CCA

The start of a CMMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 0 (–81 dBm for 540 MHz, –78 dBm for 1080 MHz) shall cause CCA to indicate busy with a probability > 90% within 1 μs. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 0.

25.6 CMMG OFDM mode

25.6.1 Introduction

Transmission and reception of OFDM mode PPDUs are optional.

25.6.2 CMMG OFDM mode PPDU format

A CMMG OFDM mode OFDM PPDU frame is composed of the CMMG OFDM mode STFs, the CMMG OFDM mode CEF, the CMMG OFDM mode SIG field, the CMMG OFDM mode Short Training Field (OSTF), the CMMG OFDM mode Channel Estimation Field (OCEF), CMMG OFDM mode symbols, and the optional training fields, as shown in Figure 25-22.

25.6.4 Overview of CMMG OFDM mode PPDU encoding process

25.6.4.1 General

This subclause provides an overview of the CMMG OFDM mode PPDU encoding process.

25.6.4.2 Construction of CMMG OFDM mode SIG

The construction of the CMMG OFDM mode SIG field proceeds as follows:

a) Obtain the parameters from TXVECTOR. Add the reserved bits, append the calculated CRC. The calculation of the CRC of the CMMG OFDM mode SIG is described in 25.3.6.
b) Scrambler: Scramble the CMMG OFDM mode SIG bits. The Scrambler is described in 25.3.7.
c) LDPC encoder: The scrambled bits are encoded using the LDPC code as described in 25.5.5.4.2.
d) Constellation mapper: BPSK modulate the coded bits as described in 25.5.5.4.3 to form the transmitted symbol blocks of CMMG PHY SIG.
e) Duplication and phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as 25.5.5.4.4.
f) CSD: Apply CSD for each transmit chain as described in 25.5.5.4.5. This is need only for the CMMG OFDM MIMO mechanism.
g) Symbol blocking and GI insertion: Prepend a GI and generate the transmission symbol block.
h) Upsampling, filtering, and downsampling: Sample rate change in CMMG OFDM mode transmission as described in 25.6.5.4. This only applies to the CMMG OFDM mode MIMO mechanism.
i) Pulse filter, Analog, and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

NOTE—Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

25.6.4.3 Construction of CMMG OFDM mode PPDU

The construction of the Data field in an OFDM mode PPDU with LDPC encoding proceeds as follows:

a) Scrambler: Scramble the PHY padded data. The scrambler is described in 25.3.7.
b) LDPC encoder: The scrambled bits are encoded using the LDPC code with the APEP_LENGTH in the TXVECTOR as described in 25.6.8.3.
c) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 25.6.8.5.
d) Constellation mapper: Map to BPSK, QPSK, 16-QAM, or 64-QAM constellation points as described in 25.6.8.6.
e) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 25.6.8.7.
f) OFDM symbol padding zeros: Append the CMMG OFDM mode pad bits to the PSDU as described in 25.6.8.4.
g) STBC: Apply STBC as described in 25.6.8.8.
h) Pilot insertion: Insert pilots following the steps described in 25.6.8.9.
i) CSD: Apply CSD for each space-time stream as described in 25.6.8.10.
j) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11.
k) Phase rotation: Apply the appropriate phase rotations for each 540 MHz subchannel as described in 25.3.4.4.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

l) IDFT: Compute the inverse discrete Fourier transform.

m) Insert GI and apply windowing: Prepend a GI and apply windowing.

n) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit.

25.6.4.4 Construction of OSTF

The OSTF is defined in 25.6.6 and is constructed as follows:

a) Sequence generation: Generate the OSTF in the frequency-domain over the bandwidth indicated by CH_BANDWIDTH as described in 25.6.6.

b) Phase rotation: Apply appropriate phase rotation for each 540 MHz subchannel as described in 25.3.4.3 and 25.3.4.4.

c) CSD: Apply CSD for each space-time stream and frequency segment as described in 25.6.8.10.

d) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11.

e) IDFT: Compute the inverse discrete Fourier transform.

f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 25.3.4.3.

g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 25.3.4.3 and 25.6.6 for details.

25.6.4.5 Construction of OCEF

The OCEF is defined in 25.6.7 and constructed as follows:

a) Sequence generation: Generate the OCEF sequence in the frequency-domain over the bandwidth indicated by CH_BANDWIDTH as described in 25.6.7.

b) Phase rotation: Apply appropriate phase rotation for each 540 MHz subchannel as described in 25.3.4.3 and 25.3.4.4.

c) Matrix mapping: Apply the matrix to the OCEF sequence and apply the matrix to the pilot tones as described in 25.6.7.

d) CSD: Apply CSD for each space-time stream and frequency segment as described in 25.6.8.10.

e) Spatial mapping: Apply the **Q** matrix as described in 25.6.8.11.

f) IDFT: Compute the inverse discrete Fourier transform.

g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 25.3.4.3.

h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 25.3.4.3 and 25.6.7 for details.

25.6.5 CMMG OFDM mode SIG fields

25.6.5.1 SIG fields

See 25.5.5.1 to 25.5.5.4.2.

25.6.5.2 Modulation

See 25.4.4.5.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.6.5.3 Duplication

If the channel bandwidth is 1080 MHz, the modulated SIG symbols are duplicated as described in 25.3.10.

25.6.5.4 Symbol blocking, CSD, and GI insertion

See 25.5.5.4.5.

25.6.5.5 Symbol rate change

If the channel bandwidth is 540 MHz, the preamble sequence and the CMMG OFDM mode SIG fields defined in the above subclauses are specified at the SC chip rate (T_C). For transmission in the OFDM (nominal) sample rate, the signal is resampled with a 3/2 rate change. The resampling is done by upsampling by a factor of 3, filtering by the filter h_{Filt} defined in 25.3.11, and downsampling by a factor of 2 (see equation below). To define the transmission of the preamble when the packet is an OFDM packet, the preamble waveform is defined below.

Let $r(nT_C) = r_{STF}(nT_C) + r_{CEF}(nT_C - t_{ce}) + r_{SIG}(nT_C - t_{SIG})$, then

$$r\left(n\frac{T_s}{2}\right) = \begin{cases} r\left(n\frac{T_c}{3}\right), n = 0, 3, 6, \ldots \\ 0, otherwise \end{cases} \quad (25\text{-}36)$$

$$\tilde{r}\left(n\frac{T_s}{2}\right) = \sum_{k=0}^{K-1} r\left((n-k)\cdot\frac{T_s}{2}\right) h_{Filt}(k), n = 0, 1, \ldots \quad (25\text{-}37)$$

$$r(nT_s) = \tilde{r}\left(2n\frac{T_s}{2} - \frac{K-1}{2}\frac{T_s}{2}\right), n = 0, 1, \ldots \quad (25\text{-}38)$$

where K is the length of the filter defined in 25.3.11, $\tilde{r}(n=0)$ for $n<0$.

25.6.6 OSTF definition

The main purpose of the OFDM Short Training Field (OSTF) is to improve automatic gain control estimation in a MIMO transmission. The duration of the OSTF is T_{OSTF} regardless of the Short GI field setting in CMMG OFDM SIG.

For a 540 MHz transmission, the frequency domain sequence is given by Equation (25-39).

$$OSTF_{-89,\,89} = \{0, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, 0, 0, 0, 0, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{b}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{b}, \mathbf{a}, \mathbf{a}, 0, 0\} \quad (25\text{-}39)$$

where **a** = [1, 0, 0, 0] and **b** = [–1, 0, 0, 0].

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For a 1080 MHz transmission, the frequency domain sequence is given by Equation (25-40).

$$OSTF_{-177,\,177} = \frac{1+j}{\sqrt{2}}\{\,0,\ \mathbf{b, b, a, a, a, b, b, b, a, a, b, a, a, a, a, b, b, b, b, a, b, a, b, b, b, a,}$$
$$\mathbf{b, b, a, b, a, b, a, a, b, b, a, a, b, a, a, a, b, a, b, 0, 0, 0, 0, a, a, b, b, b, b, b, b, b, a, a,} \quad (25\text{-}40)$$
$$\mathbf{b, b, a, a, a, a, a, a, b, a, a, a, a, a, b, a, a, a, b, a, b, a, a, a, a, a, a, a, a, b, b,}\ -1,\ 0\,\}$$

where **a** = [1, 0, 0, 0] and **b** = [–1, 0, 0, 0].

The time domain representation of the signal of transmit chain i_{TXT} shall be as specified in Equation (25-41).

$$r^{i_{TX}}_{OSTF}(t) = \frac{w_{T_{OCEF}}(t)}{\sqrt{N_{Tone}N_{STS}}} \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} [Q_k]_{i_{TX},\,m}\, \Upsilon_{k,\,CBW} OSTF_k \exp(j2\pi\Delta_F(t - T_{CS}(m))) \quad (25\text{-}41)$$

where

N_{Tone} is, for 540 MHz transmission, 176, and, for 1080 MHz transmission, 352
T_{CS} is given in Table 25-27
Q_k is defined in 25.6.8.13
$\Upsilon_{k,\,CBW}$ is defined in 25.3.4.4

25.6.7 OCEF definition

The OCEF provides a means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for N_{STS} space-time streams (spatial mapper inputs) used for the transmission of the PSDU(s). For each tone, the MIMO channel that can be estimated is a $N_{RX} \times N_{STS}$ matrix. A frame transmission has a preamble that contains OCEF symbols, where the data tones of each OCEF symbol are multiplied by entries belonging to a matrix $\mathbf{P}_{OCEF}$, to enable channel estimation at the receiver. The pilot tones of each OCEF symbol are multiplied by the entries of a matrix $\mathbf{R}_{OCEF}$ defined in the following text. The multiplication of the pilot tones in the OCEF symbol by the $\mathbf{R}_{OCEF}$ matrix instead of the $\mathbf{P}_{OCEF}$ matrix allows receivers to track phase and frequency offset during MIMO channel estimation using the OCEF. The number of OCEF symbols, N_{OCEF}, is a function of the number of space-time streams N_{STS} as shown in Table 25-17. As a result the OCEF consists of one, two, or four symbols.

Table 25-17—Number of OCEFs required for different numbers of space-time streams

N_{STS}	N_{OCEF}

In a 540 MHz transmission, let $OCEF_{left}$ and $OCEF_{right}$ be the sequences defined in Equation (25-42) and Equation (25-43), respectively.

$$\begin{aligned} OCEF_{left} = \{&1,-1,-1,1,1,-1,-1,1,1,-1,1,1,1,1,1,1,1,1,-1,-1,1,-1,1,1,1,\\ &-1,1,1,-1,1,-1,-1,1,1,-1,-1,1,-1,1,1,1,1,1,1,1,1,-1,-1,1,1,1,\\ &-1,1,1,-1,1,-1,1,-1,-1,-1,1,-1,-1,-1,-1,1,1,-1,-1,-1,-1,-1,\\ &-1,1,-1,-1,-1,1,1,1,1,-1,-1,1,1,-1,1,1\} \end{aligned} \tag{25-42}$$

$$\begin{aligned} OCEF_{right} = \{&-1,1,-1,1,1,-1,1,-1,-1,-1,1,1,1,1,1,-1,-1,-1,1,1,1,1,-1,-1,\\ &-1,-1,-1,-1,-1,1,-1,1,-1,1,1,1,-1,-1,-1,-1,1,1,-1,-1,-1,1,\\ &1,-1,1,1,-1,1,1,1,1,-1,1,-1,-1,-1,1,-1,1,-1,1,-1,1,-1,1,1,\\ &1,1,-1,1,-1,1,-1,-1,1,1,1,-1,1,1,-1,-1,-1,1\} \end{aligned} \tag{25-43}$$

In a 540 MHz transmission, the OCEF sequence transmitted is given by Equation (25-44).

$$OCEF_{-89,89} = \{OCEF_{left}, 0, 0, 0, OCEF_{right}\} \tag{25-44}$$

In a 1080 MHz transmission, let $OCEF_{left}$ and $OCEF_{right}$ be the sequences defined in Equation (25-45) and Equation (25-46), respectively.

$$\begin{aligned} OCEF_{left} = \{&1,-1,1,-1,-1,-1,-1,-1,1,1,-1,-1,1,1,1,1,1,-1,-1,-1,-1,1,\\ &-1,1,-1,1,1,1,1,-1,1,1,-1,-1,1,1,1,-1,1,1,-1,-1,1,-1,-1,-1,\\ &1,-1,1,1,-1,1,1,1,-1,-1,1,-1,-1,-1,-1,-1,1,1,-1,-1,-1,-1,\\ &-1,1,-1,1,1,1,-1,-1,-1,-1,1,1,1,-1,1,1,1,1,-1,-1,1,1,-1,1,1,\\ &1,1,1,-1,-1,-1,1,-1,1,1,-1,1,1,-1,1,1,-1,1,-1,1,1,1,1,1,-1,1,\\ &1,-1,1,-1,1,1,1,1,1,1,-1,-1,1,-1,-1,-1,1,-1,1,1,-1,1,1,1,-1,\\ &-1,1,-1,1,1,1,1,-1,1,1,1,-1,1,1,1,1,-1,1,-1,-1,-1,1,-1,1,1,1,\\ &-1,-1,-1,-1,-1,-1,1\} \end{aligned} \tag{25-45}$$

$$\begin{aligned} OCEF_{right} = \{&-1,1,-1,-1,1,1,1,-1,1,-1,1,1,1,1,-1,-1,1,1,-1,1,1,-1,-1,-1,\\ &1,1,1,-1,-1,1,-1,-1,-1,1,-1,1,-1,1,-1,1,1,1,-1,1,-1,-1,-1,\\ &-1,1,1,-1,1,-1,1,1,1,-1,1,1,1,1,-1,-1,-1,-1,1,1,1,1,1,-1,1,\\ &-1,1,1,-1,1,-1,-1,1,-1,-1,-1,-1,1,1,1,1,-1,1,1,1,1,1,-1,1,\\ &1,-1,-1,-1,1,-1,-1,-1,1,-1,1,1,1,1,-1,-1,-1,1,1,-1,1,-1,1,\\ &-1,1,-1,-1,-1,-1,-1,-1,1,-1,-1,-1,1,-1,1,1,1,1,1,-1,-1,-1,\\ &1,1,1,-1,-1,-1,1,-1,-1,-1,-1,1,-1,1,-1,1,1,1,1,1,1,-1,1,-1,\\ &1,-1,1,1,1,-1,1,-1,1,-1,1,1\} \end{aligned} \tag{25-46}$$

In a 1080 MHz transmission, the OCEF sequence transmitted is given by Equation (25-47).

$$OCEF_{-177,177} = \{OCEF_{left}, 0, 0, 0, OCEF_{right}\} \tag{25-47}$$

The generation of the time domain OCEF symbols per frequency segment is shown in Figure 25-25 where A_{OCEF} is given in Equation (25-48).

$$A^{k}_{OCEF} = \begin{cases} R_{OCEF}, k \in K_{Pilot} \\ P_{OCEF}, otherwise \end{cases} \tag{25-48}$$

where K_{Pilot} is the set of subcarrier indices for the pilot tones.

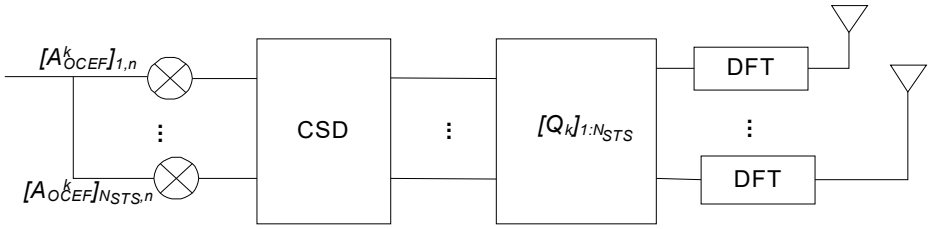

Figure 25-25—Generation of OCEF symbols per frequency segment

For a 540 MHz transmission, $K_{Pilot} = \{\pm 11, \pm 33, \pm 55, \pm 77\}$.

For a 1080 MHz transmission, $K_{Pilot} = \{\pm 11, \pm 33, \pm 55, \pm 77, \pm 99, \pm 121, \pm 143, \pm 165\}$.

$\mathbf{R}_{OCEF}$ is a $N_{OCEF} \times N_{OCEF}$ matrix whose elements are defined in Equation (25-49).

$$[R_{OCEF}]_{m,n} = [P_{OCEF}]_{1,n},\ 1 \le m, n \le N_{OCEF} \tag{25-49}$$

$$P_{OCEF} = \begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix} \tag{25-50}$$

The time domain representation of the waveform transmitted on transmit chain i_{TX} shall be as described by Equation (25-51).

$$r^{i_{TX}}_{OCEF}(t) = \sum_{n=0}^{N_{OCEF}-1} \frac{w_{T_{OCEF}}(t - nT_{OCEF})}{\sqrt{N_{Tone}N_{STS}}} \left(\sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STS}} [Q_k]_{i_{TX},m} [A^k_{OCEF}] \Upsilon_{k,CBW} OCEF_k \exp(j2\pi\Delta_F(t - nT_{OCEF} - T_{GI} - T_{CM}(m))) \right) \tag{25-51}$$

where

N_{Tone}	is, for 540 MHz transmission, 176, and, for 1080 MHz transmission, 352
T_{CS}	is given in Table 25-27
Q_k	is defined in 25.6.8.13
$\Upsilon_{k,CBW}$	is defined in 25.3.4.4
T_{OCEF}	is the duration of each OCEF symbol
A_{OCEF}	is defined in Equation (25-49)

25.6.8 Data fields

25.6.8.1 General

The LDPC encoding process is composed of several steps including determining the number of padding bits, padding with zeros, and the coding of every word.

25.6.8.2 Scrambler

The operation of the scrambler is defined in 25.3.7. The scrambling of the Data field continues the scrambling of the CMMG OFDM mode SIG with no reset for OFDM transmission.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

25.6.8.3 Encoding

See 25.3.12.

25.6.8.4 OFDM symbol padding zeros

The number of symbol blocks, N_{SYM}, is calculated as

$$N_{SYM} = \left\lceil \frac{Length \times 8 + (8 + L_{CHECK}) \times N_{CW}}{R \cdot lcm\{m_{STBC}N_{CBPS}, L_{CW}\}} \right\rceil \cdot \frac{lcm\{m_{STBC}N_{CBPS}, L_{CW}\}}{N_{CBPS}} \quad (25\text{-}52)$$

where

L_{CHECK} is the number of LDPC parity bits
$lcm\{a,b\}$ denotes the least common multiple of a and b
L_{CW} denotes the LDPC code word length
$Length$ is the length of the PSDU defined in the CMMG SIG field
R is the code rate
N_{CBPS} is the number of code bits per symbol as defined in the MCS table
$m_{STBC} = 2$ if STBC is used; else $m_{STBC} = 1$

$$N_{SPAD} = R \times N_{SYM} \times N_{CBPS} - (Length \times 8 + (8 + L_{CHECK}) \times N_{CW}) \quad (25\text{-}53)$$

The PSDU is concatenated with N_{SPAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU.

25.6.8.5 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoder are processed in groups of N_{CBPS}. Each of these groups is rearranged into N_{ss} blocks of N_{CBPSS} bits.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (25-54).

$$s = \max\left\{1, \frac{N_{BPSCS}}{2}\right\} \quad (25\text{-}54)$$

Consecutive blocks of s bits are assigned to different spatial streams in a round robin fashion.

Bit i at the output of encoder is assigned to input bit k of spatial stream where

$$i = (i_{SS} - 1) \cdot s + N_{ss} \cdot s \cdot \left\lfloor \frac{k}{s} \right\rfloor + k \mod s \quad (25\text{-}55)$$

where $i_{SS} = 1, 2, \ldots, N_{SS}$, $i = 0, 1, \ldots, N_{CBPS} - 1$, $k = 0, 1, \ldots, N_{CBPSS} - 1$.

25.6.8.6 Subcarrier modulation mapping

The OFDM subcarriers shall be modulated by using BPSK, QPSK, 16-QAM, or 64-QAM, depending on the RATE requested. The encoded and interleaved binary serial input data shall be divided into groups of (1, 2, 4, or 6) bits and converted into complex numbers representing BPSK, QPSK, 16-QAM, or 64-QAM constellation points. The conversion shall be performed according to Gray-coded constellation mappings, illustrated in Figure 25-26, with the input bit, B_0 being the earliest in the stream. The output values, d, are formed by multiplying the resulting (I+jQ) value by a normalization factor K_{MOD}, as described in Equation (25-56).

$$d = (I + jQ) \times K_{MOD} \tag{25-56}$$

The normalization factor, K_{MOD}, depends on the base modulation mode, as prescribed in Table 25-18. Note that the modulation type can be different from the start to the end of the transmission, as the signal changes from SIGNAL to DATA, as shown in Figure 25-20 and Figure 25-26. The purpose of the normalization factor is to achieve the same average power for all mappings. In practical implementations, an approximate value of the normalization factor may be used, as long as the device conforms with the modulation accuracy requirements described in 25.6.9.1.2.

Table 25-18—Modulation-dependent normalization factor

Modulation	K_{MOD}
BPSK	1
QPSK	$1/\sqrt{2}$
16-QAM	$1/\sqrt{10}$
64-QAM	$1/\sqrt{42}$

For BPSK, B_0 determines the I value, as illustrated in Table 25-19. For QPSK, B_0 determines the I value, and B_1 determines the Q value, as illustrated in Table 25-20. For 16-QAM, B_0 and B_1 determine the I value, and B_2 and B_3 determine the Q value, as illustrated in Table 25-21. For 64-QAM, B_0, B_1, and B_2 determine the I value, and B_3, B_4, and B_5 determine the Q value, as illustrated in Table 25-22.

25.6.8.7 Tone mapping

The LDPC tone mapping shall be performed on all LDPC encoded streams using an LDPC tone-mapping distance parameter, D_{TM}. D_{TM} is constant for each bandwidth, and its value for different bandwidths is given in Table 25-23.

Table 25-23—Value of tone mapping parameter

Parameter	CBW540 MHz	CBW1080 MHz
D_{TM}	6	12

LDPC tone mapping for LDPC-coded streams is done by permuting the stream of complex numbers generated by the constellation mappers to obtain

$$d''_{t(k),i,n} = d'_{k,i,n} \tag{25-57}$$

where

$i = 1, 2, \ldots, N_{SS}$

$$t(k) = D_{TM}\left(k \bmod \frac{N_{SD}}{D_{TM}}\right) + \left\lfloor \frac{kD_{TM}}{N_{SD}} \right\rfloor \tag{25-58}$$

The two consecutively generated complex constellation numbers are transmitted on two data tones that are separated by at least $D_{TM} - 1$ from other data tones.

25.6.8.8 Space-time block coding

This subclause defines a set of optional robust transmission techniques that are applicable only when using STBC coding for OFDM mode PPDUs. In this case, N_{SS} spatial streams are mapped to N_{STS} space-time streams. These techniques are based on STBC. When the STBC field in the CMMG SIG is 1, a symbol operation shall occur between the constellation mapper and the spatial mapper as defined in this subclause.

If STBC is applied, the stream of complex numbers $d_{k,i,n}$, $k = 0, 1, \ldots, N_{SD}-1$, $i = 1, 2, \ldots, N_{SS}$, $n = 0, 1, \ldots, N_{SYM}-1$, is the input to the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}_{k,i_{STS},n}$, $k = 0, 1, \ldots, N_{SD}-1$, $i_{STS} = 1, 2, \ldots, N_{STS}$, $n = 0, 1, \ldots, N_{SYM}-1$. For given values of k and i, STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the values of $\tilde{d}_{k,2i-1,2m}$ and $\tilde{d}_{k,2i,2m}$ depend on $\tilde{d}_{k,2i,2m}$ and $d_{k,i,2m+1}$. Also, $\tilde{d}_{k,2i-1,2m+1}$ and $\tilde{d}_{k,2i,2m+1}$ depend on $d_{k,i,2m}$ and $d_{k,i,2m+1}$. This is defined in Table 25-24.

If STBC is not applied, $d_{k,i,n} = \tilde{d}_{k,i,n}$ and $N_{STS} = N_{SS}$.

NOTE—When STBC is applied, an odd number of space-time streams is not allowed, and $N_{STS} = 2N_{SS}$.

25.6.8.9 Pilot subcarriers

For a 540 MHz transmission, eight pilot tones shall be inserted in subcarriers {± 77, ± 55, ± 33, ± 11}. The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (25-59).

$$\begin{aligned} P_n^k \in \{-77,-55,-33,-11,11,33,55,77\} &= \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \cdots, \Psi_{(n+7) \bmod 8}\} \\ P_n^k \notin \{-77,-55,-33,-11,11,33,55,77\} &= 0 \end{aligned} \quad (25\text{-}59)$$

where Ψ_m is defined in Table 25-25.

25.6.8.10 Cyclic shift diversity (CSD) for OFDM mode data fields transmission

The cyclic shift values defined in this subclause apply to the data fields of the PPDU. Cyclic shifts are applied eliminate unintended beamforming when correlated signals are transmitted in multiple space-time streams $T_{CS}(n)$. The cyclic shift value for the data fields for space-time stream n out of N_{STS} total space-time streams is shown in Table 25-27.

Table 25-27—Cyclic shift values for the data fields of an OFDM mode PPDU

$T_{CS}(n)$ values for the data field of a PPDU				
N_{STS}	Cyclic shift for space-time stream n (ns)			
	1	2	3	4
1	0	—	—	—
2	0	$-128T_S$	—	—
3	0	$-170T_S$	$-85T_S$	—
4	0	$-128T_S$	$-64T_S$	$-192T_S$

25.6.8.11 OFDM modulation

The time domain waveform of the Data field of a CMMG OFDM mode PPDU from transmit chain, shall be as defined in Equation (25-61).

$$r_{Data}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{Tone}N_{STS,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{m=1}^{N_{STT}} [Q_K]_{i_{TX},m} \Upsilon_{k,CBW} (\tilde{D}_{k,m,n,CBW} + p_n P_n^k) \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{GI} - T_{CS} m)) \quad (25\text{-}61)$$

where

p_n is defined in 17.3.5.10

N_{Tone} is, for 540 MHz transmission, 176 and, for 1080 MHz transmission, 352

$\tilde{D}_{k,m,n,CBW}$ is the transmitted constellation on subcarrier k, space-time stream m, and Data field OFDM symbol n and is defined in Equation (25-62) to Equation (25-64)

T_{GI} is the (short) guard interval duration and is given in Table 25-3

$T_{CS}(n)$ is given in 25.6.8.10

P_n^k is defined in 25.6.8.9

$\Upsilon_{k,CBW}$ is defined in 25.3.4.4

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

For a 540 MHz transmission,

$$\tilde{D}_{k,m,n,540} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 33, \pm 55, \pm 77 \\ \tilde{d}_{M^r_{540}(k),m,n}, otherwise \end{cases} \quad (25\text{-}62)$$

and $M^r_{540}(k)$ is defined as

$$M^r_{540}(k) = \begin{cases} k+89, -89 \le k \le -78 \\ k+88, -76 \le k \le -56 \\ k+87, -54 \le k \le -34 \\ k+86, -32 \le k \le -12 \\ k+85, -10 \le k \le -2 \\ k+82, 2 \le k \le 10 \\ k+81, 12 \le k \le 32 \\ k+80, 34 \le k \le 54 \\ k+79, 56 \le k \le 76 \\ k+78, 78 \le k \le 89 \end{cases} \quad (25\text{-}63)$$

For a 1080 MHz transmission,

$$\tilde{D}_{k,m,n,1080} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 33, \pm 55, \pm 77, \pm 99, \pm 121, \pm 143, \pm 165 \\ \tilde{d}_{M^r_{1080}(k),m,n}, otherwise \end{cases} \quad (25\text{-}64)$$

and $M^r_{1080}(k)$ is defined as

$$M^r_{1080}(k) = \begin{cases} k+177, -177 \le k \le -166 \\ k+176, -164 \le k \le -144 \\ k+174, -142 \le k \le -122 \\ k+173, -120 \le k \le -100 \\ k+172, -98 \le k \le -78 \\ k+171, -76 \le k \le -56 \\ k+170, -54 \le k \le -34 \\ k+169, -32 \le k \le -12 \\ k+168, -10 \le k \le -2 \\ k+165, 2 \le k \le 10 \\ k+164, 12 \le k \le 32 \\ k+163, 34 \le k \le 54 \\ k+162, 56 \le k \le 76 \\ k+161, 78 \le k \le 98 \\ k+160, 100 \le k \le 120 \\ k+159, 122 \le k \le 142 \\ k+158, 144 \le k \le 164 \\ k+157, 166 \le k \le 177 \end{cases} \quad (25\text{-}65)$$

$\mathbf{Q}_k$ is a spatial mapping/steering matrix with N_{TX} rows and columns N_{STS} for subcarrier k. $\mathbf{Q}_k$ may be frequency dependent. Refer to the examples of listed in 19.3.11.11.2 for examples of that could be used for OFDM mode PPDU. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2.

25.6.8.12 Duplication transmission

When the TXVECTOR parameter DUPLICATE_MODULATION is present, the transmitted PPDU is a duplicate. For 1080 MHz, the Data field shall be as defined by Equation (25-66).

$$r_{Data}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{Tone}N_{STS,total}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t-nT_{SYM}) \sum_{k=-89}^{89} \sum_{m=1}^{N_{STS}} (\tilde{D}_{k,m,n} + p_n P_n^k)([Q_{k-88}]_{i_{TX,m}} \Upsilon_{k,CBW} \exp(j2\pi(k-88)\Delta_F(t-nT_{SYM}-T_{GI}-T_{CS}(m))) + j[Q_{k-88}]_{i_{TX,m}} \Upsilon_{k,CBW} \exp(j2\pi(k+88)\Delta_F(t-nT_{SYM}-T_{GI}-T_{CS}(m))))) \quad (25\text{-}66)$$

where

p_n is defined in 17.3.5.10

N_{Tone} is 352

$\tilde{D}_{k,m,n}$ is the transmitted constellation on subcarrier k, space-time stream m, and Data field OFDM symbol n and is defined in Equation (25-62) to Equation (25-64)

T_{GI} is the (short) guard interval duration and is given in Table 25-3

$T_{CS}(n)$ is given in 25.6.8.10

P_n^k is defined in 25.6.8.9

$\Upsilon_{k,CBW}$ is defined in 25.3.4.4

25.6.8.13 Beamforming

25.6.8.13.1 General

CMMG OFDM MIMO beamforming is used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. With CMMG OFDM MIMO beamforming, all space-time streams in the transmitted signal are intended for reception at a single STA.

For CMMG OFDM MIMO beamforming, the steering matrix $\mathbf{Q}_k$ can be determined from the effective channel $\mathbf{H}_{eff,k}$, or the beamforming feedback matrix, $\mathbf{V}_k$, that is sent back to the beamformer by the beamformee using compressed beamforming feedback matrix format as defined in 25.6.8.13.2. The feedback report format is described in 9.6.29.2.

25.6.8.13.2 Compressed Beamforming feedback matrix

Upon receipt of a NDP sounding PPDU, the beamformee shall remove the space-time stream CSD in Table 25-27 from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrix $\mathbf{V}_k$, found by the beamformee for subcarrier k shall be compressed in the form of angles using the method described in 19.3.12.3.6. The angles, $\phi(k)$ and $\psi(k)$, are quantized according to Table 9-87.

The beamformee shall generate the beamforming feedback matrices with the number of rows (N_r) equal to the N_{STS} of the NDP.

After receiving the angle information, $\phi(k)$ and $\psi(k)$, the beamformer reconstructs $\mathbf{V}_k$ using Equation (19-79). For CMMG OFDM MIMO beamforming, the beamformer can use this $\mathbf{V}_k$ matrix to determine the steering matrix $\mathbf{Q}_k$. The method used by the beamformer to calculate the steering matrix $\mathbf{Q}_k$ is implementation specific.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The beamformee decides the tone grouping value to be used in the beamforming feedback matrix **V**. A beamformer shall support all tone grouping values and codebook information values.

25.6.8.14 CMMG preamble format for sounding PPDU

25.6.8.14.1 General

The MIMO channel measurement takes place in every PPDU as a result of transmitting the OCEFs as part of the PHY preamble. The number of OCEFs transmitted shall be determined by the number of space-time streams transmitted. The use of the same spatial transformation enables the computation of the spatial equalization at the receiver.

When the number of space-time streams, N_{STS}, is less than the number of transmit antennas, or less than min(N_{TX}, N_{RX}), sending only N_{STS} OCEFs does not allow the receiver to recover a full characterization of the MIMO channel, even though the resulting MIMO channel measurement is sufficient for receiving the Data field of the CMMG PPDU.

However, there are several cases where it is desirable to obtain as full a characterization of the channel as possible, thus requiring the transmission of a sufficient number of OCEFs to sound the full dimensionality of the channel, which is in some cases N_{STS} and in other cases min(N_{TX}, N_{RX}). These cases of MIMO channel measurement are referred to as MIMO channel sounding. A sounding PPDU may be used to sound available channel dimensions. A sounding PPDU is identified by setting the Not Sounding field in the CMMG SIG to 0. A sounding PPDU may have any allowed number of OCEFs satisfying $N_{OCEFs} \geq N_{STS}$ as shown in Table 25-17.

25.6.8.14.2 Sounding with an NDP

A STA may sound the channel using a NDP (indicated by zero in the Length field in the CMMGSIG field) with the Not Sounding field set to 0. The number of OCEFs is the number implied by the $2^{STBC}\,N_{ss}$, which shall indicate spatial time streams. The last OCEF of an NDP shall not be followed by a Data field as shown in Figure 25-27.

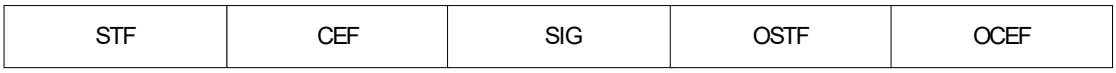

Figure 25-27—CMMG NDP format

It is optional for a STA to process an NDP.

25.6.8.14.3 Sounding PPDU for channel quality assessment

In response to an MRQ, sent by STA A to STA B, the responding STA B returns to the requesting STA A an MCS selection that STA B determines to be a suitable MCS for STA A to use in subsequent transmissions to STA B. In determining the MCS, STA B performs a channel quality assessment, which entails using whatever information STA B has about the channel, such as an estimate of the MIMO channel derived from the sounding PPDU that carries the MRQ. To enable this calculation, the MRQ is sent in conjunction with a sounding PPDU.

The STA sending the MRQ (STA A) determines how many OCEFs to send and whether to use an NDP or not, based on the Transmit Beamforming Capabilities field, number of space-time streams used in the PPDU carrying the MRQ, the number of transmit chains it is using (N_{TX}), whether the transmit and receive STAs support STBC, and in some cases, the number of receive chains at the responding STA (N_{RX}).

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

The maximum number of available space-time streams is set by the number of transmit and receive chains and the STBC capabilities of the transmitter and receiver, as is shown in Table 25-28. While the number of receive chains at a STA is not communicated in a capabilities indicator, the maximum number of space-time streams supported may be inferred from the STBC capabilities of the receiving STA. When the number of receive chains is known at the transmitter, the number of OCEFs sent to obtain a full channel quality assessment is determined according to the maximum number of space-time streams indicated in Table 25-28. The number of OCEFs to use in conjunction with the indicated number of space-time streams is determined according to Table 25-17.

Table 25-28—Maximum available space-time streams

N_{TX}	N_{RX}	$N_{STS,max}$ **without STBC**	$N_{STS,max}$ **with STBC**
1	1	1	N/A
2	1	1	2
4	1	1	2
4	2	2	4

The sounding PPDU may have nonidentity spatial mapping matrix $\mathbf{Q}_k$. For different receiving STAs, $\mathbf{Q}_k$ may vary.

25.6.9 Performance requirements

25.6.9.1 Transmit requirements

25.6.9.1.1 Introduction

This subclause describes the performance requirement from the OFDM mode transmitter.

25.6.9.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, etc.

The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

a) Start of frame shall be detected.
b) Transition from short sequences to channel estimation sequences shall be detected, and fine timing (with one sample resolution) shall be established.
c) Frequency offsets shall be estimated and corrected.
d) The frame shall be de-rotated according to estimated frequency offset.
e) The complex channel response coefficients shall be estimated for each of the subcarriers using information contained in the preamble (STF/CEF and/or OCEF).
f) For each of the OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to estimated phase, and divide each subcarrier value with a complex estimated channel response coefficient.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

g) For each data-carrying subcarrier, compute the Euclidean distance to the ideal location for the symbol, or pilot.

h) Compute the RMS average of all errors in a packet. It is given by

$$EVM = 20\log_{10}\left(\frac{1}{N_f}\sum_{i=1}^{N_f}\sqrt{\frac{\sum_{j=1}^{N_{SYM}}\left\{\sum_{k\in K}\left[(I(i,j,k)-I^*(i,j,k))^2+(Q(i,j,k)-Q^*(i,j,k))^2\right]\right\}}{(N_{ST}-N_{DC})N_{SYM}P_0}}\right) \quad (25\text{-}67)$$

where

N_f is the number of frames
i is the frame index
k is the carrier index
K is the set of pilot and data subcarriers $\{1,2,\ldots,(N_{SR}-1),(N_{SR}+N_{DC}),(N_{SR}+N_{DC}+1),\ldots,N_{ST}\}$
j is the symbol index
N_{SYM} is the number of symbols
N_{ST} is the total number of subcarriers
I^*,Q^* is the ideal constellation point for I and Q, respectively
P_0 is the average power of the constellation (I^*,Q^*) computed over the i^{th} frame

The measurements shall occur on the OFDM symbols and shall not occur on the other kinds of symbols. The measurement shall be performed on at least 10 frames with 16 symbols at least in each of them. Random data shall be used.

The EVM RMS error shall not exceed an MCS dependent value as found in Table 25-29.

Table 25-29—EVM requirements for OFDM

MCS index	Modulation	Coding rate	EVM value (dB)
9	BPSK	1/2	–7
10	QPSK	1/2	–11
11	QPSK	3/4	–13
12	16-QAM	1/2	–15
13	16-QAM	3/4	–19
14	64-QAM	5/8	–22
15	64-QAM	3/4	–24
16	64-QAM	13/16	–26

25.6.9.2 TX flatness

25.6.9.2.1 TX flatness for 540 MHz channel

When using the OFDM mode and only while transmitting OFDM symbols, the average energy of the OFDM symbols constellations in each of the subcarriers with indices –70 to –2 and +2 to +70 shall deviate no more than ± 2 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –71 to –89 and +70 to +89 shall deviate no more than +2/–4 dB from the average energy of subcarriers with indices –71 to –89 and +70 to +89.

25.6.9.2.2 TX flatness for 1080 MHz channel

When using the OFDM mode and only while transmitting OFDM symbols, the average energy of the OFDM symbols constellations in each of the subcarriers with indices –146 to –2 and +2 to +145 shall deviate no more than ± 2 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices –147 to –177 and +147 to +177 shall deviate no more than +2/–4 dB from the average energy of subcarriers with indices –177 to –2 and +2 to +177.

25.6.9.2.3 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

— MULTICHANNEL_SAMPLING_RATE is 660×10^6 sample/s for 540 MHz and 1320×10^6 sample/s for 1080 MHz.
— FIRST_TRANSITION_FIELD is Short Training field.
— SECOND_TRANSITION_FIELD is Channel Estimation field.
— TRAINING_FIELD is Channel Estimation field.
— TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

25.6.9.3 Receive requirements

25.6.9.3.1 Introduction

Subclause 25.6.9.3.2 describes the performance requirement for an OFDM mode receiver.

25.6.9.3.2 CCA

The start of a CMMG OFDM mode or CMMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 0 (–81 dBm for 540 MHz, –78 dBm for 1080 MHz) shall cause CCA to indicate busy with a probability > 90% within 1 μs.

25.7 Analog beamforming PHY frame format

25.7.1 TX sector sweep

The packets sent during TX sector sweep are control mode packets as defined in 25.4.

25.7.2 Beam refinement

25.7.2.1 General

Beam refinement is a process where a STA can improve its antenna configuration (or antenna weight vectors) both for transmission and reception. If the SLS beamforming training did not include an RSS, as in the case where both devices have more than one transmit sector per antenna, beam refinement can serve as the first receive antenna configuration training. The procedure of beam refinement is described in 10.42.6.4. In the beam refinement procedure, BRP PPDUs are used to train the receiver and transmitter antenna. There are two types of BRP PPDUs: BRP-RX PPDUs and BRP-TX PPDUs.

— BRP-RX PPDUs are PPDUs that have TRN-R training sequences following the Data field. These packets enable receiver antenna weight vector training.

— BRP-TX PPDUs are PPDUs that have TRN-T training sequences following the Data field. The transmitting STA may change antenna configuration at the beginning of each sequence. The receiving STA performs measurements on these sequences and sends feedback to the STA that transmits the BRP-TX PPDU.

25.7.2.2 BRP PPDU structure

Each BRP PPDU is composed of an STF, a CEF, and a data field followed by a training field containing an AGC field and a receiver training field.

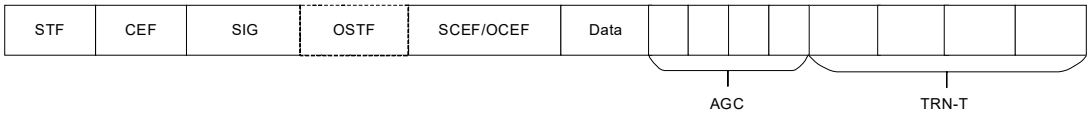

Figure 25-28—BRP PPDU structure

25.7.2.3 BRP PPDU SIG fields

The PPDU Type field in a BRP PPDU is defined in Table 25-7.

A value of *N* in the Training Length field indicates that the AGC has 4*N* subfields and that the TRN- R/T field has *N* subfields.

The value *N* in the Training Length field of a BRP-RX PPDU is equal to the value of the L-RX field requested by the intended receiver of the BRP-RX PPDU at a previously received BRP Request field (see 9.5.4).

25.7.2.4 Beam refinement AGC field

The beam refinement AGC fields are composed of 4*N* repetitions of the sequence $[Z_{64}^{1}\ Z_{64}^{1}\ Z_{64}^{1}\ Z_{64}^{1}\ Z_{64}^{1}]$ when the packet is transmitted using the control mode in bandwidth 540 MHz, $[Z_{64}^{2}\ Z_{64}^{2}\ Z_{64}^{2}\ Z_{64}^{2}\ Z_{64}^{2}]$ when the packet is transmitted using the SC mode in bandwidth 540 MHz, $[Z_{64}^{3}\ Z_{64}^{3}\ Z_{64}^{3}\ Z_{64}^{3}\ Z_{64}^{3}]$ when the packet is transmitted using the OFDM mode in bandwidth 540 MHz, $[Z_{128}^{1}\ Z_{128}^{1}\ Z_{128}^{1}\ Z_{128}^{1}\ Z_{128}^{1}]$ when the packet is transmitted using the control mode in bandwidth 1080 MHz, $[Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}\ Z_{128}^{2}]$ when the packet is transmitted using the SC mode in bandwidth 1080 MHz, and $[Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}\ Z_{128}^{3}]$ when the packet is transmitted using the OFDM mode in bandwidth 1080 MHz. The sequences Z_{64}^{1}, Z_{64}^{2}, Z_{64}^{3}, Z_{128}^{1}, Z_{128}^{2}, and Z_{128}^{3} are defined in 25.8. The sequences are transmitted using rotated π/2-QPSK modulation.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

In a BRP-TX PPDU, the transmitter may change the TX AWV configuration at the beginning of each AGC subfield. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Z_{64}^{1}, Z_{64}^{2}, or Z_{64}^{3} subsequence in bandwidth 540 MHz and Z_{128}^{1}, Z_{128}^{2}, or Z_{128}^{3} subsequence in bandwidth 1080 MHz. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T subfields. In a BRP-RX PPDU, the transmitter shall use the same TX AWV as in the preamble and data fields of the packet.

25.7.2.5 Beam refinement TRN-R subfield

The TRN-R subfields enable receiver AWV training. The TRN-R subfields have the form shown in Figure 25-29.

Figure 25-29—TRN-R subfield definition

Each subfield CEF matches the Channel Estimation field defined in 25.3.5. The $4N$ subfields R_1 to R_{4N} each consist of the sequence $[Z_{256}^{1}\ Z_{256}^{3}\ Z_{256}^{1}\ Z_{256}^{2}\ Z_{256}^{4}\ Z_{256}^{2}]$ in bandwidth 540 MHz and $[Z_{512}^{1}\ Z_{512}^{3}\ Z_{512}^{1}\ Z_{512}^{2}\ Z_{512}^{4}\ Z_{512}^{2}]$ in bandwidth 1080 MHz. The sequences Z_{256}^{1}, Z_{256}^{2}, Z_{256}^{3}, and Z_{256}^{4} are defined in Table 25-33, and Z_{512}^{1}, Z_{512}^{2}, Z_{512}^{3}, and Z_{512}^{4} are defined in Table 25-34 in 25.8. The sequences are transmitted using rotated π/2-QPSK modulation.

25.7.2.6 Beam refinement TRN-T subfield

The TRN-T subfield enables transmitter AWV training. The TRN-T subfields have the form shown in Figure 25-30.

Figure 25-30—TRN-T subfield definition

Each subfield CEF matches the Channel Estimation field defined in 25.3.5. The $4N$ subfields T_1 to T_{4N} each consist of the sequence $[Z_{256}^{1}\ Z_{256}^{3}\ Z_{256}^{1}\ Z_{256}^{2}\ Z_{256}^{4}\ Z_{256}^{2}]$ in bandwidth 540 MHz and $[Z_{512}^{1}\ Z_{512}^{3}\ Z_{512}^{1}\ Z_{512}^{2}\ Z_{512}^{4}\ Z_{512}^{2}]$ in bandwidth 1080 MHz. The sequences Z_{256}^{1}, Z_{256}^{2}, Z_{256}^{3}, and Z_{256}^{4} are defined in Table 25-33, and Z_{512}^{1}, Z_{512}^{2}, Z_{512}^{3}, and Z_{512}^{4} are defined in Table 25-34 in 25.8. The sequences are transmitted using rotated π/2-QPSK modulation. When transmitting the CEF subfield, the transmitter shall use the same AWV as in the preamble and data fields of the packet. Any transmit signal transients that occur due to TX AWV configuration changes between subfields shall settle by the end of the first 64 samples of the subfield.

25.7.2.7 Channel measurement

The good autocorrelation properties of the ZCZ sequences enable reconstructing part of the impulse response of the channel between the transmitter and the receiver. The receiver should find the tap with largest amplitude in the channel during the CEF of the BRP-RX. It selects thereafter the set of taps that is measured around the tap with the largest amplitude, according to the value of dot11ChanMeasFBCKNtaps. It can select a contiguous set of taps or select a noncontiguous set of taps and include the tap delays subfield as part of the subfield measurement. It then measures the phase and amplitude of the corresponding channel taps in each of the TRN-T subfield repetition (except for those using the CEF AWV configuration). The beam refinement feedback subfield k–1 is the relative amplitude and phase of this tap in the k'th repetition compared to this tap in the first TRN-T subfield.

25.7.2.8 BRP resampling in an OFDM mode packet

The BRP AGC field, the CEF, and Tn/Rn field are specified at the SC chip rate (T_c). When appended to an OFDM packet, the signal is resampled as defined in 25.3.10.

25.8 ZCZ sequence

The following ZCZ sequences set is used in the STF, the CEF, the SCTF, and the Unique Word (UW). These are 5 ZCZ sequences sets, namely, Z_{32}^{i}, Z_{64}^{i}, Z_{128}^{i}, Z_{256}^{i}, and Z_{512}^{i}, with i = 1, 2, 3, 4where the subscript denotes the length of the sequences and the superscript denotes the index of the ZCZ sequence. The sets are generated using the following recursive procedure, illustrated as in Figure 25-31.

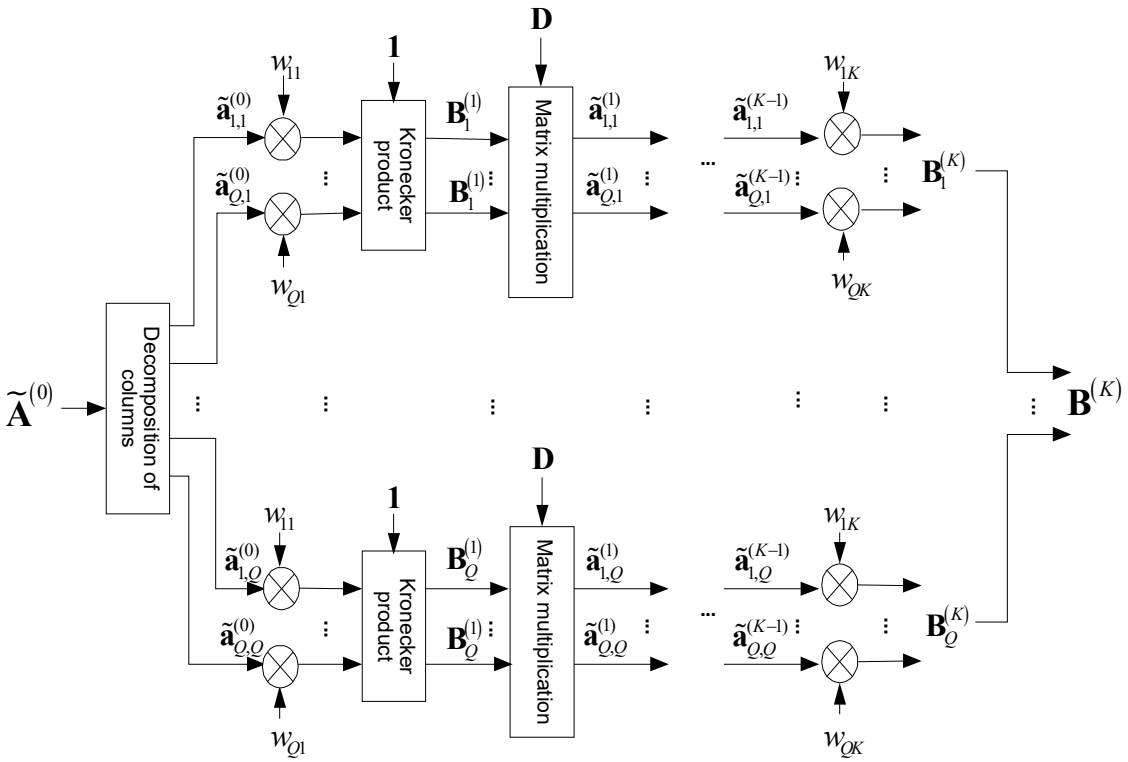

Figure 25-31—Generation of ZCZ sequences set

$\tilde{\mathbf{A}}^{(0)}$, $\mathbf{B}^{(k)}$, and $\tilde{\mathbf{A}}^{(k)}$ used in Figure 25-31 are defined as follows, respectively.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} \tilde{\mathbf{a}}_{1,1}^{(0)} & \cdots & \tilde{\mathbf{a}}_{1,Q}^{(0)} \\ \cdots & \cdots & \cdots \\ \tilde{\mathbf{a}}_{Q,1}^{(0)} & \cdots & \tilde{\mathbf{a}}_{Q,Q}^{(0)} \end{bmatrix} \tag{25-68}$$

$$\mathbf{B}^{(k)} = \begin{bmatrix} w_{1,k}\mathbf{I}_{Q^{k-1}L} & \mathbf{0}_{Q^{k-1}L} & \cdots & \mathbf{0}_{Q^{k-1}L} \\ \mathbf{0}_{Q^{k-1}L} & w_{2,k}\mathbf{I}_{Q^{k-1}L} & \cdots & \mathbf{0}_{Q^{k-1}L} \\ \cdots & \cdots & \cdots & \cdots \\ \mathbf{0}_{Q^{k-1}L} & \mathbf{0}_{Q^{k-1}L} & \cdots & w_{Q,k}\mathbf{I}_{Q^{k-1}L} \end{bmatrix} \tilde{\mathbf{A}}^{(k-1)}, \tilde{\mathbf{A}}^{(k)} = \mathbf{D}(\mathbf{1} \otimes \mathbf{B}^{(k)}) \tag{25-69}$$

where

$\tilde{\mathbf{a}}_{i,j}^{(0)}, i = 1, ..., Q, j = 1, ..., Q$	denotes the initial sequence
Q	is the number of ZCZ sequences
$\mathbf{I}_{Q^{k-1}L}$	denotes the identity matrix of size $Q^{k-1}L \times Q^{k-1}L$
L	denotes the length of the initial sequence
$\mathbf{0}_{Q^{k-1}L}$	denotes all zero matrix of size $Q^{k-1}L \times Q^{k-1}L$
$w_{i,j}, i = 1, \ldots, Q, j = 1, \ldots, K$	are elements of the coefficient matrix $\mathbf{W}$ of size $Q \times K$
K	is the number of the iterations
$\mathbf{D} = Diag(f_{1,1}\mathbf{I}_{Q^{k-1}L}, ..., f_{1,Q}\mathbf{I}_{Q^{k-1}L}, ..., f_{Q,1}\mathbf{I}_{Q^{k-1}L}, ..., f_{Q,Q}\mathbf{I}_{Q^{k-1}L})$	with $Diag(\upsilon)$ denoting the diagonal matrix with diagonal element υ
$f_{i,j}, i = 1, \ldots, Q, j = 1, \ldots, Q$	are elements of the Discrete Fourier Transform (DFT) matrix $\mathbf{F}_Q$ of size $Q \times Q$
$\mathbf{1}$	denotes all 1 column vector
$\otimes$	denotes Kronecker product

Note that $M = \{e^{(j2\pi\theta)/Q}\}_{\theta=0}^{Q-1}$, the elements of $\tilde{\mathbf{A}}^{(0)}$ belongs to M, and $w_{i,k} \in M, i = 1, ..., Q$.

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-70), the generated ZCZ sequence set Z_{32}^i is listed in Table 25-30 where 0, 1, 2, and 3 denote +1,+j,–1,–j.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} (-1,-1)^T & (-1,1)^T & (-1,-1)^T & (-1,1)^T \\ (-1,-1)^T & (-1,1)^T & (1,1)^T & (1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (-1,1)^T & (-1,-1)^T \\ (-1,1)^T & (-1,-1)^T & (1,-1)^T & (1,1)^T \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} 1 \\ -j \\ -1 \\ 1 \end{bmatrix} \tag{25-70}$$

When $\tilde{\mathbf{A}}^{(0)}$, $\mathbf{F}_4$, and $\mathbf{W}$ are given by Equation (25-71), the generated ZCZ sequence set Z_{64}^i is listed in Table 25-31 where 0, 1, 2, and 3 denote +1,+j,–1,–j.

$$\tilde{\mathbf{A}}^{(0)} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{F}_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}, \mathbf{W} = \begin{bmatrix} -j & -1 \\ -1 & j \\ j & -j \\ -1 & -j \end{bmatrix} \tag{25-71}$$

25.9 Regulatory requirements

Wireless LANs (WLANs) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded.

25.10 Channelization

A CMMG channel is specified by the two PLME MIB fields specified in Table 25-35.

Table 25-35—Fields to specify CMMG channels

Field	Meaning
dot11CMMGCurrentChannelWidth	Channel width. Possible values represent 540 MHz and 1080 MHz channels.
dot11CMMGCurrentChannelCenterFrequencyIndex	For a 540 MHz or 1080 MHz channel, denotes the channel center frequency.

If dot11CMMGCurrentChannelWidth indicates a 540 MHz channel, the channel center frequency is given by Equation (25-75) (see Figure 25-32).

$$f(n)\ [GHz] = \quad (25\text{-}75)$$

$$\begin{cases} 42.66 + 0.54 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 1),\ 1 \le \text{dot11CMMGCurrentChannelCenterFrequencyIndex} \le 8 \\ 47.52 + 0.54 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 9),\ \text{dot11CMMGCurrentChannelCenterFrequencyIndex} = 9, 10 \end{cases}$$

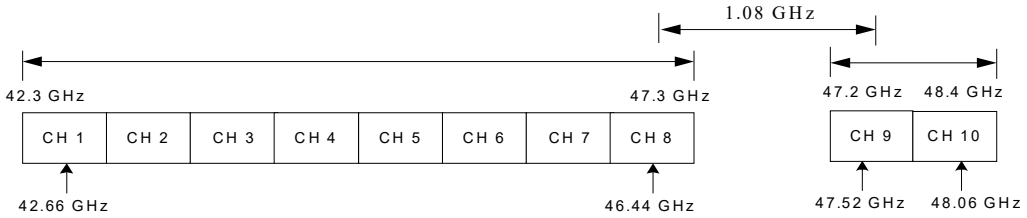

Figure 25-32—Channelization for CBW540 MHz

If dot11CMMGCurrentChannelWidth indicates a 1080 MHz channel, the channel center frequency is given by Equation (25-76) (see Figure 25-33).

$$f(n)\ [GHz] = \quad (25\text{-}76)$$

$$\begin{cases} 42.93 + 1.08 \times (\text{dot11CMMGCurrentChannelCenterFrequencyIndex} - 1),\ 1 \le \text{dot11CMMGCurrentChannelCenterFrequencyIndex} \le 4 \\ 47.79,\ \text{dot11CMMGCurrentChannelCenterFrequencyIndex} = 5 \end{cases}$$

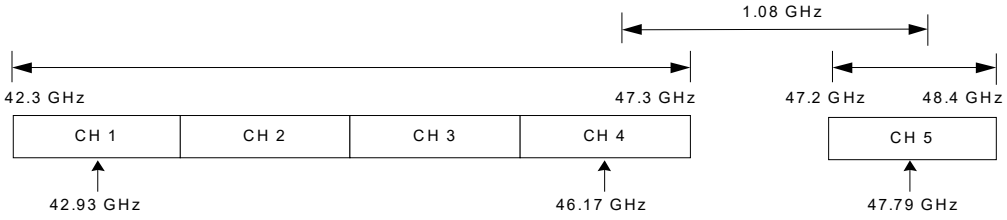

Figure 25-33—Channelization for CBW1080 MHz

25.11 Transmit spectrum mask

For a 540 MHz or 1080 MHz mask PPDU, the interim transmit spectral mask shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth of 470 MHz or 940 MHz, –17 dBr at 330 MHz or 660 MHz frequency offset, –22 dBr at 1350 MHz or 2670 MHz frequency offset, and –30 dBr at 1530 MHz or 3060 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 235 MHz or 470 MHz and 330 MHz or 660 MHz, in between 330 MHz or 660 MHz and 1350 MHz or 2700 MHz, and in between 1350 MHz or 2700 MHz and 1530 MHz or 3060 MHz shall be linearly interpolated in dB domain from the requirements for 235 MHz, 330 MHz, 1350 MHz, and 1530 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask.

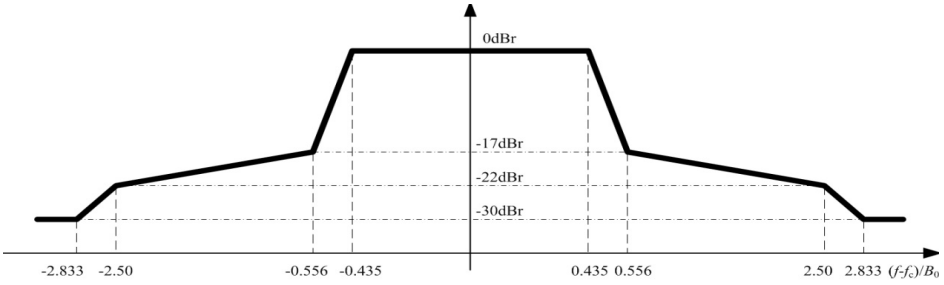

Figure 25-34—Example transmit spectral mask for a PPDU

25.12 PHY transmit procedure

25.12.1 PHY transmit procedure for a CMMG SC mode transmission

The PHY transmit procedure for a CMMG SC mode transmission is shown in Figure 25-35. In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 25.14. Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHYTXSTART.request (TXVECTOR) primitive, as described in Table 25-1.

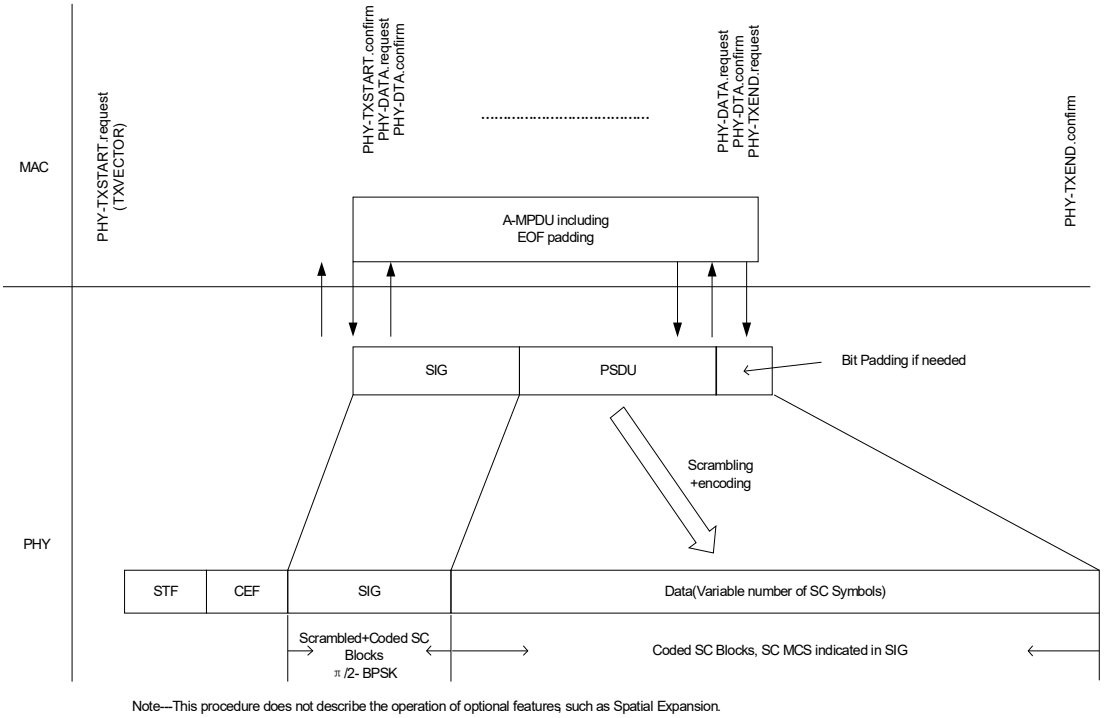
The PHY shall then issue a PHY-TXSTART.request primitive, and transmission of the PHY preamble shall start, based on the parameters passed in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the packet according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the scrambling, encoding, and transmission of the CMMG-SIG-A according to the PHY-TXSTART.request(TXVECTOR) primitive parameters. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 25.5.6.3. The encoded data are then modulated as described in 25.5.6.6, depending on the MCS requested in the PHY_TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN-T and TRN-R fields are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN-T/R subfields. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN-T/R subfield. The packet transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHYTXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.



Note—This procedure does not describe the operation of optional features, such as Spatial Expansion.

Figure 25-35—PHY transmit procedure for a CMMG SC mode transmission

25.12.2 PHY transmit procedure for a CMMG OFDM mode transmission

The PHY transmit procedure for a CMMG OFDM transmission is shown in Figure 25-36. In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 25.14. Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHYTXSTART.request(TXVECTOR) primitive, as described in Table 25-1.

The PHY shall then issue a PHY-TXSTART.request primitive, and transmission of the PHY preamble shall start, based on the parameters passed in the PHY-TXSTART.request primitive. The PHY shall calculate the length of the packet according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the scrambling, encoding, and transmission of the CMMG SIG according to the PHY-TXSTART.request(TXVECTOR) primitive parameters. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are scrambled and encoded as described in 25.6.8.2 and 25.6.8.3, respectively. The encoded data are then modulated as described in 25.6.8.6,

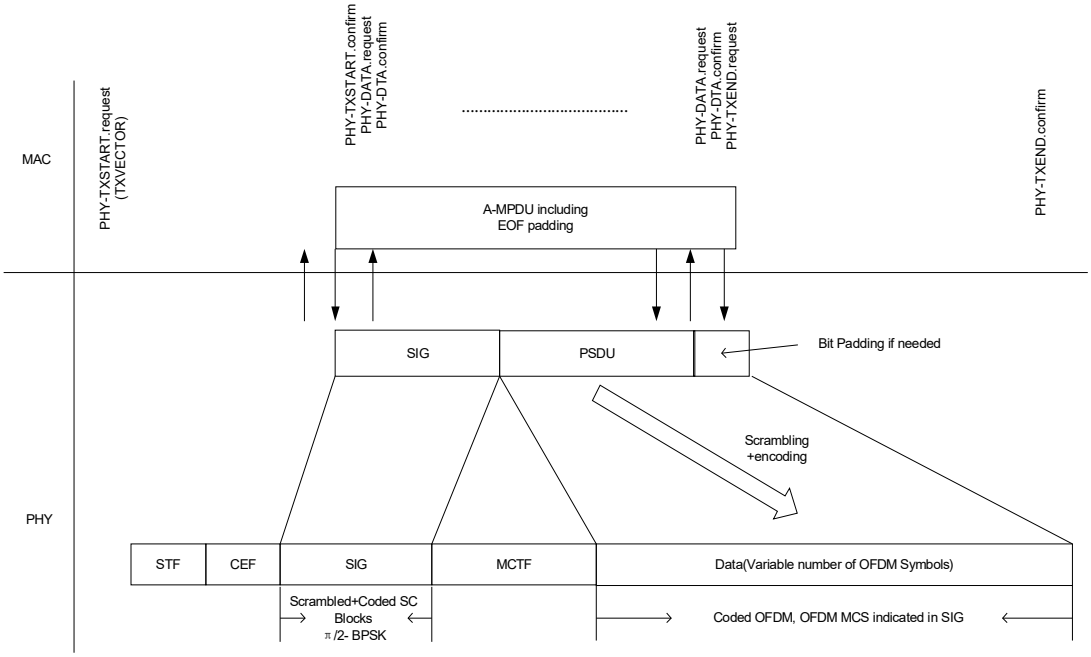
depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN-T and TRN-R fields are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN-T/R subfields. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN-T/R subfield. The packet transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHYTXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.



Note---This procedure does not describe the operation of optional features, such as STBC or Spatial Expansion.

A typical state machine implementation of the transmit PHY for an OFDM mode transmission is provided in Figure 25-37. This state machine does not describe the operation of optional features, such as STBC.

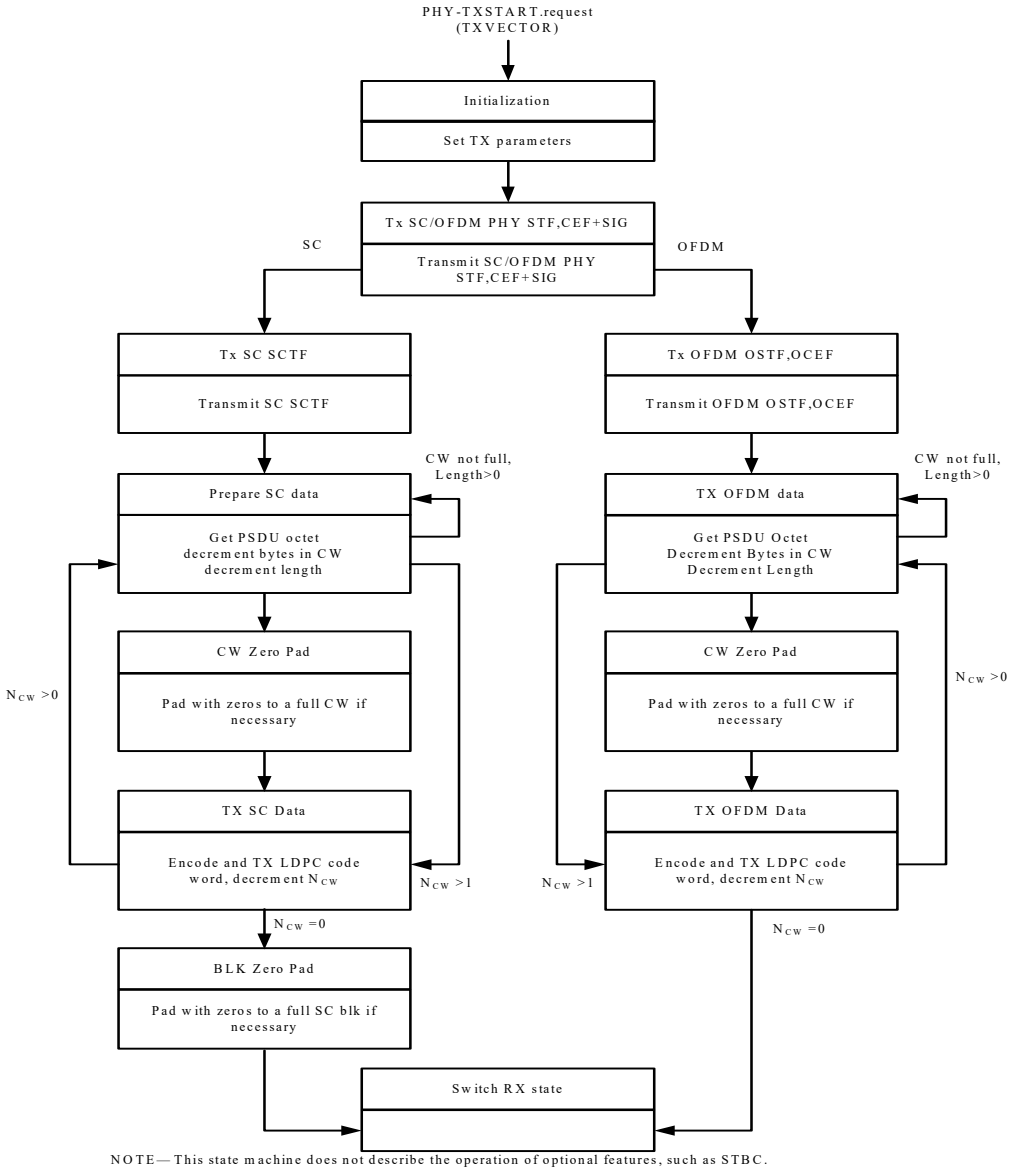

Figure 25-37—Typical Tx state machine

25.13 Receive procedure

A typical PHY receive procedure is shown in Figure 25-39 for a CMMG SC mode transmission.

Upon receiving the transmitted PHY preamble overlapping the primary 540 MHz channel, the PHY measures a receive signal strength. This activity is indicated by the PHY to the MAC via a PHY-CCA.indication primitive. A PHY-CCA.indication (BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 25.6.9.3.2. The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 540 MHz. The channel-list parameter is present and includes the entry primary when the operating channel width is 1080 MHz.

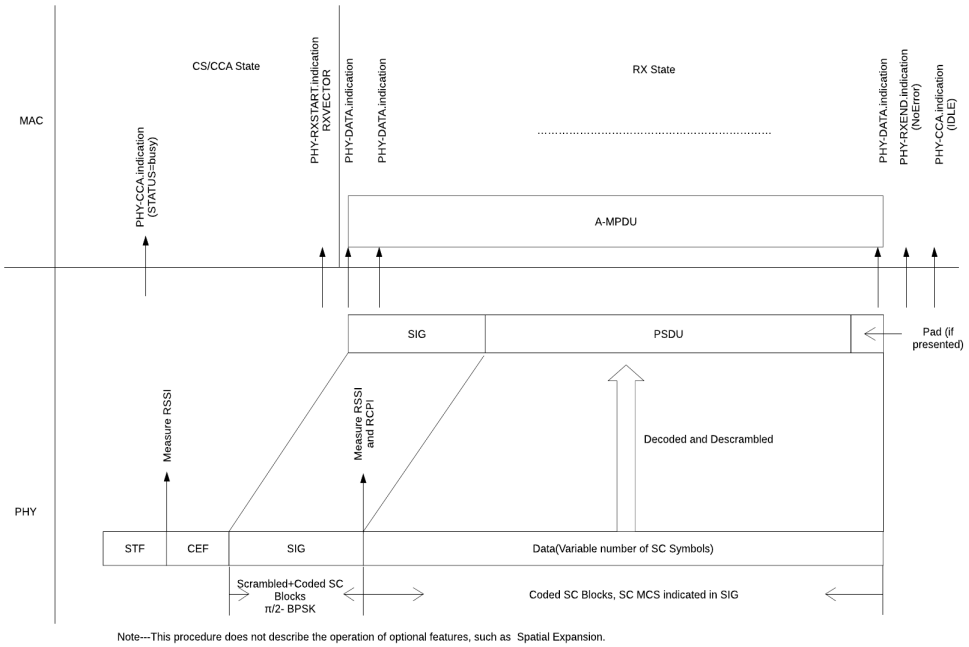

Figure 25-38—PHY receive procedure for a CMMG SC mode transmission

After the PHY-CCA.indication(BUSY) primitive is issued, the PHY entity shall use the following ZCZ sequences of length 256 for synchronization and channel estimation. If the CE field indicated a SC mode, the receiver is capable of receiving SC mode. The PHY shall decode the CMMG SIG and determine the MCS, length, and other parameters needed for the demodulation of the packet.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued, and the RX-START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 25.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.55 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

At the end of the data portion of the packet, the PHY shall indicate PHY-RXEND.indication(No_Error) primitive to the MAC. If the CMMG SIG indicated the presence of the training field, the PHY shall continue to receive these training fields after the data portion of the packet and measure the channel. After the end of the training fields, the PHY shall generate a PHY-CCA.indication(IDLE) primitive.

In the case of signal loss before the decoding of the CMMG SIG or in the case of an invalid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below a value that is 20 dB higher than the receiver sensitivity of MCS 1. In the case of signal loss after decoding of a valid CMMG SIG, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the expected end of the packet, including the AGC and TRN fields.

A typical state machine implementation of the receive PHY is given in Figure 25-39. This receive procedure and state machine do not describe the operation of optional features, such as STBC.

25.14 CMMG PLME

25.14.1 PLME SAP sublayer management primitive

Table 25-36 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

25.14.2 PHY MIB

CMMG PHY MIB attributes are defined in Annex C with specific values defined in Table 25-36. The "Operational semantics" column in Table 25-36 contains two types: static and dynamic.

— Static MIB attributes are fixed and cannot be modified for a given PHY implementation.

— Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

25.14.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for a SC mode PPDU using Equation (25-77) and for an OFDM mode PPDU using Equation (25-78).

$$TXTIME = T_{STF} + T_{CEF} + T_{SIG} + T_{SCTF} + N_{BL} \times T_{BLK} \quad (25\text{-}77)$$

$$TXTIME = T_{STF} + T_{CEF} + T_{SIG} + T_{OSTF} + N_{OCEF} T_{OCEF} + N_{SYM} \times T_{SYM} \quad (25\text{-}78)$$

where T_{STF}, T_{CEF}, T_{SIG}, T_{SCTF}, T_{OSTF}, and T_{OCEF} are defined in Table 25-3.

For an NDP, there is no Data field, and $N_{SYM} = 0$.

For a SC mode PPDU, the total number of data blocks in the Data field, N_{BL}, is given by Equation (25-27).

25.14.4 PHY characteristics

The static CMMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 25-37. The definitions for these characteristics are given in 6.5.4.

Table 25-37—CMMG PHY characteristics

PHY parameter	Value
aRIFSTime	1 μs
aSIFSTime	3 μs
aRxRFDelay	Implementation dependent
aRxPHYDelay	Implementation dependent
aRxTxTurnaroundTime	1 μs

aPPDUMaxTime	12 ms
aPSDUMaxLength	262 143 octets
aSCBlockSize	256 for 540 MHz 512 for 1080 MHz

25.15 Parameters for CMMG-MCSs

25.15.1 General

The rate-dependent parameters for 540 MHz and 1080 MHz are given in 25.15.2 and 25.15.3. Support for short GI is optional in all cases. Support for CMMG-MCSs 4 to 16 is optional in all cases. A CMMG STA shall support single spatial stream CMMG-MCSs within the range CMMG-MCS 0 to 3 for 540 MHz channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported CMMG-MCS and NSS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported

CMMG-MCS and NSS Set field may result in a reduced CMMG-MCS range (cut-off) for N_{SS} = 2, 3, 4. Support for 540 MHz with N_{SS} = 1 and SC transmission is mandatory. Support for 540 MHz and 1080 MHz with N_{SS} = 2, 3, 4 and SC transmission is optional. Support for 540 MHz and 1080 MHz with OFDM transmission is optional.

25.15.2 Parameters for CMMG-MCSs with SC mode transmission

The related parameters for different modulation are summarized in Table 25-38 to Table 25-41 for 540 MHz channel bandwidth with SC mode transmission.

Table 25-38—CMMG SC MCSs for mandatory 540 MHz, N_{ss}=1

MCS index	Modulation	*R*	N_{CBPS}	Data rate (Mb/s)	
				Long GI	Short GI

Annex B

(normative)

Protocol Implementation Conformance Statement (PICS) proforma

B.1 Introduction

The supplier of a protocol implementation that is claimed to comply with IEEE Std 802.11-2020 shall complete the following protocol implementation conformance statement (PICS) proforma.

A completed PICS proforma is the PICS for the implementation in question. The PICS is a statement of which capabilities and options of the protocol have been implemented. This annex might not be compatible with operation in any Regulatory Domain or describe combinations of usable features in any Regulatory Domain. The PICS has a number of uses, including use:

a) By the protocol implementer, as a checklist to reduce the risk of failure to comply with the standard through oversight;

b) By the supplier and acquirer, or potential acquirer, of the implementation, as a detailed indication of the capabilities of the implementation, stated relative to the common basis for understanding provided by the standard PICS proforma;

c) By the user, or potential user, of the implementation, as a basis for initially checking the possibility of interworking with another implementation (note that, while interworking is not guaranteed, failure to interwork can often be predicted from incompatible PICS proformas);

d) By a protocol tester, as the basis for selecting appropriate tests against which to assess the claim for compliance of the implementation.

B.2 Abbreviations and special symbols

B.2.1 Symbols for Status column

M mandatory
O optional
O.<n> optional — Support of at least one of the group of options labeled by the same numeral <n> is required. The scope of the group of options is limited to a single table (i.e., subclause) within the PICS.
pred: predicate identification

B.2.2 General abbreviations for Item and Support columns

N/A not applicable
AD address function
AVT audio video transport
CDMG-M China directional multi-gigabit (CDMG) medium access control (MAC) features
CDMG-P China directional multi-gigabit (CDMG) physical layer (PHY) features
CMMG-M China Millimeter-wave multi-gigabit (CMMG) medium access control (MAC) features
CMMG-P China Millimeter-wave multi-gigabit (CMMG) physical layer (PHY) features
CF implementation under test (IUT) configuration

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

DMG-M	directional multi-gigabit (DMG) medium access control (MAC) features
DMG-P	directional multi-gigabit (DMG) physical layer (PHY) features
DS	direct sequence
DSE	dynamic station enablement
ERP	extended rate physical layer (PHY)
FILS	fast initial link setup
FR	frame reception
FS	frame exchange sequence
FT	frame transmission
HRDS	high rate direct sequence
HTM	high-throughput (HT) medium access control (MAC) features
HTP	high-throughput (HT) physical layer (PHY) features
HWM	hybrid wireless mesh protocol (HWMP) path selection protocol capability
IW	interworking with external networks
MD	multidomain
MP	mesh protocol
OC	operating classes
OF	orthogonal frequency division multiplexing (OFDM)
PAD	preassociation discovery
PC	protocol capability
RL	S1G Relay features
RM	radio management
QB	quality-of-service (QoS) base functionality
QD	quality-of-service (QoS) enhanced distributed channel access (EDCA)
QMF	quality-of-service Management frame
QP	quality-of-service (QoS) hybrid coordination function (HCF) controlled channel access (HCCA)
SIGM	Sub 1 GHz (S1G) medium access control (MAC) features
SIGP	Sub 1 GHz (S1G) physical layer (PHY) features
SM	spectrum management
TDLS	tunneled direct-link setup
TVHTM	television very high throughput medium access control (MAC) features
TVHTP	television very high throughput physical layer (PHY) features
TVWS	television white spaces
VHTM	Very high throughput MAC
VHTP	Very high throughput PHY
WNM	wireless network management

B.3 Instructions for completing the PICS proforma

B.3.1 General structure of the PICS proforma

The first parts of the PICS proforma, Implementation identification and Protocol summary, are to be completed as indicated with the information necessary to identify fully both the supplier and the implementation.

The main part of the PICS proforma is a fixed questionnaire, divided into subclauses, each containing a number of individual items. Answers to the questionnaire items are to be provided in the rightmost column, either by simply marking an answer to indicate a restricted choice (usually Yes or No) or by entering a value or a set or a range of values. (Note that there are some items where two or more choices from a set of possible answers may apply. All relevant choices are to be marked in these cases.)

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

Each item is identified by an item reference in the first column. The second column contains the question to be answered. The third column contains the reference or references to the material that specifies the item in the main body of this standard. The remaining columns record the status of each item, i.e., whether support is mandatory, optional, or conditional, and provide the space for the answers (see also B.3.4). Marking an item as supported is to be interpreted as a statement that all relevant requirements of the subclauses and normative annexes, cited in the References column for the item, are met by the implementation.

A supplier may also provide, or be required to provide, further information, categorized as either Additional Information or Exception Information. When present, each kind of further information is to be provided in a further subclause of items labeled A<*I*> or X<*I*>, respectively, for cross-referencing purposes, where <*I*> is any unambiguous identification for the item (e.g., simply a numeral). There are no other restrictions on its format or presentation.

A completed PICS proforma, including any Additional Information and Exception Information, is the PICS for the implementation in question.

NOTE—Where an implementation is capable of being configured in more than one way, a single PICS might be able to describe all such configurations. However, the supplier has the choice of providing more than one PICS, each covering some subset of the implementation's capabilities, if this makes for easier and clearer presentation of the information.

B.3.2 Additional information

Items of Additional Information allow a supplier to provide further information intended to assist in the interpretation of the PICS. It is not intended or expected that a large quantity of information will be supplied, and a PICS can be considered complete without any such information. Examples of such Additional Information might be an outline of the ways in which an (single) implementation can be set up to operate in a variety of environments and configurations, or information about aspects of the implementation that are outside the scope of this standard but have a bearing upon the answers to some items.

References to items of Additional Information may be entered next to any answer in the questionnaire, and may be included in items of Exception Information.

B.3.3 Exception information

It may happen occasionally that a supplier wishes to answer an item with mandatory status (after any conditions have been applied) in a way that conflicts with the indicated requirement. No preprinted answer is found in the Support column for this. Instead, the supplier shall write the missing answer into the Support column, together with an X<*I*> reference to an item of Exception Information, and shall provide the appropriate rationale in the Exception Information item itself.

An implementation for which an Exception Information item is required in this way does not comply with this standard.

NOTE—A possible reason for the situation described above is that a defect in this standard has been reported, a correction for which is expected to change the requirement not met by the implementation.

B.3.4 Conditional status

The PICS proforma contains a number of conditional items. These are items for which both the applicability of the item itself, and its status if it does apply, mandatory or optional, are dependent upon whether certain other items are supported.

Where a group of items is subject to the same condition for applicability, a separate preliminary question about the condition appears at the head of the group, with an instruction to skip to a later point in the

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

questionnaire if the N/A answer is selected. Otherwise, individual conditional items are indicated by a conditional symbol in the Status column.

A conditional symbol is of the form "<pred>:<S>" or "O" (or "O.<n>"), where "<pred>" is a predicate as described below, and "<S>" is one of the status symbols "M" or "O" (or "O.<n>").

If the value of a predicate is true, the conditional symbol is applicable, and yields the status given by S. If any applicable conditional symbol yields mandatory status, the conditional item has mandatory status. Otherwise, if any applicable conditional symbol [including one of the form "O" (or "O.<n>")] yields optional status, the conditional item has optional status. In either case, the support column is to be completed in the usual way. If no conditional symbol is applicable, the conditional item is not relevant and the N/A answer is to be marked.

A predicate is one of the following:

a) An item-reference for an item in the PICS proforma: the value of the predicate is true if the item is marked as supported and is false otherwise.

b) An expression constructed by combining item-references using the boolean operators (in decreasing order of precedence) "NOT", "AND", and "OR", with or without the use of parenthetical groupings: the value of the predicate is true if the expression evaluates to true and is false otherwise.

NOTE—If optional feature F1 requires features F2 and F3, this can be represented in the PICS in one of two ways:
— The status for conditional items F2 and F3 is "F1:M" and the status for conditional item F1 is "O", or
— The status for conditional item F1 is "F2 AND F3:O".

If feature F1 is required if feature F2 or F3 is supported, and is optional otherwise, this can be represented in the PICS in one way:
— The status for conditional item F1 is "F2 OR F3:M" and "O".

If feature F1 is required if feature F2 or F3 is supported, and is not relevant otherwise, this can be represented in the PICS in one way:
— The status for conditional item F1 is "F2 OR F3:M".

If feature F1 is required if feature F2 is supported, is optional if feature F3 is supported, and is not relevant otherwise, this can be represented in the PICS in one way:
— The status for conditional item F1 is "F2:M" and "F3:O".

Conditional symbols can be given in any order.

Each item referenced in a predicate, or in a preliminary question for grouped conditional items, is indicated by an asterisk in the Item column.

B.4 PICS proforma—IEEE Std 802.11-2020[58]

B.4.1 Implementation identification

Supplier	
Contact point for queries about the PICS	
Implementation Name(s) and Version(s)	
Other information necessary for full identification, e.g., name(s) and version(s) of the machines and/or operating system(s), system names	

NOTE 1—Only the first three items are required for all implementations. Other information might be completed as appropriate in meeting the requirement for full identification.

NOTE 2—The terms Name and Version need to be interpreted appropriately to correspond with a supplier's terminology (e.g., Type, Series, Model).

B.4.2 Protocol summary

Identification of protocol standard	IEEE Std 802.11-2020
Identification of amendments and corrigenda to this PICS proforma that have been completed as part of this PICS	Amd. : Corr. : Amd. : Corr. :
Have any exception items been required? (See B.3.3; the answer Yes means that the implementation does not comply with IEEE Std 802.11-2020.)	Yes ☐ No ☐

Date of statement (yyyy-mm-dd)

B.4.3 IUT configuration

Item	IUT configuration	References	Status	Support
	What is the configuration of the IUT?			
* CFAP	Access point (AP)	4.3	O.1	Yes ☐ No ☐
* CFIndepSTA	Independent station (neither an AP, nor a mesh STA, nor a STA operating outside the context of a BSS)	4.3	O.1	Yes ☐ No ☐
*CFSTAofAP	Operation in an infrastructure BSS	4.3	CFIndepSTA: M	Yes ☐ No ☐ N/A ☐
*CFIBSS	Operation in an independent BSS (IBSS)	4.3	CFIndepSTA: O	Yes ☐ No ☐ N/A ☐
*CFPBSS	Operation in a PBSS	4.3.3	CFIndepSTA AND CFDMG:M CFDMG:O.7	
*CFPCP	Operation as a PCP	4.3.3	CFPBSS:M	Yes ☐ No ☐
*CFPBSSnotPCP	Operation *not* as a PCP	4.3.3	CFPBSS:M	Yes ☐ No ☐
NOTE—See CFMBSS for mesh STA and CFOCB for OCB operation.				
* CFDSSS.	Direct sequence spread spectrum (DSSS) PHY for the 2.4 GHz band	—	O.2 CFHRDSSS: M	Yes ☐ No ☐
* CFOFDM	Orthogonal frequency division multiplexing (OFDM) PHY	—	O.2 CFHT5G:M CFTVHT:M CFS1G:M	Yes ☐ No ☐
* CFHRDSSS	High rate direct sequence spread spectrum (HR/DSSS) PHY	—	O.2 CFERP:M	Yes ☐ No ☐
* CFMD	Multidomain operation capability implemented	10.22	O	Yes ☐ No ☐
* CFERP	Extended Rate PHY (ERP)	Clause 18	O.2 CF2G4:M	Yes ☐ No ☐
* CFSM	Spectrum management	9.4.1.4, 11.7, 11.8	O	Yes ☐ No ☐
*CFOC	Operating classes capability implemented	9.4.2.9, 17.3.8.4.2, 17.3.8.6, 17.4.2 Annex D, Annex E	O	Yes ☐ No ☐ N/A ☐
* CFQoS	Quality of service (QoS)	10.23, 10.25, 4.3.13, 4.3.21.3	O CFHT OR CFMBSS OR CFQMF OR CFAVT:M CFDMG:M CFTVHT:M CFS1G:M	Yes ☐ No ☐ N/A ☐

B.4.3 IUT configuration *(continued)*

Item	IUT configuration	References	Status	Support
* CFRM	Radio Measurement	9.4.1.4, 11.10	(CFMD AND CFOC):O	Yes ☐ No ☐ N/A ☐
*CFInfraSTA	Infrastructure mode	4.3.4	CFAP OR CFSTAofAP: M CFDMG:O.7	Yes ☐ No ☐ N/A ☐
*CF3G6	3.65–3.70 GHz band in the United States	9.4.2.51, 11.11, 17.3.6, 17.3.10.6, Annex D, Annex E	CFOFDM AND CFMD AND CFSM AND CFOC:O	Yes ☐ No ☐ N/A ☐
*CFHT	High-throughput (HT) PHY	9.4.2.55	O.2 CFVHT:M	Yes ☐ No ☐
* CFHT2G4	HT operation in 2.4 GHz band	Clause 19	CFHT:O.6	Yes ☐ No ☐ N/A ☐
* CFHT5G	HT operation in 5 GHz band	Clause 19	CFHT:O.6 CFVHT:M	Yes ☐ No ☐ N/A ☐
*CF5G9	5.9 GHz band	Annex E	CFOFDM:O	Yes ☐ No ☐ N/A ☐
*CFTDLS	Tunneled direct-link setup supported	11.20	O	Yes ☐ No ☐ N/A ☐
*CFWNM	Wireless network management (WNM)		((CFMD AND CFOC AND CFRM):O	Yes ☐ No ☐ N/A ☐
*CFIW	Interworking with external networks service	9.4.2.26	O	Yes ☐ No ☐
*CFMBSS	Operation in a mesh BSS (MBSS)	4.3.21	(NOT CFDMG) AND (NOT CFS1G):O.1	Yes ☐ No ☐ N/A ☐
* CFS1G	Sub 1 GHz (S1G) features	9.4.2.200	O.2	Yes ☐ No ☐ N/A ☐
* CFS1GRelay	S1G relay	10.54	(CFAP AND CFIndepSTA): O	Yes ☐ No ☐ N/A ☐
*CFQMF	QoS management frame (QMF) policy	11.24	O	Yes ☐ No ☐ N/A ☐
*CFAVT.	Robust audio/video transport (AVT)	4.3.24	O	Yes ☐ No ☐
*CFDMG	Directional multi-gigabit (DMG) PHY	9.4.2.127	O.2 CFDMG:M	Yes ☐ No ☐
*CFMBO	Multi-band operation	9.6.20, 11.30	At least two of CFDSSS, CFOFDM, CF3G6, CF5G9, CFDMG:O	Yes ☐ No ☐ N/A ☐
*CFVHT	Very High Throughput (VHT) features	9.4.2.157	O.2	Yes ☐ No ☐
*CFTVHT	TVWS Operation	Annex D, Annex E	O	Yes ☐ No ☐
*CFOCB	Operation outside the context of a BSS (OCB)	11.18	O.1 CF5G9:M	Yes ☐ No ☐

B.4.3 IUT configuration *(continued)*

Item	IUT configuration	References	Status	Support
*CFESM	Extended spectrum management	10.22.3	O CFVHT OR CFTVHT:M	Yes ☐ No ☐
*CFFILS	Fast Initial Link Setup (FILS)	11.45	O	Yes ☐ No ☐
*CFCDMG	China directional multi-gigabit (CDMG) PHY	9.4.2.219	O.2 CFCDMG:M	Yes ☐ No ☐
*CFCMMG	China Millimeter-wave multi-gigabit (CMMG) PHY	9.4.2.229	O.2 CFCMMG:M	Yes ☐ No ☐
*CFGLK	GLK enabled STA	11.50	(NOT CFOCB):O	Yes ☐ No ☐ N/A ☐
CFGLK.1	GLK-GCR	11.21.16.4	CFGLK:O	Yes ☐ No ☐ N/A ☐
CFPAD	Preassociation discovery	11.23	O	Yes ☐ No ☐ N/A ☐

B.4.4 MAC protocol

B.4.4.1 MAC protocol capabilities

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol capabilities supported?			
PC1	Authentication service	4.5.4.2, 4.5.4.3, 11.18, 12.2	CFInfraSTA AND not CFDMG:M CFIBSS OR CFDMG:M	Yes ☐ No ☐ N/A ☐
PC1.1	Authentication state	11.3	PC1:M	Yes ☐ No ☐
PC1.2	Open System authentication	12.2.2	PC1 AND not CFDMG:M	Yes ☐ No ☐
PC1.3	Shared Key authentication	12.2.3, 12.5	PC2:M	Yes ☐ No ☐ N/A ☐
* PC2	Wired equivalent privacy (WEP) algorithm. This capability is obsolete. Support for this mechanism might be removed in a later revision of the standard.	4.5.4.4, 12.3.2	O	Yes ☐ No ☐
PC2.1	WEP encryption procedure	12.3.2	PC2:M	Yes ☐ No ☐ N/A ☐
PC2.2	WEP decryption procedure	12.3.2	PC2:M	Yes ☐ No ☐ N/A ☐
PC3	Distributed coordination function (DCF)	10.2, 10.3	M	Yes ☐ No ☐
PC3.1	Network allocation vector (NAV) function	10.3.2.1, 10.3.4	M	Yes ☐ No ☐
PC3.2	Interframe space usage and timing	10.3.2.3, 10.3.4, 10.3.7	M	Yes ☐ No ☐
PC3.3	Random Backoff function	10.3.3	M	Yes ☐ No ☐
PC3.4	DCF Access procedure	10.3.4.2, 10.3.4.5	M	Yes ☐ No ☐

B.4.4.1 MAC protocol capabilities *(continued)*

Item	Protocol capability	References	Status	Support
PC3.5	Random Backoff procedure	10.3.4.3	M	Yes ☐ No ☐
PC3.6	Recovery procedures and retransmit limits	10.3.4.4	M	Yes ☐ No ☐
PC3.7	Request to send (RTS)/clear to send (CTS) procedure	10.3.2.4, 10.3.2.6, 10.3.2.9	M	Yes ☐ No ☐
PC3.8	Individually addressed MAC protocol data unit (MPDU) transfer	10.3.5	M	Yes ☐ No ☐
PC3.9	Group addressed MPDU transfer	10.3.6	M	Yes ☐ No ☐
PC3.10	MAC-level acknowledgment	10.3.2.2, 10.3.2.11	M	Yes ☐ No ☐
PC3.11	Duplicate detection and recovery	10.3.2.14	M	Yes ☐ No ☐
PC3.12	Dynamic EIFS	10.3.7	O	Yes ☐ No ☐
PC6	Fragmentation	10.3, 10.4	M	Yes ☐ No ☐
PC7	Defragmentation	10.3, 10.5	M	Yes ☐ No ☐
PC8	MAC data service	10.2.7, 10.7	M	Yes ☐ No ☐
PC8.1	ReorderableGroupAddressed service class	10.7	M	Yes ☐ No ☐
PC9	Multirate support	10.6	M	Yes ☐ No ☐
PC9.1	Rate selection using Rx Supported VHT-MCS and NSS Set / Tx Supported VHT-MCS and NSS Set	10.6.13.1, 10.6.13.2	CFVHT:M CFTVHT:M	Yes ☐ No ☐ N/A ☐
PC9.2	Rate selection constraints for VHT PPDUs	10.6.13.3	CFVHT:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
* PC10	Multiple outstanding MAC service data unit (MSDU) support	10.7	O	Yes ☐ No ☐
PC10.1	Multiple outstanding MSDU transmission restrictions	10.7	PC10:M	Yes ☐ No ☐ N/A ☐
PC11	Timing synchronization function (TSF)	11.1	CFAP OR CFIndepSTA: M	Yes ☐ No ☐
PC11.1	Timing in an infrastructure network	11.1.2.1, 11.1.5	CFInfraSTA: M	Yes ☐ No ☐ N/A ☐
PC11.2	Timing in an independent basic service set (IBSS)	11.1.2.2, 11.1.5	CFIBSS:M	Yes ☐ No ☐ N/A ☐
PC11.3	Beacon generation function	11.1.3	CFAP OR CFIBSS OR CFPCP:M	Yes ☐ No ☐
PC11.4	TSF synchronization and accuracy	11.1.2, 11.1.3	CFAP OR CFIndepSTA: M	Yes ☐ No ☐ N/A ☐
PC11.5	Infrastructure basic service set (BSS) initialization	11.1.4	CFAP:M	Yes ☐ No ☐ N/A ☐
PC11.6	IBSS initialization	11.1.4	CFIBSS:M	Yes ☐ No ☐ N/A ☐

B.4.4.1 MAC protocol capabilities *(continued)*

Item	Protocol capability	References	Status	Support
PC11.7	Passive scanning	11.1.4	(CFSTAofAP OR CFIBSS OR CFPBSSnotPCP):O.1	Yes ☐ No ☐ N/A ☐
PC11.8	Active scanning	11.1.4	(CFSTAofAP OR CFIBSS OR CFPBSSnotPCP):O.1	Yes ☐ No ☐ N/A ☐
PC11.9	Probe response	11.1.4	(NOT CFOCB):M	Yes ☐ No ☐ N/A ☐
PC11.10	*Reserved*			
PC12	Infrastructure power management	11.2.3	CFInfraSTA AND not CFDMG:M	Yes ☐ No ☐ N/A ☐
PC12.1	STA power management modes	11.2.3.2, 11.2.3.7	(CFSTAofAP or CFIBSS):M	Yes ☐ No ☐ N/A ☐
PC12.2	Traffic indication map (TIM) transmission	11.2.3.3, 11.2.3.4	CFAP:M	Yes ☐ No ☐ N/A ☐
PC12.3	AP function	11.2.3.6	CFAP:M	Yes ☐ No ☐ N/A ☐
PC12.4	Reserved			
PC12.5	Non-AP STA receive function	11.2.3.7	CFSTAofAP:M	Yes ☐ No ☐ N/A ☐
PC12.6	Reserved			
PC12.7	Aging function	11.2.3.10	CFAP:M	Yes ☐ No ☐ N/A ☐
PC13	IBSS power management. This capability is deprecated.	11.2.4	CFIBSS:M	Yes ☐ No ☐ N/A ☐
PC13.1	Initialization of power management	11.2.4.3	CFIBSS:M	Yes ☐ No ☐ N/A ☐
PC13.2	STA power state transitions	11.2.4.4	CFIBSS:M	Yes ☐ No ☐ N/A ☐
PC13.3	Announcement traffic indication message (ATIM) and frame transmission	11.2.4.4 f)	CFIBSS:M	Yes ☐ No ☐ N/A ☐
*PC14	(Re)Association	4.5, 11.3, 11.3.5,	CFInfraSTA OR CFPCP:M CFPBSSnotPCP:O	Yes ☐ No ☐ N/A ☐
PC14.1	Association state	11.3.5	PC14:M	Yes ☐ No ☐ N/A ☐
PC14.2	STA association procedure	11.3.5.2	CFSTAofAP:M CFPBSSnotPCP:O	Yes ☐ No ☐ N/A ☐
PC14.3	AP association procedure	11.3.5.3	CFAP OR CFPCP:M	Yes ☐ No ☐ N/A ☐

B.4.4.1 MAC protocol capabilities *(continued)*

Item	Protocol capability	References	Status	Support
PC14.4	STA reassociation procedure	11.3.5.4	CFSTAofAP: M CFPBSSnotPCP:O	Yes ☐ No ☐ N/A ☐
PC14.5	AP reassociation procedure	11.3.5.5	CFAP OR CFPCP:M	Yes ☐ No ☐ N/A ☐
PC15	Management information base (MIB)	Annex C	M	Yes ☐ No ☐
PC15.1	dot11SMTbase, dot11SmtAuthenticationAlgorithms	Annex C	M	Yes ☐ No ☐
* PC15.2	dot11SMTprivacy	Annex C	PC2:M	Yes ☐ No ☐ N/A ☐
PC15.3	dot11MACbase, dot11CountersGroup, dot11GroupAddressesTable	Annex C	M	Yes ☐ No ☐
* PC15.4	dot11MACStatistics	Annex C	O	Yes ☐ No ☐
PC15.5	dot11ResourceTypeID	Annex C	M	Yes ☐ No ☐
PC16	Set dot11ShortPreambleOptionImplemented to 1	9.4.1.4	CFERP:M	Yes ☐ No ☐ N/A ☐
PC17	*Reserved*			
PC18	*Reserved*			
PC19	*Reserved*			
PC20	Set Short Slot Time subfield as described in reference	9.4.1.4	CFERP:M	Yes ☐ No ☐ N/A ☐
PC21	Monitor each received Short Time Slot subfield and take action as described in reference.	9.4.1.4	CFERP:M	Yes ☐ No ☐ N/A ☐
PC22	Transmit the ERP element in each transmitted Beacon or Probe Response frame in the format and with content as described in reference	9.4.1.4	CFERP:M	Yes ☐ No ☐ N/A ☐
PC23	Receive the ERP element and employ a protection mechanism when required prior to transmitting information using ERP-OFDM modulation	9.4.1.4	CFERP:M	Yes ☐ No ☐ N/A ☐
PC24	Determine the value of aCWmin based on the characteristic rate set as described in the reference	10.3.9	CFERP:M	Yes ☐ No ☐ N/A ☐
PC25	Transmit control response frames at the largest basic rates less than equal to the rate received and with the same PHY options or use the highest mandatory rate if no basic rate meets the above criterion	10.6	CFERP:M	Yes ☐ No ☐ N/A ☐
PC26	Transmit group addressed frames at a rate contained in the BSSBasicRateSet parameter	10.6	CFERP:M	Yes ☐ No ☐ N/A ☐

B.4.4.1 MAC protocol capabilities *(continued)*

Item	Protocol capability	References	Status	Support
PC27	Transmit individually addressed frames at any supported rate selected by a rate switching mechanism as long as it is supported by the destination STA	10.6	CFERP:M	Yes ☐ No ☐ N/A ☐
PC28	*Reserved*			
PC29	Use ERP element to control use of protection mechanism as described in the reference	10.27	CFERP:M	Yes ☐ No ☐ N/A ☐
PC30	Updated NAV is long enough to cover frame and any response	10.27	CFERP:M	Yes ☐ No ☐ N/A ☐
PC31	Support transmission of CTS-to-self sequence as described in the references	10.3.2.15	CFERP:O CFTVHT:O	Yes ☐ No ☐ N/A ☐
PC32	Support reception of CTS-to-self sequence as described in the references	10.3.2.15	CFERP:M CFTVHT:M	Yes ☐ No ☐ N/A ☐
PC33	Update NAV	10.27	CFERP:M	Yes ☐ No ☐ N/A ☐
* PC34	Robust security network association (RSNA)	9.3.2.1, 9.4.1.4, 4.5.4.4, 11.3.4, 11.3.5, 12.5.3	O	Yes ☐ No ☐
PC34.1	RSNE	9.4.2.24	PC34:M	Yes ☐ No ☐ N/A ☐
PC34.1.1	Group cipher suite	9.4.2.24	PC34.1:M	Yes ☐ No ☐ N/A ☐
PC34.1.2	Pairwise cipher suite list	9.4.2.24	PC34.1:M	Yes ☐ No ☐ N/A ☐
PC34.1.2.1	Counter mode with cipher-block chaining message authentication code protocol (CCMP) data confidentiality protocol using CCMP-128	12.5.3	PC34:M	Yes ☐ No ☐ N/A ☐
PC34.1.2.1.1	CCMP cryptographic encapsulation procedure using CCMP-128	12.5.3.3	PC34.1.2.1:M	Yes ☐ No ☐ N/A ☐
PC34.1.2.1.2	CCMP decapsulation procedure using CCMP-128	12.5.3.4	PC34.1.2.1:M	Yes ☐ No ☐ N/A ☐
PC34.1.2.2	Temporal key integrity protocol (TKIP) data confidentiality protocol. This capability is deprecated (applicable only to systems that are backward compatible).	12.5.2	PC34:O	Yes ☐ No ☐ N/A ☐
PC34.1.2.2.1	TKIP cryptographic encapsulation procedure	12.5.2.1.2	PC34.1.2.2:M	Yes ☐ No ☐ N/A ☐
PC34.1.2.2.2	TKIP decapsulation procedure	12.5.2.1.3	PC34.1.2.2:M	Yes ☐ No ☐ N/A ☐
PC34.1.2.2.3	TKIP countermeasures	12.5.2.4	PC34.1.2.2:M	Yes ☐ No ☐ N/A ☐

B.4.4.3 Frame exchange sequences

Item	Frame exchange sequence	References	Status	Support
	Are the following frame exchange sequences supported?			
FS1	Basic frame exchange sequences	10.3.2.6, 10.3.2.9, 10.3.2.11, 10.3.5, 10.3.6	M	Yes ☐ No ☐

B.4.4.4 MAC addressing functions

Item	MAC Address function	References	Status	Support
	Are the following MAC Addressing functions supported?			
AD1	STA universal individual IEEE 802 address	9.2.4.3	M	Yes ☐ No ☐
AD2	BSS identification (BSSID) generation	9.2.4.3, 11.1.4	M	Yes ☐ No ☐
AD3	Receiver address matching	9.2.4.3, 9.3.2.1	M	Yes ☐ No ☐
AD4	Wildcard BSSID	9.2.4.3.4, 9.3.2	CFOCB:M	Yes ☐ No ☐ N/A ☐
AD5	MAC and PHY operation resumes with appropriate MIB attributes in less than 2 TU	11.18	CFOCB:M	Yes ☐ No ☐ N/A ☐
AD6	Group addressed mesh Data frame addressing (3 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD7	Individually addressed mesh Data frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD8	Proxied group addressed mesh Data frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.7.3, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD9	Proxied individually addressed mesh Data frame addressing (6 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.7.3, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD10	Multihop Action frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.7.3, 9.6.17, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD11	TA filtering for mesh STA	9.2.4.3, 9.3.2.1, 9.3.5	CFMBSS:M	Yes ☐ No ☐ N/A ☐
AD12	Group addressed Data frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3	CFS1GRelay: O RL2:O CFAP: O CFIndepSTA: O	Yes ☐ No ☐ N/A ☐

B.4.4.4 MAC addressing functions *(continued)*

Item	MAC Address function	References	Status	Support
AD13	Individually addressed Data frame addressing (4 address frame)	9.2.3, 9.2.4.1, 9.2.4.3	CFS1GRelay: O RL2:O CFAP: O CFIndepSTA: O	Yes ☐ No ☐ N/A ☐
AD14	Group addressed PV1 Data frame addressing (4 address frame)	9.8, 10.54.4, 10.54.3	CFS1GRelay: O RL2:O CFS1G: O	Yes ☐ No ☐ N/A ☐
AD15	Individually addressed PV1 Data frame addressing (4 address frame)	9.8, 10.54.4, 10.54.3	CFS1GRelay: O RL2:O CFS1G: O	Yes ☐ No ☐ N/A ☐
AD16	Receive SYNRA	10.66	(CFGLK AND CFIndep-STA):M	Yes ☐ No ☐ N/A ☐
AD17	Transmit SYNRA	10.66	(CFGLK AND CFAP):O	Yes ☐ No ☐ N/A ☐

B.4.5 Direct sequence PHY functions

Item	PHY feature	References	Status	Support
	PHY sublayer procedures	15.3		
DS1	Preamble prepend on transmit (TX)	15.3.1	M	Yes ☐ No ☐
DS1.1	PHY frame format	15.3.2, 15.3.3	M	Yes ☐ No ☐
DS1.2	PHY integrity check generation	15.3.3, 15.3.3.7	M	Yes ☐ No ☐
DS1.3	TX rate change capability	15.2.3.4, 15.3.5	M	Yes ☐ No ☐
DS1.4	Supported data rates	15.1, 15.2.3.4	M	Yes ☐ No ☐
DS1.5	Data whitener scrambler	15.3.4	M	Yes ☐ No ☐
DS1.6	Scrambler initialization	15.3.4	M	Yes ☐ No ☐
DS2	Preamble process on receive (RX)	15.3.1		
DS2.1	PHY frame format	15.3.2, 15.3.3	M	Yes ☐ No ☐
DS2.2	PHY integrity check verify	15.3.3, 15.3.3.7	M	Yes ☐ No ☐
DS2.3	RX Rate change capability	15.2.3.4, 15.3.5	M	Yes ☐ No ☐
DS2.4	Data whitener descrambler	15.3.4	M	Yes ☐ No ☐
DS3	Pseudonoise (PN) code sequence	15.4.4.4	M	Yes ☐ No ☐
DS4	Chipping continue on power-down	15.3.6	O	Yes ☐ No ☐
*DS5	Operating channel capability	15.3.6, 15.4.4.3		
* DS5.1	North America (FCC)	15.3.6, 15.4.4.3	DS5:O.1	Yes ☐ No ☐ N/A ☐
DS5.1.1	Channel 1	15.3.6, 15.4.4.3	DS5.1:M	Yes ☐ No ☐ N/A ☐
DS5.1.2	Channel 2	15.3.6, 15.4.4.3	DS5.1:M	Yes ☐ No ☐ N/A ☐
DS5.1.3	Channel 3	15.3.6, 15.4.4.3	DS5.1:M	Yes ☐ No ☐ N/A ☐

B.4.10 Spectrum management extensions

Item	IUT configuration	References	Status	Support
SM1	Country, Power Constraint, and transmit power control (TPC) Report elements included in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.8, 9.4.2.11, 9.4.2.14	CFSM:M	Yes ☐ No ☐ N/A ☐
SM1.1	Transmit Envelope element(s) in Beacon and Probe Response frames	9.4.2.161	CFSM AND CFESM:M	Yes ☐ No ☐ N/A ☐
SM2	Spectrum Management Capability bit	9.4.1.4	CFSM:M	Yes ☐ No ☐ N/A ☐
SM3	Power Capability and Supported Channels elements in (Re)Association Request and Response frames	9.3.3.5, 9.3.3.6, 11.6.1	CFSM:M	Yes ☐ No ☐ N/A ☐
SM4	Action frame protocol for spectrum management actions	9.4.1.11, 9.6	CFSM:M	Yes ☐ No ☐ N/A ☐
SM4.1	Measurement Request frame	9.6.2.2	CFSM:M	Yes ☐ No ☐ N/A ☐
SM4.2	Measurement Report frame	9.6.2.3	CFSM:M	Yes ☐ No ☐ N/A ☐
SM4.3	TPC Request frame	9.6.2.4	CFSM:M	Yes ☐ No ☐ N/A ☐
SM4.4	TPC Report frame	9.6.2.5	CFSM:M	Yes ☐ No ☐ N/A ☐
SM4.5	Channel Switch Announcement frame	9.6.2.6	CFSM AND NOT CFDMG:M	Yes ☐ No ☐ N/A ☐
SM5	Measurement requests			
SM5.1	Basic request	9.4.2.20.2	CFSM:M	Yes ☐ No ☐ N/A ☐
SM5.2	CCA request	9.4.2.20.3	CFSM:O	Yes ☐ No ☐ N/A ☐
SM5.3	Receive power indication (RPI) histogram	9.4.2.20.4	CFSM:O	Yes ☐ No ☐ N/A ☐
SM5.4	Enabling/disabling requests and reports	9.4.2.20	CFSM:M	Yes ☐ No ☐ N/A ☐
SM6	Measurement reports			
SM6.1	Basic report	9.4.2.21.2	CFSM:M	Yes ☐ No ☐ N/A ☐
SM6.2	CCA report	9.4.2.21.3	CFSM:O	Yes ☐ No ☐ N/A ☐
SM6.3	RPI histogram report	9.4.2.21.4	CFSM:O	Yes ☐ No ☐ N/A ☐
SM6.4	Refusal to measure	9.4.2.21	CFSM:M	Yes ☐ No ☐ N/A ☐
SM7	Quiet interval	EMPTY		
SM7.1	AP-defined Quiet interval	9.3.3.2, 9.3.3.10, 9.4.2.22, 11.6.2	(CFAP and CFSM):M	Yes ☐ No ☐ N/A ☐
SM7.2	STA-defined Quiet interval	9.3.3.2, 9.3.3.10, 9.4.2.22, 11.6.2	(CFSTAofAP and CFSM):M	Yes ☐ No ☐ N/A ☐
SM7.3	STA support for Quiet interval	9.3.3.2, 9.3.3.10, 9.4.2.22, 11.6.2	CFSM:M	Yes ☐ No ☐ N/A ☐
SM8	Association control based on spectrum management capability	11.7, 11.8	(CFAP and CFSM):M	Yes ☐ No ☐ N/A ☐

B.4.10 Spectrum management extensions *(continued)*

Item	IUT configuration	References	Status	Support
SM9	Association control based on transmit power capability	11.7.2	(CFAP and CFSM):M	Yes ☐ No ☐ N/A ☐
SM10	Maximum transmit power levels			
SM10.1	AP determination and communication of local maximum transmit power level	11.7.5	(CFAP AND CFSM):M	Yes ☐ No ☐ N/A ☐
SM10.2	STA determination and communication of local maximum transmit power level	11.7.5	((CFSTAofAP OR CFIBSS) AND CFSM):M	Yes ☐ No ☐ N/A ☐
SM11	Selection of transmit power	11.7.6	CFSM:M	Yes ☐ No ☐ N/A ☐
SM12	Adaptation of transmit power			
SM12.1	TPC report in Beacon and Probe Response frames	11.7.7	CFSM:M	Yes ☐ No ☐ N/A ☐
SM13.1	Dynamic transmit power adaptation	11.7.7	CFSM:O	Yes ☐ No ☐ N/A ☐
SM13	Testing channels for radar	11.8.4	CFSM:M	Yes ☐ No ☐ N/A ☐
SM14	Detecting and discontinuing operations after detection of radar	11.8.5	CFSM:M	Yes ☐ No ☐ N/A ☐
SM15	Requesting and reporting of measurements	11.8.7	CFSM:M	Yes ☐ No ☐ N/A ☐
SM16	Autonomous reporting of radar	11.8.7	CFSM:M	Yes ☐ No ☐ N/A ☐
SM17	IBSS dynamic frequency selection (DFS) element including channel map	9.4.2.23	(CFIBSS AND CFSM):M	Yes ☐ No ☐ N/A ☐
SM18	DFS owner function	11.8.8	(CFIBSS AND CFSM):M	Yes ☐ No ☐ N/A ☐
SM19	DFS owner recovery procedure	11.8.8	(CFIBSS AND CFSM):M	Yes ☐ No ☐ N/A ☐
SM20	Channel switching procedure			
SM20.1	Transmission of channel switch announcement and channel switching procedure by an AP	11.8.8	(CFAP AND CFSM):M	Yes ☐ No ☐ N/A ☐
SM20.2	Transmission of channel switch announcement and channel switching procedure by a STA	11.8.8	(CFSTAofAP AND CFSM):M	Yes ☐ No ☐ N/A ☐
SM20.3	Reception of channel switch announcement and channel switching procedure by a STA	11.8.8	CFSM:M	Yes ☐ No ☐ N/A ☐
SM20.4	Transmission of Wide Bandwidth Channel Switch element in Channel Announcement frame and transmission of Wide Bandwidth Channel Switch subelement in Channel Switch Wrapper element in Beacon/ Probe Response frames, and associated channel switching procedure by an AP	11.38.4	(CFAP AND CFSM AND CFESM):M	Yes ☐ No ☐ N/A ☐

B.4.11 Operating classes extensions

Item	Protocol capability	References	Status	Support
OC1	Operating and coverage classes	9.4.2.8	CFMD AND CFOC:M	Yes ☐ No ☐ N/A ☐
OC2	Operating and coverage classes (20 MHz channel spacing)	9.4.2.8, 17.3.8.6	CFMD AND CFOC:M	Yes ☐ No ☐ N/A ☐
OC3	Operating and coverage classes (10 MHz channel spacing)	9.4.2.8, 17.3.8.6	CFMD AND CFOC AND OF1.7:M	Yes ☐ No ☐ N/A ☐
OC4	Operating and coverage classes (5 MHz channel spacing)	9.4.2.8, 17.3.8.6	CFMD AND CFOC AND OF1.8:M	Yes ☐ No ☐ N/A ☐
OC5	Coverage classes 0–31	10.22.5	CF3G6:M	Yes ☐ No ☐ N/A ☐
	Coverage class operation when not associated	10.22.5	CF3G6:M	Yes ☐ No ☐ N/A ☐
OC6	Power level, equivalent maximum transmit power level and operating class	10.22.5	CF3G6:M	Yes ☐ No ☐ N/A ☐
	Power level operation when not associated	10.22.5	CF3G6:M	Yes ☐ No ☐ N/A ☐
OC7	Power level, different maximum transmit power level and operating class	10.22.5	CF3G6:M	Yes ☐ No ☐ N/A ☐
	Power level operation when not associated	10.22.5	CF3G6:M	Yes ☐ No ☐ N/A ☐
OC8	Operation with multiple country elements	—	OC1:O	Yes ☐ No ☐ N/A ☐

B.4.12 QoS base functionality

Item	Protocol capability	References	Status	Support
QB1	QoS frame format			
QB1.1	QoS frame format	9.3.1.2–9.3.1.4, 9.3.2.1, 9.3.3.2, 9.3.3.5–9.3.3.8, 9.3.3.10, 9.3.3.13	not CFDMG AND CFQoS:M	Yes ☐ No ☐ N/A ☐
QB1.2	QoS frame format	9.3.1.2, 9.3.1.4, 9.3.1.7, 9.3.1.8, 9.3.1.10–9.3.1.18, 9.3.2.1, 9.3.4.2, 9.3.3.5–9.3.3.8, 9.3.3.10, 9.3.3.13	CFDMG:M	Yes ☐ No ☐ N/A ☐
QB2	Per traffic identifier (TID) duplicate detection	9.2.4.4, 9.2.4.5, 10.3.2.14	CFQoS OR CFDMG:M	Yes ☐ No ☐ N/A ☐
QB3	Decode of No Ack ack policy in QoS Data frames	9.2.4.5.4, 10.23.2.8, 10.23.2.12, 10.23.4.2, 10.23.4.3	CFQoS OR CFDMG:M	Yes ☐ No ☐ N/A ☐

B.4.12 QoS base functionality *(continued)*

Item	Protocol capability	References	Status	Support
QB4	Block acknowledgments (block ack)			
QB4.1	Immediate block ack Non-HT block ack is obsolete. Support for this mechanism might be removed in a later revision of the standard.	9.3.1.7.1, 9.3.1.8.1, 9.6.4, 10.25 (except 10.25.6), 11.5	CFQoS:O CFHT OR CFDMG OR CFTVHT:M	Yes ☐ No ☐ N/A ☐
*QB4.2	*Reserved*			
QB4.3	Compressed Block Ack			
QB4.3.1	Compressed Block Ack	9.3.1.7.2	CFQoS:O CFHT OR CFDMG OR CFTVHT:M	Yes ☐ No ☐ N/A ☐
QB4.3.2	Extended Compressed Block Ack	9.3.1.7.3	CFDMG:O	Yes ☐ No ☐ N/A ☐
QB4.4	Multi-TID Block Ack	9.3.1.8.3	CFQoS:O CFHT OR CFTVHT:M	Yes ☐ No ☐ N/A ☐
QB5	Automatic power save delivery (APSD)	9.6.3, 11.2.3	(CFAP and CFQoS):O (CFIndepSTA and CFQoS):O	Yes ☐ No ☐ N/A ☐

B.4.13 QoS enhanced distributed channel access (EDCA)

Item	Protocol capability	References	Status	Support
QD1	Support for four transmit queues with a separate channel access entity associated with each	10.2.3.2, 10.23.2.1	not CFDMG AND CFQoS:M CFS1G AND S1GM20.5: M CFS1G AND S1GM20.4:O	Yes ☐ No ☐ N/A ☐
QD2	Per-channel access function differentiated channel access	10.23.2.2, 10.23.2.4, 10.23.2.12	not CFDMG AND CFQoS:M	Yes ☐ No ☐ N/A ☐
QD3	Multiple frame transmission support	10.23.2.8	CFQoS OR CFDMG OR CFS1G:O	Yes ☐ No ☐ N/A ☐
QD4	Maintenance of within-queue ordering, exhaustive retransmission when sending non-QoS Data frames	10.23.2.12	(CFQoS AND NOT CFS1G) OR CFDMG:M	Yes ☐ No ☐ N/A ☐
QD5	Interpretation of admission control mandatory (ACM) subfield in EDCA Parameter Set element	9.4.2.12, 10.23.4.2	(CFSTAofAP AND (CFQoS OR CFDMG)):M (CFPBSSnotPCP AND CFDMG):	Yes ☐ No ☐ N/A ☐

B.4.13 QoS enhanced distributed channel access (EDCA) *(continued)*

Item	Protocol capability	References	Status	Support
QD6	Contention based admission control	9.4.2.13, 9.4.2.14, 9.6.3.2–9.6.3.4, 10.23.4.2, 11.4	(CFAP AND (CFQoS OR CFDMG)):O (CFSTAofAP AND (CFQoS OR CFDMG)):O (CFPCP AND CFDMG):O (CFPBSSnotPCP AND CFDMG):O	Yes ☐ No ☐ N/A ☐
QD7	Power management in an infrastructure BSS or in an IBSS	11.2	(CFAP AND CFQoS):O (CFIndepSTA AND CFQoS):O	Yes ☐ No ☐ N/A ☐
QD8	Default EDCA parameters for communications outside context of BSS	9.4.2.28, 10.23.2.2	CFOCB:M	Yes ☐ No ☐ N/A ☐
QD9	Duration/ID rules for QoS STA	9.2.5	CFQoS	Yes ☐ No ☐ N/A ☐
QD10	Mirrored Stream Classification Service (MSCS)	9.6.18.6, 9.6.18.7, 11.25.3	CFQoS:O	Yes ☐ No ☐ N/A ☐

B.4.14 QoS hybrid coordination function (HCF) controlled channel access (HCCA)

Item	Protocol capability	References	Status	Support
QP1	Traffic specification (TSPEC) and associated frame formats	9.6.3	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP2	HCCA rules	10.2.3.3, 10.23.3, 10.23.3.2–10.23.3.5	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP3	HCCA schedule generation and management	10.23.4	(CFAP AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP4	HCF frame exchange sequences	10.23.2	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP5	Traffic stream (TS) management	11.4	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP6	Minimum TSPEC parameter set	10.23.4	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐
QP7	Power management in an infrastructure BSS	11.2.3.5, 11.2.3.6, 11.2.3.6, 11.2.3.7, 11.2.3.7, 11.2.3.8, 11.2.3.9	(CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M	Yes ☐ No ☐ N/A ☐

B.4.15 Radio management extensions

Item	Protocol capability	References	Status	Support
	Are the following Radio Measurement capabilities supported?			
RM1	Radio Measurement Capability	9.4.1.4	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2	Action frame protocol for measurements	9.6	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.1	Radio Measurement Request frame	9.6.6.2	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.2	Radio Measurement Report frame	9.6.6.3	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.3	Link Measurement Request frame	9.6.6.4	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.4	Link Measurement Report frame	9.6.6.5	CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.4.1	Link Measurement Report frame	9.6.6.5	not CF DMG AND CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.4.2	Link Measurement Report frame	9.6.6.5, 9.4.2.148, 9.4.2.149, 10.42.9	CFDMG AND CFRM:M	Yes ☐ No ☐ N/A ☐
RM2.5	Neighbor Report Request			
RM2.5.1	Generate and transmit Neighbor Report Request	9.6.6.6	(CFRM AND CFSTAofAP):M	Yes ☐ No ☐ N/A ☐
RM2.5.2	Receive and process Neighbor Report Request	9.6.6.6	(CFRM AND CFAP):M	Yes ☐ No ☐ N/A ☐
RM2.6	Neighbor Report Response			
RM2.6.1	Generate and transmit Neighbor Report Response	9.4.2.36, 9.6.6.7	(CFRM AND CFAP):M	Yes ☐ No ☐ N/A ☐
RM2.6.2	Receive and process Neighbor Report Response	9.4.2.36, 9.6.6.7	(CFRM AND CFSTAofAP):M	Yes ☐ No ☐ N/A ☐
RM3	General protocol for requesting and reporting of measurements	9.4.2.20, 9.4.2.21, 11.10, 11.10.6	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.1	Parallel Measurements	9.4.2.20, 9.4.2.21, 11.10.6	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.2	Use of Enable, Request and Report bits to enable/ disable measurement requests and triggered autonomous reports Measurement Requests	9.4.2.20, 11.10.6, 11.10.8	CFRM:M	Yes ☐ No ☐ N/A ☐

B.4.15 Radio management extensions *(continued)*

Item	Protocol capability	References	Status	Support
RM3.3	Enable Autonomous Report	9.4.2.20, 11.10.8	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.4	Duration Mandatory	9.4.2.20, 11.10.4	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.5	Incapable Indication	9.4.2.21	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.6	Refused Indication	9.4.2.21, 11.10.5	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.7	Repeated Measurement	9.6.6.2, 11.10.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM3.8	Measurement Pause	9.4.2.20.12, 11.10.9.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4	Beacon Measurement Type	11.10, 11.10.9.1	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.1	Beacon request	9.4.2.20.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.2	Passive Measurement mode	9.4.2.20.7, 11.10.9.1	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.3	Active Measurement mode	9.4.2.20.7, 11.10.9.1	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.4	Beacon table mode	9.4.2.20.7, 11.10.9.1	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.5	Reporting Conditions	9.4.2.20.7	CFRM:O	Yes ☐ No ☐ N/A ☐
RM4.6	Beacon report	9.4.2.20.7	CFRM:M	Yes ☐ No ☐ N/A ☐
RM4.7	Reporting Detail	9.4.2.20.7, 9.4.2.21.7, 9.4.2.35	CFRM:O	Yes ☐ No ☐ N/A ☐
* RM5	Frame Measurement Type	11.10, 11.10.9.2	CFRM:O	Yes ☐ No ☐ N/A ☐
RM5.1	Frame request	9.4.2.20.8	(CFRM AND RM5):M	Yes ☐ No ☐ N/A ☐

B.4.17.1 HT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
HTM16	SM power save support			
*HTM16.1	AP support for non-AP STA dynamic and static SM power save mode	11.2.6	(CFHT AND CFAP):M (CFTVHT AND CFAP):M	Yes ☐ No ☐ N/A ☐
*HTM16.2	STA support for local dynamic and static SM power save mode	11.2.6	(CFHT AND CFIndepSTA):O (CFTVHT AND CFIndepSTA):O	Yes ☐ No ☐ N/A ☐
HTM16.3	Transmit SM power save state information using HT Capabilities element, or SM Power Save frame	9.6.11.3, 11.2.6	HTM17.2:M	Yes ☐ No ☐ N/A ☐
HTM16.4	Receive SM power save state information and support frame exchanges with STAs in SM power save mode	11.2.6	HTM17.1:M	Yes ☐ No ☐ N/A ☐
HTM17	Mechanisms for coexistence of 20 MHz and 40 MHz channels	11.15	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM18	Channel selection methods for 20/40 MHz operation	11.15.3	(HTP2.3.4 AND CFAP):M	Yes ☐ No ☐ N/A ☐
HTM19	20/40 MHz operation	11.15	HTP2.3.4:M	Yes ☐ No ☐ N/A ☐
HTM20	Management information base (MIB)			
HTM20.1	dot11PhyHTComplianceGroup	Annex C	CFHT:M	Yes ☐ No ☐ N/A ☐
HTM20.2	dot11PhyMCSGroup	Annex C	CFHT:M	Yes ☐ No ☐ N/A ☐

B.4.17.2 HT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
HTP1	PHY operating modes			
HTP1.1	Operation according to Clause 17 (OFDM) and/or Clause 18 (ERP)	19.1.4	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP1.2	HT-mixed format	19.1.4	CFHT:M	Yes ☐ No ☐ N/A ☐
*HTP1.3	HT-greenfield format	19.1.4	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2	PHY frame format			
HTP2.1	HT-mixed format PPDU format	19.3.2	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.2	HT-greenfield PPDU format	19.3.2	HTP1.3:M	Yes ☐ No ☐ N/A ☐

B.4.17.2 HT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
HTP2.3	Modulation and coding schemes (MCS)			
HTP2.3.1	MCS 0 to MCS 7 in 20 MHz with 800 ns guard interval (GI)			
HTP2.3.1.1	Support for 20 MHz with 800 ns GI MCS index 0	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.2	Support for 20 MHz with 800 ns GI MCS index 1	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.3	Support for 20 MHz with 800 ns GI MCS index 2	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.4	Support for 20 MHz with 800 ns GI MCS index 3	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.5	Support for 20 MHz with 800 ns GI MCS index 4	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.6	Support for 20 MHz with 800 ns GI MCS index 5	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.7	Support for 20 MHz with 800 ns GI MCS index 6	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.1.8	Support for 20 MHz with 800 ns GI MCS index 7	19.3.5, 19.5	CFHT:M	Yes ☐ No ☐ N/A ☐
HTP2.3.2	MCS 8 to MCS 15 in 20 MHz with 800 ns GI			
HTP2.3.2.1	Support for 20 MHz with 800 ns GI MCS index 8	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐
HTP2.3.2.2	Support for 20 MHz with 800 ns GI MCS index 9	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐
HTP2.3.2.3	Support for 20 MHz with 800 ns GI MCS index 10	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐

B.4.17.2 HT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
HTP2.3.2.4	Support for 20 MHz with 800 ns GI MCS index 11	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐
HTP2.3.2.5	Support for 20 MHz with 800 ns GI MCS index 12	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐
HTP2.3.2.6	Support for 20 MHz with 800 ns GI MCS index 13	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐
HTP2.3.2.7	Support for 20 MHz with 800 ns GI MCS index 14	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐
HTP2.3.2.8	Support for 20 MHz with 800 ns GI MCS index 15	19.3.5, 19.5	(CFHT AND CFAP AND NOT CFVHT):M (CFVHT AND CFAP):O (CFHT AND NOT CFAP):O	Yes ☐ No ☐ N/A ☐
HTP2.3.3	Transmit and receive support for 400 ns GI	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
*HTP2.3.4	Operation at 40 MHz	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5	Support for MCS with indices 16 to 76			
HTP2.3.5.1	Support for MCS with index 16	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.2	Support for MCS with index 17	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.3	Support for MCS with index 18	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.4	Support for MCS with index 19	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.5	Support for MCS with index 20	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.6	Support for MCS with index 21	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.7	Support for MCS with index 22	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐

B.4.17.2 HT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
HTP2.3.5.8	Support for MCS with index 23	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.9	Support for MCS with index 24	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.10	Support for MCS with index 25	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.11	Support for MCS with index 26	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.12	Support for MCS with index 27	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.13	Support for MCS with index 28	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.14	Support for MCS with index 29	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.15	Support for MCS with index 30	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.16	Support for MCS with index 31	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.17	Support for MCS with index 32 The use of MCS with index 32 is deprecated.	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.18	Support for MCS with index 33	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.19	Support for MCS with index 34	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.20	Support for MCS with index 35	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.21	Support for MCS with index 36	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.22	Support for MCS with index 37	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.23	Support for MCS with index 38	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.24	Support for MCS with index 39	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.25	Support for MCS with index 40	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.26	Support for MCS with index 41	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.27	Support for MCS with index 42	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.28	Support for MCS with index 43	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.29	Support for MCS with index 44	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.30	Support for MCS with index 45	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.31	Support for MCS with index 46	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.32	Support for MCS with index 47	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.33	Support for MCS with index 48	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.34	Support for MCS with index 49	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.35	Support for MCS with index 50	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.36	Support for MCS with index 51	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.37	Support for MCS with index 52	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.38	Support for MCS with index 53	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.39	Support for MCS with index 54	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.40	Support for MCS with index 55	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.41	Support for MCS with index 56	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.42	Support for MCS with index 57	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.43	Support for MCS with index 58	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐
HTP2.3.5.44	Support for MCS with index 59	19.3.5, 19.5	CFHT:O	Yes ☐ No ☐ N/A ☐

B.4.19 WNM extensions *(continued)*

Item	Protocol capability	References	Status	Support
WNM23.5	Transmitter of Fine Timing Measurement Range request and receiver of Fine Timing Measurement Range report	11.10.9.11	WNM23:M	Yes ☐ No ☐ N/A ☐
WNM23.6	Receiver of Fine Timing Measurement Range request and transmitter of Fine Timing Measurement Range report	11.10.9.11	(CFIndepSTA OR CFMBSS) AND WNM23:M	Yes ☐ No ☐ N/A ☐

B.4.20 Interworking (IW) with external networks extensions

Item	Protocol capability	References	Status	Support
	Are the following Interworking with External Networks capabilities supported?			
IW1	Interworking capabilities and Information	9.4.2.91, 11.22.2	CFIW:M	Yes ☐ No ☐ N/A ☐
IW1.1	Interworking element	9.4.2.91	IW1:M	Yes ☐ No ☐ N/A ☐
IW1.2	Access network type	9.4.2.91	IW1:M	Yes ☐ No ☐ N/A ☐
IW1.3	Venue type	9.4.2.91	IW1:M	Yes ☐ No ☐ N/A ☐
IW1.4	HESSID	9.4.2.91	IW1:M	Yes ☐ No ☐ N/A ☐
IW2	Generic Advertisement Service	11.22.3	CFIW:M	Yes ☐ No ☐ N/A ☐
IW2.1	Advertisement Protocol element	9.4.2.92	IW2:M	Yes ☐ No ☐ N/A ☐
*IW2.2	GAS Protocol	11.22.3.2	IW2:M	Yes ☐ No ☐ N/A ☐
*IW2.2.1	GAS frames	9.6.7	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.2.2	Access network query protocol	9.4.5	IW2.2:M	Yes ☐ No ☐ N/A ☐
IW2.2.3	Query List	9.4.5.2	IW2.2.1:M	Yes ☐ No ☐ N/A ☐
IW2.2.4	Capability List	9.4.5.3	IW2.2.1:M	Yes ☐ No ☐ N/A ☐
IW2.2.5	Venue Name	9.4.5.4	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.6	Emergency Call Number	9.4.5.5	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.7	Network Authentication Type	9.4.5.6	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.8	Roaming Consortium	9.4.5.7	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.9	IP Address Type Availability	9.4.5.9	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.10	NAI Realm	9.4.5.10	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.11	3GPP Cellular Network	9.4.5.11	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.12	AP Geospatial Location	9.4.5.12	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.13	AP Civic Location	9.4.5.13	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.14	AP Location Public Identifier URI/ FQDN	9.4.5.14	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.15	Domain Name	9.4.5.15	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.16	Emergency Alert URI	9.4.5.16	IW2.2.1:O	Yes ☐ No ☐ N/A ☐

B.4.20 Interworking (IW) with external networks extensions *(continued)*

Item	Protocol capability	References	Status	Support
IW2.2.17	Emergency NAI	9.4.5.17	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.18	Vendor Specific	9.4.5.8	IW2.2.1:O	Yes ☐ No ☐ N/A ☐
IW2.2.19	MIS Information Service	9.4.2.92, 11.22.4	IW2:O	Yes ☐ No ☐ N/A ☐
IW2.2.20	MIS Event and Command Services Discovery	9.4.2.92, 11.22.4	IW2.2:O	Yes ☐ No ☐ N/A ☐
IW2.2.21	Emergency Alert System (EAS)	9.4.2.92, 9.4.2.96	IW2.2:O	Yes ☐ No ☐ N/A ☐
IW2.2.22	Advertisement Protocol ID, Vendor Specific	9.4.2.92	IW2.2:O	Yes ☐ No ☐ N/A ☐
IW2.2.23	TDLS Capability	9.4.5.18	IW2.21:O	Yes ☐ No ☐ N/A ☐
IW2.2.24	Neighbor Report	9.4.5.19	IW2.21:O	Yes ☐ No ☐ N/A ☐
IW2.3	GAS Initial Request frame	9.6.7.12	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.4	GAS Initial Response frame	9.6.7.13	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.5	GAS Comeback Request frame	9.6.7.14	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.6	GAS Comeback Response frame	9.6.7.15	IW2:M	Yes ☐ No ☐ N/A ☐
IW2.7	Group Addressed GAS Request frame	9.6.7.14	O	Yes ☐ No ☐ N/A ☐
IW2.8	Group Addressed GAS Response frame	9.6.7.15	O	Yes ☐ No ☐ N/A ☐
IW2.9	Retransmission of a query response fragment	11.22.3.2.1	O	Yes ☐ No ☐ N/A ☐
IW3	QoS Mapping from External Networks	10.23.4.2, 10.23.4.3, 11.22.9	CFIW:O	Yes ☐ No ☐ N/A ☐
IW3.1	QoS Map element	9.4.2.94	IW3:M	Yes ☐ No ☐ N/A ☐
IW3.2	Transport of QoS Map	11.22.9	IW3:M	Yes ☐ No ☐ N/A ☐
IW3.3	QoS Map Configure	9.6.3.6	IW3:M	Yes ☐ No ☐ N/A ☐
IW4	MIS Support	6.4, 11.22.4	CFIW:O	Yes ☐ No ☐ N/A ☐
IW4.1	MAC state generic convergence function support	6.4	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.2	Informational events	6.4.5	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.3	ESS status reporting	6.4.7	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.4	Network configuration	6.4.8	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.5	Network events	6.4.9	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.6	Network command interface	6.4.10	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.7	Mobility management	6.4.11	IW4:M	Yes ☐ No ☐ N/A ☐
IW4.8	Network configuration	6.4.8	IW4:M	Yes ☐ No ☐ N/A ☐
IW5	Extended channel switching enabled	9.4.2.57, 11.1.4	(CF3G6 AND DSE9):M	Yes ☐ No ☐ N/A ☐
IW6	Expedited Bandwidth Request	9.4.2.93	CFIW:O	Yes ☐ No ☐ N/A ☐
IW7	SSPN Interface	11.22.5	CFIW:O	Yes ☐ No ☐ N/A ☐

B.4.21 Mesh protocol capabilities

B.4.21.1 General mesh support

Item	Protocol capability	Reference	Status	Support
*MP1	Support of mesh capability	4.3.21, 14.1	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP1.1	Mesh BSS scanning	14.2.2, 14.2.6	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.2	Candidate peer mesh STA determination	14.2.7	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.3	Active mesh profile determination	14.2.3, 14.2.4	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.4	Establishing a mesh BSS	14.2.8	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.5	Becoming a member of a mesh BSS	14.2.8	MP1:M	Yes ☐ No ☐ N/A ☐
MP1.6	Announcement of mesh profile and supplemental information for the mesh discovery	14.2.3, 14.2.5	MP1:M	Yes ☐ No ☐ N/A ☐
*MP2	Mesh peering management (MPM) framework	14.3	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP2.1	Mesh peering management (MPM) protocol	14.3	MP2:M	Yes ☐ No ☐ N/A ☐
MP2.1.1	Processing of Mesh Peering Open frame	14.3.6	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.2	Processing of Mesh Peering Confirm frame	14.3.7	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.3	Processing of Mesh Peering Close frame	14.3.8	MP2.1:M	Yes ☐ No ☐ N/A ☐
MP2.1.4	MPM finite state machine	14.4	MP2.1:M	Yes ☐ No ☐ N/A ☐
*MP2.2	Authenticated mesh peering exchange (AMPE)	14.5	MP2:O	Yes ☐ No ☐ N/A ☐
MP2.2.1	Mesh authentication using SAE	12.4, 14.3.3	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.2	Mesh authentication using IEEE Std 802.1X	4.10, 14.3.3	MP2.2:O	Yes ☐ No ☐ N/A ☐
MP2.2.3	Protected mesh peering Management frame processing	14.5.3, 14.5.3	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.4	Mesh pairwise master key security association (PMKSA) caching	12.6.12	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.5	AMPE finite state machine	14.5.6	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.6	MGTK distribution	14.5.4	MP2.2:M	Yes ☐ No ☐ N/A ☐
MP2.2.7	MGTK update	14.6	MP2.2:O	Yes ☐ No ☐ N/A ☐
MP3	Mesh STA beaconing	14.13.3	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP4	Mesh STA synchronization	14.13.2	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP4.1	Neighbor offset synchronization method	14.13.2	MP4:M	Yes ☐ No ☐ N/A ☐
MP4.1.1	Calculation of TSF offset	14.13.2.2.2	MP4.1:M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP4.1.2	Clock drift adjustment	14.13.2.2.3	MP4.1:M	Yes ☐ No ☐ N/A ☐
*MP4.2	Mesh beacon collision avoidance (MBCA)	14.13.4	MP4:O	Yes ☐ No ☐ N/A ☐
MP4.2.1	Beacon timing advertisement	14.13.4.2	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.2	TBTT selection	14.13.4.3	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.3	TBTT adjustment	14.13.4.4	MP4.2:M	Yes ☐ No ☐ N/A ☐
MP4.2.4	Frame transmission across reported TBTT	14.13.4.5	MP4.2:O	Yes ☐ No ☐ N/A ☐
MP4.2.5	Delayed beacon transmission	14.13.4.6	MP4.2:O	Yes ☐ No ☐ N/A ☐
*MP5	MCCA	10.24.3	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP5.1	MCCAOP Advertisement	10.24.3.7	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.2	Neighbor MCCAOP Recognition	10.24.3.4, 10.24.3.5	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.3	MCCAOP Setup	10.24.3.6	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.4	Access during MCCAOPs	10.24.3.9	MP5:M	Yes ☐ No ☐ N/A ☐
MP5.5	MCCAOP teardown	10.24.3.8	MP5:M	Yes ☐ No ☐ N/A ☐
*MP6	Intra mesh congestion control	14.12	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP6.1	Local congestion monitoring and detection	14.12	MP6:M	Yes ☐ No ☐ N/A ☐
MP6.2	Congestion control signaling	14.12	MP6:M	Yes ☐ No ☐ N/A ☐
MP6.3	Local rate control	14.12	MP6:M	Yes ☐ No ☐ N/A ☐
*MP7	MBSS channel switching procedure	11.8.8, 11.9.3	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP7.1	Transmission of channel switch advertisement	11.8.8, 11.9.3	MP7:M	Yes ☐ No ☐ N/A ☐
MP7.2	Propagation of channel switch advertisement	11.8.8, 11.9.3	MP7:M	Yes ☐ No ☐ N/A ☐
*MP8	Mesh power save operation (operation in light or deep sleep mode)	14.14	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP8.1	Link-specific mesh power management mode setting	14.14.2.2, 14.14.8	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.2	Nonpeer mesh power management mode setting	14.14.2.3	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.3	Light sleep mode operation	14.14.8.4	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.4	Deep sleep mode operation	14.14.8.5	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.5	STA power state transitions	14.14.3	MP8:M	Yes ☐ No ☐ N/A ☐
MP8.6	Mesh awake window operation	14.14.6	MP8:M	Yes ☐ No ☐ N/A ☐
*MP9	Mesh power save support	14.14	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP9.1	TIM transmission	14.14.4	MP9:M	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP9.2	Link-specific mesh power management modes determination	14.14.2	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.3	Group addressed frame transmission	14.14.7	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.4	Frame transmission to a mesh STA in light sleep mode	14.14.7, 14.14.9	MP9:M	Yes ☐ No ☐ N/A ☐
MP9.5	Frame transmission to a mesh STA in deep sleep mode	14.14.7, 14.14.9	MP9:M	Yes ☐ No ☐ N/A ☐
*MP10	Link metric computation	14.9	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP10.1	Airtime link metric computation		MP10:M	Yes ☐ No ☐ N/A ☐
MP10.2	High PHY rate airtime link metric computation	14.9.2	MP10:O	Yes ☐ No ☐ N/A ☐
*MP11	Link metric reporting	14.8.3	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP11.1	Autonomous link metric reporting	14.8.3	MP11:O	Yes ☐ No ☐ N/A ☐
MP11.2	Link metric reporting upon request	14.8.3	MP11:M	Yes ☐ No ☐ N/A ☐
*MP12	Proxy operation	14.11.4	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP12.1	Data forwarding at proxy mesh gate	14.11.3	MP12:M	Yes ☐ No ☐ N/A ☐
MP12.2	Maintenance of proxy information	14.11.4.2	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP12.3	Proxy update using Proxy Update and Proxy Update Confirmation frames	14.11.4	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP12.4	Proxy update using HWMP Mesh Path Selection frames	14.10.9, 14.10.10, 14.10.11	HWM1:M	Yes ☐ No ☐ N/A ☐
*MP13	Gate announcement	14.11.2	CFMBSS: O	Yes ☐ No ☐ N/A ☐
MP13.1	GANN transmission	14.11.2	MP13:O	Yes ☐ No ☐ N/A ☐
MP13.2	GANN reception and propagation	14.11.2	CFMBSS: M	Yes ☐ No ☐ N/A ☐
*MP14	Mesh Control field handling	9.2.4.7.3	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP14.1	Address Extension recognition	9.2.4.7.3, 9.3.5	MP14:M	Yes ☐ No ☐ N/A ☐
MP14.2	Mesh TTL handling	9.2.4.7.3, 10.38.3, 10.38.4, 10.38.5	MP14:M	Yes ☐ No ☐ N/A ☐
MP14.3	Mesh Sequence Number handling	9.2.4.7.3, 10.38.3, 10.38.4, 10.38.5, 10.38.6	MP14:M	Yes ☐ No ☐ N/A ☐
*MP15	MSDU/MMPDU forwarding	10.38	CFMBSS: O	Yes ☐ No ☐ N/A ☐

B.4.21.1 General mesh support *(continued)*

Item	Protocol capability	Reference	Status	Support
MP15.1	Individually addressed MSDU forwarding	10.38.3	MP15:M	Yes ☐ No ☐ N/A ☐
MP15.2	Group addressed MSDU forwarding	10.38.4	MP15:M	Yes ☐ No ☐ N/A ☐
MP15.3	MMPDU forwarding	10.38.5	MP15:M	Yes ☐ No ☐ N/A ☐
MP15.4	Detection of duplicate MSDUs/ MMPDUs	10.38.6	CFMBSS: M	Yes ☐ No ☐ N/A ☐
MP15.5	Treatment of unknown destination	10.38.8	CFMBSS: M	Yes ☐ No ☐ N/A ☐

B.4.21.2 HWMP path selection protocol capabilities

Item	Protocol capability	Reference	Status	Support
*HWM1	Hybrid wireless mesh protocol (HWMP)	14.10	CFMBSS:M	Yes ☐ No ☐ N/A ☐
*HWM1.1	On-demand path selection	14.10.3	HWM1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.1	PREQ processing for on-demand path selection	14.10.9	HWM1.1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.2	PREP processing for on-demand path selection	14.10.10	HWM1.1:M	Yes ☐ No ☐ N/A ☐
HWM1.1.3	PERR processing for on-demand path selection	14.10.11	HWM1.1:M	Yes ☐ No ☐ N/A ☐
*HWM1.2	Proactive tree building	14.10.4	HWM1:M	Yes ☐ No ☐ N/A ☐
HWM1.2.1	PREQ processing for proactive tree building	14.10.9	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.2	PREP processing for proactive tree building	14.10.10	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.3	PERR processing for proactive tree building	14.10.11	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM1.2.4	RANN processing	14.10.12	HWM1.2:M	Yes ☐ No ☐ N/A ☐
HWM2	Maintenance of forwarding information	10.38.2, 14.10.8.4	MP15:M	Yes ☐ No ☐ N/A ☐

B.4.22 QMF extensions

Item	Protocol capability	References	Status	Support
QMF1	Extended Capabilities element	9.4.2.26	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF2	Channel access procedures for QMFs	10.2.3.2	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF3	Duplicate detection and recovery for QMFs	10.3.2.14	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF4	QMF policy Configuration	11.24.2	CFQMF:M	Yes ☐ No ☐ N/A ☐

Copyright © 2021 IEEE. All rights reserved.

Authorized licensed use limited to: University of Shanghai For Science and Technology. Downloaded on March 18,2021 at 09:17:23 UTC from IEEE Xplore. Restrictions apply.

B.4.22 QMF extensions *(continued)*

Item	Protocol capability	References	Status	Support
QMF5	Interpreting QMF priority	11.24.3	CFQMF:M	Yes ☐ No ☐ N/A ☐
QMF6	CCMP cryptographic encapsulation for QMFs	12.5.3.3	(CFQMF AND PC34.1.10):M	Yes ☐ No ☐ N/A ☐

B.4.23 RobustAVT extensions

Item	Protocol capability	References	Status	Support
AVT1	Extended Capabilities element	9.4.2.26	CFAVT:M	Yes ☐ No ☐ N/A ☐
AVT2	Groupcast with Retries (GCR)	11.21.16.3.2, 11.21.16.3.3, 11.21.16.3.4, 11.21.16.3.5, 11.21.16.3.6	(CFHT AND CFAVT AND WNM19):M (CFTVHT AND CFAVT AND WNM19):M	Yes ☐ No ☐ N/A ☐
			(CFAP AND CFAVT AND WNM19 AND HTM4.4):M	Yes ☐ No ☐ N/A ☐
AVT2.1	Advanced GCR	9.4.2.26, 10.25.8, 11.21.16.3.7, 11.21.16.3.8	(CFAVT AND QB5):O	Yes ☐ No ☐ N/A ☐
AVT3	Alternate EDCA transmit queues	10.2.3.2	CFAVT AND CFHT:O	Yes ☐ No ☐ N/A ☐
AVT4	Stream Classification Service (SCS)	11.25.2	CFAVT:O	Yes ☐ No ☐ N/A ☐
AVT4.1	SCS Request frame	9.6.18.2	AVT4:M	Yes ☐ No ☐ N/A ☐
AVT4.2	SCS Response frame	9.6.18.3	AVT4:M	Yes ☐ No ☐ N/A ☐
AVT4.3	Drop eligibility indicator (DEI)	11.25.2	(CFHT AND AVT4):M (CFTVHT AND AVT4):M	Yes ☐ No ☐ N/A ☐
ATV5	Overlapping Basic Service Set (OBSS) Management	9.4.2.26, 11.26	(CFAP AND (QP2 OR QD6) AND CFAVT):M	Yes ☐ No ☐ N/A ☐
ATV5.1	AP PeerKey	12.10	AVT5:O	Yes ☐ No ☐ N/A ☐
ATV5.2	QLoad Report	11.26.2	AVT5:M	Yes ☐ No ☐ N/A ☐
AVT5.2.1	QLoad Report element	9.4.2.122	AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.2	QLoad Request frame	9.6.7.20	AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.3	QLoad Report frame	9.6.7.21	AVT5.2:M	Yes ☐ No ☐ N/A ☐
AVT5.2.4	Protected QLoad Report	9.6.7.21	(AVT5.2 AND AVT5.1):O	Yes ☐ No ☐ N/A ☐
AVT5.3	HCCA TXOP Update Count element	9.4.2.123	(AVT5 AND QP2):O	Yes ☐ No ☐ N/A ☐
AVT5.3.1	HCCA TXOP Negotiation	11.26.3	AVT5.3:O	Yes ☐ No ☐ N/A ☐

B.4.23 RobustAVT extensions *(continued)*

Item	Protocol capability	References	Status	Support
AVT5.3.2	Protected HCCA TXOP Negotiation	11.26.3	(AVT5.3 AND ATV5.1):O	Yes ☐ No ☐ N/A ☐
AVT6	GCR for Mesh	9.4.2.26, 10.25.8, 11.21.16.3.6, 11.21.16.3.7	(WNM19 AND HTM4.4 AND CFHT AND CFAVT AND CFMBSS):O (WNM19 AND HTM4.4 AND CFTVHT AND CFAVT and CFMBSS):O	Yes ☐ No ☐ N/A ☐

B.4.24 DMG features

B.4.24.1 DMG MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
DMG-M1	DMG capabilities signaling			
DMG-M1.1	DMG Capabilities element	9.4.2.127	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.127	(CFDMG AND (CFSTAofAP OR CFIBSS OR CFPBSSnotPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M1.3	Signaling of STA and BSS capabilities in DMG Beacon, Probe Response, (Re)Association Response frames	9.3.3.6, 9.3.3.8, 9.3.3.10, 9.3.4.2, 9.4.2.127	(CFDMG AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M2	Signaling of DMG operation	9.4.2.128	(CFDMG AND (CFAP OR CFPCP)):M	Yes ☐ No ☐ N/A ☐
DMG-M3	MSDU aggregation			
DMG-M3.1	Reception of Basic A-MSDUs	9.2.4.5, 9.3.2.2.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.2	Basic A-MSDU format	9.3.2.2.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.3	Basic A-MSDU content	9.3.2.2.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M3.4	Transmission of Basic A-MSDUs	9.2.4.5, 9.3.2.2.2	CFDMG:O	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
*DMG-M3.5	Reception of Short A-MSDU	9.2.4.5, 9.3.2.2.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M3.6	Short A-MSDU format	9.3.2.2.3	(DMG-M3.5 OR DMG-M3.8):M	Yes ☐ No ☐ N/A ☐
DMG-M3.7	Short A-MSDU content	9.3.2.2.3	(DMG-M3.5 OR DMG-M3.8):M	Yes ☐ No ☐ N/A ☐
*DMG-M3.8	Transmission of Short A-MSDU	9.2.4.5, 9.3.2.2.3	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M3.9	Negotiation of Short A-MSDU usage	9.4.2.29	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M4	MPDU aggregation			
DMG-M4.1	Reception of A-MPDU	9.4.2.127.2, 10.12.2, 11.3	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M4.2	A-MPDU format	9.7.1	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M4.3	A-MPDU content	9.7.3	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M4.4	Transmission of A-MPDU	9.4.2.127.2, 10.12.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M5	A-PPDU aggregation	10.12-10.14		
*DMG-M5.1	Reception of A-PPDU	9.4.2.127.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M5.2	A-PPDU format	20.5.2, 20.5.2	(DMG-M5.1 OR DMG-M5.3):M	Yes ☐ No ☐ N/A ☐
*DMG-M5.3	Transmission of A-PPDU	9.4.2.127.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
*DMG-M6	Reverse direction aggregation exchanges	9.4.2.127.2, 10.29	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M6.1	Constraints regarding responses	10.29.3	DMG-M6:M	Yes ☐ No ☐ N/A ☐
DMG-M7	DMG channel access			
DMG-M7.1	ATI transmission			
DMG-M7.1.1	Transmission of Request	10.39.3	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
DMG-M7.1.2	Reception of Request	10.39.3	CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M7.1.3	Transmission of Response	10.39.3	CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.1.4	Reception of Response	10.39.3	CFDMG AND (CFAP OR CFPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.2	DTI transmission	10.39.4	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M7.3	Time allocation			
*DMG-M7.3.1	Service period (SP) allocation	9.4.2.131, 9.4.2.133, 9.4.2.137, 10.39.6.2	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
*DMG-M7.3.2	CBAP allocation	9.4.2.131, 9.4.2.137, 10.39.6.2	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
DMG-M7.3.3	Interpretation of allocation	9.4.2.131, 9.4.2.137, 10.39.5, 10.39.6.2	CFDMG AND (CFInfraSTA OR CFIBSS OR CFPCP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
*DMG-M7.4	Contention based access period	10.39.5, 10.39.6.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1	Distributed coordination function (DCF)			
DMG-M7.4.1.1	Network allocation vector (NAV) function	10.3.2.2, 10.3.4, 10.39.10	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.2	Interframe space usage and timing	10.3.2.4, 10.3.4, 10.3.7	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.3	Random Backoff function	10.3.3	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.4	DCF Access procedure	10.3, 10.3.4.2, 10.3.4.5	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.5	Random Backoff procedure	10.3, 10.3.4.3	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.6	Recovery procedures and retransmit limits	10.3.4.4	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.7	Request to send (RTS)/DMG clear to send (DMG CTS) procedure	10.3.2.6, 10.3.2.9, 10.3.2.10, 10.39.10	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M7.4.1.8	Individually addressed MAC protocol data unit (MPDU) transfer	10.3.5	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.9	Group addressed MPDU transfer	10.3.6	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.10	MAC-level acknowledgment	10.3.2.3, 10.3.2.11	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.1.11	Duplicate detection and recovery	10.3.2.14	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.2	Enhanced DCF (EDCA)			
*DMG-M7.4.2.1	Support for one transmit queue with AC_BE access category	10.2.3.2, 10.23.2.1	DMG-M7.4:M	Yes ☐ No ☐ N/A ☐
DMG-M7.4.2.2	Support for four transmit queues with a separate channel access entity associated with each	10.2.3.2, 10.23.2.1	DMG-M7.4.2.1:O	Yes ☐ No ☐ N/A ☐
DMG-M7.4.2.3	AC_BE access category and differentiated channel access	10.23.2.2, 10.23.2.4, 10.23.2.12	DMG-M7.4.2.1:M	Yes ☐ No ☐ N/A ☐
DMG-M7.5	Pseudo-static allocation			
DMG-M7.5.1	Scheduling of pseudo-static allocation	9.4.2.112, 9.4.2.141, 10.39.6.2, 10.39.6.5, 11.4.13.2	DMG-M7.3.1:O	Yes ☐ No ☐ N/A ☐
DMG-M7.5.2	Operation within pseudo-static allocation	9.4.2.139, 9.4.2.141, 10.39.6.2, 10.39.6.4	CFDMG AND (CFAP OR CFSTAofAP OR CFPCP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.6	Guard time	10.39.6.5	DMG-M7.3.1:M	Yes ☐ No ☐ N/A ☐
DMG-M7.7	DMG protected period			
*DMG-M7.7.1	Establishment of DMG protected period with RTS at source DMG STA	10.39.6.6	DMG-M7.3.1:O	Yes ☐ No ☐ N/A ☐
*DMG-M7.7.2	Establishment of DMG protected period using a DMG CTS frame at destination DMG STA	10.39.6.6	DMG-M7.3.1:M	Yes ☐ No ☐ N/A ☐
DMG-M7.7.3	Transmission of DMG DTS frame at destination DMG STA	10.39.6.6	DMG-M7.7.2:O	Yes ☐ No ☐ N/A ☐
DMG-M7.7.4	Reception of DMG DTS frame at source DMG STA	10.39.6.6	DMG-M7.7.1:M	Yes ☐ No ☐ N/A ☐
DMG-M7.8	Service period recovery	10.39.6.7	DMG-M7.3.1 AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M7.9	Dynamic allocation of service period	10.39.7		
DMG-M7.9.1	Polling period (PP)	9.4.2.143, 10.39.7.2		
DMG-M7.9.1.1	Transmission of Poll	9.3.1.10	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
DMG-M7.9.1.2	Reception of Poll	9.3.1.10	CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.9.1.3	Transmission of SPR	9.3.1.11	CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.9.1.4	Reception of SPR	9.3.1.11	CFDMG AND (CFAP OR CFPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.9.2	Grant period (GP)	10.39.7.3		
DMG-M7.9.2.1	Transmission of Grant	9.3.1.12	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐
DMG-M7.9.2.2	Reception of Grant	9.3.1.12	CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.10	Dynamic truncation of service period	10.39.8		
DMG-M7.10.1	Transmission of CF-End	9.3.1.15	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M7.10.2	Reception of CF-End	9.3.1.15	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M7.11	Dynamic extension of service period	10.39.9		
DMG-M7.11.1	Transmission of SPR	9.3.1.11	CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):O	Yes ☐ No ☐ N/A ☐
DMG-M7.11.2	Reception of SPR	9.3.1.11	CFDMG AND (CFAP OR CFPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.11.3	Transmission of Grant	9.3.1.12	CFDMG AND (CFAP OR CFPCP):O	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M7.11.4	Reception of Grant	9.3.1.12	CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.12	Isochronous and Asynchronous TS support			
DMG-M7.12.1	Isochronous operation	9.4.2.131, 9.4.2.133, 9.4.2.137, 11.4.13.2	DMG-M7.3.1 AND (CFInfraSTA OR CFPCP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M7.12.2	Asynchronous operation	9.3.1.11, 9.4.2.131, 9.4.2.133, 9.4.2.137, 11.4.13.2	DMG-M7.3.1 AND (CFInfraSTA OR CFPCP OR CFPBSSnotPCP):M	Yes ☐ No ☐ N/A ☐
DMG-M8	AP or PCP clustering			
DMG-M8.1	S-AP in centralized AP or PCP cluster	10.40	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M8.2	Except when centralized AP or PCP clusters on all channels supported by the AP or PCP in the operating class, join a centralized AP or PCP cluster or cease activity on channel	10.40.2.2	CFDMG AND (CFAP OR CFPCP) AND NOT DMG-M8.1:M	Yes ☐ No ☐ N/A ☐
DMG-M8.3	Other AP or PCP clustering	10.40	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M9	DMG beamforming			
DMG-M9.1	Sector-level sweep	10.42.2, 10.42.6.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M9.2	Beamforming in BTI	10.42.4	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M9.3	Beamforming in A-BFT	10.42.5	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M9.4	BRP setup	10.42.3.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M9.5	MID	10.42.6.3.3	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M9.6	BC	10.42.6.3.4	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M9.7	BRP			
*DMG-M9.7.1	BRP with BS-FBCK	10.42.3, 10.42.6.4	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M9.7.2	BRP with channel measurement	10.42.3, 10.42.6.4	DMG-M9.7.1:O	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M9.8	Beam tracking	10.42.7	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M10	DMG block ack with flow control	9.4.2.127.2, 10.42.9	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M11	DMG link adaptation	10.42.9	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M12	Timing synchronization function (TSF) in a PBSS			
DMG-M12.1	Timing in a PBSS	11.1.2.1, 11.1.5	CFPCP AND CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M12.2	PBSS initialization	11.1.4	CFPCP AND CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M13	Power management			
DMG-M13.1	STA power management without wakeup schedule	11.2.7.2.2, 11.2.7.2.4	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M13.2	STA power management with wakeup schedule	9.4.2.138, 11.2.7.2.3, 11.2.7.2.4	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M13.3	PCP power management	9.4.2.138, 11.2.7.2.3	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M14	Authentication and association			
DMG-M14.1	Association state	11.3.1	M	Yes ☐ No ☐
DMG-M14.2	STA association procedure	11.3.5.2	CFSTAofAP AND CFDMG:M CFPBSSnotPCP AND CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M14.3	AP or PCP association procedure	11.3.5.3	CFAP AND CFDMG:M CFPCP AND CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M14.4	Communicating PBSS information	11.3.7	(CFPCP OR CFPBSSnotPCP) AND CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M14.5	SAE authentication	12.4	(DMG-M14.2 OR DMG-M14.3) AND PC39:O	Yes ☐ No ☐ N/A ☐
DMG-M14.6	FT authentication	13	(DMG-M14.2 OR DMG-M14.3) AND PC35:O	Yes ☐ No ☐ N/A ☐

B.4.24.1 DMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
DMG-M14.7	FILS authentication	12.11	(DMG-M14.2 OR DMG-M14.3) AND FILS4:O	Yes ☐ No ☐ N/A ☐
DMG-M15	DMG beamformed link and BSS maintenance			
DMG-M15.1	Beamformed link maintenance			
*DMG-M15.1.1	Negotiation of dot11BeamLinkMaintenanceTime timer	9.5.6	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M15.1.2	Beamformed link maintenance procedure	11.27.1	DMG-M15.1.1:O	Yes ☐ No ☐ N/A ☐
DMG-M15.2	PCP handover	11.27.2	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M16	DMG BSS Peer and Service Discovery	11.28	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M17	Changing DMG BSS parameters	11.29	CFDMG:O	Yes ☐ No ☐ N/A ☐
*DMG-M18	Spatial sharing and interference mitigation	11.30	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M19	DMG Coexistence with other DMG systems	11.33	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-M20	Traffic specification (TSPEC and DMG TSPEC) and associated frame formats	9.6.3	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M21	DMG frame formats			
DMG-M21.1	DMG Action field	9.6.19.1	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M21.2	Announce frame	9.6.21.2	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M21.3	Power Save Configuration	9.6.19.2, 9.6.19.3	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M21.4	Information Request/Response	9.6.19.4, 9.6.19.5	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M21.5	BRP	9.6.21.3	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-M21.6	Handover	9.6.19.6, 9.6.19.7	DMG-M15.2:M	Yes ☐ No ☐ N/A ☐
DMG-M21.7	DMG relay	9.6.19.8–9.6.19.22	DMG-M22:M	Yes ☐ No ☐ N/A ☐
DMG-M22	DMG relay	10.45, 11.34	CFDMG:O	Yes ☐ No ☐ N/A ☐

B.4.24.2 DMG PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
DMG-P1	PHY operating modes			
DMG-P1.1	Operation according to Clause 20	20	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-P2	PHY frame format			
*DMG-P2.1	DMG control mode format	20.4	CFDMG:M	Yes ☐ No ☐ N/A ☐
*DMG-P2.2	DMG SC mode format	20.5	CFDMG:M	Yes ☐ No ☐ N/A ☐
*DMG-P2.3	DMG low-power SC mode format. The DMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	20.6	CFDMG:O	Yes ☐ No ☐ N/A ☐
DMG-P2.4	Modulation and coding schemes (MCS)			
DMG-P2.5.1	MCS 0 of DMG control mode		DMG-P2.1:M	Yes ☐ No ☐ N/A ☐
DMG-P2.5.2	MCS 1-12 of DMG SC mode			
DMG-P2.5.2.1	MCS 1-4		DMG-P2.2:M	Yes ☐ No ☐ N/A ☐
DMG-P2.5.2.2	MCS 5-12		DMG-P2.2:O	Yes ☐ No ☐ N/A ☐
DMG-P2.5.2.3	π/2-8-PSK for MCS 10 and 11		DMG-P2.2:O	Yes ☐ No ☐ N/A ☐
DMG-P2.5.3	MCS 25-31 of DMG low-power SC mode		DMG-P2.3:M	Yes ☐ No ☐ N/A ☐
DMG-P2.6	Common preamble format	20.3.6	CFDMG:M	Yes ☐ No ☐ N/A ☐
DMG-P2.7	Use of LDPC codes	20.3.8	CFDMG:M	Yes ☐ No ☐ N/A ☐

B.4.25 Very high throughput (VHT) features

B.4.25.1 VHT MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
VHTM1	VHT capabilities signaling			
VHTM1.1	VHT Capabilities element	9.4.2.157.1	CFVHT:M	Yes ☐ No ☐ N/A ☐

Copyright © 2021 IEEE. All rights reserved.

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.157.1	(CFVHT AND CFIndepSTA): M (CFVHT AND CFMBSS):M	Yes ☐ No ☐ N/A ☐
VHTM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.2, 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.157	(CFVHT AND CFAP):M (CFVHT AND CFMBSS):M	Yes ☐ No ☐ N/A ☐
VHTM2	Signaling of VHT operation	9.4.2.158	(CFVHT AND CFAP):M (CFVHT AND CFMBSS):M (CFVHT AND CFIBSS):M	Yes ☐ No ☐ N/A ☐
VHTM3	Link adaptation			
*VHTM3.1	Use of the VHT variant HT Control field for link adaptation in immediate response exchange.	9.2.4.6, 9.3.3.14, 10.32.3, 10.8	CFVHT:O, CFS1G:O	Yes ☐ No ☐ N/A ☐
VHTM4	Transmit beamforming			
*VHTM4.1	SU Beamformer Capable	9.4.2.157	CFVHT:O	Yes ☐ No ☐ N/A ☐
*VHTM4.2	SU Beamformee Capable	9.4.2.157	CFVHT:O	Yes ☐ No ☐ N/A ☐
*VHTM4.3	MU Beamformer Capable	9.4.2.157	CFAP AND VHTM4.1:O	Yes ☐ No ☐ N/A ☐
*VHTM4.4	MU Beamformee Capable	9.4.2.157	CFIndepSTA AND VHTM4.2:O	Yes ☐ No ☐ N/A ☐
VHTM4.5	Transmission of null data PPDU	10.36	VHTM4.1:M	Yes ☐ No ☐ N/A ☐
VHTM4.6	Reception of null data PPDU	10.36	VHTM4.2:M	
VHTM5	VHT Sounding Protocol			
VHTM5.1	VHT sounding protocol as SU beamformer	10.36.5	VHTM4.1:M	Yes ☐ No ☐ N/A ☐
VHTM5.2	VHT sounding protocol as SU beamformee	10.36.5	VHTM4.2:M	Yes ☐ No ☐ N/A ☐
VHTM5.3	VHT sounding protocol as MU beamformer	10.36.5	VHTM4.3:M	Yes ☐ No ☐ N/A ☐
VHTM5.4	VHT sounding protocol as MU beamformee	10.36.5	VHTM4.4:M	Yes ☐ No ☐ N/A ☐
VHTM6	TXOP Sharing			
VHTM6.1	Sharing of EDCA TXOP	10.23.2.7	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM6.2	Use of Primary and Secondary AC	10.23.2.7	VHTM6.1:M	Yes ☐ No ☐ N/A ☐
VHTM7	VHT TXOP power saving	11.2.3.17	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM8	BSS Operation			
VHTM8.1	Use of primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels	10.3.2.7, 10.3.2.9	CFVHT:M	Yes ☐ No ☐ N/A ☐

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM8.2	Use of secondary 80 MHz channels for 160 MHz and 80+80 MHz	11.38.1	(VHTP3.4 OR VHTP3.5):M	Yes ☐ No ☐ N/A ☐
VHTM8.3	CCA on primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels	11.38.5	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM8.4	CCA on secondary 80 MHz channels for 160 MHz and 80+80 MHz	11.38.5	(VHTP3.4 OR VHTP3.5):M	Yes ☐ No ☐ N/A ☐
VHTM9	Group ID			
VHTM9.1	Transmission of Group ID Management frame	9.6.22.3	VHTM4.3:M	Yes ☐ No ☐ N/A ☐
VHTM9.2	Reception of Group ID Management frame	9.6.22.3	VHTM4.4:M	
VHTM10	Bandwidth signaling			
VHTM10.1	Support for non-HT bandwidth signaling and static operation	10.3.2.7	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM10.2	Support for non-HT bandwidth signaling and dynamic operation	10.3.2.7	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM11	S-MPDU format	10.12.7	CFVHT:M CGS1G:M	Yes ☐ No ☐ N/A ☐
VHTM12	Partial AID in VHT PPDU	10.19	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM13	Extended BSS Load element	9.4.2.159	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM13.1	Transmission of the Extended BSS Load element	9.4.2.159	CFAP AND CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTM14	Quiet Channel element			
VHTM14.1	Transmission of Quiet Channel element by an AP or mesh station in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.164, 11.8.3	(CFAP OR CFMBSS) AND CFSM AND CFVHT AND VHTP3.4:O	Yes ☐ No ☐ N/A ☐
VHTM14.2	Transmission of Quiet Channel element by an independent station or mesh station in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.164, 11.8.3	(CFIndepSTA OR CFMBSS) AND CFSM AND CFVHT AND VHTP3.4:O	Yes ☐ No ☐ N/A ☐
VHTM14.3	Reception of Quiet Channel element by an independent station or mesh station in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.164, 11.8.3	(CFIndepSTA OR CFMBSS) AND CFSM AND CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM15	Space-time block coding (STBC)			
VHTM15.1	STBC operation	9.4.2.157, 10.16	VHTP9:M	Yes ☐ No ☐ N/A ☐
VHTM15.2	Transmission of at least 2×1 STBC	9.4.2.157.2	VHTP9:O.1	Yes ☐ No ☐ N/A ☐
VHTM15.3	Reception of 1 STBC spatial stream	9.4.2.157.2	VHTP9:O.1	Yes ☐ No ☐ N/A ☐
VHTM15.4	Reception of 2 STBC spatial streams	9.4.2.157.2	VHTM15.3:O	Yes ☐ No ☐ N/A ☐
VHTM15.5	Reception of 3 STBC spatial streams	9.4.2.157.2	VHTM15.4:O	Yes ☐ No ☐ N/A ☐

B.4.25.1 VHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
VHTM15.6	Reception of 4 STBC spatial streams	9.4.2.157.2	VHTM15.5:O	Yes ☐ No ☐ N/A ☐
VHTM16	Highest Supported Long GI Data Rate			
VHTM16.1	Tx Highest Supported Long GI Data Rate	9.4.2.157.3	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTM16.2	Rx Highest Supported Long GI Data Rate	9.4.2.157.3	CFVHT:M	Yes ☐ No ☐ N/A ☐
NOTE—Required support for MCS might be limited by the declaration of Tx and Rx Highest Supported Long GI Data Rates.				

B.4.25.2 VHT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
VHTP1	PHY operating modes			
VHTP1.1	Operation according to Clause 17 (OFDM) and/or Clause 19 (high throughput)	21.1.4	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP2	VHT format	21.3.2	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3	BSS bandwidth			
VHTP3.1	20 MHz operation	11.38.1	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.2	40 MHz operation	11.38.1	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.3	80 MHz operation	11.38.1	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP3.4	160 MHz operation	11.38.1	CFVHT:O VHTP3.5:M	Yes ☐ No ☐ N/A ☐
VHTP3.5	80+80 MHz operation	11.38.1	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP4	Bandwidth indication	17.3.5.5	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5	PHY timing parameters			
VHTP5.1	Values in 20 MHz channel	21.3.6	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.2	Values in 40 MHz channel	21.3.6	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.3	Values in 80 MHz channel	21.3.6	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP5.4	Values in 160 MHz channel	21.3.6	VHTP3.4:M	Yes ☐ No ☐ N/A ☐
VHTP5.5	Values in 80+80 MHz channel	21.3.6	VHTP3.5:M	Yes ☐ No ☐ N/A ☐
VHTP6	VHT preamble	21.3.8	CFVHT:M	Yes ☐ No ☐ N/A ☐
VHTP7	Use of LDPC Code	21.3.10.5.4	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8	Modulation and coding schemes (MCS)			
VHTP8.1	CBW20, CBW40, and CBW80	21.5

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.2.24	VHT-MCS with Index 0-9 and $N_{SS} = 8$	21.5	VHTP8.2.23:O	Yes ☐ No ☐ N/A ☐
VHTP8.3	CBW80+80	21.5		
VHTP8.3.1	VHT-MCS with Index 0-7 and $N_{SS} = 1$	21.5	VHTP3.5:M	Yes ☐ No ☐ N/A ☐
VHTP8.3.2	VHT-MCS with Index 0-8 and $N_{SS} = 1$	21.5	VHTP8.3.1:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.3	VHT-MCS with Index 0-9 and $N_{SS} = 1$	21.5	VHTP8.3.2:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.4	VHT-MCS with Index 0-7 and $N_{SS} = 2$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.5	VHT-MCS with Index 0-8 and $N_{SS} = 2$	21.5	VHTP8.3.4:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.6	VHT-MCS with Index 0-9 and $N_{SS} = 2$	21.5	VHTP8.3.5:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.7	VHT-MCS with Index 0-7 and $N_{SS} = 3$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.8	VHT-MCS with Index 0-8 and $N_{SS} = 3$	21.5	VHTP8.3.7:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.9	VHT-MCS with Index 0-9 and $N_{SS} = 3$	21.5	VHTP8.3.8:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.10	VHT-MCS with Index 0-7 and $N_{SS} = 4$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.11	VHT-MCS with Index 0-8 and $N_{SS} = 4$	21.5	VHTP8.3.10:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.12	VHT-MCS with Index 0-9 and $N_{SS} = 4$	21.5	VHTP8.3.11:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.13	VHT-MCS with Index 0-7 and $N_{SS} = 5$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.14	VHT-MCS with Index 0-8 and $N_{SS} = 5$	21.5	VHTP8.3.13:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.15	VHT-MCS with Index 0-9 and $N_{SS} = 5$	21.5	VHTP8.3.14:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.16	VHT-MCS with Index 0-7 and $N_{SS} = 6$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.17	VHT-MCS with Index 0-8 and $N_{SS} = 6$	21.5	VHTP8.3.16:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.18	VHT-MCS with Index 0-9 and $N_{SS} = 6$	21.5	VHTP8.3.17:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.19	VHT-MCS with Index 0-7 and $N_{SS} = 7$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.20	VHT-MCS with Index 0-8 and $N_{SS} = 7$	21.5	VHTP8.3.19:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.21	VHT-MCS with Index 0-9 and $N_{SS} = 7$	21.5	VHTP8.3.20:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.22	VHT-MCS with Index 0-7 and $N_{SS} = 8$	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐

B.4.25.2 VHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
VHTP8.3.23	VHT-MCS with Index 0-8 and $N_{SS} = 8$	21.5	VHTP8.3.22:O	Yes ☐ No ☐ N/A ☐
VHTP8.3.24	VHT-MCS with Index 0-9 and $N_{SS} = 8$	21.5	VHTP8.3.23:O	Yes ☐ No ☐ N/A ☐
VHTP8.4	Transmit and receive support for 400 ns GI	21.5	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP9	Space-time block coding (STBC)	21.3.10.9.4	CFVHT:O	Yes ☐ No ☐ N/A ☐
VHTP10	Non-HT duplicate format	21.3.10.12	CFVHT:M	Yes ☐ No ☐ N/A ☐

B.4.26 TVWS functions

Item	Protocol capability	References	Status	Support
TVWS 1	Fixed STA TVWS operation	11.42, Annex D, E.2.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVWS 2	Master STA TVWS operation	11.42, 11.42.2, Annex D, E.2.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
*TVWS3	Client STA TVWS operation	11.42.3, Annex D, E.2.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVWS 3.1	GDD dependent STA TVWS behavior	11.42.3, Annex D, E.2.5	WS3:M	Yes ☐ No ☐ N/A ☐
TVWS 4	Channel Availability Query	9.4.5.2, 9.6.7.25, 11.42.4	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVWS 5	Channel Schedule Management	9.4.5.3, 9.6.7.26, 11.42.5	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVWS 6	Contact Verification Signal	9.6.7.27, 11.42.6	CFTVHT:M	Yes ☐ No ☐ N/A ☐
*TVWS7	Network Channel Control	6.3.97, 9.4.5.4, 9.6.7.30, 11.42.7	CFTVHT:M	
TVWS 7.1	NCC Requesting STA	11.42.7.2	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVWS 7.2	NCC Responding STA	11.42.7.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVWS 8	White Space Map Announcement	9.4.2.169, 9.6.7.31, 11.42.8	CFTVHT:M	Yes ☐ No ☐ N/A ☐

B.4.26.1 TVHT MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
TVHTM1	TVHT Capabilities element			
TVHTM1.1	VHT Capabilities element	9.4.2.157.1	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM1.2	Signaling of STA capabilities in Probe Request, (Re)Association Request frames	9.3.3.5, 9.3.3.7, 9.3.3.9, 9.4.2.157.1	(CFTVHT AND CFIndepSTA): O (CFTVHT AND CFMBSS):O	Yes ☐ No ☐ N/A ☐
TVHTM1.3	Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames	9.3.3.2, 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.157	(CFTVHT AND CFAP):O (CFTVHT AND CFMBSS):O	Yes ☐ No ☐ N/A ☐
TVHTM2	Signaling of VHT operation	9.4.2.158	(CFTVHT AND CFAP):O (CFTVHT AND CFMBSS):O (CFTVHT AND CFIBSS):O	Yes ☐ No ☐ N/A ☐
TVHTM3	Link adaptation			
TVHTM3.1	Use of the VHT variant HT Control field for link adaptation in immediate response exchange	9.2.4.6, 9.3.3.14, 10.29.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM4	Transmit beamforming			
*TVHTM4.1	SU Beamformer Capable	9.4.2.157	CFTVHT:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.2	SU Beamformee Capable	9.4.2.157	CFTVHT:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.3	MU Beamformer Capable	9.4.2.157	CFAP AND TVHTM4.1:O	Yes ☐ No ☐ N/A ☐
*TVHTM4.4	MU Beamformee Capable	9.4.2.157	CFIndepSTA AND TVHTM4.2:O	Yes ☐ No ☐ N/A ☐
TVHTM4.5	Transmission of null data PPDU	10.32	TVHTM4.1:M	Yes ☐ No ☐ N/A ☐
TVHTM4.6	Reception of null data PPDU	10.32	TVHTM4.2:M	Yes ☐ No ☐ N/A ☐
TVHTM5	VHT sounding protocol			
TVHTM5.1	VHT sounding protocol as SU beamformer	10.36.5	TVHTM4.1:M	Yes ☐ No ☐ N/A ☐
TVHTM5.2	VHT sounding protocol as SU beamformee	10.36.5	TVHTM4.2:M	Yes ☐ No ☐ N/A ☐

B.4.26.1 TVHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTM5.3	VHT sounding protocol as MU beamformer	10.36.5	TVHTM4.3:M	Yes ☐ No ☐ N/A ☐
TVHTM5.4	VHT sounding protocol as MU beamformee	10.36.5	TVHTM4.4:M	Yes ☐ No ☐ N/A ☐
TVHTM6	TXOP Sharing			
TVHTM6.1	Sharing of EDCA TXOP	9.19.2.3a	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM6.2	Use of Primary and Secondary AC	9.19.2.3a	TVHTM6.1:M	Yes ☐ No ☐ N/A ☐
TVHTM7	VHT TXOP power saving	10.2.1.4a	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM8	BSS Operation			
TVHTM8.1	Use of primary TVHT_W, secondary TVHT_W, and secondary TVHT_2W channels	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM8.2	CCA on primary TVHT_W, secondary TVHT_W, and secondary TVHT_2W channels	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM9	Group ID			
TVHTM9.1	Transmission of Group ID Management frame	9.6.22.3	TVHTM4.3:M	Yes ☐ No ☐ N/A ☐
TVHTM9.2	Reception of Group ID Management frame	9.6.22.3	TVHTM4.4:M	Yes ☐ No ☐ N/A ☐
TVHTM10	Bandwidth signaling			
TVHTM10.1	Support for non-HT bandwidth signaling and static operation	9.3.2.5a	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM10.2	Support for non-HT bandwidth signaling and dynamic operation	9.3.2.5a	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM11	S-MPDU	10.12.8	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM12	Partial AID in VHT PPDU	10.19	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTM13	Extended BSS Load element	9.4.2.159	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM13.1	Transmission of the Extended BSS Load element	9.4.2.159	CFAP AND CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM14	Quiet Channel element			
TVHTM14.1	Transmission of Quiet Channel element by an AP or mesh STA in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.164, 11.8.3	(CFAP OR CFMBSS) AND CFSM AND CFTVHT AND TVHTP3.4:O	Yes ☐ No ☐ N/A ☐

B.4.26.1 TVHT MAC features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTM14.2	Transmission of Quiet Channel element by an independent STA or mesh STA in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.164, 11.8.3	(CFIndepSTA OR CFMBSS) AND CFSM AND CFTVHT AND TVHTP3.4:O	Yes ☐ No ☐ N/A ☐
TVHTM14.3	Reception of Quiet Channel element by an independent STA or mesh STA in Beacon and Probe Response frames	9.3.3.2, 9.3.3.10, 9.4.2.164, 11.8.3	(CFIndepSTA OR CFMBSS) AND CFSM AND CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM15	Space-time block coding (STBC)			
TVHTM15.1	STBC operation	9.4.2.157, 10.14	TVHTP9:M	Yes ☐ No ☐ N/A ☐
TVHTM15.2	Transmission of at least 2×1 STBC	9.4.2.157	TVHTP9:O.1	Yes ☐ No ☐ N/A ☐
TVHTM15.3	Reception of 1 STBC spatial stream	9.4.2.157	TVHTP9:O.1	Yes ☐ No ☐ N/A ☐
TVHTM15.4	Reception of 2 STBC spatial stream	9.4.2.157	TVHTM15.3:O	Yes ☐ No ☐ N/A ☐
TVHTM15.5	Reception of 3 STBC spatial stream	9.4.2.157	TVHTM15.4:O	Yes ☐ No ☐ N/A ☐
TVHTM15.6	Reception of 4 STBC spatial stream	9.4.2.157	TVHTM15.5:O	Yes ☐ No ☐ N/A ☐
TVHTM16	Highest Supported Long GI Data Rate			
TVHTM16.1	Tx Highest Supported Long GI Data Rate	9.4.2.157.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTM16.2	Rx Highest Supported Long GI Data Rate	9.4.2.157.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
NOTE—Required support for MCS might be limited by the declaration of Tx and Rx Highest Supported Long GI Data Rates.				

B.4.26.2 TVHT PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
TVHTP1	PHY operating modes			Yes ☐ No ☐ N/A ☐
TVHTP2	VHT format	21.3.2	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP3	BSS bandwidth			
TVHTP3.1	TVHT_W operation	11.41	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP3.2	TVHT_2W operation	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP3.3	TVHT_W+W operation	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐

B.4.26.2 TVHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTP3.4	TVHT_4W operation	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP3.5	TVHT_2W+2W operation	11.41	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP4	Bandwidth indication	17.3.5.5	CFVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5	PHY timing parameters			
TVHTP5.1	Values in 6 MHz channel	22.3.6	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.2	Values in 7 MHz channel	22.3.6	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.3	Values in 8 MHz channel	22.3.6	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP5.4	Values in non-HT 6 MHz, 7 MHz, and 8 MHz channels	22.2.4	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP6	TVHT preamble	22.3.8	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP7	Use of LDPC Code	11.5.4, 21.3	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8	Modulation and coding schemes (MCS)			
TVHTP8.1	TVHT_MODE_1	22.5		
TVHTP8.1.1	TVHT-MCS with Index 0-7 and $N_{SS} = 1$	22.5	CFTVHT:M	Yes ☐ No ☐ N/A ☐
TVHTP8.1.2	TVHT-MCS with Index 0-8 and $N_{SS} = 1$	22.5	TVHTP8.1.1:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.3	TVHT-MCS with Index 0-9 and $N_{SS} = 1$	22.5	TVHTP8.1.2:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.4	TVHT-MCS with Index 0-7 and $N_{SS} = 2$	22.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.5	TVHT-MCS with Index 0-8 and $N_{SS} = 2$	22.5	TVHTP8.1.4:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.6	TVHT-MCS with Index 0-9 and $N_{SS} = 2$	22.5	TVHTP8.1.5:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.7	TVHT-MCS with Index 0-7 and $N_{SS} = 3$	22.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.8	TVHT-MCS with Index 0-8 and $N_{SS} = 3$	22.5	TVHTP8.1.7:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.9	TVHT-MCS with Index 0-9 and $N_{SS} = 3$	22.5	TVHTP8.1.7:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.10	TVHT-MCS with Index 0-7 and $N_{SS} = 4$	22.5	CFTVHT:O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.11	TVHT-MCS with Index 0-8 and $N_{SS} = 4$	22.5	TVHTP8.1.10: O	Yes ☐ No ☐ N/A ☐
TVHTP8.1.12	TVHT-MCS with Index 0-9 and $N_{SS} = 4$	22.5	TVHTP8.1.11: O	Yes ☐ No ☐ N/A ☐

B.4.26.2 TVHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTP8.2	TVHT_MODE_2C and TVHT_MODE_2N	22.5		
TVHTP8.2.1	TVHT-MCS with Index 0-7 and $N_{SS} = 1$	22.5	(TVHTP3.2 AND TVHTP3.3):M	Yes ☐ No ☐ N/A ☐
TVHTP8.2.2	TVHT-MCS with Index 0-8 and $N_{SS} = 1$	22.5	TVHTP8.2.1:O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.3	TVHT-MCS with Index 0-9 and $N_{SS} = 1$	22.5	TVHTP8.2.2:O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.4	TVHT-MCS with Index 0-7 and $N_{SS} = 2$	22.5	(TVHTP3.2 AND TVHTP3.3):O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.5	TVHT-MCS with Index 0-8 and $N_{SS} = 2$	22.5	TVHTP8.2.4:O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.6	TVHT-MCS with Index 0-9 and $N_{SS} = 2$	22.5	TVHTP8.2.5:O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.7	TVHT-MCS with Index 0-7 and $N_{SS} = 3$	22.5	(TVHTP3.2 AND TVHTP3.3):O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.8	TVHT-MCS with Index 0-8 and $N_{SS} = 3$	22.5	TVHTP8.2.7:O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.9	TVHT-MCS with Index 0-9 and $N_{SS} = 3$	22.5	TVHTP8.2.8:O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.10	TVHT-MCS with Index 0-7 and $N_{SS} = 4$	22.5	(TVHTP3.2 AND TVHTP3.3):O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.11	TVHT-MCS with Index 0-8 and $N_{SS} = 4$	22.5	TVHTP8.2.10: O	Yes ☐ No ☐ N/A ☐
TVHTP8.2.12	TVHT-MCS with Index 0-9 and $N_{SS} = 4$	22.5	TVHTP8.2.11: O	Yes ☐ No ☐ N/A ☐
TVHTP8.3	TVHT_MODE_4C and TVHT_MODE_4N	22.5		
TVHTP8.3.1	TVHT-MCS with Index 0-7 and $N_{SS} = 1$	22.5	(TVHTP3.4 AND TVHTP3.5):M	Yes ☐ No ☐ N/A ☐
TVHTP8.3.2	TVHT-MCS with Index 0-8 and $N_{SS} = 1$	22.5	TVHTP8.3.1:O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.3	TVHT-MCS with Index 0-9 and $N_{SS} = 1$	22.5	TVHTP8.3.2:O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.4	TVHT-MCS with Index 0-7 and $N_{SS} = 2$	22.5	(TVHTP3.4 AND TVHTP3.5):O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.5	TVHT-MCS with Index 0-8 and $N_{SS} = 2$	22.5	TVHTP8.3.4:O	Yes ☐ No ☐ N/A ☐

B.4.26.2 TVHT PHY features *(continued)*

Item	Protocol capability	References	Status	Support
TVHTP8.3.6	TVHT-MCS with Index 0-9 and $N_{SS} = 2$	22.5	TVHTP8.3.5:O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.7	TVHT-MCS with Index 0-7 and $N_{SS} = 3$	22.5	(TVHTP3.4 AND TVHTP3.5):O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.8	TVHT-MCS with Index 0-8 and $N_{SS} = 3$	22.5	TVHTP8.3.7:O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.9	TVHT-MCS with Index 0-9 and $N_{SS} = 3$	22.5	TVHTP8.3.8:O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.10	TVHT-MCS with Index 0-7 and $N_{SS} = 4$	22.5	(TVHTP3.4 AND TVHTP3.5):O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.11	TVHT-MCS with Index 0-8 and $N_{SS} = 4$	22.5	TVHTP8.3.10: O	Yes ☐ No ☐ N/A ☐
TVHTP8.3.12	TVHT-MCS with Index 0-9 and $N_{SS} = 4$	22.5	TVHTP8.3.11: O	Yes ☐ No ☐ N/A ☐
TVHTP9	Space-time block coding (STBC)	22.3.10.9.4	CFTVHT:O	Yes ☐ No ☐ N/A ☐

B.4.27 FILS features

Item	Protocol capability	References	Status	Support
FILS1.1	FILS Discovery frame	11.45.2	(CFAP OR CFSTAofAP) AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS1.2	FILS Discovery frame	9.6.7.36	(CFAP OR CFSTAofAP) AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS2.1	DILS	11.45.5, 9.4.2.186	CFFILS: O	Yes ☐ No ☐ N/A ☐
* FILS3	ANQP procedure for FILS	9.4.5.24	(CFAP OR CFSTAofAP) AND CFIW AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS3.1	Query AP List	9.4.5.25	FILS3: M	Yes ☐ No ☐ N/A ☐
FILS3.3	Common ANQP Group	9.4.5.26, 9.4.2.176	FILS3: M	Yes ☐ No ☐ N/A ☐
* FILS4	FILS authentication	12.11, 9.4, 9.4.2.178, 9.4.2.179, 9.4.2.182, 9.4.2.189	(CFAP OR CFSTAofAP) AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS4.1	FILS Shared Key authentication without PFS	9.4.2.187, 12.11.2.3	FILS4: O.1	Yes ☐ No ☐ N/A ☐
FILS4.2	FILS Shared Key authentication with PFS	9.4.2.187, 12.11.2.3	FILS4: O	Yes ☐ No ☐ N/A ☐

B.4.27 FILS features *(continued)*

Item	Protocol capability	References	Status	Support
FILS4.3	FILS Public Key authentication	9.4.2.180, 9.4.2.188, 12.11.2.4	FILS4: O.1	Yes ☐ No ☐ N/A ☐
* FILS5	Higher Layer Setup during (re)association procedure	11.45.3	(CFAP OR CFSTAofAP) AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS5.1	HLP Packet Encapsulation	11.45.3.2, 9.4.2.183	FILS5: M	Yes ☐ No ☐ N/A ☐
FILS5.2	FILS IP Address Configuration	11.45.3.3, 9.4.2.184	FILS5: O	Yes ☐ No ☐ N/A ☐
* FILS6	Scanning Enhancement	11.1.4	(CFAP OR CFSTAofAP) AND CFFILS: M	Yes ☐ No ☐ N/A ☐
FILS6.1	Probe Request Reduction	11.1.4.3.2	FILS6: M	Yes ☐ No ☐ N/A ☐
FILS6.2	Probe Response Reduction	11.1.4.3.4, 9.4.2.177	FILS6: M	Yes ☐ No ☐ N/A ☐
FILS6.3	OmitReplicateProbeResponses	11.1.4.3.9	FILS6: M	Yes ☐ No ☐ N/A ☐
FILS6.4	AP Configuration Sequence Number	9.4.2.181	FILS6: O	Yes ☐ No ☐ N/A ☐
FILS6.5	Reduced Neighbor Report	11.49, 9.4.2.170	FILS6: M	Yes ☐ No ☐ N/A ☐

B.4.28 Sub 1 GHz (S1G) features

B.4.28.1 S1G MAC features

Item	Protocol capability	References	Status	Support
	Are the following MAC protocol features supported?			
S1GM1	S1G capabilities signaling		CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM1.1	S1G Capabilities element	9.4.2.200	CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM1.2	Signaling of S1G capabilities in Probe Request, (Re)Association Request frames	9.4.2.200, 9.3.3.5, 9.3.3.7, 9.3.3.9	(CFIndepSTA AND CFS1G):M	Yes ☐ No ☐ N/A ☐
S1GM1.3	Signaling of S1G capabilities in S1G Beacon, Probe Response, (Re)Association Response frames	9.4.2.200, 9.3.4.3, 9.3.3.6, 9.3.3.8, 9.3.3.10	(CFAP AND CFS1G):M	Yes ☐ No ☐ N/A ☐
S1GM2	S1G operation		CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM2.1	S1G Operation element	9.4.2.212	CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM2.2	Signaling of S1G operation in S1G Beacon, Probe Response	9.4.2.212, 9.3.4.3, 9.3.3.10	((CFAP OR CFIndep-STA.2) AND CFS1G):M	Yes ☐ No ☐ N/A ☐

B.4.28.1 S1G MAC features *(continued)*

Item	Protocol capability	References	Status	Support
S1GM3	MSDU aggregation	10.11, 9.2.4.5, 9.8.3.2, 9.3.2.2.4	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM3.1	Transmission of Dynamic A-MSDU		CFS1G:O (CFS1G AND HTM4.4):M	Yes ☐ No ☐ N/A ☐
S1GM3.2	Reception of Dynamic A-MSDU		CFS1G:O (CFS1G AND HTM4.1):M	Yes ☐ No ☐ N/A ☐
S1GM3.3	Transmission of Dynamic A-MSDU in PV1 frame		(CFS1G AND HTM4.4 AND FT45):M	Yes ☐ No ☐ N/A ☐
S1GM3.4	Reception of Dynamic A-MSDU in PV1 frame		(CFS1G AND HTM4.1 AND FT46):M	Yes ☐ No ☐ N/A ☐
S1GM3.5	Reception of Dynamic A-MSDU		(CFS1G AND (HTM4.1 OR HTM4.4 OR S1GM3.3 OR S1GM3.4)):M	Yes ☐ No ☐ N/A ☐
S1GM4	Timing synchronization function (TSF)		CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM4.1	Generation of S1G Beacon	11.1.3.10.2	(CFAP AND CFS1G): M	Yes ☐ No ☐ N/A ☐
S1GM4.1.1	S1G Beacon generation at TBTT		(CFAP AND CFS1G): M	
S1GM4.1.2	S1G Beacon generation at TSBTT		(CFAP AND CFS1G): O	Yes ☐ No ☐ N/A ☐
S1GM4.1.3	S1G Beacon reception at TBTT		(CFIndepSTA AND CFS1G): M	Yes ☐ No ☐ N/A ☐
S1GM4.1.4	S1G Beacon reception at TSBTT		(CFIndepSTA AND CFS1G): M	Yes ☐ No ☐ N/A ☐
S1GM4.2	TSF timer accuracy with S1G Beacon	11.1.3.10.3	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GM4.3	TSF timer accuracy with TACK, STACK, BAT, PV1 Probe Response frames		CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GM4.4	Signaling PV1 Probe Response Option element in Probe Request frame		CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GM4.5	Active scanning using NDP Probe Request frame	11.1.4.3.6	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GM4.6	Sending PV1 Probe Response frame	11.1.4.3.7, 11.1.4.3.6	(CFAP AND CFS1G): O	Yes ☐ No ☐ N/A ☐
S1GM5	Reverse direction protocol	10.29	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM5.1	Initiation of RD protocol		CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM5.2	Response to RD request		CFS1G:O	Yes ☐ No ☐ N/A ☐
*S1GM6	Target wake time (TWT) operation	10.47	CFS1G:O	Yes ☐ No ☐ N/A ☐

B.4.28.1 S1G MAC features *(continued)*

Item	Protocol capability	References	Status	Support
*S1GM6.1	Assume the role of TWT requesting STA	10.47.1	S1GM6:O.1	Yes ☐ No ☐ N/A ☐
*S1GM6.2	Assume the role of TWT responding STA	10.47.1	S1GM6:O.1	Yes ☐ No ☐ N/A ☐
S1GM6.3	Request TWT Setup	10.47.1	S1GM6.1:O	Yes ☐ No ☐ N/A ☐
S1GM6.4	Response to TWT Setup request	10.47.1	S1GM6.2:M	Yes ☐ No ☐ N/A ☐
S1GM6.5	TWT Teardown	10.47.8	S1GM6:O	Yes ☐ No ☐ N/A ☐
S1GM6.6	TWT acknowledgment procedure	10.47.2	S1GM6:M	Yes ☐ No ☐ N/A ☐
S1GM6.7	Explicit TWT operation	10.47.3	S1GM6:O.2	Yes ☐ No ☐ N/A ☐
S1GM6.8	Implicit TWT operation	10.47.4	S1GM6:O.2	Yes ☐ No ☐ N/A ☐
S1GM6.9	Request NDP Paging Setup	10.47.6	S1GM6.1:O	Yes ☐ No ☐ N/A ☐
S1GM6.10	Accept the NDP Paging Setup request	10.47.6	S1GM6.2:O	Yes ☐ No ☐ N/A ☐
S1GM6.11	Schedule NDP Paging frame as the first frame in a TWT		S1GM10:M	Yes ☐ No ☐ N/A ☐
S1GM6.12	TWT grouping	10.47.5	S1GM6:O	Yes ☐ No ☐ N/A ☐
S1GM6.13	Protected TWT Operations	10.47.1	(PC 34.1.10 AND S1GM6):O	Yes ☐ No ☐ N/A ☐
S1GM7	Non-TIM operation	10.48	(CFIndepSTA AND CFS1G):O (CFAP AND CFS1G AND (S1GM20.1 OR S1GM20.3)): M	Yes ☐ No ☐ N/A ☐
S1GM7.1	Request non-TIM Mode	11.2.3.2	(CFIndepSTA AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.2	Response to non-TIM Mode request	11.2.3.2	(CFAP AND S1GM7):M	Yes ☐ No ☐ N/A ☐
S1GM7.3	Request rescheduling of awake/doze cycle	10.48.2	(CFIndepSTA AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.4	Reschedule awake/doze cycle of S1G STAs in non-TIM mode	10.48.2	(CFAP AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.5	Temporary PS Mode Switch to TIM mode	10.48.2	(CFIndepSTA AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.6	Listen interval update procedure for S1G STAs in non-TIM mode		S1GM7:O	Yes ☐ No ☐ N/A ☐
S1GM7.7	Resource protection for S1G STAs in non-TIM mode	10.48.1	(CFAP AND S1GM7):O	Yes ☐ No ☐ N/A ☐
S1GM7.8	Resource protection for S1G STAs in non-TIM mode using periodic RAW (PRAW) operation	10.48.1.2	(CFAP AND S1GM7):O	Yes ☐ No ☐ N/A ☐

B.4.28.1 S1G MAC features *(continued)*

Item	Protocol capability	References	Status	Support
S1GM8	Sync frame operation	10.49	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM8.1	Request for a sync frame transmission	10.49	(CFIndepSTA AND S1GM8):O	Yes ☐ No ☐ N/A ☐
S1GM8.2	Schedule a sync frame transmission	10.49	(CFAP AND S1GM8):M	Yes ☐ No ☐ N/A ☐
S1GM8.3	Request for time slot protection	10.49	(CFIndepSTA AND S1GM8):O	Yes ☐ No ☐ N/A ☐
S1GM8.4	Protect the time slot assigned to the STA that requested for time slot protection.	10.49	(CFAP AND S1GM8):M	Yes ☐ No ☐ N/A ☐
S1GM8.5	Respond to sync frame	10.49	(CFIndepSTA AND S1GM8):M	Yes ☐ No ☐ N/A ☐
S1GM9	Bidirectional TXOP	10.50	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM9.1	Act as BDT Initiator	10.50.2	S1GM9:O	Yes ☐ No ☐ N/A ☐
S1GM9.2	Act as BDT Responder		S1GM9:M	Yes ☐ No ☐ N/A ☐
S1GM10	Subchannel Selective Transmission (SST)	10.50	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM11	Sectorized beam operation	10.53	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM11.1	Support for Group Sectorization Operation	10.53.3	(CFAP AND S1GM11):O.3 (CFIndepSTA AND S1GM11):M	Yes ☐ No ☐ N/A ☐
S1GM11.2	Support for TXOP-based Sectorization Operation	10.53.4	(CFAP AND S1GM11):O.3 (CFIndepSTA AND S1GM11):M	Yes ☐ No ☐ N/A ☐
S1GM11.3	Transmission of S1G Sector Operation element with Sectorization Type field equal to 0	10.53.2	(CFAP AND S1GM11.1):M	Yes ☐ No ☐ N/A ☐
S1GM11.4	Transmission of S1G Sector Operation element with Sectorization Type field equal to 1	10.53.2	(CFAP AND S1GM11.2):M	Yes ☐ No ☐ N/A ☐
S1GM11.5	Sector training operation	10.53.2	S1GM11:O	Yes ☐ No ☐ N/A ☐
S1GM11.6	Send back Sector ID feedback to associated AP	10.53.2	(CFIndepSTA AND S1GM11):O	Yes ☐ No ☐ N/A ☐
S1GM12	1 MHz Control Response Preamble Support	10.6.6.6	CFS1G: O	Yes ☐ No ☐ N/A ☐
*S1GM13	Group AID	10.55	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM14	Traveling Pilot Operation	10.56	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM15	Bitmap Protection for NDP Block-Ack frames	10.57	(CFS1G AND (FT47 OR FR 48)): M	Yes ☐ No ☐ N/A ☐

B.4.28.1 S1G MAC features *(continued)*

Item	Protocol capability	References	Status	Support
S1GM16	Header compression procedure	10.58	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM16.1	Signaling Header Compression element in (Re)Association Request frames	10.58	(CFIndepSTA AND S1GM16):O	Yes ☐ No ☐ N/A ☐
S1GM16.2	Signaling Header Compression element in (Re)Association Response frames	10.58	(CFAP AND S1GM16):M	Yes ☐ No ☐ N/A ☐
S1GM16.3	Request header compression procedure		S1GM16:O	Yes ☐ No ☐ N/A ☐
S1GM16.4	Store the optional fields indicated in the Header Compression frame request		S1GM16:O	Yes ☐ No ☐ N/A ☐
S1GM16.5	Send back the Header Compression frame response		CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM17	Flow control	10.61	CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM17.1	Request flow suspension/resump-tion	10.61	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM17.2	Flow suspension in response to Flow Suspension frame or NDP ACK frame	10.61	(CFIndepSTA AND CFS1G):M	Yes ☐ No ☐ N/A ☐
S1GM17.3	Flow suspension in response to STACK or BAT or TACK frame		(CFIndepSTA AND S1GM6.6):M	Yes ☐ No ☐ N/A ☐
S1GM17.4	Flow resumption upon receiving a Flow Resumption frame		(CFIndepSTA AND CFS1G):O	Yes ☐ No ☐ N/A ☐
*S1GM18	Dynamic AID assignment opera-tion	10.20	CFS1G:O	Yes ☐ No ☐ N/A ☐
S1GM18.1	Request AID switch	10.20	(CFIndepSTA AND S1GM18):O	Yes ☐ No ☐ N/A ☐
S1GM18.2	Respond to request for AID switch	10.20	(CFAP AND S1GM18):M	Yes ☐ No ☐ N/A ☐
S1GM18.3	Issue unsolicited AID switch instruction	10.20	(CFAP AND S1GM18):O	Yes ☐ No ☐ N/A ☐
S1GM18.4	Respond to unsolicited AID switch instruction	10.20	(CFIndepSTA AND S1GM18):O	Yes ☐ No ☐ N/A ☐
S1GM19	System information update procedure	10.46.2	CFS1G:M	Yes ☐ No ☐ N/A ☐
S1GM19.1	Update the Change Sequence field in S1G Beacon frame		(CFAP AND CFS1G):M	Yes ☐ No ☐ N/A ☐
S1GM19.2	Respond to changes in the Change Sequence field in S1G Beacon frame		(CFIndepSTA AND CFS1G):M	Yes ☐ No ☐ N/A ☐
S1GM19.3	Respond to probe request frames that contain the Change Sequence field		(CFAP AND CFS1G):O	Yes ☐ No ☐ N/A ☐

B.4.28.1 S1G MAC features *(continued)*

Item	Protocol capability	References	Status	Support
S1GM25.2.1	Centralized authentication control		(CFAP AND S1GM25.2): O.2 (CFIndepSTA AND S1GM25.2): O	Yes ☐ No ☐ N/A ☐
S1GM25.2.2	Distributed authentication control		(CFAP AND S1GM25.2): O.2 (CFIndepSTA AND CFS1G): M	Yes ☐ No ☐ N/A ☐
S1GM26	Robust security network association (RSNA)		O	Yes ☐ No ☐
S1GM26.1	PV1 CCMP MPDU format	12.5.3.2	CFS1G AND (FT45 or FR46): M	Yes ☐ No ☐ N/A ☐
S1GM26.2	Local construction of CCMP header for PV1 MPDUs	12.5.3.3.6	CFS1G AND FR46: M	Yes ☐ No ☐ N/A ☐
S1GM26.3	CCMP cryptographic encapsulation procedure for PV1 MPDUs	12.5.3.3	CFS1G AND FT45: M	Yes ☐ No ☐ N/A ☐
S1GM26.4	CCMP decapsulation procedure for PV1 MPDUs	12.5.3.4	CFS1G AND FR46: M	Yes ☐ No ☐ N/A ☐
S1GM27	Asymmetric BA	10.6.6.5.2, 10.6.6.5.5	CFS1G: O	Yes ☐ No ☐ N/A ☐
*S1GM28	Control Response MCS Negotiation	10.6.6.5.5	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GM29	OBSS Mitigation Support	10.6.6.6	CFS1G: O	Yes ☐ No ☐ N/A ☐

B.4.28.2 S1G PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
S1GP1	BSS bandwidth			
S1GP1.1	1 MHz operation	10.46.1, 23.1.1	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GP1.2	2 MHz operation	10.46.1, 23.1.1	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GP1.3	4 MHz operation	10.46.1, 23.1.1	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GP1.4	8 MHz operation	10.46.1, 23.1.1	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GP1.5	16 MHz operation	10.46.1, 23.1.1	CFS1G: O	Yes ☐ No ☐ N/A ☐

B.4.28.2 S1G PHY features *(continued)*

Item	Protocol capability	References	Status	Support
S1GP2	Coding scheme			
S1GP2.1	Use of BCC code	23.1.1, 23.3.4	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GP2.2	Use of STBC code	23.1.1, 23.3.4	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GP2.3	Use of LDPC code	23.1.1, 23.3.4	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GP3	Demodulation scheme			
S1GP3.1	SIG-A of greater than or equal to 2 MHz long preamble format PPDU	23.1.1, 23.3.4.2.3	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GP4	PHY timing parameters			
S1GP4.1	Normal (long) guard interval	23.1.1, 23.3.6	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GP4.2	Short guard interval	23.1.1, 23.3.6	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GP5	Use of S1G beamforming	23.1.1, 23.3.10	CFS1G: O	Yes ☐ No ☐ N/A ☐
S1GP6	PPDU format			
S1GP6.1	1 MHz short preamble format PPDU	23.1.1, 23.3.2	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GP6.2	2 MHz short preamble format PPDU	23.1.1, 23.3.2	CFS1G: M	Yes ☐ No ☐ N/A ☐
S1GP6.3	Greater than 2 MHz short preamble format PPDU	23.1.1, 23.3.2	CFS1G: O	Yes ☐ No ☐ N/A ☐

B.4.30.1 CDMG MAC features *(continued)*

Item	Protocol capability	References	Status	Support
CDMG-M2	Dynamic bandwidth control	9.3.4.2, 10.64	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-M3	Dynamic channel selection	11.47, 9.6.7.37, 9.6.7.38, 9.6.7.39, 9.6.7.40, 6.3.114	CFCDMG:O	Yes ☐ No ☐ N/A ☐
CDMG-M4	Opportunistic transmissions	9.4.1.7, 9.4.2.229, 10.39.11	CFCDMG:O	Yes ☐ No ☐ N/A ☐
CDMG-M5	Selection of candidate SPs for spatial sharing	9.4.2.222, 11.30.1, W.1	CFCDMG:O	Yes ☐ No ☐ N/A ☐
CDMG-M6	CDMG AP or PCP clustering	10.40	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-M7	CDMG protected period establishment and maintenance	10.39.6.6.3	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-M8	Spatial sharing in a CDMG AP or PCP cluster	10.41.6	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-M9	CDMG enhanced beam tracking	10.42.9, W.3	CFCDMG:O	Yes ☐ No ☐ N/A ☐
CDMG-M10	CDMG dynamic truncation of service period	10.39.8.2	CFCDMG:M	Yes ☐ No ☐ N/A ☐

B.4.30.2 CDMG PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
CDMG-P1	PHY operating modes			
CDMG-P1.1	Operation according to Clause 24	Clause 24	CFCDMG :M	Yes ☐ No ☐ N/A ☐
CDMG-P2	CDMG PHY frame format			
CDMG-P2.1	CDMG control mode format	24.4	CFCDMG :M	Yes ☐ No ☐ N/A ☐
CDMG-P2.2	CDMG SC mode format	24.5	CFCDMG :M	Yes ☐ No ☐ N/A ☐
CDMG-P2.3	CDMG low-power SC mode format. The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	24.6	CFCDMG :O	Yes ☐ No ☐ N/A ☐
CDMG-P2.4	Modulation and coding schemes (MCSs)			Yes ☐ No ☐ N/A ☐
CDMG-P2.4.1	MCS 0 of CDMG control mode		CDMG-P2.1:M	Yes ☐ No ☐ N/A ☐

B.4.30.2 CDMG PHY features *(continued)*

Item	Protocol capability	References	Status	Support
CDMG-P2.4.2	MCSs 1 to 16 of CDMG SC mode			Yes ☐ No ☐ N/A ☐
CDMG-P2.4.2.1	MCSs 1 to 9		CDMG-P2.2:M	Yes ☐ No ☐ N/A ☐
CDMG-P2.4.2.2	MCSs 10 to 16		CDMG-P2.2:O	Yes ☐ No ☐ N/A ☐
CDMG-P2.4.3	MCSs 17 to 23 of CDMG low-power SC mode. The CDMG low-power SC mode is obsolete. Support for this mechanism might be removed in a later revision of the standard.	24.6	CDMG-P2.3:M	Yes ☐ No ☐ N/A ☐
CDMG-P2.5	Common preamble format	24.3	CFCDMG:M	Yes ☐ No ☐ N/A ☐
CDMG-P2.6	Enhanced mobile device support mode	24.5	CFCDMG:M	Yes ☐ No ☐ N/A ☐

B.4.31 CMMG features

B.4.31.1 CMMG PHY features

Item	Protocol capability	References	Status	Support
	Are the following PHY protocol features supported?			
CMMG-P1	PHY operating modes			
CMMG-P1.1	Operation according to Clause 25	Clause 25	CFCMMG:M	
CMMG-P2	PHY frame format			
CMMG-P2.1	CMMG control mode format	25.4	CFCMMG:M	Yes ☐ No ☐ N/A ☐
CMMG-P2.2	CMMG SC mode format	25.5	CFCMMG:M	Yes ☐ No ☐ N/A ☐
CMMG-P2.3	CMMG OFDM mode format	25.6	CFCMMG:O	Yes ☐ No ☐ N/A ☐
CMMG-P2.4	Modulation and coding schemes (MCSs)			
CMMG-P2.4.1	MCS 0 of CMMG control mode	25.4	CMMG-P2.1:M	Yes ☐ No ☐ N/A ☐
CMMG-P2.4.2	MCSs 1 to 8 of CMMG SC mode			
CMMG-P2.4.2.1	MCSs 1 to 3	25.5	CMMG-P2.2:M	Yes ☐ No ☐ N/A ☐
CMMG-P2.4.2.2	MCSs 4 to 8	25.5	CMMG-P2.2:O	Yes ☐ No ☐ N/A ☐
CMMG-P2.4.3	MCSs 9 to 16 of CMMG OFDM mode	25.6	CMMG-P2.3:M	Yes ☐ No ☐ N/A ☐

Annex C

(normative)

ASN.1 encoding of the MAC and PHY MIB

C.1 General

The MIB for the current revision of IEEE Std 802.11 is available online at the following URL: http://www.ieee802.org/11/802.11mib.txt. The MAC and PHY MIBs are described in Abstract Syntax Notation One (ASN.1), defined in ISO/IEC 8824-1:1995, ISO/IEC 8824-2:1995, ISO/IEC 8824-3:1995 and ISO/IEC 8824-4:1995.

NOTE—An external management entity is a component that is beyond the scope of this standard. The SME is not an external management entity.

C.2 Guidelines for IEEE 802.11 MIB authors/editors

The MIB may be compiled using the "smitools" package from the Institute of Operating Systems and Computer Networks at the Technical University of Braunschweig, Germany. These tools may be accessed online using the following URL: http://www.ibr.cs.tu-bs.de/bin/smitools.cgi.

Using this tool, the MIB should compile without generating warnings of severity 3 or lower.

Specific points that authors and editors should pay attention to:

- The MIB should compile as specified above prior to submission to IEEE SA RevCom.
- Use only the 7-bit US-ASCII character-set. In particular, use only straight single and double quotes.
- Do not use symbols such as <greek-mu> in units, instead spell out the units fully, i.e., "microseconds."
- Follow the guidelines for writing MIB modules in http://www.rfc-editor.org/rfc/rfc4181.txt (including any updates thereto).
- Pay attention to IETF recommendations on object types.
- When adding a lot of new objects, consider adding a new module.
- Consider seeking advice from an IETF MIB Doctor when creating significant new material. The IEEE has an arrangement with the IETF whereby the IEEE may ask for a MIB Advisor from the IETF MIB Doctors.
- When an object is deprecated, add a line to the Description indicating why (IETF convention).

dot11StationConfigEntry OBJECT-TYPE
   SYNTAX Dot11StationConfigEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
      "An entry in the dot11StationConfigTable. It is possible for there to be
      multiple IEEE 802.11 interfaces on one agent, each with its unique MAC
      address. The relationship between an IEEE 802.11 interface and an
      interface in the context of the Internet-standard MIB is one-to-one. As
      such, the value of an ifIndex object instance can be directly used to
      identify corresponding instances of the objects defined herein.

      ifIndex - Each IEEE 802.11 interface is represented by an ifEntry.
      Interface tables in this MIB module are indexed by ifIndex."

    DESCRIPTION
        "This is a status variable.
        It is written by the SME when the device is initialized for operation in a
        band that requires Geolocation Database Control.

        This attribute specifies the type of STA mode for the purpose of channel
        availability query requirements. This value is used to set the desired
        channel availability query request parameters in using GAS frames carrying
        Channel Availability Query element of RLQP. When set to gddap, the STA
        indicates that it operates as a personal/portable AP  after channel avail-
        ability query.
        When set to gddnonapsta, the STA indicates that it operates as a personal/
        portable non-AP STA after channel availability query. When set to
        gddfixedsta, the STA indicates that it operates as a fixed STA after
        channel availability query. When set to any other values, its use is
        reserved, and remains unspecified."

   DESCRIPTION
      "This is a control variable.
      It is written by an external management entity.
      Changes take effect as soon as practical in the implementation.

      This attribute specifies the Mobility Domain identifier (MDID) of this
      entity.

      The MDID is used to indicate a group of APs, within an ESS, between which
      a STA can use fast BSS transition services. Fast BSS transitions are
      allowed only between APs that have the same MDID and are within the same
      ESS. They are not allowed between APs with different MDIDs or in different
      ESSs.
```

-- ************************************************************************
-- * IEEE 802.11 RM and WNM Interface MIB
-- ************************************************************************

-- * The primary interface to the radio measurements and Wireless
-- * Network Management functions is meant to be real-time information
-- * obtained through the request/response mechanisms of RM and WNM.
-- * A secondary interface to the measurements and management functions
-- * is through retention of information in this MIB. Non-SNMP requests
-- * for information are obtained via object IDs (OIDs) through the NDIS
-- * or wireless interfaces in the operating systems. SNMP requests for
-- * information are obtained via SNMP SETs and GETs (see IETF RFC 1157 [B23]).

-- *  dot11RMRequest and dot11RMReport Usage
-- *
-- * The dot11RMRequest and dot11RMReport portions of the RM MIB
-- * provide access to the Radio Measurement service. By performing
-- * SET operations on the various dot11RMRequest MIB objects,
-- * radio measurements may be initiated directly on the local STA or
-- * on any peer station within the same BSS. Subsequently, by
-- * performing GET operations on the various dot11RMReport MIB
-- * objects the results of the requested measurements may be
-- * retrieved.
-- *
-- * In the diagram below, a radio measurement could be initiated
-- * for STA x by performing a MIB.set operation on the RM MIB of
-- * STA x and specifying the MAC address of STA x in
-- * dot11RMRqstTargetAdd. Additionally, it is possible to have STA x
-- * request a measurement from STA y by performing a MIB.set operation
-- * on the SME MIB of STA x and specifying the MAC address of STA y in
-- * dot11RMRqstTargetAdd. In both cases the result of the measurements
-- * can be retrieved by performing a MIB.get operation on the RM MIB
-- * of STA x upon completion of the measurement.
-- *
-- *
-- *          MIB.Set                                          MIB.Set
-- *             or                                               or
-- *          MIB.Get                                          MIB.Get

```
-- * Measurement Request frame by setting the same
-- * dot11RMRqstToken value into multiple dot11RMRequestEntrys.
-- *
-- * Each row, dot11RMRequestEntry, of the dot11RMRequestTable
-- * provides read-create access for the initiation of a measurement
-- * request. The dot11RMRequestNextIndex object can be used to
-- * determine which is the next available row. Each row corresponding to
-- * one measurement in the sequence is created with a dot11RMRqstRowStatus
-- * equal to notInService. Once the dot11RMRequestEntry(s) have been
-- * created for a desired measurement sequence the corresponding
-- * dot11RMRqstRowStatus(s) objects are set to active to indicate that
-- * the SME can trigger the appropriate MLME primitives. Upon processing
-- * the request, the SME returns the corresponding dot11RMRqstRowStatus(s)
-- * object to notInService and are now available for additional
-- * measurement requests.
-- *
-- * After a radio measurement is complete the RM populates the RMReport
-- * objects with the results of the measurement. Each STA maintains a set
-- * of RMReport tables, one corresponding to each measurement type. The
-- * results of the entire measurement sequence are spread across the tables
-- * based on the type of measurements requested. Each xxxReportEntry
-- * within a xxxReportTable contains a xxxRprtRqstToken that corresponds
-- * to the original dot11RMRqstToken in the measurement request. So the
-- * results of the measurement can be collected by searching the appropriate
-- * xxxReportTables and retrieve any reports with the matching request
-- * token.
-- *
-- * Similar structures and mechanisms are used for WNM

dot11RMRequestNextIndex OBJECT-TYPE
   SYNTAX Unsigned32 (0..65535)
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
      "This is a status variable.
      It is written by the SME when able to accept a new request.

      Identifies a hint for the next value of dot11RMRqstIndex to be used in a
      row creation attempt for dot11RMRequestTable. If no new rows can be
      created for some reason, such as memory, processing requirements, etc.,
      the SME sets this attribute to 0. It updates this attribute to a proper
      value other than 0 as soon as it is capable of receiving new measurement
      requests. The nextIndex is not necessarily sequential nor monotonically
      increasing."

```
    SYNTAX SEQUENCE OF Dot11RMRequestEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
       "This group contains the current list of requests for RM reports to be
       issued and have been issued until removed. A network manager adds an RM
       request by creating a row with createAndWait row status and then filling
       in the request parameters/attributes. The request becomes active to be
       issued when the row status is set to Active. The columnar objects or
       attributes other than the rowStatus are not written if the rowStatus is
       Active. The request rows can be deleted, if commanded by a network manager
       via changing the value of dot11RMRqstRowStatus to Destroy. This may leave
       orphaned rows if a manager crashes and forgets which rows are being used
       by it. One recommended way to manage orphaned or finished rows is to
       delete rows if their dot11RMRqstRowStatus remains other than Active for
       longer than a period (recommend at least 5 minutes, IETF RFC 2579). Or
       another recommended way is to delete older rows as needed based on their
       dot11RMRqstTimeStamp values. This can be done by the agent as well as the
       manager. "

```
            individual request. When this attribute is set to Active, AND a
            measurement request can be unambiguously created based on the parameters
            in the row, then the MLME may proceed to issue the request to its intended
            targets when appropriate. If not, this attribute may be set to Not-ready
            immediately to indicate parametric errors. However, it is the network
            managers
            responsibility to correct the error. If the request is successfully issued
            to the target STA, then the rowStatus is set to notInService."
        ::= { dot11RMRequestEntry 2 }

    dot11RMRqstToken OBJECT-TYPE
        SYNTAX OCTET STRING
        MAX-ACCESS read-create
        STATUS current
        DESCRIPTION
            "This is a control variable.
            It is written by an external management entity when the table entry is
            created, i.e., when requesting a measurement..
            Changes take effect when dot11RMRqstRowStatus is set to Active.

            This attribute indicates a unique string to identify a group of rows to be
            issued as parallel or sequential measurements. To guarantee the uniqueness
            of this token across multiple network managers, it is recommended that
            this token be prefixed with the IP address of the network manager creating
            this row. This token is not necessarily equivalent to the measurement
            tokens in RM request frames. If this attribute is an empty string, then
            this row of request is independent from other requests."

   MAX-ACCESS read-create
   STATUS current
   DESCRIPTION
      "This is a control variable.
      It is written by an external management entity when requesting a
      measurement.
      Changes take effect when dot11RMRqstRowStatus is set to Active.

      This attribute indicates the timeout interval during which a measuring STA
      does not generate further triggered Transmit Stream/Category measurement
      reports after a trigger condition has been met and a report generated.
      This attribute is valid only if the dot11RMRqstType is 9, indicating a
      transmit stream/category request, and is ignored otherwise."
   DEFVAL { 20 }
   ::= { dot11RMRequestEntry 44 }

dot11RMRqstChannelLoadReportingCondition OBJECT-TYPE

   DESCRIPTION
      "This is a control variable.
      It is written by an external management entity when requesting a
      measurement.
      Changes take effect when dot11RMRqstRowStatus is set to Active.

      This attribute indicates the channel load reporting condition reference
      value. The measured Channel Load is compared to this reference value and a
      report is issued if the reporting condition is satisfied. The reference
      value is in the same units as Channel Load and represents the fractional
      time of the measurement duration during which the STA determined the
      channel to be busy. This attribute is valid only if the dot11RMRqstType is
      3, indicating a Channel Load request, and is ignored otherwise."

    DESCRIPTION
        "This is a control variable.
        It is written by an external management entity when requesting a
        measurement.
        Changes take effect when dot11RMRqstRowStatus is set to Active.

        This attribute indicates the noise histogram reporting condition ANPI
        reference value. The measured ANPI is compared to this reference value and
        a report is issued if the indicated reporting condition is satisfied.
        ANPIval = Floor((ANPIpower in dBm + 110)*2), for ANPI in the range -110
        dBm to 0 dBm. ANPIval = 220 for ANPI > 0 dBm. ANPIval = 255 when ANPI is
        not available. This attribute is valid only if the dot11RMRqstType is 4,
        indicating a Noise Histogram request, and is ignored otherwise."

    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
       "This is a status variable.
       It is written by the SME when a measurement report is completed.

       If dot11STAStatisticsMeasurementDuration is 0, this attribute indicates
       the value of the Channel Utilization returned from the STA in this STA
       Statistics report. If dot11STAStatisticsMeasurementDuration indicates a
       nonzero value, this attribute indicates the difference in the Channel
       Utilization value over the indicated duration. The Channel Utilization is
       the time fraction during which the AP sensed the channel busy. This
       attribute is valid only if the dot11STAStatisticsGroupID is 10 and is
       ignored otherwise."

    STATUS current
    DESCRIPTION
       "This is a status variable.
       It is written by the SME when a measurement report is completed.

       This attribute indicates the outcome status for the measurement request
       which generated this measurement report; status is indicated using the
       following reason codes: 1 indicates this STA is incapable of generating
       the report, 2 indicates this STA is refusing to generate the report, 0
       indicates the STA successfully carried out the measurement request."

    DESCRIPTION
        "This is a status variable.
        It is written by the SME when a measurement report is completed.

        If dot11STAStatisticsMeasurementDuration is zero, this attribute indicates
        the value of dot11ExplicitBARFailureCount returned from the STA in this
        STA Statistics report. If dot11STAStatisticsMeasurementDuration indicates
        a nonzero value, this attribute indicates the difference in the referenced
        dot11 variable over the indicated duration. This attribute is valid only
        if the dot11STAStatisticsGroupID is 13 and is ignored otherwise."
